1.0 INTRODUCTION

As part of the Corrective Action Plan submitted to the U.S. Army Corps of Engineers by Atlanta Testing & Engineering in July 1991, a Phase II Interim Remediation plan for the Base Gas Station, Building 133, Hunter Army Airfield, Savannah, Georgia was developed. Aneptek Corporation (Aneptek), under contract with the U.S. Army Corps of Engineers, Contract Number DACA21-94-C-0049, performed the Phase II Interim Remediation.

The Phase II Interim Remediation involved the removal of six underground storage tanks (USTs) from the vicinity of Building 133, removal of petroleum contaminated soil and treatment of contaminated groundwater. This closure report details the UST removal action.

Figure 1 shows the site location of Building 133. It is located at the intersection of Mitchell Boulevard and Barksdale Circle. Building 133 has been in existence since the 1950's and was taken out of service in 1991. Six USTs were removed from the station during the month of August 1994. Five of the USTs were used for the storage of gasoline with the sixth being used for the storage of waste oil. Four of the gasoline USTs had a capacity of 6,000 gallons while the other had a capacity of 4,000 gallons. The waste oil UST had a capacity of 1,000 gallons.

A Georgia Department of Natural Resources Underground Storage Tank Closure Activity Form, (GUST 29), was completed and sent to the State for processing on May 17, 1994 by Aneptek. An EPA Form 7530-1, Notification for Underground Storage Tanks, Georgia Revision, was sent to the State by the Department of Public Works, Environmental Division, Hunter Army Airfield, immediately after all tanks were removed and properly disposed of from the site. This Closure Report was prepared by Aneptek after all waste associated with the tank contents and all petroleum contaminated soil associated with the USTs was removed and properly disposed of from the site.

2.0 TANK OWNERSHIP AND LOCATION

As these USTs were located on a Federal Military Installation, the ownership falls under the jurisdiction of the Department of the Army. All information regarding the ownership and location of these USTs as listed on the GUST 29 Form is as follows:

Site Location: Hunter Army Airfield, Building 133
Savannah, Georgia

Contact Person: Ms. Angie Eason
Department of Public Works
Environmental Division
Hunter Army Airfield

