1. Qualified Groundwater Scientist Certification

I certify that I am a qualified groundwater scientist who has received a baccalaureate or postgraduate degree in the natural sciences or engineering, and have sufficient training and experience in groundwater hydrology and related fields as demonstrated by state registration, professional certifications, or completion of accredited university courses that enable that individual to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport.

Revision 1 – October 2011
Original Report – October 2010

Executive Summary

This compliance status report (CSR) documents the site investigations and development of risk reduction standards (RRS) for the Military Construction Account (MCA) Barracks Site (HAA-15) at the Hunter Army Airfield (HAAF) in Savannah, Georgia. This CSR investigation was conducted in accordance with the requirements of the Georgia Hazardous Site Response Act (HSRA).

Initial discovery of impacts occurred during pre-construction investigations for the Special Operations Forces (SOF) facility and MCA Barracks during 1996 through 1998. These areas are contiguous and were combined into a single site (Hazardous Sites Inventory [HSI] Site #10521). Subsequent investigations conducted from 1999 through 2003 consisted of characterizing and delineating volatile organic compounds (VOCs) in groundwater using direct push technology (DPT). These data indicated that groundwater is predominantly impacted with trichloroethene (TCE) and cis-dichloroethene (cis-DCE). Petroleum hydrocarbons were detected in isolated areas at low concentrations. Low concentrations of other chlorinated volatile organics (tetrachloroethene [PCE], dichloroethane [DCA]) have also been detected in isolated areas.

During 2005 and 2006, additional investigation activities were conducted that included collecting soil, groundwater, surface water, and sediment samples. Soil samples were analyzed for VOCs, semi-volatile organic compounds (SVOCs), and/or metals, with parameters selected based on operational history of the area being investigated. Potential source areas were identified by the U.S. Army Corps of Engineers ([USACE] 2004) as discussed in the Site Investigation Work Plan [HydroGeoLogic (HGL), 2005c]. The soil sampling results indicated isolated areas of low concentration vadose zone soil impacts. TCE was only detected in one soil sample, which was collected at Hangar T-811. Lead and mercury were detected in surface soil in the Old Hospital Area at concentrations above background and Type 1 RRS concentrations. Groundwater samples were collected from temporary borings using DPT and from 30 groundwater monitor wells. The data from the groundwater samples confirmed TCE as the predominant contaminant of concern with the impact area covering a large area. Six surface water samples and nine sediment samples were collected from Pond 29. No impacts to the surface water (Pond 29) were detected and sediment samples were below the applicable standards.

In 2007, HAAF personnel sampled liquids in a grease trap connected to Hangar T-811. The sampling results indicated that high concentrations of TCE and its degradation products (cis-DCE and vinyl chloride [VC]) were present in the liquid. Subsequently, the grease trap was disconnected, cleaned and partially removed in April 2007. Soil samples were collected in the immediate area following removal.

TCE was detected in three soil samples collected in the immediate vicinity of the grease trap.

Additional investigation activities were conducted from November 2009 through June 2010. These recent site investigation activities included the following tasks:

- Investigating potential TCE source areas using Membrane Interface Probe (MIP) technology
- Investigating potential TCE source areas by collecting soil samples using DPT
- Collecting additional stratigraphic data to better define the hydrostratigraphy underlying the site
- Collecting water-level data from site monitor wells to confirm vertical and horizontal hydraulic gradients
- Installing additional monitor wells to delineate potential source areas and extent of impacts
- Sampling of monitor wells for analysis of VOCs
- Sampling of soil for analysis of lead

Additional investigation activities were subsequently conducted from July 2011 through September 2011. These most recent site investigation activities included the following tasks:

- Soil sampling for vertical delineation
- Installation of six shallow monitoring wells for horizontal delineation
- Installation of eight deep monitoring wells for horizontal delineation
- Installation of three deep double-cased monitoring wells for vertical delineation
- Development and sampling of new groundwater monitoring wells
- Collection of water level measurements from selected monitoring wells associated with HAA-15

Based on the results of the MIP, DPT and groundwater sampling results from existing and new monitor wells, two source areas have been identified. The first source was determined to be located in the Hangar T-811 area where TCE was used as a cleaner and solvent as part of previous operations. It is likely that TCE contamination in soil is located in the vicinity of the grease trap. TCE was detected at concentrations that indicate the likely presence of dense non-aqueous phase liquid (DNAPL) across Lightning Drive from the Hangar T-811 and former grease trap area. Soil contamination, detected below the water table in this area, appears to be a continuing source of groundwater contamination. A pathway for the downward migration of the TCE DNAPL was not located and may have dissipated through dissolution and natural

attenuation following the termination of the cleaning and maintenance operations in Hangar T-811 that resulted in the TCE release.

A potential second source area was identified near the aircraft wash racks and former Industrial Waste Treatment Plant (IWTP) adjacent to Building 850, southeast of the Hangar T-811. In this area, TCE was detected in groundwater in the deep zone of the upper aquifer at one location. The TCE concentration [2.8 milligram per liter (mg/L)] was much lower than the impacts detected near Hangar T-811. Concentrations indicative of source mass were not detected in unsaturated soil in the area or in the shallow zone of the upper aquifer.

Based on the available data, the TCE mass is located predominantly in the deeper zone of the upper aquifer from 35 to 50 feet below ground surface (ft bgs). Significantly lower concentrations (1 to 2 orders of magnitude) were detected in the shallow zone of the upper aquifer.

Vertical delineation in the source area indicated that the impacts are predominantly held up in the interbedded clays between 35 and 50 ft bgs. These interbedded clays in the deeper interval of the upper aquifer and the clay of the upper Hawthorne confining unit have effectively prevented any significant vertical migration beyond 50 ft bgs. The two potable wells in the area have open intervals below the Hawthorne confining unit in the upper Floridan Aquifer (259 to 504 ft bgs and 260 to 555 ft bgs) and are not at risk from the impacts at this site.

Impacts were not detected in Pond 29 during surface water and sediment sampling in 2006. Pond 29 has been drained due to a leak and storm water runoff is currently shut off. Based on historical and recent elevation data, Pond 29 periodically intercepts groundwater dependent on groundwater fluctuations. The continuing low contaminant concentrations in the shallow zone of the aquifer indicate that surface water impacts will continue to be minimal.

As stated above, the 2006 surface soil sampling results indicated lead and mercury impacts to be present at concentrations exceeding the Type 1 RRS in the Old Hospital Area. Mercury impacts were delineated to below background and Type 1 RRS concentrations in 2006. Supplemental surface soil sampling performed in 2010 completed the delineation of lead impacts and confirmed that it is limited to a small area.

A baseline risk assessment was performed to evaluate whether constituent concentrations detected in surface soil, subsurface soil, sediment, surface water and groundwater at HAA-15 pose a risk or hazard to current and hypothetical future receptors. The maximum detected soil and groundwater constituent concentrations were compared with the Type 1 through 4 RRSs. Surface water and sediment

maximum detected concentrations were compared with the Type 1 RRSs. Finally, potential vapor migration from soil and groundwater into buildings at the site was evaluated.

Lead and mercury concentrations in soil exceeded the Type 1 and Type 2 standards. Lead also exceeded the Type 3 and Type 4 standards at one location. Four constituents were detected in shallow groundwater at concentrations exceeding the Type 1 and Type 3 RRSs: cis-DCE; isopropylbenzene; methyl tert-butyl ether (MTBE); and TCE. Only TCE exceeded the Type 2 and Type 4 RRSs. Seven constituents were detected in deep groundwater at concentrations exceeding the Type 1 and Type 3 RRSs: benzene; 1,1-dichloroethene; cis-DCE; isopropylbenzene; methylene chloride; TCE; and VC. Four constituents were detected in the deep groundwater at concentrations greater than the Type 2 RRS: benzene; cis-DCE; TCE; and VC. Three constituents exceeded their Type 4 RRS: cis-DCE; TCE; and VC.

Soil and shallow groundwater results were evaluated for the vapor intrusion pathway. The maximum detected medium-specific concentrations were used in the calculations as a conservative measure. The results indicated that the risks were less than the Georgia Environmental Protection Division (GAEPD) HSRA benchmark of 1×10^{-5} for all receptors except residents exposed to vapors migrating from groundwater. For that receptor, the calculated risk was 1×10^{-5}, just slightly greater than the GAEPD benchmark and well within the U.S. Environmental Protection Agency (USEPA) risk range. TCE was the vapor intrusion risk driver. The noncancer hazards were less than the benchmark of 1, again with the exception of the resident exposed to vapors migrating from groundwater where the hazard was calculated to be 5, due to the presence of TCE. These risks and hazards were calculated using the updated cancer slope factors and reference doses for TCE that were released on September 28, 2011. If the average TCE concentration were used in the vapor migration model, the excess lifetime cancer risk (ELCR) and hazard index (HI) would be less than and equal to the GAEPD HSRA benchmarks of 1×10^{-5} or 1, respectively.

