CORRECTIVE ACTION PLAN PART A

Facility Name: UST 79, Building 1224 Street Address: Wilson Ave between Divarty Rd & W. 6th St.

Facility ID: 9-089026 City: Fort Stewart County: Liberty Zip Code: 31314

Latitude: 32° 16' 08" Longitude: 82° 05' 12"

Submitted by UST Owner/Operator:

Name: Thomas C. Fry/ Environmental Branch

Company: U.S. Army/HQ 3d, Inf. Div (Mech)

Address: DPW ENRD ENV. Br. (Fry)

1557 Frank Cochran Drive

City: Fort Stewart State: GA

Zip Code: 31314-4928

Telephone: (912) 767-2010

Prepared by Consultant/Contractor:

Name: Patricia A. Stoll

Company: SAIC

Address: P.O. Box 2502

City: Oak Ridge State: TN

Zip Code: 37831

Telephone: (423) 481-8792

I. PLAN CERTIFICATION:

A. UST Owner/Operator Certification

I hereby certify that the information contained in this plan and in all the attachments is true, accurate, and the plan satisfies all criteria and requirements of rule 391-3-15-09 of the Georgia Rules for Underground Storage Tank Management.

Name: Thomas C. Fry

Signature: Thomas C. Fry Date: 10/29/99

B. Registered Professional Engineer or Professional Geologist Certification

I hereby certify that I have directed and supervised the field work and preparation of this plan, in accordance with State Rules and Regulations. As a registered professional geologist and/or professional engineer, I certify that I am a qualified groundwater professional, as defined by the Georgia State Board of Professional Geologists. All of the information and laboratory data in this plan and in all of the attachments are true, accurate, complete, and in accordance with applicable State Rules and Regulations.

Name: Patricia A. Stoll

Signature: Patricia A. Stoll

Date: 10/22/99

General: READ THE GUIDANCE DOCUMENT FOR CAP PART-A BEFORE COMPLETING THIS FORM. FAILURE TO READ THE GUIDANCE DOCUMENT WILL MOST LIKELY RESULT IN PREPARATION OF AN UNACCEPTABLE REPORT. All text, figures, and tables requested in their respective sections should be prepared strictly in accordance with the Georgia EPD CAP-A guidance document. Please fill out this form as provided. Do not change the size of the fields or alter the placement of each section on each page.

(Appendix I: All Report Figures)

(Appendix II: All Report Tables)

II. INITIAL RESPONSE REPORT

A. Initial Abatement

Were initial abatement actions initiated?

YES _____ NO X

If Yes, please summarize. If No, please explain why not.

Actions were not required to abate imminent hazards and/or emergency conditions at the UST 79 site. Therefore, contaminant migration and release prevention, fire and vapor migration, or emergency free product removal was not performed prior to, or during, the removal of UST 79.

B. Free Product Removal

(Table 1: Summary of Free Product Removal – must include Free Product thickness in each well in which it was detected, and volume of product removed)

Free Product Detected?

YES _____ NO X

If Yes, please summarize free product recovery efforts.

Continuing free product recovery proposed?

YES _____ NO X

If yes, please indicate the method and frequency of removal.

C. Tank History

List current and former UST's operated at site based on owner/operator knowledge consistent with EPA 7530-1 Form). Systems must be illustrated on Figure 2 (Site Plan), as described in section D below.

CURRENT UST SYSTEMS (if applicable)

<u>Tank ID Number</u>	<u>Capacity (gal)</u>	<u>Substance Stored</u>	<u>Age (yrs)</u>	<u>Meets 1998 Upgrade Standards (Yes/No)</u>
N/A	N/A	N/A	N/A	N/A

FORMER UST SYSTEMS (if applicable)

<u>Tank ID Number</u>	<u>Capacity (gal)</u>	<u>Substance Stored</u>	<u>Date Removed</u>
79	1000	used oil	7/18/96

D. Initial Site Characterization

(Figure 1: Vicinity/Location Map)

(Figure 2: Site Plan)

1. Regulated Substance Released (gasoline, diesel, used oil, etc.): used oil
Discuss how this determination was made and circumstances of discovery.

Anderson Columbia Environmental, Inc. (ACE) initiated characterization of petroleum-related contamination at the site during UST system closure activities on July 18, 1996. After removing the tank, one groundwater sample was collected from the tank pit (Figure 7). Benzene was present in sample TK79-GW at a concentration of 130 µg/L, which is above the MCL of 5 µg/L. Toluene, ethylbenzene, and xylenes were also present in the groundwater sample but did not exceed their respective MCLs. No soil samples were collected during tank removal activities.

2. Source(s) of Contamination: Unknown; piping leakage or tank overflow suspected
Discuss how this determination was made.

A detailed schematic diagram illustrating the former UST 79 and ancillary piping as configured during operation is presented in Figure 2. During removal activities by ACE, no holes in the tank were reported. Therefore, the source of contamination is believed to have been piping leakage and/or tank overflow.

3. Local Water Resources

(Figure 3: Quadrangle Map -- Public and Private drinking water and surface water)

(Appendix III: Water resources survey documentation, including, but not limited to: USGS database search, interview forms, and documentation of field survey)

a. Site located in high/average X OR low _____ groundwater pollution susceptibility area?

b. Water Supplies within applicable radii?

YES X NO _____

If yes,

i. Nearest public water supply located within: 2700 feet

ii. Nearest down-gradient public water supply located within: 2700 feet

iii. Nearest non-public water supply located within: >10,560 feet

iv. Nearest down-gradient non-public water supply located within: >10,560 feet

c. Surface Water Bodies and sewers:

i. Nearest surface water located within 2500 feet

ii. Nearest down-gradient surface water located within 5000 feet

iii. Nearest storm or sanitary sewer located within: 110 feet

iv. Depth to bottom of sewer at a point nearest the plume 4.0 feet

4. Impacted Environmental Media

a. Soil Impacted

(Table 2: Soil Analysis Results)

(Figure 4: Soil Quality Map)

(Appendix IV: Soil Boring Logs)

(Appendix V: Soil Laboratory Reports)

(Appendix VI: ATL Calculations, if applicable)

Provide a brief discussion of soil sampling.

Continuous soil cores were collected at 1.5- or 2.0-foot intervals during the installation of thirteen boreholes. Field headspace gas analyses were performed on each sample to determine the organic vapor concentration. Two soil samples were selected from each borehole for laboratory chemical analysis of BTEX, TPH, and PAH. In boreholes where organic vapors were detected, one sample was collected from the sample interval where the highest vapor concentration was recorded, and the other from the deepest sample interval with the lowest concentration. If organic vapors were not detected, one sample was collected from the sample interval nearest the midpoint of the boring, and the other from the sample interval located immediately above the water table. Refer to Attachment A for complete documentation of the technical approach implemented during this investigation.

- i. Soil contamination above applicable threshold levels? YES ☒ NO ☐
If yes, indicate highest concentrations in soil along with locations and depths detected.

During the CAP-Part A investigation in November 1998, benzene was detected in boring 84-06 at a depth of 0.7 – 2.2 feet BGS at a concentration of 0.009 mg/kg. In February 1999, benzene was detected in boring 84-10 at concentrations of 0.374J mg/kg and 0.224J mg/kg at depths of 1.1 – 2.0 feet BGS and 2.0 – 4.0 feet BGS, respectively. These sample locations are located 50 to 70 feet upgradient of the former tank pit and located directly beneath the concrete of the motorpool and above the water table. This area of contamination is most likely due to an oil leak associated with armored personnel carriers located within the motorpool and is not associated with the former tank and its operations.

- ii. ATLS calculated? YES ☐ NO ☒
If yes, present ATLS.

- iii. If ATL's calculated, is soil contamination above ATL's? YES ☐ NO ☐ N/A ☒

- b. Groundwater Impacted
(Table 3: Groundwater Analysis Results)
(Figure 5: Groundwater Quality Map)
(Appendix VII: Monitoring Well Details)
(Appendix VIII: Groundwater Laboratory Results)

Provide a brief discussion of groundwater sampling.

At each borehole location, except the vertical profile boring, one groundwater sample was collected from the temporary piezometer screened from ground surface to approximately 5.0 feet below the water table. At the vertical profile location (84-05), groundwater samples were collected every 5 feet below the water table until several groundwater sample intervals indicated a headspace gas measurement of zero. Chemical parameters for groundwater samples submitted for laboratory analysis included BTEX and PAH. Refer to Attachment A for complete documentation of the technical approach used to collect groundwater samples.

- i. Groundwater contamination above MCLs? YES ☒ NO ☐
ii. Groundwater contamination above In-Stream Water Quality Standards? YES ☒ NO ☐

If yes, indicate highest concentrations in groundwater along with the locations.

In 1996, the closure sample from the tank pit contained benzene at a concentration of 130 µg/L. During the CAP-Part A investigation in May 1998, benzene was present in borings 84-01 and 84-03 at concentrations of 5.8J µg/L and 52.6 µg/L, respectively. These two borings were located around the perimeter of the former tank pit and the greaserack.

In November 1998 and February 1999, the investigation was extended to include additional sampling in an effort to determine extent. Benzene was detected in boring 84-10 at a concentration of 32.4 µg/L; however, this is the boring that is located upgradient of the tank pit and contains soil contamination that is not related to the tank operations. Refer to Attachment C for supplemental information on risk screening and fate and transport modeling.

- c. *Surface Water Impacted?* YES _____ NO X
If Yes, indicate concentration(s) of surface water sample(s) taken from the surface water body/bodies impacted.

- d. *Point of Withdrawal Impacted?* YES _____ NO _____ N/A X
If Yes, indicate concentration(s) of water sample(s) taken from withdrawal point(s).

5. Other Geologic/Hydrogeologic Data

- a. *Depth to Groundwater (ft BTOC):* 7.80 – 12.74 (Table 4: Groundwater Elevations)
b. *Groundwater Flow Direction:* northwest (Figure 6: Potentiometric Surface Map)
c. *Hydraulic Gradient* 0.0038 ft/ft
d. *Geophysical Province:* coastal plain
e. *Unique geologic/hydrological conditions:* The Hawthorn Formation acts as a
Confining unit between the surficial and Floridan aquifers.

6. Corrective Action Completed or In-Progress (if applicable)

(Table 5: UST System Closure Sampling)

(Figure 7: UST System Closure Sampling)

(Appendix IX: Contaminated Soil Disposal Manifests)

- a. *Underground Storage Tank (UST) System Closure:* N/A _____
If applicable, summarize UST system closure activities conducted.