Telephone Number: 912-352-5535

UST Owner: Department of the Army, Director of Public Works

Mailing Address: Director of Public Works
Fort Stewart
Hinesville, Georgia 31314

Contact Person: Lieutenant Colonel R.R. McLaughlin

Telephone Number: 912-767-8356

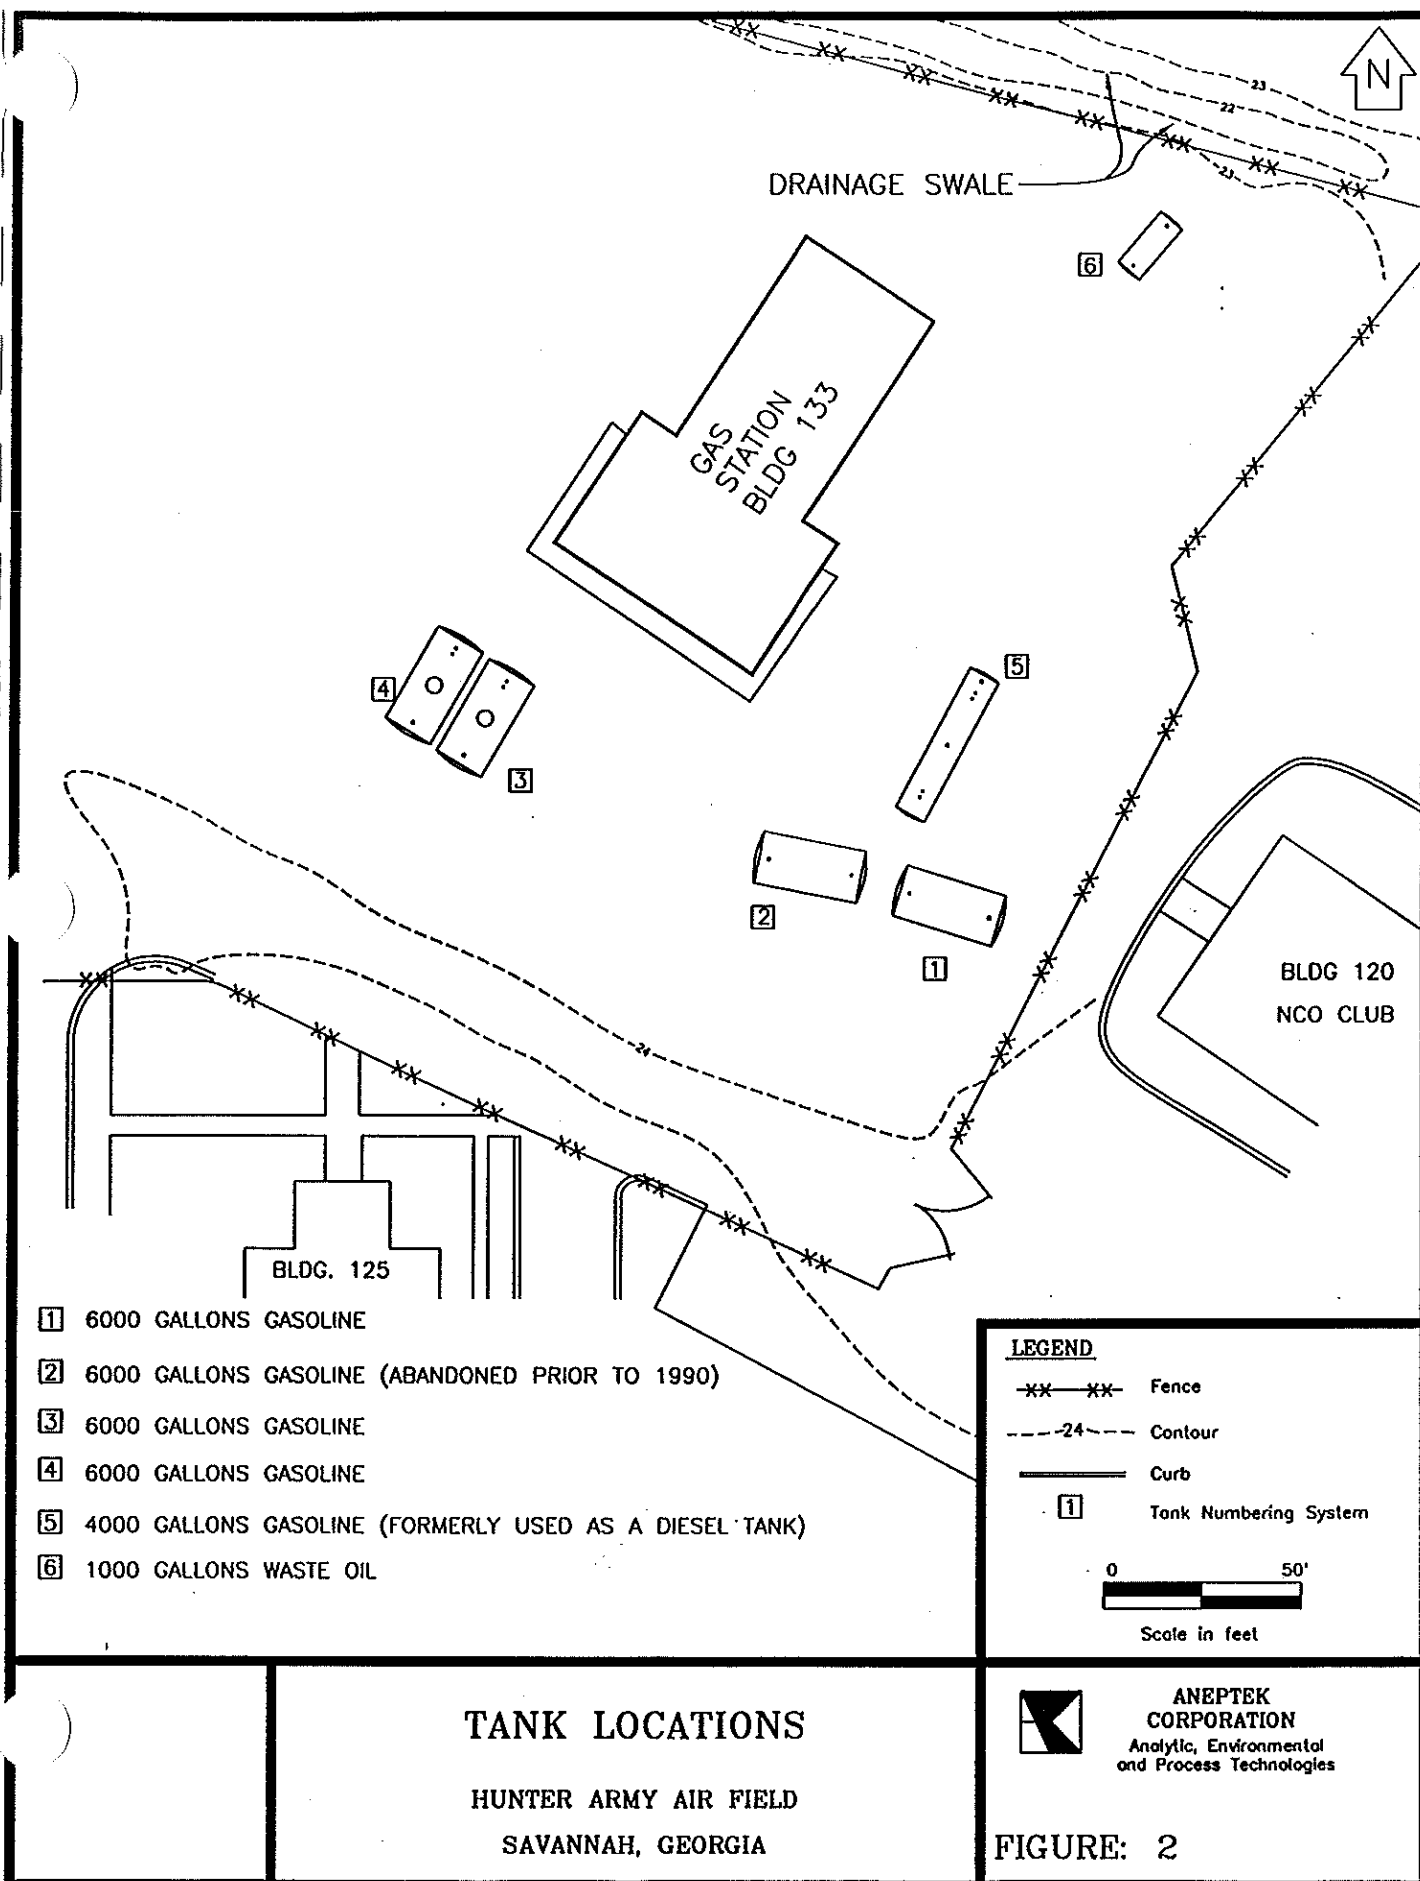

3.0 TANK REMOVAL

The Department of Public Works at Hunter Army Airfield demolished and removed Building 133, the pump island and the overhead canopy. All debris from the demolition was removed prior to Aneptek's arrival for site mobilization. Aneptek removed the concrete pad which covered the five gasoline USTs. The waste oil tank only had a soil covering. The overlying concrete pad was removed and disposed of at the Savannah Landfill. Figure 2 shows Building 133 and tank locations.

According to the U.S. Army Corps of Engineers, a very small amount of sludge, water and/or product (less than 10 inches) remained inside each UST. Prior to removal, the contents of each tank was sampled by Aneptek personnel utilizing EPA sampling protocols and dedicated teflon bailers. Samples were analyzed for the following parameters using the appropriate EPA Method:

- Total Petroleum Hydrocarbons (TPH),
- Toxicity Characteristic Leaching Procedure (TCLP) for RCRA 8 metals,
- Total Organic Halogens (TOX),
- Pesticides,
- Polychlorinated Biphenyls (PCBs),
- Flashpoint and,
- pH.

All product and/or water was removed from tanks prior to tank excavation. All ancillary piping to the tanks was removed prior to tank excavation. The product and/or water was placed in a 5,000 gallon tank trailer which was used as a holding tank for any recoverable free product that was found during the soil excavation phase of the project. At the completion of the project the tanker contents were manifested as hazardous waste and transported by a licensed hazardous waste hauler to Southeastern Chemical and Solvent, Sumter, South Carolina for reclamation.

After product and/or water was removed from the tanks, each tank was inerted with dry ice using approximately three to four pounds of dry ice per 100 gallons of tank volume. A 12 foot vent stack was placed upon each tank as dry ice was added as per American Petroleum Institute's (API) Recommended Practice 1604. During inerting of the tanks, the atmosphere inside the tanks was continuously monitored for combustible vapors and percent oxygen. When the percent of oxygen remaining inside the tanks could not support combustion, the tanks were removed from the excavations. All API Recommended Practices for UST removal were implemented during this project.