Screening level and baseline ecological risk assessments (ERAs) were performed for HAA-15. The screening level ecological risk assessments (SLERA) and baseline ecological risk assessments (BERA) focused on evaluation of constituents identified in surface soil, surface water, sediment and shallow groundwater. Risks were characterized for ecological receptors at the site by considering direct contact with constituents of potential ecological concern (COPEC) in each medium and the potential for food chain exposures to bioaccumulate COPEC. In the SLERA, several constituents, including Benzo(a)pyrene, Bis(2ethylhexyl)phthalate, Fluoranthene, Chromium, Lead and Mercury in surface soil were determined to have hazard quotients greater than 1. Further, there were several constituents that lacked ecological

screening values (ESVs); therefore, they were also identified as COPECs and those were: acetone, acenaphthylene, benz(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,4-cd)pyrene. There were no constituents in surface water with a hazard quotient (HQ) greater than 1 and surface water was not evaluated further in the ERA. Acetone, 2-butanone, dichlorodifluoromethane, and toluene were the only detected constituents in sediment. They were all identified as COPEC due to lack of ESVs. Three constituents, acetone, cis-DCE, and MTBE, were identified as SLERA COPECs in groundwater because they did not have ESVs identified in the SLERA. These constituents were carried forward as COPECs into the BERA.

Lead and mercury were the only two constituents identified as BERA COPECs in surface soil. Potential risk to ecological receptors from exposure to lead in surface soil cannot be ruled out considering the current Site conditions. However, the extent of elevated lead at the site has been evaluated and found to be localized. Adverse ecological impacts associated with mercury via direct contact are not considered likely.

Based on the available data, there is sufficient information to conclude that adverse impacts to aquatic and terrestrial wildlife and plants exposed to constituents in surface soil, surface water, sediment and shallow groundwater are unlikely. The one exception is lead at one location in surface soils. Adverse impacts are possible for ecological receptors potentially exposed to lead impacted surface soil at the site. However, the potential risks calculated for this exposure scenario were based on the conservative assumptions that these receptors would be chronically exposed throughout their lifetime. As additional data and information is gathered, the potential for soil to represent a potential ecological concern will be refined.

This CSR for HAA-15 has presented physical, analytical, and risk assessment data to support the conclusion that the potential impacts to the environment by past activities at the site have been sufficiently characterized in surface soil, subsurface soil, sediment, surface water and groundwater. Based on the data provided herein, the following recommendations are submitted for consideration by the GAEPD:

- The CSR investigation has been completed, and the potential impacts to the environment by past activities at HAA-15 have been fully characterized and delineated where necessary in surface soils, subsurface soils, sediment, surface water and groundwater.
- The vapor intrusion pathway has been evaluated and determined to not present an exposure pathway. The soil and shallow groundwater were conservatively evaluated for the vapor intrusion pathway and the results indicated that the risks were less than or equal to the GAEPD HSRA benchmarks. The exception was residents exposed to vapors from groundwater, which slightly exceeded the

ELCR and HI bench marks. If the average TCE concentration was used in the vapor migration model, the ELCR and HI would be less than and equal to the GAEPD HSRA benchmarks of 1×10^{-5} or 1, respectively Vapor intrusion risks will be reduced during remediation of the soil and groundwater impacts.

§ A Corrective Action Plan (CAP) will be developed to address chlorinated VOC impacts in groundwater and lead impacts in surface soil. A remedy for the chlorinated VOC impacts will be developed that focuses on mitigating the mass in the deep zone that is a continuing source.

Revision 1 – October 2011
Original Report – October 2010

3. Introduction

The U.S. Army Environmental Command (USAEC) has retained ARCADIS on behalf of HAAF to investigate and remediate impacted soil and groundwater at the MCA Barracks Site, also known as site HAA-15. As previous investigations triggered notification to GAEPD, the HAA-15 site has been assigned HSI Site # 10521. The GAEPD has required HAAF to pursue delineation and clean up of impacted soil and groundwater at HAA-15 in accordance with HSRA.

This CSR incorporates data obtained from recent investigations completed by ARCADIS from November 2009 through May 2010 and July through September 2011 as well as previous investigations conducted from 1999 through 2006. Recent field investigation activities were completed by ARCADIS in accordance with the scope in the Site Investigation Work Plan (ARCADIS 2009) and in response to comments from GAEPD on the Final CSR.

ARCADIS

Revision 1 – October 2011
Original Report – October 2010

4. Site Background

4.1 Regulatory Status

In 1996 HAA-15 was defined as an area of concern when a pre-construction environmental site assessment at a proposed new SOF facility, north of Lightning Drive, identified VOCs in groundwater. An additional environmental site assessment completed for an adjacent proposed MCA Barracks Site in 1998 revealed additional VOC-impacted groundwater. The sites were subsequently combined and added to the HSI as site No. 10521. Investigations of soil and groundwater quality at HAA-15 have been completed in compliance with HSRA rules and regulations and included in this CSR.

4.2 Site Description and Setting

4.2.1 Site Description

HAAF is an active military installation located in Savannah, Georgia, encompassing use as industrial, commercial, and temporary residential property occupied by a variety of administrative, maintenance, and barracks facilities (Figure 4-1). The facility also includes an active air field and a 10-acre man-made storm water retention pond. The MCA Barracks Site (HAA-15) is located in the northeastern portion of HAAF. A site map depicting the HAA-15 area with historic sampling locations is included as Figure 4-2. The HAA-15 area with the current monitor well network and the survey data for each monitor well's location and elevation is shown on Figure 4-3.

4.2.2 Facility and Site History

The following summary regarding the development of the HAA-15 area and historical operations conducted in this area is taken from the Flightline Mitigation Report (FMR) Section 2, FMR Section 5 and Hunter Army Airfield: A History. The full copies of the referenced documents are included in Appendix L.

HAAF is the site of the first Savannah Municipal Airport, a graded grass airfield constructed in 1929. Construction of three intersecting asphalt runways located in the middle of the current concrete parking apron, and a new hangar was completed in 1936. The hangar, now Building 1206, is the oldest building remaining at HAAF.

From October 1940 to May 1941, construction was completed on over fifty-five barracks and sixty-seven other buildings just north of the runways, including administration buildings, recreation facilities, crash stations, warehouses, guardhouses, hospital buildings, a Link trainer building, mess halls, officers quarters, and a theater. The Army constructed its aircraft maintenance area just to the north of

the runways, consisting of two hangars and a heat plant facility (Buildings 811, 812, and 813), two bomb sight storage facilities (Buildings 803 and 816), and thirteen 700 Series wood squadron operations buildings (no longer standing). A concrete parking apron extended about two hundred feet to the south of the buildings and connected to the existing runways. The squadron operations buildings were adjacent to the hangars to the west of Building 813 and the east of Building 811, next to the bomb sight storage facilities.

In 1946 control of the airfield reverted back to the Savannah Municipal Airport. Municipal Airport and private airline offices moved back to the Municipal Airport Building. Buildings 811, 813, and 1206 were used as civilian hangars.

In 1950 Hunter AFB became part of the Strategic Air Command's (SAC) Second Air Force. By late 1952, the 2nd Bomb Wing Armaments and Electronics Maintenance Squadron (AEMS) operated primarily from Building 811 while the 308th AEMS was based out of Building 1206.

In 1953, the installation addressed its lack of permanent aircraft maintenance space, beginning construction on a double cantilever hangar (Building 850). For specialized maintenance needs, job orders were called in to wing Maintenance Control, which, for the 2nd Bomb Wing, operated out of Building 811 and for the 308th Bomb Wing, from Building 1290.

The Field Maintenance Squadron (FMS) for both wings operated from the new double cantilever hangars, with the 2nd FMS in Building 850 and the 308th FMS in Building 860. Work on aircraft would occur inside the hangars or on the flightline, unless a mechanical component needed such extensive work that it needed to be removed to a shop. Depending on facility requirements, some shops in the FMS were housed away from the double cantilever hangars. For instance, the 2nd FMS Engine Shop was located in Building 813 and the 308th FMS Engine Shop in Building 1206.

In late 1966 the US Army announced plans to create the Advanced Flight Training Center at Fort Stewart and HAAF. The north edge of the airfield, including the remaining nosedocks, became a maintenance and operations center for AH-1 Cobras, while Buildings 850 and 860 became maintenance buildings for UH-1s. HAAF was formally transitioned from the U.S. Air Force to the U.S. Army in April 1967.

By the mid-1980s the military had sixteen installation and tenant units stationed at HAAF. The aviation units used Buildings 850, 860, and the old SAC nosedocks for maintenance hangars, working on both helicopters and small fixed wing Army

aircraft. Major exterior changes were performed on Building 813 in 1983. In the late 1990s, the Army performed major changes to the exterior of Building 811.

Currently, Hunter Army Airfield has approximately 5,000 soldiers on station. It is home for units of the 3d Infantry Division (Mechanized) headquartered at Fort Stewart. There are also a number of non-divisional units assigned to Hunter.

The major divisional units stationed at Hunter include the 3d Aviation Brigade, and 603d Aviation Support Battalion. Non-divisional units which make up the major tenant units include: the 260th Quartermaster Battalion; the 1st Battalion, 75th Ranger Regiment; 3d Battalion, 160th Special Operations Aviation Regiment (Airborne); and the 224th Military Intelligence Battalion (Aerial Exploitation).