ACE removed UST 79 on July 18, 1996. The UST piping was drained into the tank, and all used oil was removed using a vacuum truck and/or compressor-driven barrel vacuum device. A backhoe was used to excavate down to the tank top. All lines were capped except the fill and vent. After the tank atmosphere was tested with a combustible gas indicator, all accessible tank openings were capped, and the tanks were lifted from the excavation pit. The ancillary piping was removed to the greaserack, and both ends were grouted in place.

b. Excavation and Treatment/Disposal of Backfill Materials and Native Soils

Check one: *No UST removal performed*

Returned to UST excavation

Excavated soils treated or disposal off site

X

If soils were excavated, summarize excavation and treatment/disposal activities:

All contaminated soil removed during the entire project (i.e., all USTs removed under contract with ACE, to include clean and non-clean closures) was tested in accordance with the disposal facility requirements and transported to Kedesh, Inc., Highway 84, Ludowici, GA, 31316. The Closure Report was not submitted to GA EPD because review of the closure analytical data indicated that a CAP-Part A would be required (i.e., per requirements of GUST-9, Item 15, page 12, dated August 1995). However, all pertinent information (i.e., copies of analytical data, manifests and maps) are provided in this CAP-Part A report. Disposal manifests for the UST 79 site were submitted to GAEPD USTMP in September 1998 with the UST 207A (Facility ID #9-089039) Closure Report response to comments correspondence (Perez 1998). Approximately 38.6 tons of contaminated soil was excavated from the site.

7. Site Ranking:

3100 (based on CAP-Part A soil and closure
groundwater data)

Environmental Site Sensitivity Score: 850 (based on CAP-Part A soil and groundwater data)
(Appendix X: Site Ranking Form)

8. Conclusions and Recommendations

Complete applicable section below, one section only

a. No Further Action Required (if applicable)
(provide justification)

N/A X

b. Monitoring Only (if applicable)
(provide justification)

N/A

Benzene was detected in three soil samples during the CAP-Part A investigation in excess of applicable GUST soil threshold levels (i.e., Table A Column 2); however, the samples were located 50 to 70 feet upgradient of the former tank pit and directly beneath the concrete of the motorpool. This soil contamination is not considered to be related to the former tank and/or associated operations. Benzene was detected in four groundwater samples from four temporary wells at concentrations above its MCL, with the highest concentration being 52.6 µg/L. Fate and transport modeling results of the CAP-Part A data indicate that benzene will not reach the downgradient receptors at detectable concentrations. The horizontal and vertical extent of contamination due to tank operations was determined during the CAP-Part A.

c. CAP-B (if applicable)
(provide justification)

N/A X

III. MONITORING ONLY PLAN (if applicable):

N/A _____

A. Monitoring points

Five shallow monitoring wells will be installed as part of the long-term monitoring as shown in Figure 8. The shallow wells will be screened across the water table with 3 to 5 feet of screen above the water table in order to detect the presence of free product. All monitoring wells will be completed flush with the ground surface. Boring logs and well construction diagrams will be provided in the First Annual Monitoring Only Report.

B. Period/Frequency of monitoring and reporting

Groundwater monitoring will be completed on a semiannual basis and the results will be summarized in an annual monitoring only report submitted to GA EPD. Monitoring will continue for a period of up to two years, for a total of up to four sampling events.

C. Monitoring Parameters

One groundwater sample will be collected from each of the four monitoring wells and analyzed for BTEX.

D. Milestone Schedule

Monitoring well installation will be conducted pending the availability of FY2000 funding. A milestone schedule will be provided to GA EPD upon availability of funds and approval of the monitoring only plan.

E. Scenarios for site closure or CAP-Part B

The monitoring system will be evaluated annually. A recommendation for no further action required will be made if benzene concentrations remain below the predicted two-year maximum concentrations that will be presented in the monitoring only report.

IV. SITE INVESTIGATION PLAN (if applicable):

N/A X

(Figure 8: Proposed additional boring/monitoring well location)

A. Proposed Investigation of Horizontal and Vertical Extent of Contamination In:

1. Soil

N/A X

2. Groundwater

a. Free Product

N/A X

b. Dissolved phase

N/A X

3. Surface Water

N/A X

B. Proposed Investigation of Vadose Zone And Aquifer Characteristics:

Additional vadose zone and aquifer characteristics were collected as part of the CAP-Part A investigation, thus no additional data is required.

V. PUBLIC NOTICE

(Figure 9. Tax Map)

(Appendix XI: Copies of public notification letters & certified return receipts or newspaper notice if approved)

UST 79 is located within the confines of Fort Stewart Military Reservation, a federal facility. The U.S. Government owns all of the property contiguous to the site. The Fort Stewart Directorate of Public Works (DPW) has complied with the public notice requirements defined by Georgia Environmental Protection Division (GA EPD) guidance by publishing an announcement in the *Savannah Morning News* on June 27 and July 4, 1999.

VI. CLAIM FOR REIMBURSEMENT (for GUST Trust Fund sites only):

N/A X

(Appendix XII: GUST Trust Fund Reimbursement Application and Claim for reimbursement)

Fort Stewart is a federally owned facility and has funded the investigation for the UST 79, Building 1224, Facility ID #9-089026, using Department of Defense Environmental Restoration Account Funds. Application for Georgia Underground Storage Tank Trust Fund reimbursement is not being pursued at this time.

APPENDIX III

WATER RESOURCES SURVEY DOCUMENTATION

THIS PAGE INTENTIONALLY LEFT BLANK

WATER RESOURCES SURVEY DOCUMENTATION

1.0 LOCAL WATER RESOURCES

As required by the GA EPD UST CAP-Part A guidance, a water resource survey documenting information for public and non-public water supply wells, surface water bodies, underground utilities, and potential receptors was conducted for the Fort Stewart UST investigation sites. The information presented in this appendix provides the supporting documentation for Section II.D.3 of the CAP-Part A Form.

1.1 WATER SUPPLY WELL SURVEY

The water supply well survey was conducted using the following GA EPD guidelines/requirements:

- Fort Stewart is located in an area of average or higher groundwater pollution susceptibility.
- Locate all public supply wells as defined by GA EPD that exist within 2 miles of the investigation sites.
- Locate all non-public supply wells that exist within 0.5 miles of the investigation sites.
- Locate all supply wells nearest the investigation sites.
- Locate all wells downgradient of the investigation sites.

A total of seven groundwater supply wells are located within a 2-mile radius of the Fort Stewart garrison area. Six of these wells are located within the confines of the garrison area. The other well is located at Wright Army Airfield, approximately 1.2 miles northeast of the garrison area. All of the groundwater supply wells are classified as public wells that supply water to Fort Stewart for drinking and nondrinking purposes. These wells are approximately 450 feet deep and draw groundwater from the Principal Artesian (also known as the Floridan) aquifer. Chlorine and fluoride are added into the groundwater at the well heads prior to being pumped into storage tanks and/or water towers, according to Fort Stewart DPW personnel. The location of these wells, along with a 500-foot radius drawn around each well, is shown in Figure 3.

1.2 SURFACE WATER BODIES

Surface water(s) in the State of Georgia, as defined by Rules and Regulations for Water Quality Control, Chapter 391-3-6, shall mean any and all rivers, streams, creeks, branches, lakes, reservoirs, ponds, drainage systems, springs producing 100,000 gallons per day, and all other bodies of surface water, natural or artificial, lying within or forming part of the boundaries of the state, which are not entirely confined and retained completely upon the property of a single individual, partnership, or corporation. The surface water body survey was conducted using the following GA EPD guidelines/requirements:

- surface water bodies that exist within 1 mile of the investigation sites,
- all surface water bodies nearest the investigation sites if these bodies lie outside the 1-mile radius of concern,
- all surface water bodies downgradient of the investigation sites, and

- the storm and sanitary sewers adjacent to the investigation sites.

Several surface water bodies are located within a 1-mile radius of the Fort Stewart garrison area. These are shown in Figure 3 and include Mill Creek, Taylors Creek, Peacock Creek, Childpen's Pond, and two unnamed ponds. Mill Creek extends along the western side of the garrison area and flows into Taylors Creek, located approximately 0.75 miles northwest of the garrison area. Taylors Creek then flows northward approximately 3.5 miles to its confluence with Canoochee Creek. Peacock Creek originates near the east corner of the garrison area and flows southward from the garrison. Mill Creek, Taylors Creek, and Peacock Creek all have natural streambeds and exhibit perennial flow.

Childpen's Pond is located at the northwest end of the garrison area. The two unnamed ponds are located at the northwest end of the facility golf course in the vicinity of Childpen's Pond. All of the ponds are isolated water bodies that are relatively small in size, measuring less than 500 feet in diameter.

Typically, surface water run-off from the UST site moves over the existing concrete and asphalt cover to the Fort Stewart storm water drainage system. Because petroleum contamination at the sites primarily impacts surficial groundwater, the surface water run-off pathway is not a viable contaminant transport mechanism because of the concrete acting as a barrier and the location of the nearest surface water body.

2.0 POTENTIAL RECEPTOR SURVEY SUMMARY OF THE UST 79 SITE

A field potential receptor survey was conducted for the UST 79 site in June 1998. The site and adjacent areas were surveyed for locations of surface water bodies, utility lines, and basements. Basements do not exist in the buildings adjacent to the site. Additional information, provided by DPW, was used to determine the location of the nearest public and non-public water supply wells and downgradient surface water bodies not located during the field survey.

2.1 Water Supply Wells Near the UST 79 Site

The UST 79 site is located approximately 2700 feet west (upgradient) of Well #3. Therefore, the UST 79 site is classified as being located greater than 500 feet to a withdrawal point. There are no public or non-public supply wells that are located downgradient of the site within a 2-mile radius.

2.2 Surface Water Bodies Near the UST 79 Site

At the closest point to the site and in the direction of groundwater flow, Mill Creek is located approximately 2500 feet southwest of the site. In the direction of groundwater flow, a tributary to Mill Creek is located approximately 5000 feet northwest of the site. Based on the distances between the UST and the nearest surface water body, the site is classified as being located greater than 500 feet to a downgradient surface water body.

2.3 Underground Utility Lines Near the UST 79 Site

In the direction of groundwater flow a sanitary sewer and a storm drain are located about 110 feet and 200 feet, respectively, northwest of the site. The invert elevation of these lines are estimated to be approximately 3 to 4 feet BGS, which is above the water table. An industrial wastewater line is located approximately 10 feet southeast (upgradient) of the former tank pit. The invert depth of this line is 6.75 feet BGS, which is within one foot of the water table.

CONTACT REPORT

INDIVIDUAL CONTACTED, TITLE: Jeff Barnes	ORIGINATOR: Patty Stoll
ORGANIZATION: Georgia Department of Natural Resources	DATE CONTACTED: October 1, 1997
PHONE: 912 - 353 - 3225	TIME CONTACTED: 11:00 am
ADDRESS:	CONTACT TYPE: telephone
SUBJECT: Update Supply Well Information for Liberty County Supply Wells for Water Resources Survey	
DISCUSSION: During a telephone conversation with the Ga DNR, regarding drinking water wells in Liberty County, it was suggested I contact Mr. Jeff Barnes. After being transferred to Mr. Jeff Barnes and explaining our needs, he agreed to send a printout of the permitted drinking water systems in Liberty County. On October 17, 1997 we received the list of permitted drinking water systems in Liberty County.	COMMENTS, ACTIONS, DATES Review list of permitted drinking water supply wells for proximity to Fort Stewart CAP Part A and B sites.