The tanks were removed in the following order: Tank 6, Tank 5, Tank 1, Tank 2, and Tanks 3 and 4. Due to the close proximity of Tank 3 to Tank 4, only one excavation was dug and both tanks were removed. Soil samples were collected from the walls of each tank excavation immediately after tank removal. All tanks were excavated and removed using rated chains and a Caterpillar 325 track excavator. After the tanks were removed from the excavation, they were rendered unusable by cutting holes at least two feet in diameter at each end with a pneumatic sawzall. During cutting of the tank walls, the atmosphere inside the tank was continuously monitored for combustible vapors and percent oxygen. After holes were cut into the tanks, the inside and outside of the tanks were washed with water using a high pressure, low volume spray. All wash water and sludge from the interior of the tanks was pumped into the tank trailer.

The tanks were labeled and transported as scrap to Savannah Steel and Metal Company, Savannah, Georgia. Tanks were labeled with orange spray paint with lettering four to six inches in height. Tanks were labeled with the date of removal, a picture of a skull and cross bones and the following:

TANK HAS CONTAINED GASOLINE
DO NOT REUSE, NOT FOR FOOD

All ancillary piping from around the pump island and the tanks was also transported to Savannah Steel and Metal Company for scrap. The contractor responsible for UST removal was the following:

Contractor: Aneptek Corporation
 209 West Central Street
 Natick, Massachusetts 01760

Telephone Number: 508-650-1048

Contact Person: Richard Ramuglia

4.0 LOCAL GEOLOGY AND HYDROLOGY

The site is located in the Coastal Plain of Georgia and is approximately 18 miles west of the Atlantic Ocean. Geologic formations underlying the coastal plain in this area consists of unconsolidated sand and clay overlying bedrock comprised of limestone and dolomite. These

formations were deposited during the Late Cretaceous Period to the Quaternary Period. Soil types in the immediate area consist of sand, silt and clay. The area of excavation encompassed during this project was approximately one acre in size.

The terrain of the area around Building 133 is fairly flat with only a one foot change in elevation across the site. No bedrock outcrops are visible and no bedrock was encountered during the excavation of USTs or contaminated soil. The deepest depth encountered during a tank excavation was approximately ten feet. Soil types in the immediate area of the tanks consisted of black fine sand and silt, with 20%-30% clay. The clay was soft, blue-gray and orange in color, and had low plasticity, it could be rolled into 1/8" diameter strips. Ground water was found at between six and seven feet below the ground surface.

Approximately 40 feet to the north of Building 133 is a drainage swale that collects surface runoff from an area behind Building 133 and adjacent to Building 918. This drainage swale discharges into an open drainage ditch. Figure 3 depicts drainage swale and "limits of excavation". This drainage ditch was checked on a daily basis during UST and soil removal. No product or sheen associated with the site was ever detected in the drainage ditch. On the east and west end of the open ditch are large culvert pipes. The east end has a large corrugated metal pipe that carries water into the drainage ditch. This pipe brings surface runoff water from the flightline area of the Base to the drainage ditch. The west end of the drainage ditch has three large concrete pipes that run in a northeasterly direction under Mitchell Boulevard and the baseball field. These concrete pipes carry water from the drainage ditch to a surface stream behind the Base Environmental Office. This stream ultimately empties into the Forest River which is classified by the State of Georgia's Environmental Protection Division as a "Fishing River". The Forest River empties into the Little Ogeechee River, which is also classified as a "Fishing River". The Little Ogeechee River discharges into the Atlantic Ocean at Ossabaw Sound.

5.0 TANK DESCRIPTIONS

Tank descriptions are in the order that the tanks were excavated. Figure 2 depicts tank locations.

Tank 6

Tank Number 6, a 1,000 gallon waste oil tank was excavated and removed on August 17, 1994. The tank was comprised of single-walled, welded steel with no coating of any kind. It was slightly rusted with minor pits located on the tank ends. A 4-inch fill pipe was located on the top of the tank towards the center. A 2-inch vent pipe was located on top of the tank at one end. The tank was cylindrical in shape with dimensions of 10 feet in length by 51 inches in diameter. The tank was not resting on any type of pad or blocks and no hold-down straps were present. Except for the minor pitting, the integrity of the tank was sound.

The tank was covered with a one foot layer of soil. No stained soil was evident during the excavation. Soil samples were collected from each side wall of the excavation, at approximately three feet below ground surface, after the tank was removed. Ground water