The Coast Guard Air Station Savannah is also located on Hunter Army Airfield. It is the largest helicopter unit in the Coast Guard and provides Savannah and Coastal Georgia with search and rescue coverage.

4.2.3 Potable Wells at the Site

HAAF Well #1 and HAAF Well #2 are both public water supply wells located in the cantonment area of HAAF and are the main water supply system at the HAAF installation (Figure 4-3). HAAF Well #1 and HAAF Well #2 were installed in 1940 and 1942, respectively. HAAF Well #1, located at Building 711 on the corner of Moore Road and Douglass Street, is a 12-inch diameter well with 100-hp turbine pump serving a 100,000-gallon elevated storage tank (Tank 1). Potable well HAAF Well #1 was installed in the upper Floridan Aquifer to a terminal depth of 550 ft bgs with an open interval from 259 to 504 ft bgs. HAAF Well #2, located at Building 1205 on the corner of Neal Street and Strachan Road, is a 12-inch diameter well with a 100-hp turbine pump serving a 200,000-gallon elevated tank (Tank #2). Potable well HAAF Well #2 was installed in the upper Floridan Aquifer to a terminal depth of 600 ft bgs with an open interval from 260 to 555 ft bgs. Water from HAAF Well #2 also supplies a 500,000 gallon elevated storage tank (Tank #3) located on Middleground Road behind noncommissioned officer (NCO) family housing. This tank provides potable water to 694 service connections, which are used by an average of at least 5,000 individuals on a yearly basis (SAIC 2001). VOC sampling performed in July 2011 indicate no constituents of concern (COCs) are present (Appendix M).

4.2.4 Physical Setting of the Airfield

The HAAF is located on a southwest-northeast trending ridge of about 20 feet to 40 feet elevation above mean sea level (msl) and is surrounded on all sides by lower topography of about 10 to 15 feet elevation (Figure 4-4). The documented history of the

facility indicates construction activities began at the installation in 1928. It is likely that the first runways were constructed on the highest part of the ridge at or around the same time to allow for surface water drainage away from the runways.

4.2.5 Regional Geology/Hydrogeology

HAAF is located on the Lower Coastal Plain physiographic province, which is typified by low relief that slopes toward the Atlantic Ocean. The geology is composed of a seaward thickening sequence of unconsolidated sediments deposited from sediments eroded from the Blue Ridge Mountains. Previous regional investigations suggest there have been minor amounts of structural deformation in the Savannah, Georgia area during deposition of these sediments starting in the early Cretaceous Period. The total thickness of the sediments in the Savannah, Georgia, area is over 2,000 feet.

The regional hydrogeology in the vicinity of HAAF consists of two aquifers separated by a thick confining unit. Primary water supply aquifer in the Lower Coastal Plain of Georgia and Florida is the Floridan Aquifer. The Floridan Aquifer is a regionally extensive aquifer that is approximately 800 feet thick in the area of Savannah. It is composed primarily of Oligocene age and Eocene age porous limestones. The uppermost aquifer system is the surficial aquifer at and surrounding Savannah, Georgia and is underlain by two continuous clay units separating this aquifer from the Floridan. These two clay units, separating the aquifers, are part of the Hawthorne Group (Huddleston 1988). Fossils and sediment samples suggest that these units were deposited during the Middle Miocene Period in a low energy open marine environment over a wide area. The open ocean depositional environment resulted in the widespread and continuous nature of these clay units. A deep test well in Savannah (GGS-3139) shows that the clay units extend from approximately 45 feet to 167 feet in depth near HAAF. A cross-section from Huddleston is included in Appendix I. Lithologic descriptions from Well HAAF #11, which was installed in 2009 during a U.S. Geologic Survey (USGS) study at HAAF, indicate the confining unit was encountered from approximately 60 to 285 ft bgs (Appendix O). Due to the thick confining unit that separates the uppermost aquifer system from the underlying Floridan Aquifer, it has been demonstrated that there is minimal potential for shallow groundwater to impact deeper groundwater quality. As previously described, potable wells HAA Well 1 and HAA Well 2 are installed in the upper Floridan Aquifer with open intervals from 259 to 504 ft bgs and from 260 to 555 ft bgs, respectively.

The sediments overlying the Hawthorne Group clays to land surface are composed of a sequence of near-shore to shoreface (barrier island) sediments that prograde over the Hawthorne Group marine clays. Published investigations have identified nine sets of overlapping relict beach ridges of Pleistocene age to Holocene age on the Lower Coastal Plain that prograde towards the Atlantic Ocean. Each barrier sequence forms a

ridge (also termed terrace) that is progressively lower and closer to the modern barrier island. The ancient beaches formed during higher sea levels and are approximately parallel to the modern barrier island complex. Each barrier system is at a consistent elevation above sea level with about 20 feet of relief above surrounding land.

4.2.6 Hunter Army Airfield Depositional Model

HAAF is located on a relict beach ridge named the Pamlico Terrace which has current elevations ranging from about 20 feet above msl to 40 feet above msl. This abandoned beach ridge was formed during the late Pleistocene (>10,000 years) age. The Pamlico Terrace sediments are about 50 feet thick at HAAF. The shallow sediments at HAAF are comparable to sediments that form the nearby modern barrier islands along the Atlantic coast. Pamlico Terrace is older and is at a slightly higher elevation than the modern barrier beach. Common general characteristics of barrier island systems are:

- an exposed belt of sand separated from the mainland by a shallow body of water, such as a lagoon
- greater length than width
- a straight seaward margin with a lobate, crenulate, or cuspate landward margin
- a coarsening-upward sequence of sand with the uppermost portion of which consists of eolian dunes

These generalities of modern barrier islands can be used to predict the shallow stratigraphy at HAAF. Utilizing the general depositional model of barrier island system, an understanding of the shallow sediments at HAAF can be placed into context for the interrelationships of the sand units, silt units and clay units in the uppermost aquifer system observed at HAAF. The highest part of the ridge is the beach composed of fine- to medium-grained well sorted quartz sand. The beach itself is a massive sand with little clay and silt because it was reworked by constant wave action and migration of tidal inlets. This ridge is the location of the current airfields at HAAF and trends northeast to southwest through HAAF and HAA-15. East of the ridge was the shallow open Atlantic Ocean which should consist of finer sands that were constantly reworked to form well sorted sands that are finer when compared to the beach. Grain size should decrease with increasing water depth due to the limited winnowing in deeper water by reduced wave action with depth.

Marshes and bays would have occurred behind the barrier to the west of the airfields. Deposits in this area are generally silts and clays characteristic of lower energy environments with some interbeds of sands. The sand units were deposited from tidal inlets that migrated along the barrier and wash-over fans from storms. Individual units will drape off of the central barrier island sands. Clays interbedded with the sands will

compact with time to form somewhat continuous but thin units, which can be confining in nature.

ARCADIS

Revision 1 – October 2011
Original Report – October 2010

5. Investigations Conducted at HAA-15

5.1 Special Operations Forces Facility: 1996 Pre-construction Investigation

VOCs in groundwater were discovered in 1996 when the USACE collected soil and groundwater samples at a proposed new SOF facility, located north of Lightning Drive and west of Billy Mitchell Boulevard. Samples were collected from temporary wells as part of the construction clearance process. The sampling results indicated that TCE and PCE were present in groundwater at concentrations exceeding their respective primary drinking water standards. Cis-DCE was also detected in two groundwater samples.

5.2 MCA Barracks Facility: 1998 Pre-construction Investigation and Delineation

The MCA Barracks Site was identified as an area of concern in 1998 during an environmental assessment prior to the construction of new barracks. The investigation was conducted by the USACE-Savannah District and consisted of 6 composite soil samples and 12 groundwater samples. The groundwater samples were collected from temporary wells at a screened depth of 9.8 to 13.1 feet bgs. The results of the groundwater sampling indicated the presence of TCE at three locations, naphthalene at one location, and acetone at another location. Only TCE was detected at concentrations exceeding the U.S. Environmental Protection Agency (USEPA) Primary Maximum Contaminant Level (MCL) of 5.0 micrograms per liter (µg/L).

USACE conducted an additional site investigation in May 1998 to further investigate the groundwater impacts. Groundwater samples were collected from temporary wells screened across the water table. TCE was detected at five locations above the USEPA MCL concentration of 5.0 µg/L at concentrations ranging from 5.9 µg/L to 160 µg/L. Cis-DCE was detected at low levels in two groundwater samples.

5.3 SOF Facility: 1999 Well Installation and Confirmation Sampling

In September 1999, four shallow monitor wells (less than 20 feet bgs) were installed at the SOF facility. The wells were installed at locations based on data from the temporary points sampled in 1996. Groundwater samples were collected from the 4 monitor wells for the analysis of VOCs, SVOCs and metals. The sampling results confirmed the presence of organic contaminants that had been detected in 1996, including TCE, cis-DCE, PCE, 1,2-dichloroethane, 1,3-dichloroethene, bis (2-ethylhexyl) phthalate, and chloroform. TCE and bis (2-ethylhexyl) phthalate were the only constituents detected above the GAEPD target concentration values.