NOTE:

Contract for June 1998 sampling was issued prior to the new CAP-Part A guidance that was published in May 1998; thus, the new SW-846 analytical methods were not used during that sampling event.

November 1998 and February 1999 sampling was performed in accordance with the CAP-Part A guidance that was published in May 1998.

Analytical data for QA/QC samples 840123 (duplicate), 840425 (equipment rinse), 840623 (duplicate), 840913 (duplicate), and 841025 (equipment rinse) are contained within this appendix but are not summarized in this table.

Elevated PAH detection limits are a result of associated organic content such as TPH or other organic compounds. During extraction of the PAH compounds, all other organic compounds are extracted, causing a wide range of organic compounds to be present; thus, the target PAHs become small peaks in the chromatograph. As a result, the laboratory dilutes the concentrate, in turn elevating the detection limit.

¹ Georgia Department of Natural Resources Applicable Soil Threshold Levels (Table A. Column 2)

Bold values exceed soil threshold levels

NRC No regulatory criteria

Laboratory Qualifiers

U Indicates that the compound was not detected above the reported sample quantitation limit.

UJ Indicates that the compound was not detected above an approximated sample quantitation limit.

J Indicates that the value for the compound was an estimated value.

= Indicates that the compound was detected at the concentration reported.

R Indicates that the sample results are unusable and the presence or absence of the compound could not be verified.

NOTE:

Contract for June 1998 sampling was issued prior to the new CAP-Part A guidance that was published in May 1998; thus the new SW-846 analytical methods were not used during that sampling event.

November 1998 and February 1999 sampling was performed in accordance with the CAP-Part A guidance that was published in May 1998.

Analytical data for QA/QC samples 840123 (duplicate), 840425 (equipment rinsate), 840623 (duplicate), 840913 (duplicate), and 841025 (equipment rinsate) are contained within this appendix but are not summarized in this table.

Elevated PAH detection limits are a result of associated organic content such as TPH or other organic compounds. During extraction of the PAH compounds, all other organic compounds are extracted, causing a wide range of organic compounds to be present; thus, the target PAHs become small peaks in the chromatograph. As a result, the laboratory dilutes the concentrate, in turn elevating the detection limit.

¹ Georgia Department of Natural Resources Applicable Soil Threshold Levels (Table A, Column 2)

Bold values exceed soil threshold levels

NRC No regulatory criteria

Laboratory Qualifiers

U Indicates that the compound was not detected above the reported sample quantitation limit.

UJ Indicates that the compound was not detected above an approximated sample quantitation limit.

J Indicates that the value for the compound was an estimated value.

= Indicates that the compound was detected at the concentration reported.

R Indicates that the sample results are unusable and the presence or absence of the compound could not be verified.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
in accordance with General Engineering Laboratories
standard operating procedures. Please direct

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
in accordance with General Engineering Laboratories
standard operating procedures. Please direct
any questions to your Project Manager, Valerie Davis at (843) 769-7391.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
in accordance with General Engineering Laboratories

Notes:

The qualifiers in this report are defined as follows:

ND indicates that the analyte was not detected at a concentration greater than the detection limit.

J indicates presence of analyte at a concentration less than the reporting limit (RL) and greater than the detection limit (DL).

U indicates that the analyte was not detected at a concentration greater than the detection limit.

* indicates that a quality control analyte recovery is outside of specified acceptance criteria.

This data report has been prepared and reviewed
in accordance with General Engineering Laboratories
standard operating procedures. Please direct
any questions to your Project Manager, Valerie Davis at (843) 769-7391.

PERMEABILITY TEST ANALYSIS (ASTM D5084)

Project : Fort Stewart
 Location of Project : CAP Part A
 Description of Soil : Dark Brown Silty Sand

Job # : 98068
 Date of Testing: 7/31-8/3/98
 Tested by: BV-CA
 Boring # :
 Sample # : 840331
 Sample Depth : 8-10 ft.

Sample Type (Undisturbed or Remolded)
 Standard Proctor:

Maximum Dry Density: pcf
 Optimum Moisture Content: %

% Sample Compaction: %
 Sample Dry Density: pcf
 Sample Moisture Content: %
 Sample Wet Density: pcf

Sample Permeation:

De-Aired Water
 % Saturation: 100 %
 Cell Pressure: 55 psi
 Lower Pressure: 51 psi
 Upper Pressure: 50 psi
 Gradient: 13.03

Sample Dimensions		
	Before	After
Length (cm)	5.40	5.90
Diameter (cm)	4.70	4.80
Water Content (%)	25.4	25.0
Weight (g)	279.8	320.5

Constant Head Calculation:

$$K = [V(t_1, t_2) LR_T] / [P_B A t] \text{ (cm/sec)}$$

$V(t_1, t_2)$ = Volume of flow from t_1 to t_2 (cm³)

L = Length of Sample = 5.40 cm

A = Area of Sample = 17.35 cm²

t = $t_2 - t_1$ (sec)

P_B = Bias Pressure = 1 psi x 70.37 cm/psi (cm - H₂O) 70.37 cm

R_T = Temperature correction = 0.931

t_2 (sec)	t_1 (sec)	$(t_2 - t_1)$ (sec)	V (cm ³)	$[LR_T] / [P_B A]$ (cm ³)	K (cm/sec)
60	55	5	0.1	4.12E-03	8.24E-05

APPENDIX VI

ALTERNATE THRESHOLD LEVEL (ATL)
CALCULATIONS

THIS PAGE INTENTIONALLY LEFT BLANK

The maximum benzene concentration in soil was 0.324J mg/kg, but the sample location was directly beneath the concrete of the motorpool and above the water table at a distance of 70 feet upgradient of the former tank pit. The soil contamination in the area of boring 84-10 is believed to be a result of motorpool operations and not as a result of the tank operations. Thus, alternate threshold levels were not calculated. Fate and transport modeling predicted the benzene concentration due to leaching of soil contamination to groundwater. The predicted the maximum benzene concentration was estimated to be 253 µg/L, based on leaching of soil contamination to groundwater without biodegradation in the soil, which results in an ACL of 5750 µg/L. The predicted maximum benzene concentration was estimated to be 131 µg/L, based on leaching of soil contamination to groundwater with biodegradation in the soil, which results in an ACL of 5955 µg/L. The results of fate and transport modeling are presented in Attachment C.

The maximum benzene concentration in groundwater during the closure activities was 130 µg/L in the UST 79 tank pit. The maximum benzene concentration in groundwater during the CAP-Part A investigation was 52.6 µg/L in May 1998. The modeling of benzene estimated dilution attenuation factors (DAFs) of infinity for the sanitary sewer, storm drain, and tributary to Mill Creek; thus, no alternate concentration limits were calculated. The results of fate and transport modeling are presented in Attachment C.

NOTES:

Contract for June 1998 sampling was issued prior to the new CAP-Part A guidance that was published in May 1998; thus, the new SW-846 analytical methods were not used during that sampling event.

November 1998 and February 1999 sampling was performed in accordance with the CAP-Part A guidance that was published in May 1998.

Analytical data for the UST closure is summarized in Appendix II and is included at the end of this appendix but not summarized in this table.

Analytical data for QA/QC sample 840514 (duplicate) are contained within this appendix but are not summarized in this table.

Elevated PAH detection limits are a result of associated organic content such as TPH or other organic compounds. During extraction of the PAH compounds, all other organic compounds are extracted, causing a wide range of organic compounds to be present; thus, the target PAHs become small peaks in the chromatograph. As a result, the laboratory dilutes the concentrate, in turn elevating the detection limit.

Laboratory Qualifiers

- U Indicates the compound was not detected above the reported quantitation limit.
- UJ Indicates that the compound was not detected above an approximated sample quantitation limit.
- J Indicates the value for the compound is an estimated value.
- = Indicates the compound was detected at the concentration reported.

APPENDIX IX

**EXCAVATION OF CONTAMINATED SOIL
AND SUPPORTING MANIFESTS**

THIS PAGE INTENTIONALLY LEFT BLANK

All contaminated soil removed during the entire project (i.e., all USTs removed under contract with ACE, to include clean and non-clean closures) was tested in accordance with the disposal facility requirements and transported to Kedesh, Inc., Highway 84, Ludowici, GA, 31316. The Closure Report was not submitted to GA EPD because review of the closure analytical data indicated that a CAP-Part A would be required (i.e., per requirements of GUST-9, Item 15, page 12, dated August 1995). However, all pertinent information (i.e., copies of analytical data, manifests and maps) are provided in this CAP-Part A report. Disposal manifests for the UST 79 site were submitted to GAEPD USTMP in September 1998 with the UST 207A (Facility ID #9-089039) Closure Report response to comments correspondence (Perez 1998). Approximately 38.6 tons of contaminated soil was excavated from the site.

I certify that the above information is true and accurate.

Georgia Department of Natural Resources
Environmental Protection Division
Underground Storage Tank Management Program
Attention: Mr. William Logan, Environmental Specialist
4244 International Parkway, Suite 104
Atlanta, Georgia 30354

Dear Mr. Logan:

Fort Stewart is pleased to receive the Georgia Environmental Protection Division's correspondence dated August 14, 1998, in reference to the Closure Report submitted for Fort Stewart's former Underground Storage Tank (UST) #207A, Building 230, Facility Identification Number 9089039. As requested in that correspondence, the April 3, 1998 Closure Report Addendum should be amended to include the enclosed manifests for Anderson Columbia Environmental Delivery Order 101, which are provided for your use and convenience. These manifests include additional UST sites (as shown on the attached list). A total of 45 USTs were removed under this delivery order. In addition, this delivery order removed dispensing islands (note included on the provided list) from another 22 sites, for a total of 67 sites as noted in the Closure Report Addendum.

If you have any questions or comments, please contact Ms. Melanie Little or Ms. Tressa Rutland, Directorate of Public Works, Environmental Branch, at (405) 364-8461 or (912) 767-7919, respectively.

Sincerely,

for *Hale F. Kiefer*

APPENDIX X
SITE RANKING FORM

THIS PAGE INTENTIONALLY LEFT BLANK

Based on 10 years of historical leaking underground fuel tank case studies by the California Environmental Protection Department (CA EPD 1995), it has been determined that the geometry of a groundwater contamination plume from a UST leak tends to change slowly with time. In general, the length of the plume changes slowly, rarely exceed 250 feet, and tends to stabilize at a relatively short distance from the source of the contaminant release. The mass of the plume tends to decrease more rapidly than the plume length decreases. Active remediation may help reduce benzene concentrations in a groundwater plume; however, a significant reduction in benzene concentrations can occur with time, even without active remediation.