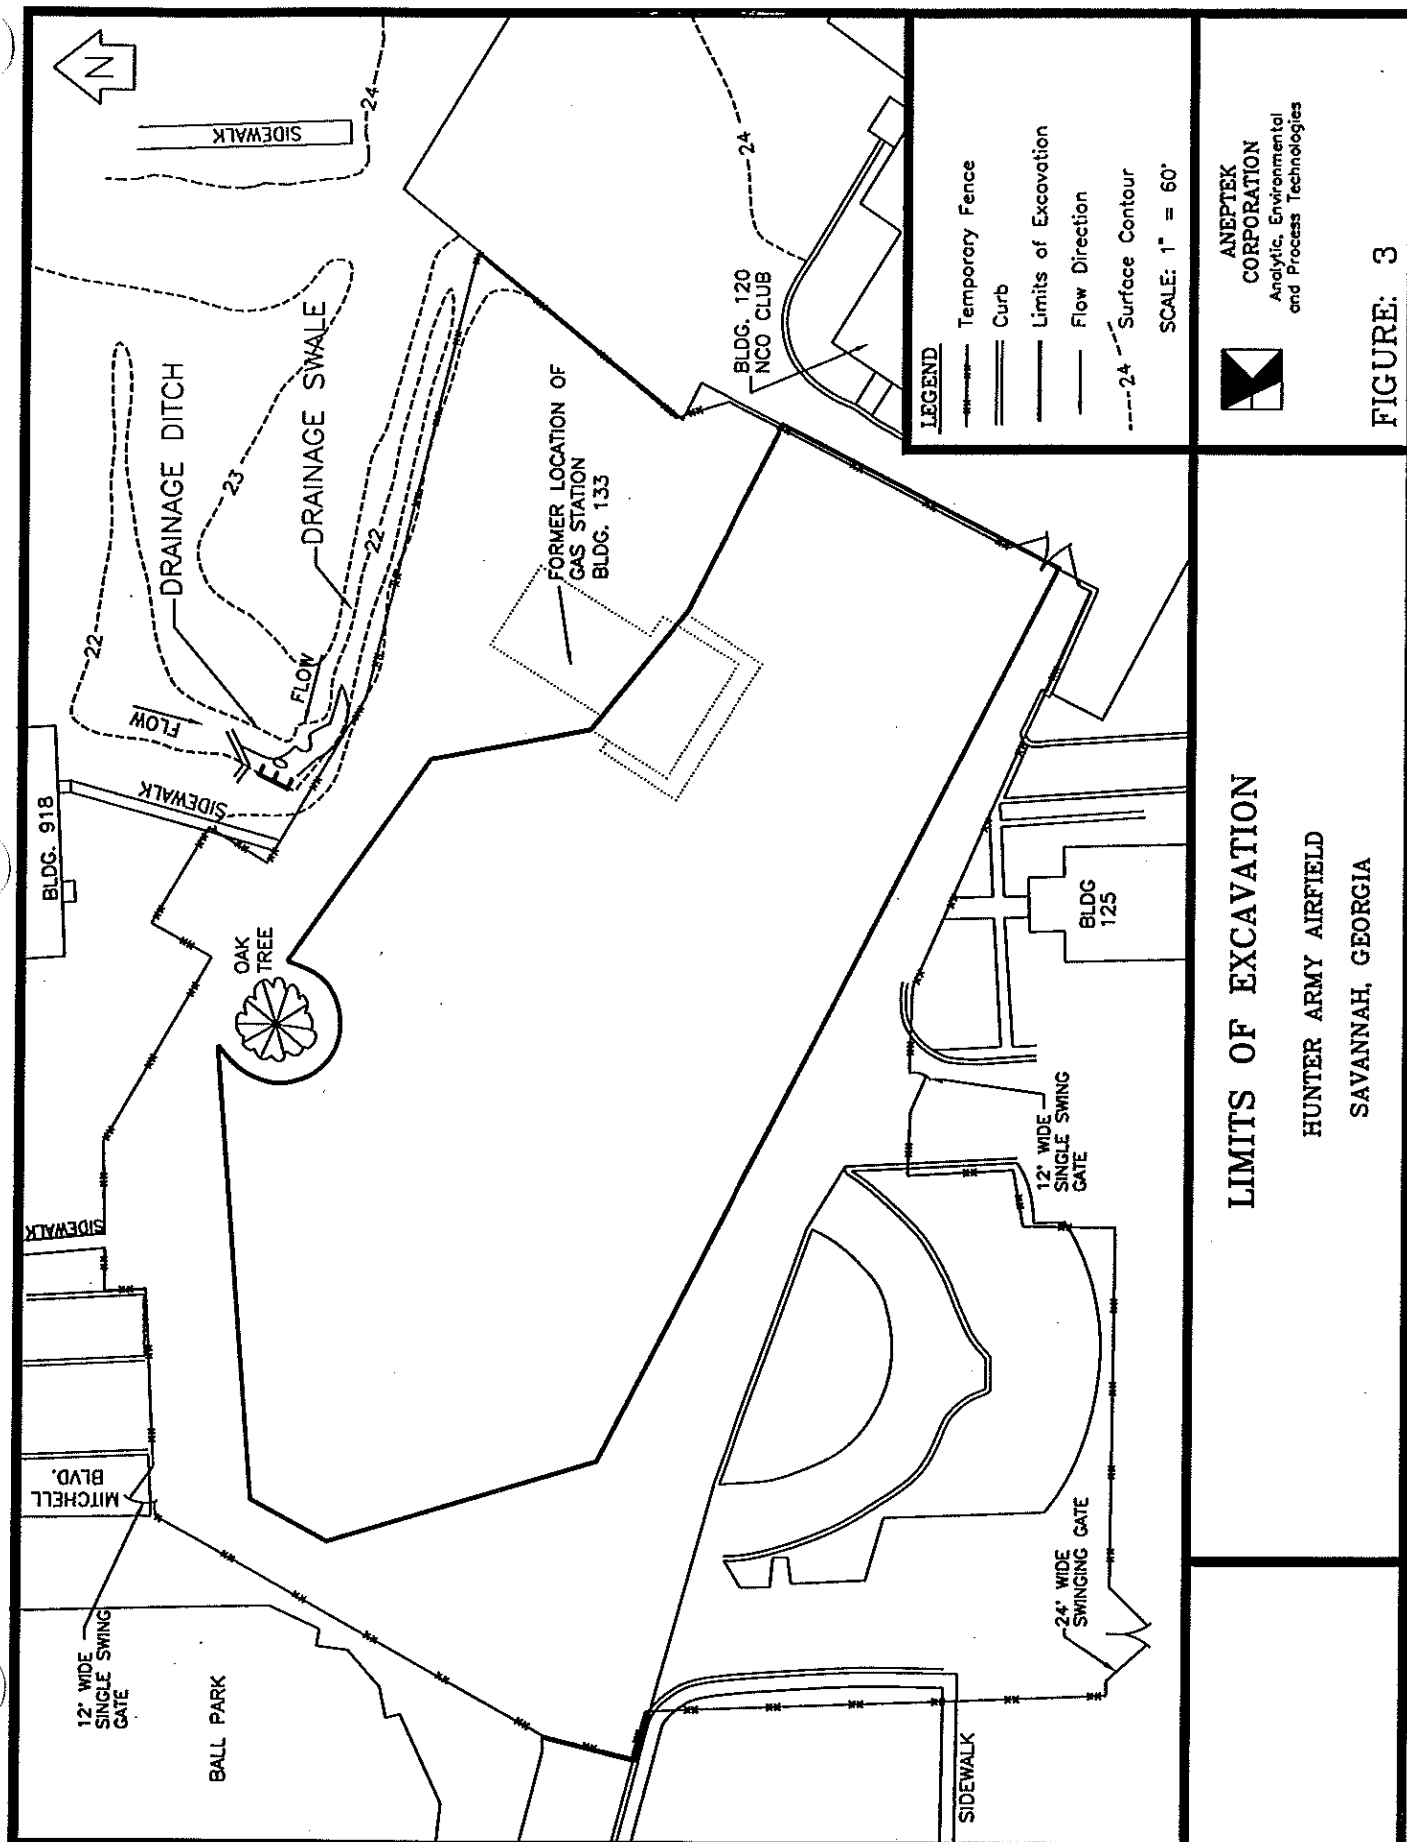

FIGURE: 3

ANEPTEK CORPORATION
Analytic, Environmental
and Process Technologies

was not encountered in the excavation and a soil sample was collected from the bottom of the excavation, approximately five feet below ground surface. The dimensions of the excavation were approximately 15' x 20' x 5'.