5.4 MCA Barracks: 1999, 2000, and 2001 Delineation Investigations

Sampling of groundwater was conducted by Science Applications International Corporation (SAIC) between 1999 and 2001 (SAIC 2004). The vertical VOC profiling of groundwater was conducted at 26 locations (XX-01 through XX-26) by collecting samples using DPT. The boring locations are shown on Figure 4-2. Vertical profile borings XX-01 through XX-15 were sampled every 5 feet from the water table to a depth of 45 to 50 feet bgs for laboratory analysis. Borings XX-16 through XX-26 were sampled at 5-foot intervals from the water table to a total depth of 36 to 45 feet bgs, but only selected samples were submitted for laboratory analysis. Approximately three at each location were selected based on soil conductivity results. Table 5-1 provides a summary of groundwater analytical results from 1999 through 2001. Several VOCs were detected in groundwater samples with TCE exceeding the GAEPD HSRA groundwater target concentration in numerous samples. In addition to TCE, cis-DCE was also detected at levels that exceeded the groundwater target concentration. Permanent monitor wells were subsequently installed at boring locations XX-04 through XX-26 and well locations are shown on Figure 4-3.

5.5 MCA Barracks: 2002 and 2003 Delineation Investigations

In 2002 and 2003, the USACE conducted additional groundwater sampling for delineation of chlorinated solvent impacts. These investigations included USACE installation of 13 vertical-profile borings (MVP-1 through MVP-5 and MCA-VP-1 through MCA-VP-8 (Figure 4-2)). Groundwater was sampled every five feet to a total depth of approximately 45 feet for analysis of VOCs. Approximately eight (8) samples were collected from each boring. Table 5-2a provides groundwater analytical data for borings MVP-1 through MVP-5, which were sampled in 2002. Table 5-2b provides groundwater analytical data for borings MCA-VP-1 through MCA-VP-8, which were sampled in 2003. VOCs were detected in eight of the thirteen borings in samples collected between 10 feet bgs and 45 feet bgs. TCE and cis-DCE were the most frequently detected VOCs. Only TCE and VC exceeded their respective GAEPD groundwater target concentrations (SAIC 2004).

5.6 MCA Barracks: 2005 and 2006 Site Investigations

Between October 2005 and April 2006, HGL performed a site investigation in accordance with the Final Site Investigation Work Plan for the MCA Barracks Site (HGL 2005). Assessment activities included DPT soil sampling, groundwater sampling, and monitor well installation and sampling. The following descriptions are based on information included in the draft CSR generated by HGL (HGL 2007).

ARCADIS

Revision 1 – October 2011
Original Report – October 2010

Background Concentrations

Background metals concentrations in soil were obtained from the "Revised Final Compliance Status Report for Former Fire Training Area" (Law, 2002). The Former Fire Training Area is located proximate to the MCA Barracks Site. A description of the procedures used to determine background metals concentrations in soils has been included as Appendix K. Background values, in milligram per kilogram (mg/kg), are listed below:

- Arsenic: 2.6
- Barium: 28
- Cadmium: 2.6
- Chromium: 7.7
- Lead: 53
- Mercury: 0.39
- Selenium: 1.9
- Silver: 2.6

Soil Investigation

During the site investigation performed by HGL, soil samples were collected from 18 locations in potential source areas (Figure 4-2). Soil analytical data from 2005 - 2006 are included in Table 5-3a. Soil samples were collected using DPT or a hand auger.

For investigation of VOC impacts, soil samples were submitted from the depth intervals determined most likely to be impacted as determined by performing field screening with a photo-ionization detector (PID) followed by analysis using Draeger tubes if VOCs were detected with the PID. Samples were also visually examined for indications of non-native or impacted soil condition. If there were no indicators of soil contamination, the interval directly above the water table was sampled for analysis.

As specified in the HGL Site Investigation Workplan (HGL, 2005c), the following laboratory analyses were performed at each area based on the area's historic use:

- Aircraft hangars: VOCs, SVOCs, RCRA metals;
- Aircraft Wash Rack: VOCs;
- IWTP: VOCs;
- Old Hospital Area including two Potential Disposal Areas: SVOCs and RCRA metals;
- Georgia Air Guard Motor Pool: VOCs, RCRA metals; and
- Motor Repair Shop: VOCs, SVOCs, RCRA metals, reactivity, sulfate and pH.

Where impacts were indicated by laboratory analytical concentrations, additional soil samples were collected from borings completed proximate to the original soil

sampling location. The distance of the offset was no less than 25 feet from the previous sample location.

Groundwater Investigation

Groundwater samples were collected from 78 vertical profile borings and from 30 permanent monitor wells (Figure 4-3). Groundwater analytical data for vertical profile points are provided in Tables 5-3b. Groundwater samples were collected with DPT by collecting samples from a slotted probe rod advanced to the target sampling depth. Most of the groundwater samples were collected from three depth ranges (10 to 15 ft bgs, 25 to 30 ft bgs and 40 to 45 ft bgs) at locations in and around the VOC impacts. A groundwater sample also was collected at 78 feet bgs from boring MCA-GW054, located approximately 200 feet east of monitoring well HGL-7B/C. Boring MCA-GW054 was advanced to this depth to provide vertical contaminant delineation (HGL 2005). A total of 61 groundwater samples were collected from 21 borings during the investigation. Groundwater samples were submitted for laboratory analysis of VOCs, the primary contaminants of concern.

The locations for new monitoring wells were selected based on the groundwater sampling results from the DPT investigation. Twenty-two groundwater monitoring wells, including shallow wells HGL-1B through HGL-11B and deep wells HGL-1C through HGL-11C, were installed at the site. Shallow wells were constructed with a screen interval of approximately 15 to 25 ft bgs. Deep wells were constructed with a screen interval of approximately 30 to 40 ft bgs. Seven boring locations were logged for lithologic profiling.

Low-flow groundwater sampling procedures were used to collect groundwater samples from existing monitoring wells XX-15, XX-17, XX-18, XX-19, XX-21, XX-22, XX-24 and XX-25 and monitoring wells HGL-1B/C through 11B/C (Figure 4-3). Groundwater analytical results from monitor well samples are provided in Table 5-3c.

Surface Water and Sediment Sampling

Surface water and sediment samples were collected from six locations at Pond 29. Pond 29 is located in the western portion of the MCA Barracks Site (Figure 4-2). Analytical results from surface water and sediment samples are provided in Tables 5-3d and 5-3e respectively. Grab samples were collected at each location as close to the water/sediment interface as possible without allowing bottom sediment to enter the sampling chamber. Sediment samples were collected near the surface water sample locations after the surface water samples were collected. Procedures described in USACE EM200-1-3, *Requirements for the Preparation of Sampling and Analysis Plans*, 2001 and USEPA, Region 4, *Environmental Investigations Standard Operating Procedures and Quality Assurance Manual*, November, 2001 were followed during the collection of surface water and sediment samples (HGL 2007).

Conductivity Testing

Monitoring well pairs at six locations were tested for hydraulic properties by HGL from March 29 through March 31, 2006. The six nested well pairs (12 wells) were screened at intervals of approximately 15 to 25 feet below grade and approximately 30 to 40 feet below grade. Slug tests were performed to determine the hydraulic conductivity values. Two rising head and two falling head slug tests were conducted at each well. The slug tests were conducted using test procedures outlined by Butler (1998). Testing data and velocity calculations are included in Appendix A.

5.7 ARCADIS Investigation Activities November 2009 through September 2011

Between December 2009 and September 2011, ARCADIS completed several investigation activities to delineate the source(s) and extent of impacts in groundwater at HAA-15. The primary focus was investigation of the source(s) of TCE impacts in groundwater at HAA-15. Additional investigation was also conducted to delineate the extent of groundwater impacts and develop a more comprehensive understanding of site characteristics. All procedures and techniques utilized for this investigation conformed to USEPA Region 4 Science and Ecosystem Support Division (SESD) guidance and the Sampling and Analysis Plan for this site (Appendix J). All soil and groundwater samples collected were analyzed by Shealy Environmental Services, Inc., a certified Georgia Laboratory.

A timeline for the ARCADIS activities is presented below:

November-December 2009:

- Installation of vertical soil profiles using MIP technology; and
- Temporary soil boring installation and subsurface soil sampling based on MIP results

January 2010:

- Installation of one shallow/deep monitoring well pair and an additional shallow monitor well using an auger rig; and
- Well development of newly-installed wells

February 2010:

- Collection of water–level measurements from monitor wells associated with HAA-15; and
- Sampling of new and selected existing groundwater monitor wells

March-April 2010:

- Installation of 3 additional deep monitoring wells and 2 additional shallow monitoring wells based on groundwater sampling results from February 2010; and
- Development and sampling of new and selected existing groundwater monitor wells

May 2010:

- Installation of 3 additional deep monitoring wells and 1 additional shallow monitoring well based on groundwater sampling results from March and April 2010; and
- Development and sampling of new groundwater monitoring wells

July 2011

- Temporary soil boring installation at future vertical delineation well installation locations
- Installation of four shallow monitoring wells for horizontal delineation; and

August 2011

- Installation of two shallow monitoring wells and eight deep monitoring wells for horizontal delineation
- Installation of three deep double-cased monitoring wells for vertical delineation
- Collection of subsurface soil samples associated with double-cased vertical delineation monitoring well locations; and
- Development and sampling of new groundwater monitoring wells

September 2011

- Development and sampling of new groundwater monitoring wells; and
- Collection of water level measurements from selected monitoring wells associated with HAA-15

Detailed descriptions of the ARCADIS field activities summarized above are discussed in the following sections.