During this case analysis by the California Environmental Protection Department, the proposed plume life cycle consisted of four phases as described in Table 1. Using this methodology for the UST sites at Fort Stewart CAP-Part A investigations, the USTs fall into the Phase III category because the active source of contamination has been removed from the site. As a result the mass of the groundwater plume is being reduced by passive bioremediation.

At the UST 79 site, the groundwater plume mass is being reduced through passive bioremediation, so the plume's length is slowly decreasing while the mass is rapidly decreasing. Due to the passive bioremediation taking place at the UST 79 site and the life cycle phase of the site, Fort Stewart believes that the CAP-Part A analytical results are more indicative of present site conditions and should be used in the decision making process in lieu of the UST closure analytical results. However, for your use and convenience, the environmental site ranking scores have been presented in this appendix, based on both closure groundwater data and CAP-Part A groundwater with the CAP-Part A soil data, because there were no soil samples collected during closure activities.

Table 1. Summary of the phases of a UST groundwater plume life cycle

Life Cycle Stage	Characteristics
Phase I	• an active fuel hydrocarbon source is present • free product is in contact with the groundwater • fuel hydrocarbons dissolve into the groundwater • dissolved fuel hydrocarbons are transported down gradient • growth phase of the groundwater plume
Phase II	• a zone of fuel hydrocarbon passive bioremediation is established • the fuel hydrocarbon mass contributed to the plume from the active source is removed in the passive bioremediation zone • removal is due to the digestion of fuel hydrocarbons by subsurface microorganisms • the groundwater plume stops growing
Phase III	• the active source is depleted or removed • the length of groundwater plume slowly decreases • the contaminant mass decreases rapidly due to either active or passive remediation, or both • fuel hydrocarbons sorbed onto the soil particulates tend to inhibit changes in the plume length because as the groundwater concentrations of fuel hydrocarbons decrease, the soils will desorb fuel hydrocarbons slowly back into the groundwater
Phase IV	• considered an "exhausted plume" • the plume mass reaches a relatively low residual mass • insignificant temporal changes in length and mass • average plume concentrations not significantly greater than 1 µg/L • passive bioremediation will continue at a slower rate because the fuel hydrocarbon food source has been diminished • active remediation is not cost effective at this point.

SITE RANKING FORM

Facility Name: UST 79, Building 1224

Ranked by: S. Stoller

County: Liberty Facility ID #: 9-089026

Date Ranked: 8/9/99

SOIL CONTAMINATION (based on CAP-Part A soil data)

A. Total PAHs –
Maximum Concentration found on the site
(Assume <0.660 mg/kg if only gasoline
was stored on site)

- ☐ ≤0.660 mg/kg = 0
☐ >0.66 - 1 mg/kg = 10
☐ >1 - 10 mg/kg = 25
☒ >10 mg/kg = 50

B. Total Benzene –
Maximum Concentration found on the site

- ☐ ≤0.005 mg/kg = 0
☐ >0.005 - .05 mg/kg = 1
☒ >0.05 - 1 mg/kg = 10
☐ >1 - 10 mg/kg = 25
☐ >10 - 50 mg/kg = 40
☐ >50 mg/kg = 50

C. Depth to Groundwater
(bls = below land surface)

- ☐ >50' bls = 1
☐ >25' - 50' bls = 2
☐ >10' - 25' bls = 5
☒ ≤10' bls = 10

Fill in the blanks: (A. 50) + (B. 10) = (60) x (C. 10) = (D. 600)

GROUNDWATER CONTAMINATION (based on CAP-Part A groundwater data)

E. Free Product (Nonaqueous-phase
liquid hydrocarbons; See Guidelines
For definition of "sheen").

- ☒ No free product = 0
☐ Sheen - 1/8" = 250
☐ >1/8" - 6" = 500
☐ >6" - 1ft. = 1,000
☐ For every additional inch, add another
100 points = 1,000 +

F. Dissolved Benzene –
Maximum Concentration at the site
(One well must be located at the source
of the release.)

- ☐ ≤5 µg/L = 0
☒ >5 - 100 µg/L = 5
☐ >100 - 1,000 µg/L = 50
☐ >1,000 - 10,000 µg/L = 100
☐ >10,000 µg/L = 250

Fill in the blanks: (E. 0) + (F. 5) = (G. 5)

Facility Name: UST 79, Building 1224 County: Liberty Facility ID #: 9-089026

POTENTIAL RECEPTORS (MUST BE FIELD-VERIFIED)

Distance from nearest contaminant plume boundary to the nearest downgradient and hydraulically connected Point of Withdrawal for water supply. **If the point of withdrawal is not hydraulically connected, evidence as outlined in the CAP-A guidance document MUST be presented to substantiate this claim.**

H. Public Water Supply

- ☐ Impacted = 2000
☐ ≤500' = 500
☐ >500' - ¼ mi = 25
☐ ¼ mi - 1 mi = 10
☐ >1 mi - 2 mi = 2

* ☒ > 2 mi = 0

For lower susceptibility areas only:

- ☐ >1 mi = 0

Note: If site is in lower susceptibility area, do not use the shaded areas.

* For justification that withdrawal point is not hydraulically connected, see attached text.

I. Non-Public Water Supply

- ☐ Impacted = 1000
☐ ≤100' = 500
☐ >100' - 500' = 25
☐ >500' - ¼ mi = 5
☐ >¼ - ½ mi = 2

☒ >½ mi = 0

For lower susceptibility areas only:

- ☐ >¼ mi = 0

J. Distance from nearest Contaminant Plume boundary to downgradient Surface Waters OR UTILITY TRENCHES & VAULTS (a utility trench may be omitted from ranking if its invert elevation is more than 5 feet above the water table)

- ☐ Impacted = 500
☒ ≤500' = 50
☐ >500' - 1,000' = 5
☐ >1,000' = 1

K. Distance from any Free Product to basements and crawl spaces

- ☐ Impacted = 500
☐ <500' = 50
☐ >500' - 1,000' = 5
☒ >1,000' or no free product = 0

Fill in the blanks: (H. 0) + (I. 0) + (J. 50) + (K. 0) = L. 50

(G. 5) × (L. 50) = M. 250

(M. 250) + (D. 600) = N. 850

P. **SUSCEPTIBILITY AREA MULTIPLIER**

- ☐ If site is located in a Low Ground-Water Pollution Susceptibility Area = 0.5
☒ All other sites = 1

Q. **EXPLOSION HAZARD**

Have any explosive petroleum vapors, possibly originating from this release, been detected in any subsurface structure (e.g., utility trenches, basements, vaults, crawl spaces, etc.)?

- ☐ Yes = 200,000
☒ No = 0

Fill in the blanks: (N. 850) × (P. 1) = (850) + (Q. 0)

= 850 (based on CAP-Part A soil data and CAP-Part A groundwater data)

ENVIRONMENTAL SENSITIVITY SCORE

ADDITIONAL GEOLOGIC AND HYDROLOGIC DATA

The following information is presented to provide supplemental information to Section II.D.5 of the CAP-Part A form and Item H of the Site Ranking Form and provides detailed information relating to the geologic and hydrogeologic conditions at Fort Stewart which supports Fort Stewart's determination that the water withdrawal point(s) located at Fort Stewart is (are) not hydraulically connected to the surficial aquifer.

1.0 REGIONAL AND LOCAL GEOLOGY

Fort Stewart is located within the coastal plain physiographic province. This province is typified by nine southeastward dipping strata that increase in thickness from 0 feet at the fall line located approximately 150 miles inland from the Atlantic coast, to approximately 4,200 feet at the coast. State geologic records describe a probable petroleum exploration well (the No. 1 Jelks-Rogers) located in the region as encountering crystalline basement rocks at a depth of 4254 feet BGS. This well provides the most complete record for Cretaceous, Tertiary, and Quaternary sedimentary strata in the region.

The Cretaceous section was found to be approximately 1970 feet thick and dominated by clastics. The Tertiary section was found to be approximately 2170 feet thick and dominated by limestone with a 175-foot-thick cap of dark green phosphatic clay. This clay is regionally extensive and is known as the Hawthorn Group. The interval from approximately 110 feet to the surface is Quaternary in age and composed primarily of sand with interbeds of clay or silt. This section is undifferentiated into separate formations (Herrick and Vochis 1963).

State geologic records contain information regarding a well drilled in October 1942, 1.8 miles north of Flemington at Liberty Field of Camp Stewart (now known as Fort Stewart). This well is believed to be an artesian well located approximately one-quarter mile north of the runway at Wright Army Airfield within the Fort Stewart Military Reservation. The log for this well describes a 410-foot section, the lowermost 110 feet of which consisted predominantly of limestone sediments, above which 245 feet of dark green phosphatic clay typical of the Hawthorn Group was encountered. The uppermost portion of the section was found to be Quaternary-age interbedded sands and clays. The top 15 feet of these sediments were described as sandy clay (Herrick and Vochis 1963).

The surface soil located throughout the Fort Stewart garrison area consists of Stilson loamy sand. The surface layer of this soil is typically dark grayish-brown loamy sand measuring approximately 6 inches in depth. The surface layer is underlain by material consisting of pale yellow loamy sand and extends to a depth of approximately 29 inches. The subsoil is dominantly sandy clay loam and extends to a depth of 72 inches or more (Herrick and Vochis 1963).

2.0 REGIONAL AND LOCAL HYDROGEOLOGY

The hydrogeology in the vicinity of Fort Stewart is dominated by two aquifers referred to as the Principal Artesian and the surficial aquifers. The Principal Artesian aquifer is the lowermost hydrologic unit and is regionally extensive from South Carolina through Georgia, Alabama, and most of Florida. Known elsewhere as the Floridan, this aquifer is composed primarily of Tertiary-age limestone, including the

Bug Island Formation, the Ocala Group, and the Suwannee Limestone. These formations are approximately 800 feet thick, and groundwater from this aquifer is used primarily for drinking water (Arora 1984).

The uppermost hydrologic unit is the surficial aquifer, which consists of widely varying amounts of sand and clay ranging from 55 to 150 feet in thickness. This aquifer is primarily used for domestic lawn and agricultural irrigation. The top of the water table ranges from approximately 2 to 10 feet BGS (Geraghty and Miller 1993). The base of the aquifer corresponds to the top of the underlying dense clay of the Hawthorn Group. The Hawthorn Group was not encountered during drilling at this site but is believed to be located at 40 to 50 feet BGS; thus, the effective aquifer thickness would be approximately 35 to 45 feet. Soil surveys for Liberty and Long Counties describe the occurrence of a perched water table within the Stilson loamy sands present within Fort Stewart (Looper 1980).