Soils surrounding Tank 6 can be described as gray-brown silty fine sand with some clay. No readings were registered on a photoionization detector from the soils. The photoionization detector used was an Hnu, model P101 with an 11.7 electron volt lamp. The excavation was backfilled with the same material that was removed from the excavation.

Tank 5

Tank Number 5, a 4,000 gallon gasoline tank was excavated and removed on August 23, 1994. It was a single-walled, welded steel tank with no visible coating. The thickness of the steel was 1/4 inch. The tank was cylindrical in shape with dimensions of 24 feet in length and 5 feet in diameter. Along the top of the tank in the middle a 4-inch fill pipe was visible. Along the top of the tank on either ends, were two 2-inch vent pipes. On the south end of the tank on the top there was what appeared to be a 4-inch check valve. Two metal straps held the tank down on a concrete pad. There were also four, 2"x 6"x 10' wood planks at the base of the tank. After the tank was removed from the excavation, loose soil was removed from the outside of the tank using non-sparking shovels (brass). The outside of the tank was then pressure washed to check for any holes, splits, or pitting. None were visible and the integrity of the tank was sound.

Soils were visibly stained around pad where the tank rested. Ground water was encountered at six feet. A petroleum sheen was noticed on the surface of the ground water. Soil samples were collected from each side wall of the excavation after the tank was removed. Soil samples were collected from approximately two to four feet below the ground surface. One ground water sample was collected from the bottom of the excavation. The dimensions of the excavation at the conclusion of the tank removal were approximately 37' x 17' x 8'.

Soils surrounding Tank 5 can be described as brown, black fine sand and silt with 20% to 30% clay. The clay was blue/orange in color, soft, with low plasticity, it could be rolled into 1/8 inch diameter strips. The highest reading from an Hnu on the soils was 110 parts per million (ppm).

Tank 1

Tank Number 1 was excavated and removed on August 24, 1994. Tank Number 1 was a single-walled, welded steel tank with a capacity of 6,000 gallons and was cylindrical in shape with dimensions of 16 feet long and 8 feet in diameter. The tank was coated with a black covering and the thickness of the steel was 1/4 inch. Along the top of the tank there was a 4-inch fill pipe on one end and at the other end were two, 2-inch vent pipes. There were no straps of any kind holding down the tank. A concrete pad was not present but instead two large, 3' x 3', concrete blocks were located at the bottom ends of the tank. It is assumed that the tank rested upon these two blocks. After the tank was removed from the excavation loose soil was removed from the outside of the tank using brass shovels. The outside of the tank was then pressure washed to check for any holes, splits, or pitting. Along the bottom

western edge of the tank, a hole approximately ten inches long and 1/4 inch to 1/2 inch wide along the weld of the tank was visible. The tank had a black coating on it and no other pits or holes were visible.

Soils around the north face of the tank were brown, black, coarse sand and gravel with a little gray clay. Soils around the east, south, and west sides of the tank were brown, black colored silt and clay. The clay was blue-green, gray in color and was soft and moist. It also had a low plasticity, it could be rolled into 1/8 inch diameter strips. Ground water was encountered at seven feet. There was no visible petroleum sheen noticed on the surface of the water. As the tank was being removed, a very strong petroleum odor was present. Soil samples were collected from each side wall of the excavation, approximately at five feet below ground surface, and a ground water sample was also collected. Readings of 10 to 20 ppm were recorded on the soils using an Hnu. The dimensions of the excavation after removal of the tank were 28' x 23' x 10'.

Tank 2

Tank 2 was excavated and removed on August 24, 1994. Tank Number 2 was a single-walled, welded steel tank with a capacity of 6,000 gallons and was cylindrical in shape with dimensions of 16 feet long and 8 feet in diameter. The tank was covered with a black coating and the thickness of the steel was 1/4 inch. On the top of the tank there was a 4-inch fill pipe on one end and two 2-inch vent pipes on the other end. There were no straps of any kind holding down the tank. A concrete pad was not present but instead two large, 3' x 3', concrete blocks were located at the bottom ends of the tank. It is assumed that the tank rested upon these two blocks. After the tank was removed from the excavation, loose soil was removed from the outside of the tank using brass shovels. The outside of the tank was then pressure washed to check for any holes, splits, or pitting. None were visible and the integrity of the tank was sound.

The soil around Tank 2 was comprised of brown, black, silt, some fine sand, and clay. Silt comprised approximately 40% - 50% of the soil and fine sand 10% - 20%, with the remainder being clay. The clay was blue-gray in color, soft and had low plasticity, it could be rolled into 1/8 inch diameter strips. Ground water was encountered at approximately seven feet. Soil samples were collected from each side wall of the excavation, approximately at five feet below ground surface. A ground water sample was also collected. The dimensions of the excavation after removal of the tank were 27' x 15' x 10'.

Tanks 3 & 4

Tank Numbers 3 and 4 were excavated and removed on August 25, 1994. Due to the close proximity of these tanks with each other, only one excavation was performed and both tanks were removed. Both tanks were identical with each having a capacity of 6,000 gallons. Both were single-walled, welded steel 1/4 of an inch thick, cylindrical in shape with dimensions of 16 feet in length and 8 feet in diameter. A black coating covered each tank. Each tank had a 24 inch manway on the top at the center of the tank, a 4 inch fill pipe at one end, and two vent pipes at the other end. One vent pipe was 1 1/4 inches in diameter and

the other 2 inches in diameter. Both tanks had metal straps holding them down and both floated on the water when the straps were cut. The straps were connected to concrete blocks located at the base of the tanks at each end. After the tanks were removed from the excavation, loose soil was removed from the outside of each tank using brass shovels. The outside of the tanks were then pressure washed to check for any holes, splits, or pitting. None were visible and the integrity of each tank was sound.