5.7.1 Water-level measurements

A complete set of water-level measurements was collected in February 2010 and September 2011. Water level measurements were collected from all deep and most shallow wells in the HAA-15 monitoring well network. The water-level measurements

were taken to provide a comprehensive view of relative groundwater flow directions in both the shallow and deep zones of the upper aquifer. Monitor well locations are shown on Figure 4-3. Groundwater elevation data are included in Table 5-4. A comparison of water levels in monitor well pairs consisting of wells screened in the shallow and deep zones is presented in Table 5-5.

5.7.2 MIP Technology Investigation

In November 2009, as part of the ARCADIS investigation activities, 27 MIP borings were installed within the areas potentially impacted with chlorinated volatile organic compounds (CVOCs) in groundwater. All of the MIP borings except 4 were installed in areas north of Hangars T-811 and T-813 along Lightning Drive and in areas further north along Zettell Street and Hickam Boulevard. Four of the MIP borings, MIP-22 through MIP-25, were installed in the vicinity of the former IWTP and the wash racks to the northeast of Building 850 where results from vertical profile sampling point MVP-3 had indicated the presence of TCE. The MIP locations north of the hangars were installed parallel to the described roads, which are roughly perpendicular to the direction of groundwater flow. Point locations were adjusted based on facility requirements, access and utility locations. The MIP borings were advanced to the top of the confining clay layer (found in this area between 40 and 50 feet bgs). The MIP locations are presented on Figure 5-1 with a summary of results presented on Figures 5-1a, b, c and d.

MIP technology is an in-situ tool installed with DPT. The MIP unit heats the soil and groundwater adjacent to the probe thereby increasing volatility and causing the vapor phase to diffuse across the membrane into an inert gas loop. The gas carries the vapors to a series of detectors housed at the surface. Continuous (2-foot increment) chemical profile logs are generated from each boring starting from approximately 5 feet bgs to the underlying silty-clay confining layer, which was encountered between 40 and 50 feet bgs. The detectors at the surface include a PID, a flame-ionization detector (FID), and an electron capture detector (ECD). The intent of the MIP investigation was to determine VOC concentrations at mg/L concentrations indicative of source mass. The MIP is not effective for detecting lower VOC concentrations (µg/L) and was not utilized to investigate the extent of impacts. The MIP data was used to locate boring locations for soil sampling and subsequently permanent well locations from which groundwater samples were collected for laboratory analysis of VOCs. The MIP unit also includes a tool to measure electrical conductivity continuously during advancement, which can be utilized to locate clay beds within the silty sand and massive sand units. Electrical conductivities were compared to well logs of nearby wells to verify variations in geology. The data from MIP points installed

initially was used to adjust locations of subsequent MIP points. MIP data logs are provided in Appendix B.

5.7.3 Soil Sampling

5.7.3.1 2009 Soil Sampling

During December 2009, the data from the MIP evaluation was used to determine locations for collection of soil samples for delineation of the source area(s). DPT technology was utilized to sample soil via temporary borings. Eleven temporary borings (H15-SB-01, H15-SB-03, H15-SB-03A, H15-SB-03C, H15-SB-12, H15-SB-12A, H15-SB-20, H15-SB-21, H15-SB-25, H15-SB-47 and H15-SEP-01) were installed to the base of the deep zone of the upper surficial aquifer at approximately 40 to 50 feet bgs. All temporary borings were continuously cored and a description of sediments was recorded by an on-site geologist. All soil samples were screened with a PID. Boring logs are included in Appendix C. DPT services were provided by ARM Environmental Services, Inc, a Georgia-certified drilling firm. Soil samples chosen for off-site laboratory analysis were selected based on intervals identified as having elevated ECD readings during MIP testing and on PID screening results. Soil samples were submitted for laboratory analysis by USEPA Method 8260B. A total of 31 samples were submitted from the 11 soil boring locations. Boring locations are shown on Figure 5-1. All samples were analyzed by Shealy Environmental Services, Inc., a certified Georgia laboratory. Soil analytical results for VOCs are presented in Table 5-6.

In addition to the temporary borings installed to sample VOC impacts, 3 borings were installed in the Old Hospital Area to collect samples for further delineation of lead. The samples were designated in the field as H15-PB-1 through H15-PB-3. Lead was detected in a 2006 surface soil sample from the area at a concentration of 5,300 mg/kg (soil sample collected in 2006 by HGL; sample ID# MCA-SO018C2). The additional soil samples were analyzed off-site for lead by USEPA Method 6010B by Shealy Environmental Services. The soil boring locations are also presented on Figure 5-1. Soil analytical results for lead are presented in Table 5-6.

During DPT sampling, additional soil samples were taken for analysis of grain size for use during remediation design. The results are included in Appendix D.

The soil waste from the installation of the soil borings was collected in U.S. Department of Transportation (DOT)-approved 55-gallon drums and staged in a centralized location. The investigation-derived waste (IDW) soil and groundwater drums were sampled for characterization and disposal purposes.

The MIPs and soil borings were located in the field using global position system technology. Upon completion, all temporary borings were grouted with cement from

total depth to approximately six inches from land surface. The boring locations were restored at the surface with concrete, asphalt or topsoil consistent with the surrounding material.

5.7.3.2 2011 Soil Sampling

In July 2011, four additional soil borings were installed in preparation for the installation additional horizontal and vertical delineation groundwater monitoring wells. One boring was installed near existing well cluster H15-MW-02B/C to characterize lithology for a vertical delineation monitoring well. This boring was advanced until a sandy clay unit with no dilatancy was encountered at 73 feet bgs. The boring was terminated at 74 feet bgs. One boring was installed near the planned location of new monitoring well cluster H15-MW-14B/C to characterize lithology in the vicinity of the new wells. One boring was installed near the planned location of new monitoring well cluster H15-MW-15B/C to characterize lithology in the vicinity of the new wells. Soil borings installed at the H15-MW-14B/C and H15-MW-15B/C locations were terminated at the expected total monitoring well installation depth of 45 feet bgs. One boring was installed near the planned location of new monitoring well H15-MW-20E to characterize lithology in the vicinity of the new wells. DPT refusal was encountered at 86 feet bgs at the H15-MW-20E boring location. Locations of the new monitoring wells and associated soil borings are shown on Figure 4-3.

ARCADIS coordinated with Parratt Wolff, an environmental drilling firm, to install the temporary soil borings. At each boring location a continuous soil core was recovered using a DPT machine and dual-tube DPT tooling. An outer DPT casing was advanced in conjunction with inner DPT rods and an acetate soil core liner. Recovered soil cores were logged and photo-documented by an ARCADIS geologist and screened with a calibrated PID meter.

At the completion of each boring the borehole was abandoned with Portland cement grout through the outer DPT casing. Grout was emplaced using a tremie pipe from the bottom of the borehole to ground surface.

The soil waste from the installation of the soil borings was collected in U.S. Department of Transportation (DOT)-approved 55-gallon drums and staged in a centralized location. The investigation-derived waste (IDW) soil and groundwater drums were sampled for characterization and off-site disposal purposes.

5.7.4 Groundwater Monitor Wells

5.7.4.1 2010 Monitor Well Installation

Based on MIP response data, soil sampling data, historic groundwater and soil data, and monitor well sampling data, ARCADIS selected locations for installation of additional monitor wells. Wells installed in the shallow zone of the upper aquifer, designated with 'B', were screened from 15 to 25 feet bgs, while those installed in the deep zone, designated with 'C', were screened from 35 to 45 feet bgs. In each case, the bottoms of the well screens represented the total depth of the wells.

ARCADIS installed 3 monitoring wells to aid in the investigation of the TCE groundwater plume in January 2010. Two of the three wells (H15-MW-01B/C) were installed as a well pair northeast of the wash racks area at Building 850. The third well, H15-MW-02B, was installed directly north of Hangar T-811 at the location of soil boring H15-SB-03A.

Following receipt of laboratory analytical results for groundwater samples collected in February 2010, additional monitoring wells were installed. Deep monitor well H15-MW-02C was installed adjacent to H15-MW-02B to delineate the deep impacts previously identified north of the T-811 Hangar building. Monitor wells H15-MW-03B/C and H15-MW-04C were installed in March to the south and north of H15-MW-01C, respectively, to delineate the extent of TCE in this area. One additional shallow well, H15-MW-05B, was installed in April 2010. Shallow monitor well H15-MW-05B was installed approximately 500 feet north of HGL-8B/C to delineate shallow groundwater impacts to the northwest. Well installation services for the installation of monitor wells H15-MW-02C and H15-MW-05B were provided by the USACE. Services for the remaining additional wells (H15-MW-03B/C and H15-MW-04C) installed during this mobilization were provided by GeoLab, Inc, a Georgia-certified drilling firm. The monitor wells described above were surveyed for location and elevation by Bateman Civil Survey, a land surveyor registered in the state of Georgia.