The confining layer for the Principal Artesian aquifer is the phosphatic clay of the Hawthorn Group and ranges in thickness from 15 to 90 feet. The vertical hydraulic conductivity of this confining unit is on the order of 10^{-8} cm/sec. There are minor occurrences of aquifer material within the Hawthorn Group; however, they have limited utilization (Miller 1990). The Hawthorn Group has been divided into three formations: Coosawhatchie Formation, Markshead Formation, and the Parachula Formation, which are listed from youngest to oldest.

The Coosawhatchie Formation is composed predominantly of clay but also has sandy clay, argillaceous sand, and phosphorite units. The formation is approximately 170 feet thick in the Savannah Georgia area. This unit disconformably overlies the Markshead Formation and is distinguished from the underlying unit by dark phosphatic clays or phosphorite in the lower part and fine-grained sand in the upper part.

The Markshead Formation is approximately 70 feet thick in the Savannah Georgia area and consists of light-colored phosphatic, slightly dolomitic, argillaceous sand to fine-grained sandy clay with scattered beds of dolostone and limestone.

The Parachula Formation consists of sand, clay, limestone, and dolomite, and is approximately 10 feet thick in the Savannah Georgia area. The Parachula Formation generally overlies the Suwannee Limestone in Georgia.

Groundwater encountered at all the UST investigation sites is part of the Surficial Aquifer system. Based on the fact that all public and non-public water supply wells draw water from the Principal (Floridan) Aquifer, and that the Hawthorn confining unit separates the Principal Aquifer from the Surficial Aquifer, it is concluded that there is no hydraulic interconnection between the Surficial Aquifer (and associated groundwater plumes, if applicable) located beneath former UST sites and identified water supply withdrawal points at Fort Stewart.

PUBLIC NOTICE
Notification of Corrective Action Plan, Underground Storage Tank Releases, Fort Stewart Garrison Area, Fort Stewart, Ga.

The Georgia EPD (GEPD) has required Fort Stewart Directorate of Public Works to prepare a Corrective Action Plan Part-A to investigate and/or clean up contamination at the underground storage tank sites listed at the end of this notification. These plans will be submitted to the GEPD on or before September 30, 1999. If you want

to examine a copy of one or more of the plans, please contact Commander, 3rd Infantry Division (Mechanized) and Fort Stewart, attn: DPW ENRD ENV. Br. (T. Rutland), 1557 Frank Cochran, Fort Stewart, Ga. 31314-4928. A copy will be mailed at a nominal fee. Comments to the plan will be accepted until October 31, 1999, and should be directed to GEPD at 404-342-2687. Following is the mailing address: GEPD USTAMP, 4244 International Parkway, Suite 104, Atlanta, Ga. 30354. GUST TRUST FUND REIMBURSEMENT APPLICATION AND CLAIM FOR REIMBURSEMENT

THIS PAGE INTENTIONALLY LEFT BLANK

Fort Stewart is a federally owned facility and has funded the investigation for the UST 79, Building 1224, Facility ID #9-089026, using Department of Defense Environmental Restoration Account Funds. Application for Georgia Underground Storage Tank Trust Fund reimbursement is not being pursued at this time.

TECHNICAL APPROACH

THIS PAGE INTENTIONALLY LEFT BLANK

TECHNICAL APPROACH

1.0 INTRODUCTION

The overall objective of this project is to provide the engineering services required to produce Corrective Action Plans (CAPs) for the subject UST sites. These reports will conform to the site closure requirements of a CAP-Part A for sites in Georgia. The field investigations necessary to support the report preparation included the installation of temporary piezometers, soil borings, and associated sampling of soil and groundwater. Upon completion of the field investigations, a CAP-Part A will be prepared to meet GA EPD, Fort Stewart, and the USACE-Savannah requirements.

2.0 FIELD ACTIVITIES

The following sections detail the methodologies used for geoprobe drilling, sampling, and piezometer installation. A geologist from SAIC was on site at all times during operations. No drilling activities were undertaken until all utility clearances and permits had been obtained from Fort Stewart's utility personnel.

2.1 Subsurface Soil Sampling

2.1.1 Geoprobe Drilling

The geoprobe method was used during the project for collecting soil samples. During all geoprobe drilling, soil samples were collected continuously on 4.0-foot centers from the ground surface to the bottom of the borehole. The total depth of each borehole was dictated by the depth where the water table was encountered.

2.1.2 Sample Collection

Soil samples for chemical analyses were collected from boreholes using 4.0-foot macro-core samplers. Upon retrieval of the sampling device, the soil core was split into two 2.0-foot sections using a stainless steel knife. A portion of each 2.0-foot section was collected for possible laboratory analysis. The remaining portion of each 2.0-foot section was used for field measurements.

During the May and June 1998 sampling events, samples designated for possible laboratory analysis were collected from the section using a stainless steel spoon. The spoon was run lengthwise down the core to collect a sample representative of the entire core section. The portion of the sample designated for volatile organic analyses was placed into laboratory sample containers first, followed by placement of the remaining portion of the sample into the containers designated for other types of analyses. Sample containers designated for volatile organic analyses were filled so that minimal headspace was present in the containers. Headspace gas concentration measurements were made using a field organic vapor meter (OVM). Initially, soil from each 2.0-foot interval was placed into a glass jar, leaving some air space, and covered with aluminum foil to create an air-tight seal. The sample was allowed to volatilize for a minimum of 15 minutes. The sealed jar was punctured with the OVM probe and headspace gas drawn until the meter reading was stable. The concentration of the headspace gas was recorded to the nearest 0.1 part per million.

Due to a change in the state regulations governing sample analysis, the collection of samples designated for volatile organic analyses was modified beginning with the November 1998 field effort. Soil samples designated for volatile organic analyses were collected using En CoreTM samplers. The samplers were locked into an En Core T-Handle. Using the T-Handle, the sampler was pushed into the soil until the coring body of the sampler was full. Once the samplers were filled, caps were locked onto them insuring that no

headspace was present. The samplers were then removed from the handle and placed in an En Core zipper bag. Three encore samples are collected from each section 2.0-foot section.

Immediately after collection of each sample and completion of bottle label information, each potential analytical sample container was placed into an ice-filled cooler to ensure preservation. A clean split-barrel sampling device was used to collect soil core from each interval of the project boreholes. Information regarding the criteria for selection of soil samples for off-site shipment to a laboratory for chemical analysis is presented in Section 3.1.3 of the project Work Plan. Soil samples, which were not selected for laboratory analysis, were disposed of as investigation-derived waste (IDW).

2.2 Groundwater Sampling

2.2.1 Groundwater Collection

Groundwater samples from geoprobe boreholes installed during Preliminary Groundwater and CAP-Part A investigations were collected using a geoprobe sampler or from temporary piezometers. The geoprobe sampler is a probe that allows the collection of a groundwater sample from a discrete undisturbed depth interval in a soil boring. Temporary piezometers were constructed of 1.0-inch inside diameter (ID) polyvinyl chloride (PVC) casing with a 5-foot or 10-foot screened interval. These piezometers were installed in the open borehole following completion of all drilling activities.

Each soil borehole was advanced to the top of the water table using direct push methods. For each borehole, the geoprobe sampler was lowered to the bottom of the borehole and driven through the undisturbed soil to a depth of approximately 3.0 feet below the water table. The outer casing of the geoprobe sampler was retracted to expose the screen and allow groundwater to enter the chamber. In cases where the geoprobe sampler could not be driven or where groundwater recovery through the geoprobe sampler was poor, the groundwater sample was collected through the temporary piezometer.

Groundwater samples were collected using a peristaltic pump or a 0.75-inch diameter stainless steel bailer. The portion of the sample designated for volatile organic analysis was poured into laboratory sample containers first, followed by pouring the remaining sample portion into containers designated for other types of chemical analyses. Sample containers designated for volatile organic analysis were filled so that no headspace was present in the containers.

2.2.2 Field Measurements

Groundwater field measurements performed during the project included measurement of static groundwater level, pH, specific conductance, and temperature. Measurement of groundwater levels in soil boreholes was accomplished through the installation of temporary PVC piezometers. A summary of the procedures and criteria to be used for groundwater sample field measurements is presented in the following sections.

Static Groundwater Level

Static groundwater level measurements were made using an electronic water level indicator. Initially, the indicator probe was lowered into each temporary piezometer casing until the alarm sounded and/or the indicator light illuminated. The probe was withdrawn several feet and slowly lowered again until the groundwater surface was contacted as noted by the alarm and/or indicator light. Water level measurements were estimated to the nearest 0.01 foot based on the difference between the nearest probe cord mark to the top of the piezometer casing.

The distance between the top of casing and the surrounding ground surface was taken into account in measuring the water level to within 0.01 foot. The static water level measurement procedure was repeated two or three times to ensure that the water level measurements were consistent (plus or minus 0.01 foot). If this was the case, then the first measured level was recorded as the depth to groundwater. If this was not the case, the procedure was repeated until consistent readings were obtained from three consecutive measurements.

pH, Specific Conductance, and Temperature

The pH, specific conductance, and temperature measurements were recorded for groundwater during groundwater sampling. The pH, temperature, and conductivity measurements were made using a combination meter designed to measure these parameters. A portion of each groundwater sample was retrieved from the PowerPunch sampler and poured into the collection cup. With the combination meter set in the pH mode, the meter electrode was swirled at a slow constant rate within the sample until the meter reading reached equilibrium. The sample pH was recorded to the nearest 0.1 pH unit. The pH measurement procedure was repeated, using a new sample each time, until the pH measurements were consistent (less than 0.2 pH units variation).

Upon completion of the pH measurement, conductivity and temperature measurements were made on a groundwater sample collected in the same manner as described above. With the combination meter set in the conductivity mode, the meter electrode was swirled at a slow constant rate within the sample until the meter reading reached equilibrium. Concurrently, a temperature probe was placed into the sample and allowed to reach equilibrium. The sample conductivity was recorded to the nearest 10 mmhos/cm and the temperature to the nearest 0.1° C. All recorded conductivity values were converted to conductance at 25° C. The conductivity and temperature measurement procedure was repeated a minimum of three times using a new sample each time, until the measurements were consistent (less than 10 percent variation for conductance and less than 0.5° C variation for temperatures).

2.3 Temporary Piezometer Installation

Following the collection of the groundwater sample, a 1.0-inch PVC piezometer, with a 5-foot or 10-foot screened section, was installed in the borehole to prevent the borehole from collapsing. These piezometers remained in the boreholes approximately 24 hours, after which time the static water level was measured. During field activities in November 1998 or later, the temporary piezometers were screened from ground surface to the bottom of the borehole.