The soil around Tanks 3 & 4 was comprised of gray fine sand with a little gravel, a little silt and clay. The fine sand comprised approximately 60% - 70% of the soil. The clay comprised approximately 10% of the soil and was blue-gray in color, soft and had low plasticity, it could be rolled into 1/8 inch diameter strips. Ground water was encountered at approximately six to seven feet. Soil samples were collected from each side wall of the excavation approximately at five feet below ground surface. A ground water sample was also collected. Soils registered 100 ppm on the Hnu. The dimensions of the excavation after removal of the tanks was 39' x 32' x 10'.

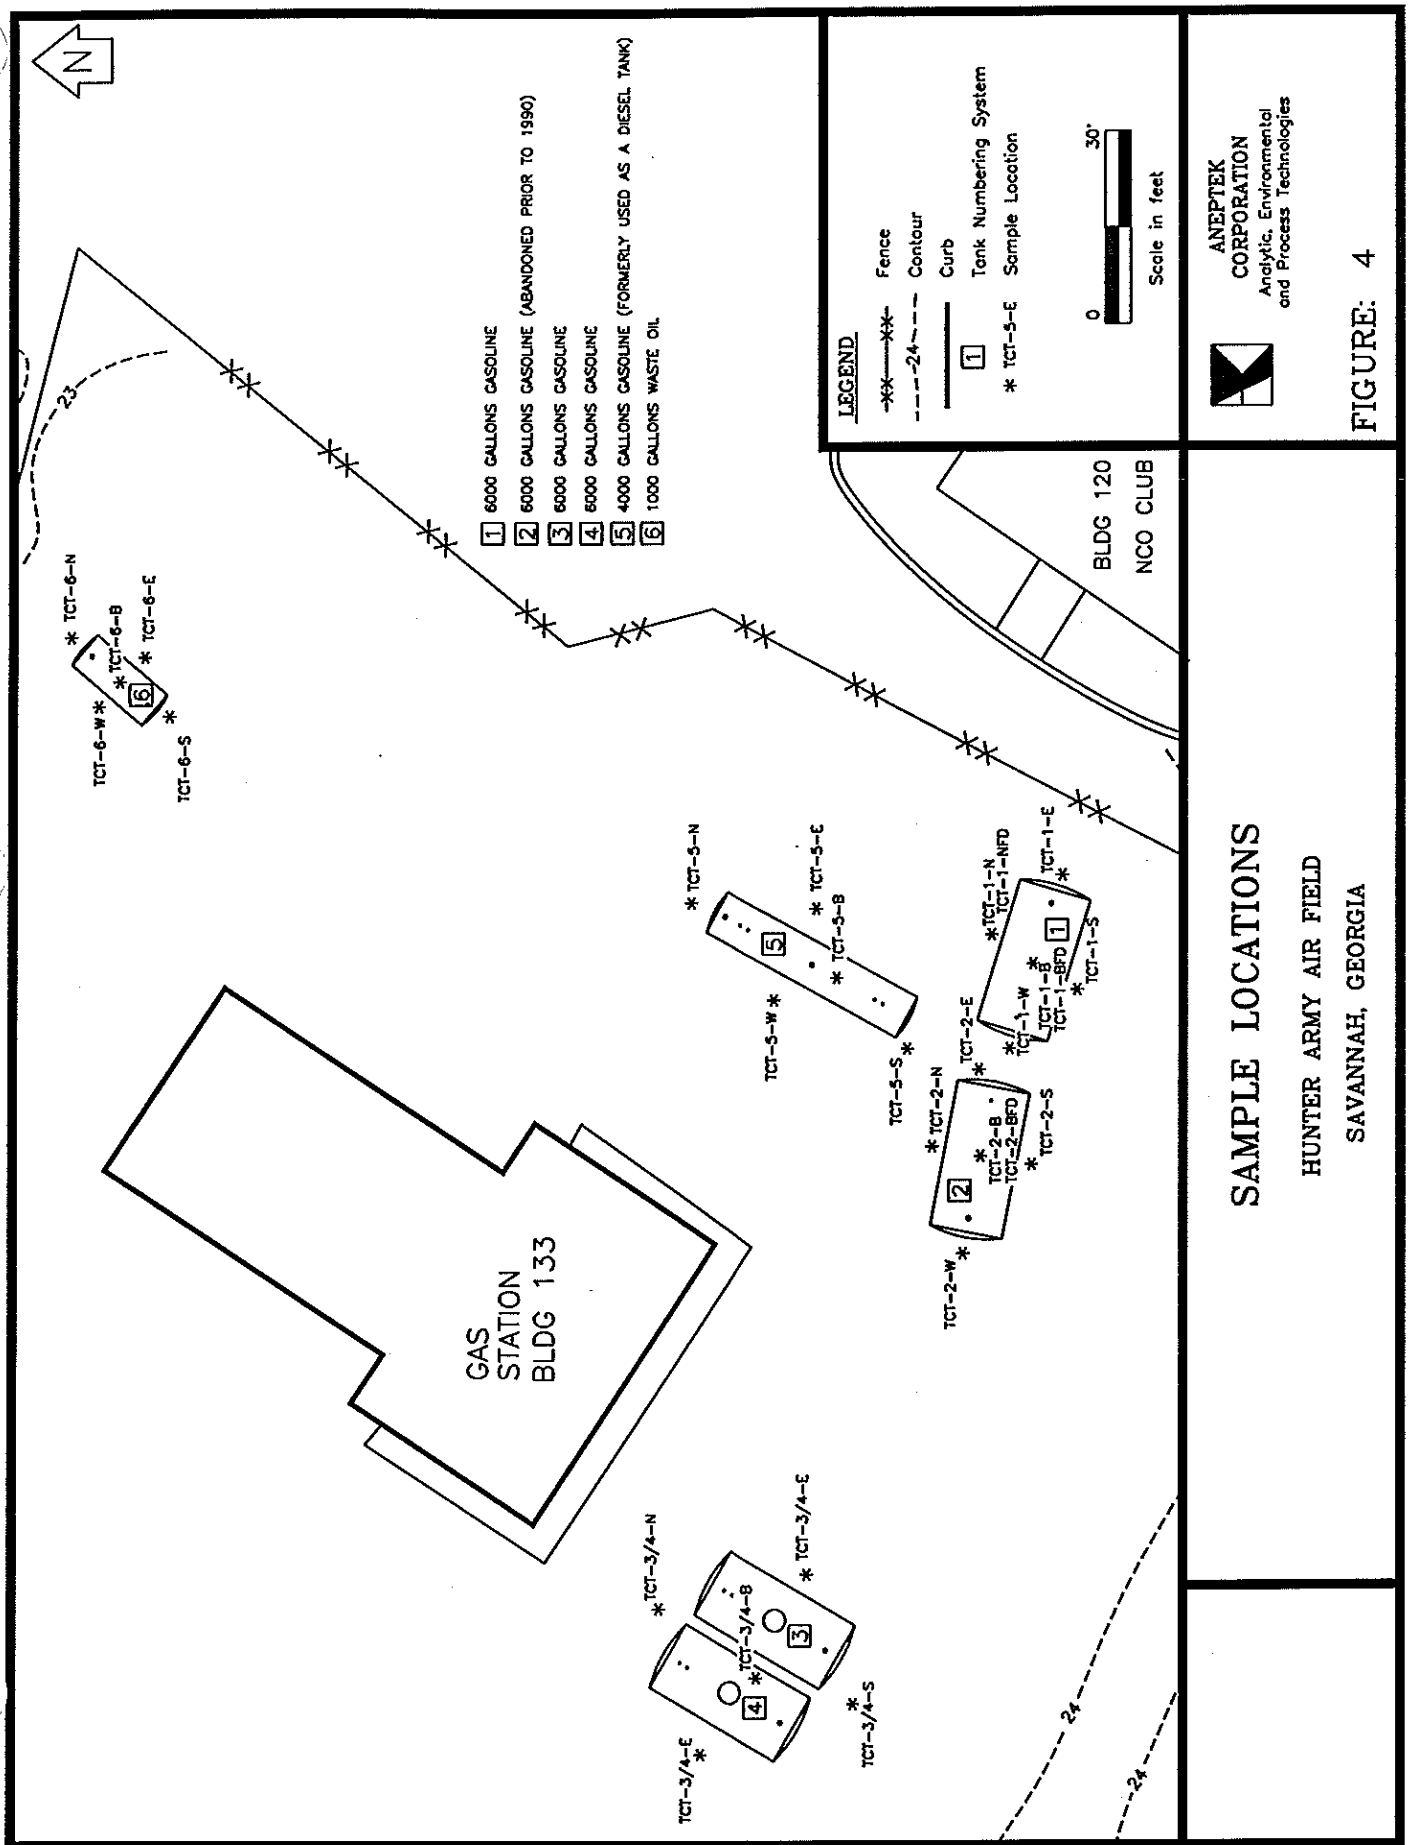

6.0 SAMPLING

Soil samples were collected from the walls of each tank excavation after tank removal. Samples were collected with decontaminated stainless steel sampling equipment utilizing EPA protocols. As part of Aneptek's Quality Control/Quality Assurance, one soil sample and one ground water sample were collected and sent to the Army Corps Laboratory in Marietta, GA. The locations of samples were noted as compass directions in relation to position of tank while it was still in the ground. Ground water was encountered during the removal of all gasoline tanks. A ground water sample was collected from each gasoline tank excavation. During removal of the waste oil tank, ground water was not encountered and a soil sample was collected at one foot below the base of the tank. Sample locations are depicted in Figure 4.

Samples were analyzed for the following parameters:

- Total Petroleum Hydrocarbons as Gasoline (TPH),
- TPH as Oil, waste oil tank only, and,
- benzene, ethyl benzene, toluene and total xylenes (BTEX).

Sample nomenclature is as follows: TCT-1-E, Tank Closure Testing, Tank No. 1, east sidewall of excavation. Summary results from all samples collected are listed in Tables 1 and 2.

7.0 RESULTS SUMMARY

All soil above and around the USTs was shown to be above the action levels of 100 ppm of total BTEX and 500 ppm TPH as set forth in the Corrective Action Plan. Ground water sampled below the USTs was also shown to be above State and Federal Drinking Water Standards.