Following sampling of the wells installed in March and April 2010, it was determined that additional delineation of the groundwater impacts was warranted. Therefore, four wells were installed in May 2010. One well pair (H15-MW-07B/C) was installed near the northeast corner of Building 860, south of the recently installed well pair H15-MW-03B/C. One additional deep well was installed at the H15-MW-05B location, to make this a well pair. Finally, an additional deep well (H15-MW-06C) was installed immediately south of Duncan Drive, between Buildings 400 and 401 to further delineate the horizontal extent to the northeast. The final well installation activities were performed by ARM Environmental Services under the supervision of an ARCADIS

geologist. The additional monitor wells were surveyed by EMC Engineering Services, Inc, a land surveyor registered in the state of Georgia.

All wells were constructed of 2-inch-diameter Schedule 40 PVC with a 10-foot screen. Well screens consist of a 2-inch inside diameter, flush threaded, 0.010-in. slotted Schedule 40 PVC. Clean, inert, siliceous No. 2 sand material was used to construct a uniform and continuous filter pack up to one to two feet above the top of the screen. A one to two foot thick layer of bentonite pellets was placed above the sand pack and hydrated to provide a proper seal. A bentonite / Portland cement slurry seal was then pumped into the annular space between the well and the outside of the borehole using a 1-inch diameter PVC tremie pipe up to a depth of approximately one foot bgs. Monitor wells were completed at ground surface with flushmount protective vaults. The surface completions were flush with the ground surface because the wells were located around buildings or in populated areas. Well construction and boring logs are included as Appendix E. Monitor well locations are presented on Figure 4-3.

Following completion of the well installation, the monitor wells were developed using a single speed whaler pump, set at the base of the wells and surged to ensure the removal of fine-grained materials from within the wells.

IDW from monitor well installation was contained within DOT-approved 55-gallon drums and sampled for characterization and disposal purposes.

5.7.4.2 2011 Monitor Well Installation

Based on comments from GAEPD, additional horizontal and vertical delineation monitor wells were installed in 2011. A total of 17 wells were installed in July and August 2011. One well (H15-MW-08C) was installed near the north side of Building 400. One well (H15-MW-09C) was installed in the former Pond 29 area northwest of the Douglas Boulevard/Lightning Drive intersection. One well (H15-MW-10C) was installed near the southeast corner of Building 305. One well (H15-MW-11C) was installed near the southwest corner of Building 404. One well (H15-MW-12C) was installed near the southwest corner of Building 125. One well (H15-MW-13C) was installed south of Building 150. One well pair (H15-MW-14B/C) was installed near the northwest corner of Hangar 850. One well pair (H15-MW-15B/C) was installed north of Building 1130. One well (H15-MW-16B) was installed north of Building 865. One well (H15-MW-17B) was installed southeast of the former Pond 29 area northwest of the Douglas Boulevard/Lightning Drive intersection. One well (H15-MW-18B) was installed near the southwest corner of Building 400. One well (H15-MW-19B) was installed west of Building 315. The wells were installed using hollow stem auger drill rigs by GeoLab and Parratt Wolff, environmental drilling firms, under the supervision of an ARCADIS

geologist. The monitor wells were surveyed by EMC Engineering Services, Inc, a land surveyor registered in the state of Georgia.

Wells were constructed of one-inch (H15-MW-16B, H15-MW-17B, H15-MW-18B, and H15-MW-19B) or two-inch-diameter Schedule 40 PVC with a 10-foot screen. Well screens consist of flush threaded, 0.010-in. slotted Schedule 40 PVC. Clean, inert, siliceous No. 1 sand material was used to construct a uniform and continuous filter pack up to two feet above the top of the screen. A two foot thick layer of bentonite pellets was placed above the sand pack and hydrated to provide a proper seal. A Portland cement seal was then pumped into the annular space between the well and the outside of the borehole using a PVC tremie pipe up to a depth of approximately one foot bgs. Monitor wells were completed at ground surface with flushmount protective vaults. The surface completions were flush with the ground surface because the wells were located around buildings or in populated areas. Well construction and boring logs are included as Appendix D. Monitor well locations are presented on Figure 4-3.

Following completion of the well installation, the monitor wells were developed using a Waterra development pump equipped with a surge block.

Additionally, three double-cased vertical delineation monitoring wells were installed. Wells H15-MW-02D and H15-MW-02E were installed near the existing H15-MW-02B/C well pair. Well H15-MW-20E was installed in the vicinity of the existing HGL-7B/C well pair. Lithology was collected at each vertical delineation well location prior to installing each well. At the H15-MW-02B/C/D/E location, a DPT soil boring was advanced until a sandy clay unit with no dilatancy was encountered at approximately 73 feet bgs. Lithology was logged by an ARCADIS geologist and soils were screened with a calibrated PID meter. Lithologic logs are presented in Appendix C.

DPT vertical aquifer profile groundwater samples were collected at the H15-MW-02B/C/D/E location from temporary screened intervals of approximately 54 to 58 ft bgs and 64 to 68 ft bgs. The groundwater samples were sent to Shealy Environmental Services, Inc. in West Columbia, South Carolina for analysis of VOCs in accordance with USEPA Method 8260B. Laboratory analytical reports are included in Appendix G. The vertical aquifer profile analytical results indicated that VOC impacts were present in the approximately 54 to 58 ft bgs and 64 to 68 ft bgs depth intervals. The H15-MW-02D screened interval was selected to monitor the deep aquifer immediately above the clayey unit identified at approximately 73 ft bgs.

Well H15-MW-02D was constructed with a four-inch-diameter Schedule 40 PVC outer casing that extended from the ground surface to 64 ft bgs. The outer casing was grouted in place with Portland cement. The grout was allowed to cure before

proceeding with additional drilling to seal deeper zones from impacted shallower zones. An inner borehole was then advanced to a total depth of 73 ft bgs and the well was completed with a two-inch diameter Schedule 40 PVC inner casing and a five-foot screen. The well screen consisted of a 2-inch inside diameter, flush threaded, 0.010-in. slotted Schedule 40 PVC. Clean, inert, siliceous No. 1 sand material was used to construct a uniform and continuous filter pack up to two feet above the top of the screen. A two foot thick layer of bentonite pellets was placed above the sand pack and hydrated to provide a proper seal. A Portland cement seal was then pumped into the annular space between the well and the outer casing using a 1-inch diameter PVC tremie pipe up to a depth of approximately one foot bgs. The well was completed at ground surface with a flushmount protective vault.

Subsurface soil samples were collected at the H15-MW-02E location in an effort to identify water-bearing zones below the clayey unit identified during the July 2011 DPT effort. The soil samples were collected using a mud rotary drill rig and split spoon sampler at five-foot intervals from approximately 72 ft bgs to the total well depth of 125 ft bgs. Soil samples were logged by an ARCADIS geologist and screened with a calibrated PID meter. Soil samples from each depth interval were sent to Shealy Environmental Services, Inc. in West Columbia, South Carolina for analysis of VOCs in accordance with USEPA Method 8260B. Laboratory analytical reports are included in Appendix G. Remaining soils were retained and sent to Ardaman and Associates, Inc, an engineering consulting firm, for geotechnical grain size analysis. Grain size analysis results are included in Appendix E. No water-bearing zone was identified between the H15-MW-02D total depth of 73 ft bgs and 116 ft bgs. The boring was terminated and four-inch-diameter Schedule 40 PVC outer casing that extended from the ground surface to 116 feet bgs was installed. The outer casing was grouted in place with Portland cement. The grout was allowed to cure before proceeding with additional drilling to seal deeper zones from impacted shallower zones. An inner borehole was then advanced to a total depth of 125 ft bgs and the well was completed with a two-inch diameter Schedule 40 PVC inner casing and a five-foot screen. The well screen consisted of a 2-inch inside diameter, flush threaded, 0.010-in. slotted Schedule 40 PVC. Clean, inert, siliceous No. 1 sand material was used to construct a uniform and continuous filter pack up to two feet above the top of the screen. A two foot thick layer of bentonite pellets was placed above the sand pack and hydrated to provide a proper seal. A Portland cement seal was then pumped into the annular space between the well and the outer casing using a 1-inch diameter PVC tremie pipe up to a depth of approximately 1 ft bgs. The well was completed at ground surface with a flushmount protective vault.

DPT vertical aquifer profile groundwater samples were attempted at the H15-MW-20E location from temporary screened intervals between 50 and 65 ft bgs. DPT groundwater samples were not recovered from these locations due to clayey material obstructing the DPT screen sampler.

Subsurface soil samples were collected at the H15-MW-20E location in an effort to identify water-bearing zones below the clayey unit and characterize PID detections identified during the July 2011 DPT effort. The soil samples were collected using a mud rotary drill rig and split spoon sampler at five-foot intervals from approximately 46 ft bgs to the total outer casing depth of 116 ft bgs. Soil samples were logged by an ARCADIS geologist and screened with a calibrated PID meter. Soil samples from each depth interval were sent to Shealy Environmental Services, Inc. in West Columbia, South Carolina for analysis of VOCs in accordance with USEPA Method 8260B. Laboratory analytical reports are included in Appendix G. Remaining soils were retained and sent to Ardaman and Associates, Inc, an engineering consulting firm, for geotechnical grain size analysis. Grain size analysis results are included in Appendix E.