2.4 Borehole Abandonment

Once the static water level was measured, the temporary piezometers were removed and the boreholes were abandoned. Abandonment was conducted in a manner precluding any current or subsequent fluid media from entering or migrating within the subsurface environment along the axis or from the endpoint of the borehole. Abandonment was accomplished by filling the entire volume of the borehole with grout.

2.5 Surveying

A topographic survey of the horizontal and vertical locations of all soil boreholes was conducted after completion of all field activities. The topographic survey was conducted by a surveyor registered in the state of Georgia.

The horizontal coordinates for each soil borehole were surveyed to the closest 1.0 foot and referenced to the State Plane Coordinate System. Ground elevations were surveyed to the closest 0.1 foot. Elevations were referenced to the National Geodetic Vertical Datum of 1983.

2.6 Decontamination Procedures

2.6.1 Geoprobe Equipment

Decontamination of equipment used for drilling boreholes was conducted within the temporary decontamination pad constructed at the central staging area. The decontamination pad was constructed so that all decontamination liquids were contained from the surrounding environment and were recovered for disposal as IDW. The entire geoprobe vehicle and equipment were decontaminated once they arrived on site and the geoprobe sampling equipment was decontaminated after completion of each soil borehole. The equipment was decontaminated by removing the caked soil material from the exterior of equipment using a rod and/or brush, steam cleaning the interior and exterior of equipment, allowing the equipment to air dry as long as possible, and wrapping or covering the equipment in plastic.

2.6.2 Sampling Equipment

Decontamination of equipment used for soil sampling and collection of groundwater samples was conducted at the temporary decontamination area. Nondedicated equipment was decontaminated after each use. The sampling equipment was washed with potable water and phosphate-free detergent using various types of brushes required to remove particulate matter and surface films, followed by a potable water rinse, American Society for Testing and Materials (ASTM) Type I or equivalent water rinse, isopropyl alcohol rinse, ASTM Type I or equivalent water rinse, allowed to air dry, and wrapped in plastic or aluminum foil.

In addition to the sampling equipment, field measurement instruments were also decontaminated between uses. Only those portions of each instrument that come into contact with potentially contaminated environmental media were decontaminated. Because of the delicate nature of these instruments, the decontamination procedure only involved initial rinsing of the instrument probes with ASTM Type I or equivalent water.

2.7 Documentation of Field Activities

All information pertinent to sampling activities, including instrument calibration data, was recorded in field logbooks. The logbooks were bound and the pages consecutively numbered. Entries in the logbooks were made in black permanent ink and included, at a minimum, a description of all activities, individuals involved in drilling and sampling activities, date and time of drilling and sampling, weather conditions, any problems encountered, and all field measurements.

Sufficient information was recorded in the logbooks to permit reconstruction of all sampling activities. For a detailed description of all field documentation, see section 4.5 of Attachment IV of the Work Plan.

3.0 SAMPLE HANDLING AND ANALYSIS

3.1 Analytical Program

Soil samples were screened for the presence of volatile vapors using a MiniRae organic vapor analyzer (PID). The MiniRae was calibrated daily using 100 parts per million (ppm) isobutylene. The headspace of each sample was measured approximately 15 minutes after collection.

For sites where the UST had contained waste oil, soil samples were analyzed for BTEX by method SW846-8020, PAH by method SW846-8270, TPH by method SW846-9073, and lead by method SW846-6010/7000, during the May and June 1998 field effort. Beginning in November 1998, BTEX was analyzed using method SW846-5035/8260B, while the analyses for the other contaminants remained the same. Groundwater samples were analyzed for BTEX by method SW846-8260 and PAH by method SW 846-8270. All samples were sent to General Engineering Laboratories, Charleston, South Carolina.

For sites where the UST had contained gasoline or diesel, soil samples were analyzed for BTEX by method SW846-8020, PAH by method SW846-8270, TPH by method SW846-8015 (modified), and lead by method SW846-6010/7000. Groundwater samples were analyzed for BTEX by method SW846-8260 and PAH by method SW 846-8270. TPH analysis included both gasoline range organics (GRO) and diesel range organics (DRO). Beginning in November 1998, soil samples were analyzed for BTEX using method SW846-5035/8260B. All samples were sent to General Engineering Laboratories, Charleston, South Carolina.

Duplicate samples of soil and groundwater were collected throughout the project and represented approximately 10 percent of the total sample population. Rinsate blanks were collected to determine whether the sampling equipment was causing cross-contamination of the samples and represented approximately 5 percent of the total sample population. Duplicates and rinsates were submitted to General Engineering Laboratories, Charleston, South Carolina.

3.2 Sample Containers, Preservation, and Holding Times

The soil sample containers, preservatives, and holding times are summarized in Table A-1. The groundwater sample containers, preservatives, and holding times are summarized in Table A-2.

3.3 Sampling Packaging and Shipment

Each sample container was labeled, taped shut with electrical tape (except those containing samples designated for volatile organic analysis), and an initialed/dated custody seal was placed over the lid. Each sample bottle was placed into a separate plastic bag and sealed. The samples were placed upright in thermally insulated rigid-body coolers and surrounded by vermiculite to prevent breakage during shipment. In addition, samples were cooled to approximately 4° C with wet ice. These measures were taken to slow the decomposition and volatilization of contaminants during shipping and handling. The sample coolers were shipped to the analytical laboratory via courier service provided by the laboratory.

Table A-1. Summary of Sample Containers, Preservation Techniques, and Holding Times for Soil Samples Collected During the Site Investigation

Analyte Group	Container	Minimum Sample Size	Preservative	Holding Time
BTEX/TPH-GRO	1 – 4 oz jar with Teflon®-lined cap (no headspace)	20 g	Cool, 4°C	14 d
BTEX (beginning 11/98)	3 – En Core™ Samplers	15 g	Cool, 0°C	48 hrs
TPH-GRO (beginning 11/98)	1 – 4 oz jar with Teflon®-lined cap (no headspace)	20 g	Cool, 4°C	14 d
PAHs	1 – 8 oz jar with Teflon®-lined cap	90 g	Cool, 4°C	14 d (extraction) 40 d (analysis)
TPH-DRO	use same container as PAHs	90 g	Cool, 4°C	14 d (extraction) 40 d (analysis)
TPH	use same container as PAHs	90 g	Cool, 4°C	14 d (extraction) 40 d (analysis)
Metals (lead)	use same container as PAHs	20 g	Cool, 4°C	180 d

Table A-2. Summary of Sample Containers, Preservation Techniques, and Holding Times for Groundwater Samples Collected During the Site Investigation

Analyte Group	Container	Minimum Sample Size	Preservative	Holding Time
BTEX	2 – 40 mL glass vials with Teflon®-lined septum (no headspace)	40 mL	Cool, 4°C HCl to pH < 2	14 d
PAHs	2 – 1L amber glass bottle with Teflon®-lined lid	1000 mL	Cool, 4°C	7 d (extraction) 40 d (analysis)

SUPPLEMENTAL INFORMATION

THIS PAGE INTENTIONALLY LEFT BLANK

1. RISK-BASED CORRECTIVE ACTION

A risk-based approach was used to aid in the decision making process to determine the need for further action at the UST 79 site. Due to the nature of the contamination (petroleum hydrocarbon contamination of groundwater), the risk-based approach was limited to human health concerns. Ecological risk concerns are negligible because of the lack of habitat available for ecological receptors as a result of the 10 to 12 inches of concrete overlying the majority of the site.

The methods for assessing human health concerns for the site were derived from GUST CAP-Part B guidance (GA EPD 1995) and recent GA EPD guidance (GA EPD 1996). These were supplemented by the additional guidance documents on risk assessment methods referenced in this section. In general, the risk-based corrective action approach is performed in two steps:

1. Results were screened against readily available regulatory levels and risk-based screening levels to identify chemicals of potential concern (COPCs).
2. Site-specific ACLs were developed for COPCs using the results of the fate and transport modeling and identified receptor locations.

The following sections present the conceptual model of the exposure setting and potential receptors as well as the general methodology employed to perform the screening for COPCs and the development of ACLs.

1.1 Potential receptor survey

The exposure assessment identifies any potentially complete pathways between the contaminant source and potential receptors. This involves identifying potential current and future receptors, release mechanisms through which contamination might come into contact with the receptors, and the routes of exposure through which the receptors might be exposed.

The UST 79 site is located within Fort Stewart, an active military installation, and within an access-controlled fence of a secured motorpool. The land use at the site is currently military industrial. In the direction of groundwater flow, a sanitary sewer and a storm drain are located approximately 110 feet and 200 feet, respectively, northwest of the site and a tributary to Mill Creek is located approximately 5000 feet northwest of the site. An industrial waterwater line is located approximately 10 feet southeast (upgradient) of the site.

No connection between site contamination and current off-site receptors has been identified. Site contamination may migrate to the surficial aquifer. The Hawthorn Group separates the surficial aquifer from the deep drinking water aquifer, the Floridan aquifer, which is approximately 90 feet of clay. There appears to be no vertical migration from the surficial aquifer to the Floridan aquifer. Well #3 is located approximately 2700 feet downgradient of the UST 79 site. However, the Hawthorn Group, a thick and highly effective confining unit, separates the water supply well from the surficial aquifer.

No current on-site receptors have been identified for the site. Potential future on-site receptors might include industrial workers and military residents.

Potential future on-site industrial receptors may come in direct contact with site soil contamination during construction or excavation activities. No near-term on-site receptors are likely to come into contact with groundwater, unless the surficial aquifer discharges into the drainage ditch.

1.2 Screening for Chemicals of Potential Concern

1.2.1 Screening Methodology

The purpose of a risk evaluation screen is to identify the COPCs and areas of concern at a site and possibly to identify sites for which no further action is needed. The first step in the risk process uses screening levels that are readily obtainable and that, due to their conservative nature, can be used with a high degree of confidence to indicate sites for which no further action is required.

An American Society of Testing and Materials (ASTM) (ASTM 1995) Tier 1-type risk evaluation process will be applied to the data collected for the UST 79 site to identify any COPCs and media for which no further action is needed. The risk evaluation screen involves the steps listed below.

- Identify potential migration and exposure pathways associated with the site, and identify potential exposure scenarios that should be used to select screening levels.
- Identify risk-based screening levels and regulatory based screening levels for each contaminant.
- Compare site-related concentrations to screening levels to determine if any potential COPCs exist at the site.
- Compare detection limits to screening levels to identify potential false negative screening results.

The screening levels for the UST 79 site data have been taken from the following sources based on GA EPD guidance (GA EPD 1996):

- federal MCLs (EPA 1989),
- GUST Soil Threshold Levels (i.e., Table A, Column 2),
- soil screening levels developed by the U.S. Environmental Protection Agency (EPA) (EPA 1996a), and
- soil and groundwater risk-based concentrations developed by EPA Region 3 (EPA 1996b).