All soil in the vicinity of the USTs was removed from the site and recycled at an asphalt plant. All ground water encountered during removal of the USTs was treated on site through an activated carbon system. Treated ground water was sampled prior to discharge into Hunter Army Airfield's sanitary sewer. Concentrations of contaminants in treated ground water were below State and Federal Drinking Water Standards before being discharged.

8.0 CONCLUSIONS

During the Phase I Interim Remediation performed at Building 133, Hunter Army Airfield, a confirmed release of gasoline was discovered floating on top of the ground water in the vicinity and down gradient of the gasoline USTs. Data taken from the Corrective Action Plan depicts ground water flow direction to the northwest. During Aneptek's Phase II Interim Remediation Project, all free product (gasoline) within the source area along with petroleum contaminated soil was removed. Additionally, free product and/or water was removed from the tanks and from ground water via skimming operation during excavation of the contaminated soil. This liquid was manifested as a hazardous waste and transported by a licensed hazardous waste hauler to Southeastern Chemical and Solvent, Sumter, South Carolina for reclamation. A total of 17,861.1 tons of petroleum contaminated soil was removed from the site and treated at Reynolds Construction, an asphalt plant in Ludowici, Georgia. Soil treatment and hazardous waste removal were completed in March and April 1995. Approximately 750,000 gallons of contaminated ground water was treated on site through activated carbon during the duration of the project. Concentrations of contaminants in treated ground water were below State and Federal Drinking Water Standards before being discharged to the Hunter Army Airfield sanitary sewer. The area of excavation encompassed during this project was approximately one acre in size.

9.0 RECOMMENDATIONS

It is recommended that further monitoring be performed at monitoring wells in place around the perimeter of the area that was excavated. According to the Corrective Action Plan, a Phase III Interim Remediation, involving installation of additional monitoring wells downgradient of the source area and continued monitoring of wells already in place is in the planning stage.