No water-bearing zone was identified between 65 ft bgs and 116 ft bgs. The boring was terminated and four-inch-diameter Schedule 40 PVC outer casing that extended from the ground surface to 116 ft bgs was installed. The outer casing was grouted in place with Portland cement. The grout was allowed to cure before proceeding with additional drilling to seal deeper zones from impacted shallower zones. An inner borehole was then advanced to a total depth of 125 ft bgs and the well was completed with a two-inch diameter Schedule 40 PVC inner casing and a five-foot screen. The well screen consisted of a 2-inch inside diameter, flush threaded, 0.010-in. slotted Schedule 40 PVC. Clean, inert, siliceous No. 1 sand material was used to construct a uniform and continuous filter pack up to two feet above the top of the screen. A two foot thick layer of bentonite pellets was placed above the sand pack and hydrated to provide a proper seal. A Portland cement seal was then pumped into the annular space between the well and the outer casing using a 1-inch diameter PVC tremie pipe up to a depth of approximately one foot bgs. Following completion of the well installation, the monitor wells were developed using a Waterra development pump equipped with a surge block.

The well was completed at ground surface with a flushmount protective vault. The surface completions were flush with the ground surface because the wells were located around buildings or in populated areas. Well construction and boring logs are included as Appendix E. Monitor well locations are presented on Figure 4-3. IDW from monitor well installation was contained within DOT-approved 55-gallon drums and sampled for characterization and disposal purposes.

5.7.5 Sampling of New and Existing Monitor Wells

In February 2010, 30 monitor wells consisting of recently installed and existing wells were sampled. Following installation of the five additional monitor wells between March and April 2010, four of the newly installed wells as well as an additional existing well were sampled. Newly installed monitoring well H15-MW-05B was determined to be filled with grout, likely due to a cracked well casing. The well was replaced, but not developed prior to the April sampling activities. A nearby well, XX-13, was sampled instead.

Following the receipt of laboratory analyses for the groundwater sampling event in April 2010, the additional four (4) monitor wells were installed and sampled in May 2010. After development, monitor well H15-MW-05B was sampled in June. Analytical results for sampling of shallow and deep monitor wells are included in Tables 5-7 and 5-8 respectively.

Low-flow techniques were used to collect groundwater samples from the new and existing monitor wells. During well purging activities, field measurements collected included pH, specific conductance, temperature, oxidation-reduction potential (ORP), dissolved oxygen (DO) and turbidity. Field sampling data sheets are included in Appendix F. The groundwater samples were sent to Shealy Environmental Services, Inc. in West Columbia, South Carolina for analysis of VOCs in accordance with USEPA Method 8260B. All laboratory analytical reports are included in Appendix G. Purge water from the sampling event was containerized in a designated 55-gallon drum and stored on-site.

In August and September 2011, recently installed monitoring wells were sampled. Except for deep delineation monitoring wells H15-MW-02E and H15-MW-20E, low-flow techniques were used to collect groundwater samples from the new and existing monitor wells. Due to slow recharge and static depth-to-water levels that approach the maximum depth of peristaltic pumps, deep delineation monitoring wells H15-MW-02E and H15-MW-20E were purged and sampled using Teflon bailers. During well purging activities, field measurements collected included pH, specific conductance, temperature, oxidation-reduction potential (ORP), dissolved oxygen (DO) and turbidity. Field sampling data sheets are included in Appendix F. The groundwater samples were sent to Shealy Environmental Services, Inc. in West Columbia, South Carolina for analysis of VOCs in accordance with USEPA Method 8260B. Laboratory analytical reports are included in Appendix G. Purge water from the sampling event was containerized in a designated 55-gallon drum and characterized for off-site disposal.

5.7.6 Surface Water Assessment

Surface water drainage patterns from the area around Hangars T-811 and T-813 were evaluated. The topography across the area is presented on Figure 4-4. The stormwater drainage system is presented in Figure 5-2. Available historic documentation was reviewed to evaluate the potential for impacts from historic operations at the site.

5.7.7 Vapor Intrusion - Indoor Air Pathway

Following source delineation, ARCADIS analyzed historic and current soil and groundwater data to determine if the indoor air pathway was complete and would need to be evaluated further.

ARCADIS

Revision 1 – October 2011
Original Report – October 2010

6. Investigation Results

6.1 Visual Inspection

During a visual inspection of Hangars T-811 and T-813 in 2006 by HGL, USACE, and base personnel, Building 811 contained a former degreasing room located in the northeast corner of the building. Equipment used during the degreasing procedure remained in place including the fume hood and a sink that may have been a replacement for the original sink. A 4-inch floor drain was present near the sink and appeared to lead to an outside oil-water separator or grease trap. The degreasing room drain was the only potential contaminant pathway that was found in Hangar T-811. Inspection of Hangar T-813 revealed no obvious or apparent potential contaminant pathways (HGL 2007).

During pre-investigation inspections by ARCADIS in 2009, it was noted that the equipment previously used during the degreasing procedure (fume hood, sink, four inch floor drain) had been removed. As previously noted, the grease trap outside the building had also been disconnected, cleaned and partially removed.

6.2 Site Geology/Hydrogeology

6.2.1 Geologic conditions

As part of the investigation activities, ARCADIS compiled soil boring installation logs from historic and recent soil borings and monitoring wells installed on the HAA-15 site. Figures 6-1a and 6-1b are cross-sections compiled from both historic and current soil boring/monitoring well locations. Figure 6-1a (A-A') traverses the southern portion of the site and runs from monitor well pair HGL-9B/C to monitor well pair HGL-5B/C. Figure 6-1b (B-B') runs north to south generally through the center of the major lobe of the TCE-impacted groundwater plume. In addition, soil collected during the vertical delineation efforts completed by ARCADIS was submitted for sieve analysis (Appendix E). Results of the sieve analysis show a substantial proportion of fines below 50 ft bgs. The proportion of fines increases with depth as the Hawthorne confining unit is encountered (Appendix E, Section E-2, Table 1). Overall, both cross-sections, which include existing and newly-installed boring locations, provide further evidence of a depositional environment of a lagoon and/or marsh behind a barrier island up to a beach with the regional confining unit at the base of the upper aquifer representative of marine sediments.

6.2.2 Hydrogeologic conditions

Monitoring well gauging data was used to establish groundwater elevations and flow directions in the shallow and deep portions of the upper aquifer. Based on data from

the HGL investigation, shallow groundwater flow in October 2005 was to the north and deep groundwater flow in October 2005 was to the north-northwest. Both shallow and deep groundwater flow in April 2006 were generally to the north-northwest.

ARCADIS collected additional water level data and stratigraphic data to supplement the data gathered during previous investigations. During the February 2010 and September 2011 groundwater sampling events, a complete round of water levels was collected to confirm groundwater flow directions. Consistent with the water level data compiled as part of HGL's HAA-15 investigation, upper aquifer groundwater in the source area proximate to Building T-811 (former Hangar 811) flows towards the north-northwest away from the runway complex. Shallow upper aquifer groundwater flow is shown on Figure 6-2a. The average shallow zone gradient was calculated to be 0.0085 feet per foot. Deep zone upper aquifer groundwater flow in the same area as indicated on Figure 6-2b is also generally to the north-northwest at an average gradient calculated to be 0.012. However, in the southeastern portion of the site proximate to Buildings 865 and 850, both shallow and deep upper aquifer groundwater flow is to the northeast.

Slug tests conducted during the 2005-2006 investigations resulted in calculated hydraulic conductivities at HAA-15 varying from 0.76 feet/day to 17 feet/day (HGL 2007). Widely varying hydraulic conductivities in sediments are typical in back barrier sequences and represent the variation from low energy marsh deposits of clays and silts to high energy tidal channel deposits of well sorted sands.

The observed depth to groundwater in the upper aquifer in February 2010 ranged from 2 feet to 10 feet across the site. In September 2011, the groundwater levels had decreased by approximately 2 feet and the depth to groundwater in the upper aquifer ranged from 3 to 13 feet.

The 10-acre man-made pond and canals at the site appear to be discharge boundaries for the shallow groundwater. It appears Pond #29 is having a minimal effect on flow direction, although it is believed to be a discharge point for shallow groundwater and representative of the shallow groundwater level when groundwater levels are high. The pond is currently dry. Also, one of the major water ways on the site, Lamar Canal is located to the northwest.

Groundwater flow within the shallow wells in the uppermost aquifer (i.e. to depths of between 20 and 25 feet bgs) exists under unconfined conditions. A geologic cross-section of HAA-15 shows a homogeneous sand unit at the surface that extends from land surface at the runway to about 10 to 20 feet bgs. The massive fine grained sand unit at the top of the sequence is part of the former beach. A series of silty clay units

interbedded with fine sand units and silt units underlies the sand unit. These units are interpreted as marsh and bay or lagoon deposits behind the Pamlico barrier. Individual clay units are often laterally extensive in the marsh behind the barrier.