These values reflect screening levels based on a combination of regulatory screening levels (i.e., MCLs and GUST soil threshold levels), and calculated risk-based values (i.e., EPA Region 3 risk-based concentrations).

Screening levels inherently incorporate assumptions about land use. In identifying COPCs, it is generally accepted that screening levels will reflect any potential future land uses, and thus, they usually reflect a conservative residential use scenario (EPA 1991; EPA 1996a; ASTM 1995). Based on GA EPD guidance, risk-based screening levels reflect residential land use for groundwater and industrial land use for deep soils (GA EPD 1996).

Default residential exposure scenarios for groundwater assume that use of the land could someday be residential and that the following exposures could occur:

- ingestion of groundwater and

- inhalation of volatiles during showering.

The default industrial exposure assumptions for deep soils assume that the following exposures could occur:

- incidental ingestion of soil and
- inhalation of volatiles and dust.

EPA's *Soil Screening Guidance* (EPA 1996a) provides two options for selecting soil values that address protection of groundwater. One value assumes no contaminant dilution or attenuation would occur between the soil and groundwater; a second value assumes a 20-fold dilution attenuation factor (DAF). A DAF of 20 was used to develop soil screening values protective of groundwater at the UST 79 site.

If ARAR- or risk-based values are not available, it generally means that (1) the chemical is not considered to be toxic except perhaps at extremely high concentrations (e.g., aluminum, sodium); (2) the dose-response data do not indicate a toxic effect; or (3) EPA is currently reviewing toxicity information, and no reference dose or cancer slope factor is currently available.

1.2.2 Screening Results

The risk screening process is a systematic screening of sample results to identify site-related COPCs. Constituent concentrations below risk- or regulatory-based screening levels are not considered COPCs and are not evaluated further. Table C-1 presents the results of the risk-based screening for the Part A SI soil data. Table C-2 presents the results of the risk-based screening for the Part A SI groundwater data.

Benzene was detected above the GUST soil threshold level for soil data collected for the Part A SI. However, the sample locations (84-06 and 84-10) associated with these constituents are located 50 to 70 feet upgradient of the former tank pit based on observed groundwater flow direction during the CAP-Part A investigation, which will be confirmed during the CAP-Part B investigation. Ethylbenzene, toluene, xylenes, acenaphthene, anthracene, benzo(a)anthracene, chrysene, fluoranthene, fluorene, naphthalene phenanthrene, pyrene, and lead were detected below screening levels during the Part A sampling. TPH was also detected, but there are no screening levels for TPH. Benzene was selected as a COPC for UST 79 site soils.

Detection limits for benzo(a)anthracene, benzo(a)pyrene, and dibenzo(a,h)anthracene exceeded risk-based screening levels for soils in nine samples. No COPCs for soils were selected for the site based on the detection limit screening.

Benzene was detected in three temporary wells at concentrations above screening levels. The concentrations were 6.8J $\mu\text{g/L}$ (well 84-01), 52.6 $\mu\text{g/L}$ (well 84-03), and 32.4 $\mu\text{g/L}$ (well 84-10). These results exceeded the risk-based screening level for benzene of 0.36 $\mu\text{g/L}$ and the federal MCL for benzene of 5 $\mu\text{g/L}$. Ethylbenzene, toluene, xylenes, and naphthalene were detected below screening values during the Part A SI. Benzo(a)pyrene was estimated in one sample above the screening value; however, the risk-based values for this compound is below analytically achievable levels. Benzo(g,h,i)perylene was estimated in one sample, but there are no risk-based screening values for this compound. Benzene was selected as a COPC for the UST 79 site groundwater.

Detection limits for several PAHs exceeded risk-based screening levels for the Part A groundwater data. For these constituents, risk-based values represent values below analytically achievable levels. The

detection limits for one PAH, benzo(a)pyrene, also exceeded the federal MCL of 0.2 µg/L by two to three orders of magnitude. No additional COPCs were selected for groundwater based on the detection limit screening.

1.3 Site-Specific Levels

Detections exceeding the conservative generic screening levels are considered COPCs. ACLs are developed, when appropriate, for the COPCs using site-specific information from the fate and transport modeling and available regulatory screening levels. When regulatory screening levels were not available, then ACLs were developed based on risk-based levels. No risk-based ACLs were developed for the UST 79 site.

1.3.1 Alternate Threshold Levels

The CAP-Part A data were screened against risk- and regulatory-based screening levels. The maximum soil concentrations at this site are above the water table and located 50 to 70 feet upgradient of the former tank pit. Exposure to these concentrations would most likely occur through contact with leached contaminants in the groundwater. Therefore, ATLs were not developed, leaching of soil contamination to groundwater was utilized to determine the maximum concentration of the contaminants in the groundwater at the source. These maximum concentrations were then used to develop ACLs in Section 1.3.2.

1.3.2 Alternative Concentration Limits

Benzene was identified as a COPC for groundwater at the site. Benzene was modeled to three potential downgradient locations where a receptor may come in contact with migrating site contamination. These three locations included a sanitary sewer 110 feet downgradient, a storm drain 200 feet downgradient, and a tributary to Mill Creek 5000 feet downgradient from the site. Fate and transport modeling of the CAP-Part A groundwater contamination was used to develop site-specific dilution attenuation factors (DAF) between the source and the receptor locations (see 1.3.3.2 below). Modeling results for the three receptors estimated a DAF for benzene of infinity for each receptor based on CAP-Part A groundwater contamination. An infinite DAF indicates that contamination will never reach these locations, thus no ACLs were developed for the sanitary sewer, the storm drain, and the tributary to Mill Creek.

Fate and transport modeling of soil contamination from boring 84-10 leaching to groundwater was used to develop a second set of site-specific DAFs between the second source and receptor locations. The receptor locations for second source (i.e., in the vicinity of 84-10) include an industrial wastewater line 60 feet downgradient, a sanitary sewer 180 feet downgradient, a storm drain 280 feet downgradient, and a tributary to Mill Creek 5070 feet downgradient from the site. Modeling results for these receptors estimated a DAF for benzene of infinity for the sanitary sewer, the storm drain, and the tributary to Mill Creek based on leaching of soil contamination to groundwater both with and without biodegradation. The DAF for benzene at the industrial wastewater line was 1150 (without biodegradation) and 1191 (with biodegradation). The MCL for benzene is 5 µg/L. Adjusting this regulatory level using the site-specific DAF identified for the potential migration of contamination from boring 84-10 to the industrial wastewater line results in an ACL for benzene of 5750 µg/L (i.e., $1150 \times 5 \mu\text{g/L}$) assuming no biodegradation is taking place and 5995 µg/L (i.e., $1191 \times 5 \mu\text{g/L}$) assuming that biodegradation does take place.

1.3.3 Fate and transport model

1.3.3.1 Model Selection

There are two sources of contamination at the UST 79 site. One source is the location of the former tank pit and the other is in the vicinity of boring 84-10 that is located upgradient of the former tank and is probably related to motorpool activities and not tank operations. Each source of contamination was modeled separately using the models discussed below.

Site-specific DAFs between the two sources and the receptor locations were developed. The DAF is a numerical value that represents the attempt to mathematically quantify the natural physical, chemical, and biological processes (e.g., advection-dispersion, sorption-retardation, biodegradation, volatilization) that result in the decrease of a chemical concentration in an environmental medium. In simple terms, the DAF is the ratio of chemical concentration at the source (or the point of origin) to the concentration at the exposure point. The DAFs reflect the natural attenuation concepts outlined in the ASTM's Risk Based Corrective Action (RBCA) protocol (ASTM 1995).

Fate and transport models are used as tools for developing DAFs. The application of fate and transport models at any release site must ensure that the modeling results are protective of human health and the environment. Therefore, the selection process of a predictive model at a release site must consider its performance, characteristics, and applicability to the site being considered. The following characteristics were considered before selecting an appropriate model for Fort Stewart:

- the model provides conservative predictions,
- the model is technically sound,
- the model is a public-domain model or is readily available,
- the model has received adequate peer review,
- the model has been applied to other similar sites, and
- the model is easy to use.

The Analytical Transient 1-, 2-, 3-Dimensional Model (AT123D) meets all of the above criteria, and was selected for performing fate and transport analysis for this site. AT123D is a well-known and commonly used analytical groundwater pollutant fate and transport model. It computes the spatial-temporal concentration distribution of chemicals in the aquifer system and predicts the transient spread of a chemical plume through a groundwater aquifer. The fate and transport processes accounted for in AT123D are advection, dispersion, adsorption/retardation, and decay. This model can be used as a tool for estimating the dissolved concentration of a chemical in one, two, or three dimensions in the groundwater, resulting from a mass release (either continuous or instant or depleting source) over a source area (i.e., point, line, area, or volume source).

SESOIL is used to simulate the vertical transport of contaminants from the source areas down through the vadose zone to the shallow groundwater (water table). SESOIL is an acronym for Seasonal Soil compartment model and is a one-dimensional, vertical transport code for the unsaturated soil zone, and is designed to simultaneously model water transport, and pollutant fate. The program was originally developed by EPA (1984) and has been extensively modified to enhance its capabilities (Hetrick et al. 1989, Hetrick et al. 1986, and Hetrick and Travis 1988).

The SESOIL defines the "soil compartment" as a soil column extending from the ground surface through the unsaturated zone to the water table. Processes simulated in SESOIL include both the hydrologic

cycle, and pollutant cycle, each of which are separate sub-module in the SESOIL code. The hydrologic cycle includes rainfall, surface runoff, infiltration, soil water content, evapotranspiration, and groundwater recharge. The pollutant cycle includes convective transport, volatilization, adsorption/desorption, and degradation/decay. A contaminant in SESOIL can partition in up to four phases (liquid, adsorbed, air, and pure).

SESOIL is well recognized and accepted by the scientific community utilizing soil-chemical fate models. Some of the attributes of SESOIL that make it particularly attractive and suitable for the vadose zone soil leaching at this site are as follows:

- SESOIL has been extensively validated and shown to work under a number of scenarios. It has also been used for similar applications in other parts of the country and is capable of providing the information required from this study (Bonazountas, Wagner, and Goodwin 1982; Wagner et al. 1986; Hetrick 1984; Watson and Brown 1985; Hetrick et al. 1986; Melancol, Pollard, and Hern 1986; Hetrick and Travis 1988; Hetrick et al. 1989; Hetrick, Luxmoore, and Tharp 1993).
- SESOIL has the advantage of fewer input requirements and faster run times than more complex unsaturated zone models, while still maintaining considerable resolution of the pollutant front in both time and space.
- The model can be divided into as few as two layers and as many as four layers, with as many as 10 sub-layers in each of the layers. This compartmental nature of the model allows for user-specified tailoring to suit a particular site.