INSTRUCTIONS			
Please type or print in ink all items except "signature" in section VIII. This form must be completed for each facility containing underground storage tanks. If more than five (5) tanks are owned at this facility, photocopy the following sheets, and staple continuation sheets to the form.			
TYPE OF NOTIFICATION			
11 NEW FACILITY 12 AMENDED 13 CLOSURE			
60 Total No. of tanks at facility 2 No. of continuation sheets attached			
GENERAL INFORMATION			
<p>Notification is required by the Georgia Underground Storage Tank Act, O.C.G.A. 12-12, as amended for all underground tanks that have been used to store regulated substances since January 1, 1974, that are in the ground as of May 8, 1984, or that are brought into use after May 2, 1984.</p> <p>The primary purpose of this notification is to locate and evaluate underground tanks that store or have stored petroleum or hazardous substances. The information you provide must be based on reasonably available records, or in the absence of such records, your knowledge, belief, or recollection.</p> <p>Who Must Notify? The (UST) Act, as amended, requires that, unless exempted, owners of underground tanks that store regulated substances must notify the Georgia Environmental Protection Division of the existence of their tanks.</p> <p>Owner means:</p> <ol style="list-style-type: none">In the case of an underground storage tank in use on November 8, 1984, or brought into use after that date, any person who owns an underground tank used for the storage, use, or dispensing of regulated substances; andIn the case of any underground storage tank in use before November 8, 1984, but no longer in use on that date, any person who owned such tank immediately before the discontinuation of its use. <p>Note: any facility that has undergone any changes in facility information or tank system status need only submit amended tank information.</p> <p>What Tanks Are Included? Underground storage tank is defined as any one or combination of tanks that (1) is used to contain an accumulation of "regulated substances," and (2) whose volume (including connected underground piping) is 10% or more beneath the ground. Some examples are underground tanks storing: 1. Gasoline, used oil, or diesel fuel, and 2. Industrial solvents, pesticides, herbicides or fumigants.</p> <p>What Tanks Are Excluded? Tanks removed from the ground are not subject to notification. Other tanks excluded from notification are:</p> <ol style="list-style-type: none">farm or residential tanks of 1,100 gallons or less capacity used for storing motor fuel for noncommercial purposes;tanks used for storing heating oil for consumptive use on the premises where stored;septic tanks;pipeline facilities (including gathering lines) regulated under the Natural Gas Pipeline Safety Act of 1968, or the Hazardous Liquid Pipeline Safety Act of 1970, or which is an interstate pipeline facility regulated under other State laws;surface impoundments, pits, ponds, or lagoons;storm water or waste water collection systems;flow-through process tanks;liquid traps or associated gathering lines directly related to oil or gas production and gathering operations;storage tanks situated in an underground area (such as a basement, cellar, mine-working, ditch, shaft, or tunnel) if the storage tank is situated upon or above the surface of the floor. <p>What Substances Are Covered? The notification requirements apply to underground storage tanks that contain regulated substances. This includes any substance defined as hazardous in section 101 (14) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA), with the exception of those substances regulated as hazardous waste under Subtitle C of RCRA. It also includes petroleum, e.g., crude oil or any fraction thereof which is liquid at standard conditions of temperature and pressure (60 degrees Fahrenheit and 14.7 pounds per square inch absolute).</p> <p>Where to Notify? Send completed forms to:</p> <p>GA Environmental Protection Division Underground Storage Tank Management Program 4244 International Parkway, Suite 100 Atlanta, GA 30354</p> <p>When To Notify? 1. Owners of underground storage tanks in use or that have been taken out of operation after January 1, 1974, but still in the ground, must have notified by May 8, 1986. 2. Owners who bring underground storage tanks into use after May 8, 1986, must notify within 30 days of bringing the tanks into use. 3. Any modification to facility tanks requires immediate notification.</p> <p>Penalties: Under the GUST Act, O.C.G.A. 12-13-14, any owner who knowingly fails to notify or submits false information shall be subject to a civil penalty not to exceed \$10,000 for each tank for which notification is not given or for which false information is submitted.</p>

Public reporting burden for this collection of information is estimated to average 37 minutes for generators, 15 minutes for transporters, and 10 minutes for treatment storage and disposal facilities. This includes time for reviewing instructions, gathering data, and completing and reviewing the form. Send comments regarding the burden estimate, including suggestions for reducing this burden, to Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., S.W., Washington, D.C. 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, D.C. 20503.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations and the laws of the State of South Carolina.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment. OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

GENERATORS NOTIFICATION OF TREATMENT REQUIREMENTS FOR WASTES RESTRICTED FROM LAND DISPOSAL UNDER 40 CFR 268 SUBPART D

MANIFEST NUMBER:

EPA ID NUMBER:

344210022733

EPA WASTE CODE:

5351 0018 0110 0011

PROFILE NUMBER:

18820

A WASTE CATEGORY [Check appropriate line(s)]

Unrestricted Waste Notification

The disposal of this waste is not restricted as specified in 40 CFR 268, subpart D and all prohibitions set forth in 40 CFR 268.32 or RCRA Section 3004(d).

Restricted Waste Notification

☐ This is a restricted waste which meets the treatment standards as specified in 40 CFR 268, Subpart D.

☒ This waste does not meet the treatment standards specified in 40 CFR 268, Subpart D. Waste must be treated to the appropriate standard and ☒ in such a manner which renders it non-liquid by chemical fixation or solidification prior to land disposal. [See treatment standard below or see attached Part II section(s).]

☐ This shipment includes RCRA Section 3004(d) California list wastes. Circle or otherwise indicate individual constituents likely to be present in the waste.

EPA CODES	SUBCATEGORY or WASTE DESCRIPTION	CONSTITUENT CONCERN	NON-WASTEWATER		WASTEWATER
			TOTAL COMPOSITION (mg/kg)	TCLP (mg/L)	TOTAL COMPOSITION (mg/L)
CALIFORNIA LISTED WASTE LAND DISPOSAL PROHIBITION LEVELS					
11	Arsenic bearing liquid wastes	Arsenic (As)	500		
11	Cadmium bearing liquid wastes	Cadmium (Cd)	100		
11	Chromium bearing liquid waste	Chromium (Cr)	500		
11	Lead bearing liquid wastes	Lead (Pb)	500		
11	Nickel bearing liquid wastes	Nickel (Ni)	100		
11	Mercury bearing liquid wastes	Mercury (Hg)	20		
11	Selenium bearing liquid wastes	Selenium (Se)	100		
	Thallium bearing liquid wastes	Thallium (Tl)	130		
	PCB bearing liquid wastes	Polychlorinated Biphenyls	50		
	Cyanide bearing liquid wastes	Cyanide (Total)	1000		
	Liquid wastes with a pH < 2.0		pH < 2.0		
	HOC bearing liquid wastes	HOCs listed below	1000		

☐ This shipment includes hazardous debris.

A required by 40 CFR 268.7(a)(2), the following certification is made for these restricted wastes:

I certify under penalty of law that I personally have examined and am familiar with the waste through analysis and testing or through knowledge of the waste to support this certification that the waste complies with the treatment standards specified in 40 CFR Part 268 Subpart D and all applicable prohibitions set forth in 40 CFR 268.32 or RCRA section 3004(d). I believe that the information I submitted is true, accurate and complete. I am aware that there are significant penalties for submitting a false certification, including the possibility of a fine and imprisonment.
