

## Army Safety Gram

<u>13-14</u>

## **Avoiding Heat Illness**

Working in an excessively hot environment can be difficult – and even fatal. Heat can create a number of safety problems and illnesses, including heat cramps, heat exhaustion and heat stroke, which can be fatal. These illnesses caused by too much heat are called hyperthermia.

Heat can also cause you to become inattentive, short-tempered, dizzy, and slow. All of these conditions can cause you to work in an unsafe manner.

Hot conditions can be caused by the weather or by the work situation itself, such as a laundry-room or a foundry. When the atmosphere is humid, the effects of the heat are compounded.

- Heat Cramps. Heat cramps affects muscles such as those in the arms, legs and abdomen – the muscles which have been used while working. These cramps may occur after work, when the person is resting. Heat cramps are a signal that the body has lost too much salt through sweating.
- **Heat Exhaustion.** Heat exhaustion is a serious condition that needs immediate attention. It may have any or all of these symptoms: A feeling of exhaustion, nausea, dizziness, pale and clammy skin, quick pulse, and low blood pressure. Heat exhaustion is also a warning that the mechanism which controls heat for the body has become seriously overtaxed. Heat stroke may follow if heat exhaustion is not treated.
- **Heat Stroke.** Heat stroke is a serious matter and it can be fatal. It occurs when the body's heat control mechanism simply shuts down. Perspiration stops and the body temperature rises. The heart pounds and the skin becomes flushed and hot. This condition is a medical emergency and must be treated immediately.

## Here are some suggestions for smoother sailing in the summer:

- When the hot weather hits, expect everyone to be sluggish for a few days until they adjust. Get used to working in the heat gradually. Alter work routines to reduce heavy exertion in the heat of the day.
- Take frequent rest breaks when working in hot conditions. These breaks can consist of moving to a cooler area or switching to lighter work for awhile.
- Drink water often to avoid dehydration. The body loses water through perspiration, so you need to replenish it
  frequently. Do not drink alcoholic beverages or caffeinated beverages because they will cause you to lose even
  more water and salt.
- Dress lightly, in layers so that you can subtract or add clothing as the temperature changes. Be sure to shade the skin against the sun. Remind your workers frequently to protect themselves from sunburn by covering up with lightweight clothing and using sunscreen.

• Remind your employees to watch each other for signs of heat illness. Mild cases can be treated by moving the person to a cool area and supplying water to drink. Heat stroke is a life-threatening condition which calls for immediate medical help.

Every summer many areas undergo periods of seriously hot weather. Make sure you know how to avoid heat illness at work and off the job.