1.3.3.2 Fate and Transport Results

The maximum soil concentrations at this site are above the water table (i.e., in the vadose zone). Therefore, leaching to groundwater by the percolating rain water was modeled using SESOIL. The SESOIL predicted maximum concentration in the leachate at the water table interface was used as the source concentration for groundwater. Lateral migration to the receptors was performed using the Analytical Transient 1-, 2-, 3-Dimensional Model (AT123D). The model was calibrated by matching the maximum concentration at the source and assuming steady state conditions. For lateral migration, two separate AT123D models were developed:

- migration of the existing plume in the groundwater based on the maximum observed concentration in the groundwater (i.e., 52.6 µg/L) near the tank pit and
- lateral migration based on SESOIL predicted maximum concentration in groundwater at boring 84-10, 70 ft upgradient of the tank pit.

Site specific geotechnical information was collected during the CAP-Part A investigation and is presented in Table C-3. Potential receptors are an industrial wastewater line, a sanitary sewer, a storm drain, and a tributary to Mill Creek.

Vertical migration of the contaminant plume through the confining unit to the Principal Artesian aquifer is improbable. The confining unit has a vertical hydraulic conductivity on the order of 10^{-8} cm/sec and ranges from 15 to 90 feet in thickness. Assuming a vertical gradient of 1.0 ft/ft and an effective porosity of 0.06 (Mills et al. 1985) for the confining unit, the groundwater travel time is estimated to be 87 years. However, benzene will not travel at the same speed as water because of retardation due to adsorption. The retardation factor for benzene through the confining unit is 5.05. Therefore, the travel time for benzene

through the confining unit (15 feet thick) is greater than 400 years (i.e., $87 \text{ years} \times 5.05 = 439 \text{ years}$). The surficial aquifer in which the contaminant plume is located is not used as a source of drinking water.

The fate and transport modeling results of the maximum observed CAP-Part A groundwater contamination are provided in Table C-4 and Section 1.5. Three potential downgradient locations at which a receptor might encounter migrating groundwater contamination were modeled. These locations include a sanitary sewer located 110 feet downgradient, a storm drain located 200 feet downgradient, and a tributary to Mill Creek located 5000 feet downgradient. These are the nearest possible locations at which a receptor might encounter migrating groundwater contamination due to a possible hydraulic connection between the groundwater and utility or the creek. Contaminant fate and transport simulations were performed to predict the maximum concentrations at these receptor locations over a simulation period of 100 years. The modeling results indicate that due to dilution attenuation, benzene contamination will not reach the underground utilities or tributary to Mill Creek at detectable concentrations. Therefore, utilities and surface water will not be impacted at concentrations above MCLs by the current site conditions at the UST 79 site, Facility ID #: 9-089026.

Based on modeling results of the observed CAP-Part A groundwater contamination, the estimated DAF for benzene at each of the receptors is infinity indicating that the predicted concentrations at this receptor is zero. Simulations were not performed to predict the maximum concentrations of benzene over a simulation period of two years because there are no permanent monitoring wells at the site to confirm the model predictions. This simulation will be performed during the long-term monitoring.

The fate and transport modeling results of the lateral migration based on SESOIL predicted maximum concentrations in groundwater (i.e., $253 \text{ } \mu\text{g/L}$ without biodegradation and $131 \text{ } \mu\text{g/L}$ with biodegradation) at boring 84-10 are provided in Tables C-5 and C-6 and in Section 1.5. Four potential downgradient locations at which a receptor might encounter migrating groundwater contamination were modeled. These locations include an industrial wastewater line located 60 feet downgradient, a sanitary sewer located 180 feet downgradient, a storm drain located 270 feet downgradient, and a tributary to Mill Creek located 5070 feet downgradient. These are the nearest possible locations at which a receptor might encounter migrating groundwater contamination due to a possible hydraulic connection between the groundwater and utility or the creek. Contaminant fate and transport simulations were performed to predict the maximum concentrations at these receptor locations over a simulation period of 100 years. The modeling results indicate that due to dilution attenuation, benzene contamination will not reach the sanitary sewer, the storm drain, or the tributary to Mill Creek at detectable concentrations. However, benzene contamination may reach the industrial wastewater line at concentrations less than $0.5 \text{ } \mu\text{g/L}$. Therefore, utilities and surface water will not be impacted at concentrations above MCLs by the current site conditions at the UST 79 site, Facility ID #: 9-089026.

Based on modeling results for the SESOIL predicted maximum concentration in groundwater, the estimated DAF for benzene at the industrial wastewater line is 1150 (i.e. $253 \text{ } \mu\text{g/L} \div 0.22 \text{ } \mu\text{g/L}$) assuming that no biodegradation of the contaminant occurs and 1191 (i.e. $131 \text{ } \mu\text{g/L} \div 0.11 \text{ } \mu\text{g/L}$) assuming that biodegradation occurs and the DAF for benzene at the drainage ditch is 96,500 (i.e., $44.4 \text{ } \mu\text{g/L} \div 0.00046 \text{ } \mu\text{g/L}$). The DAFs for the other receptor locations are infinity indicating that the predicted concentrations at the receptor is zero. Simulations were not performed to predict the maximum concentrations of benzene over a simulation period of two years because there are no permanent monitoring wells at the site to confirm the model predictions. This simulation will be performed during the long-term monitoring.

1.4 Conclusions and recommendations

The conclusions below are based on a fate and transport modeling assuming a continuous source of contamination of infinite duration at the site based on the maximum observed CAP-Part A benzene concentration (i.e. 52.6 µg/L) and the SESOIL maximum predicted benzene concentration (i.e. 253 µg/L) based on soil concentrations during the CAP-Part A investigation.

- Risk-based screening results show that benzene concentrations in groundwater exceed the initial screening levels.
- No ACLs were calculated based on the maximum observed CAP-Part A benzene concentration.
- Benzene concentrations in groundwater do not exceed the ACL of 5750 µg/L based on the SESOIL maximum predicted benzene concentration at the industrial wastewater line.
- The horizontal and vertical extent of soil and groundwater contamination due to tank operations was determined during the CAP-Part A investigation.
- Fate and transport modeling of benzene indicates that contamination does not exceed MCLs at the conservatively defined downgradient receptors from the source near boring 84-10 or the former tank pit.

Considering the site characteristics, a monitoring only plan is recommended to confirm that natural attenuation is taking place at the site.

1.5 Fate and Transport Model Output Results

Following are the data for fate and transport modeling.

Figure C-1. AT123D modeled maximum concentration of benzene in the groundwater
versus downgradient distance from the source (UST 79)

Modeling Results for the maximum observed CAP-Part A groundwater concentration

Figure C-4. SESOIL predicted concentration of benzene in the groundwater based on soil leaching from the soils at boring 84-10 (with biodegradation in the soil)

Figure C-5. AT123D modeled maximum concentration of benzene in the groundwater based on SESOIL modeling of soil contamination in boring 84-10 versus downgradient distance from the source (with biodegradation in the soil)

Modeling Results for the SESOIL maximum predicted groundwater concentration based on soil concentrations in boring 84-10 with biodegradation of benzene in the soil

Fort Stewart, UST 79, Benzene (Boring 84-10) with biodegradation

^a Average or higher groundwater pollution susceptibility area (where public water supply is within 2.0 mi.).

^b Protective of soil exposure during Industrial Land Use.

^c Protective of groundwater ingestion. Used a dilution attenuation factor of 20.

^d Values based on naphthalene as a surrogate chemical.

^e Not applicable. The screening level exceeds the expected soil concentration under free product condition.

^f Values based on pyrene as a surrogate chemical.

Italicized values indicate results exceeding risk-based screening levels.

Underlined values indicate results exceeding leaching to groundwater screening levels.

U Indicates that the compound was not detected above the reported sample quantitation limit.

J Indicates that the value for the compound was an estimated value.

UJ Indicates that the sample was not detected above an approximate sample quantitation limit.

R Indicates that the sample results are unusable and the presence or absence of the compound could not be verified.

= Indicates that the compound was detected at the concentration reported.

Bold values indicate results exceeding Georgia UST action levels.

^a Average or higher groundwater pollution susceptibility area (where public water supply is within 2.0 mi.).
^b Protective of soil exposure during Industrial Land Use.
^c Protective of groundwater ingestion. Used a dilution attenuation factor of 20.
^d Values based on naphthalene as a surrogate chemical.
^e Not applicable. The screening level exceeds the expected soil concentration under free product condition.
^f Values based on pyrene as a surrogate chemical.

Italicized values indicate results exceeding risk-based screening levels.
 Underlined values indicate results exceeding leaching to groundwater screening levels.
 U Indicates that the compound was not detected above the reported sample quantitation limit.
 J Indicates that the value for the compound was an estimated value.
 UJ Indicates that the sample was not detected above an approximate sample quantitation limit.
 R Indicates that the sample results are unusable and the presence or absence of the compound could not be verified.
 = Indicates that the compound was detected at the concentration reported.

(Maximum Observed CAP-Part A Groundwater Concentration)**

Distance from the source (ft)	Distance from the source (m)	Predicted Maximum Conc. In Groundwater (ug/L)
0.0	0.0	52.6
3.3	1.0	36.4
6.6	2.0	24.7
9.8	3.0	16.7
13.1	4.0	11.3
16.4	5.0	7.61
19.7	6.0	5.13
23.0	7.0	3.46
26.2	8.0	2.33
29.5	9.0	1.57
32.8	10.0	1.06
39.4	12.0	0.48
49.2	15.0	0.15
59.1	18.0	0.05
65.6	20.0	0.02
200.0	61.0	0
5000.0	1524.0	0

Table C-5. Natural Attenuation modeling results for UST 79 Site
(Maximum groundwater concentration is based on SESOIL modeling of
soil contamination at boring 84-10 without biodegradation of benzene in the soil)

Distance from the source (ft)	Distance from the source (m)	Predicted Maximum Conc. In Groundwater (ug/L)
0.0	0.0	253
3.3	1.0	174
6.6	2.0	118
9.8	3.0	79.8
13.1	4.0	53.9
16.4	5.0	36.3
23.0	7.0	16.5
26.2	8.0	11.1
29.5	9.0	7.51
32.8	10.0	5.06
39.4	12.0	2.31
49.2	15.0	0.712
59.1	18.0	0.22
65.6	20.0	0.1
82.0	25.0	0.015
200.0	61.0	0
5000.0	1524.0	0

**Table C-6. Natural Attenuation modeling results for UST 79 Site
(Maximum groundwater concentration is based on SESOIL modeling of
soil contamination at boring 84-10 with biodegradation of benzene in the soil)**

Distance from the source (ft)	Distance from the source (m)	Predicted Maximum Conc. In Groundwater (ug/L)
0.0	0.0	131
3.3	1.0	90.1
6.6	2.0	61.1
9.8	3.0	41.3