A persistent clay unit in some areas of the site divides the upper aquifer system into two zones. Significant downward vertical hydraulic gradients at some well locations across the site suggest semi-confined to confined conditions in the uppermost aquifer system. Table 5-4 provides a summary of groundwater elevations measured on February 1, 2010 and September 8, 2011. Table 5-5 provides a comparison of water levels in monitor well pairs and calculated hydraulic head differences and vertical gradients. In February 2010, differences in hydraulic heads ranging from between one and six feet downward were detected at four well pairs (HGL-1, HGL-7, HGL-8, and HGL-9). In September 2011, the three well pairs manifest hydraulic head difference ranging between one and six feet downward (HGL-1, HGL-7, HGL-8). As illustrated in the cross-section on Figure 6-1b, the laterally extensive clayey silt unit separates the shallower well HGL-8B from the deeper well HGL-8C. The downward gradients at the referenced well pairs suggest that the aquifers are separated at most well pairs by the clayey silt unit, which acts as a semi-confining unit. The two aquifers are termed the "Shallow" and "Deep" zones of the upper surficial aquifer system. Water elevations show minor vertical head differences at the runways to the east and at the property boundary to the west, which suggests the two units of the split upper aquifer system may be limited in extent and that these are the areas of the relict beach and shoreface consisting mainly of sands with little to no silts and clays.

Groundwater elevation comparisons with monitor wells installed for vertical delineation are also included in Table 5-5. These data show large vertical head differences between the deep zone of the upper aquifer (35-45 ft bgs) and the vertical delineation wells installed into the Hawthorne confining unit (120-125 ft bgs). The head differences at the locations of the two vertical delineation wells were 15.20 and 12.25 ft.

6.3 Soil Impacts

6.3.1 1999 through 2003 Soil Investigation Results

During the 1996 study, USACE sampled soil as part of the SOF facility pre-construction assessment. No contamination was detected in soil samples. In 1998, USACE completed another pre-construction site assessment in the area. As part of this investigation, seven composite soil samples (6 samples and 1 duplicate) were collected. Methylene chloride was the only contaminant detected in the composite soil samples. Other investigations during this period did not include sampling of soil.

6.3.2 2005 through 2006 Soil Investigation Results

In 2005 and 2006, the soil at locations selected based on historic activities was sampled by HGL. The sampling was conducted to assess whether historical activities had resulted in impacts. The results were as follows.

6.3.2.1 Potential Former Debris Disposal Areas

Soil sample MCA-SO16 was collected in 2005 at a potential former debris disposal site located near the southwest corner of Pond #29. Subsequently, additional soil samples were collected in February and April 2006 at locations to the north, south, east and west of MCA-SO16. Soil samples were analyzed for SVOCs and metals. All detections of metals (arsenic, barium, cadmium, chromium and lead) and several SVOCs observed in the initial soil sample (MCA-SO016) were below GAEPD notification concentrations (NC) and site specific background values for metals. The soil samples collected in 2006 revealed similar SVOCs and metals results with the exception of barium detections of 34 and 33 mg/kg in samples MCA-SO016B and MCA-SO016C2, respectively and a lead detection in the duplicate (MCA-SO016A2*) of 470J mg/kg. The barium detections were slightly above the site specific background value of 28 mg/kg, but were below the Type 1 RRS and GAEPD NC. The lead detection in the duplicate is above the Type 1 RRS concentration. The lead concentration in the original sample from the same location was 8.0J mg/kg, well below background and the Type 1 RRS.

Soil sampling was conducted in 2006 at a potential former debris disposal site west of Pond 29. Soil samples were analyzed for SVOCs and metals. SVOCs were not detected in the initial sample (MCA-SO017). Due to a barium detection of 97 mg/kg that exceeded the background value of 28 mg/kg, additional soil samples were collected in 2006 at locations to the north, south, east and west of MCA-SO017. The soil samples collected at locations MCA-SO017A, B, C and D also had no detections of SVOCs. Barium detections ranged from 35 mg/kg to 120 mg/kg. Each of the barium concentration was below the GAEPD NC of 500 mg/kg and Type 1 RRS of 1,000 mg/kg. Several others metals were detected but at levels below their respective background and Type 1 RRS concentrations.

6.3.2.2 Old Hospital Area

Soil samples were collected by HGL in 2006 at locations in the vicinity of the Old Hospital Area. Soil sample MCA-SO018 was collected in the vicinity of the Old Hospital Area Boiler Room and was analyzed for SVOCs and metals. Some SVOCs were detected at concentrations below their respective GAEPD NC and Type 1 RRS concentrations. Several metals were detected including mercury (0.7 mg/kg), arsenic (2.7 mg/kg), barium (32 mg/kg) and lead (200 mg/kg), which exceeded site specific

background concentrations of 0.39, 2.6, 28 and 53 mg/kg, respectively. Mercury and lead exceeded the Type 1 RRS concentrations. Due to these exceedances, locations to the north, south, east and west were sampled. Samples MCA-SO018C, D, A2, and B2 did not contain metals or SVOC concentrations above GAEPD NC or Type 1 RRS concentrations. Samples MCA-SO018A, C2, and B had concentrations of lead that exceeded the Type 1 RRS. Sample MCA-SO18A contained mercury at a concentration above the Type 1 RRS. Sample MCA-SO18C2, which contained a lead concentration of 5300 mg/kg, was the only sample that exceeded its GAEPD NC. Lead concentrations in soil in this area are presented on Figure 6-3b.

6.3.2.3 Motor Repair Shop Area

Also in 2006, two soil samples, MCA-SO001 and MCASO002, were collected from the Motor Repair Shop area and were analyzed for VOCs, metals, sulfate, reactivity and pH. VOCs were not detected in either soil sample. Barium, chromium, lead and silver were detected at concentrations that were below their respective background and Type 1 RRS concentrations.

6.3.2.4 Georgia Air National Guard Motor Pool

One sample (MCA-SO008) was collected in 2006 from the vicinity of the Georgia Air Guard Motor Pool and was analyzed for VOCs and metals. Acetone, which was the only VOC detected, was below its Type 1 RRS. Barium, chromium and lead were detected at concentrations of 11, 3.8 and 19 mg/kg, respectively, that were below their respective background and Type 1 RRS concentrations.

6.3.2.5 Hangars T-811/813

In 2006, five soil samples were collected from the vicinity of Hangars T-811 and T-813 and analyzed for VOCs and metals. VOCs were not detected in the two soil samples collected from the vicinity of Hangar T-813. Metals such as arsenic, barium, chromium, lead and mercury were detected at concentrations that were below their respective background and Type 1 RRS concentrations. Also in 2006, three samples were collected in the vicinity of Hanger T-811. One sample was collected within the building, one was collected north of the building and the other sample was collected close to the southeast corner of the building. VOCs including acetone, TCE and toluene were detected in the soil sample collected from within Hangar T-811 at estimated concentrations that were below GAEPD NC and Type 1 RRS concentrations. VOCs were not detected in the other two soil samples. Metals were detected in each of the Building T-811 soil samples, but at concentrations that were below their respective background and Type 1 RRS concentrations. TCE concentrations in soil in this area are presented on Figure 6-3a.

6.3.2.6 Former IWTP and Aircraft Washrack Area

In 2006, three soil samples were collected from the Aircraft Wash Rack area and analyzed for VOCs. VOCs were not detected in two of the samples. Ethylbenzene, m&p-xylenes, o-xylene and isopropylbenzene were detected in soil sample MCA-SO014 at concentrations of 250, 1,800, 180 and 750 • g/kg. Each of the detections was below their respective GAEPD NCs.

In 2006, three soil samples were collected from the former IWTP and analyzed for VOCs. No VOCs were detected in the samples from the former IWTP area.

TCE concentrations in soil are presented on Figure 6-3a. Soils analyses from the 2005/2006 investigation are summarized in Table 5-3a.

6.3.3 2007 Grease Trap Removal and Sampling

In October 2006, HAAF personnel sampled liquids in a grease trap connected to the Hangar T-811. Laboratory analysis of these samples indicated elevated concentrations of TCE, cis-DCE and VC (65,000, 39,000 and 6,600 • g/L, respectively) were present in the liquid.

On April 12, 2007, the grease trap was drained and partially removed from an area in front of Hangar T-811 by HAAF personnel. The drain line from Building T-811 to the former grease trap was capped. In addition, the Army collected three soil samples (Bldg 811 Bottom NE, Bldg 811 Outlet Drain and Bldg 811 Outlet Drain E) in the immediate vicinity of the grease trap located between Building T-811 and Lightning Drive. Off-site laboratory analytical results indicated elevated TCE concentrations ranging from 260 to 610 micrograms per kilogram (• g/kg), which were above the GA EPD NC of 130 • g/kg. The results are summarized in Table 6-1. The laboratory report is included in Attachment G.

6.3.4 2009 through 2010 Soil Investigation Results

6.3.4.1 MIP Investigation

In November 2009, MIP borings were installed in two rows approximately perpendicular to the groundwater flow direction downgradient of Hangars T-811 and T-813. In addition, 3 MIP points were installed north (downgradient) of these 2 rows in the area proximate to monitor well HGL-7B/C where 16 mg/L of TCE had been detected in a 2006 sample taken from the well (HGL-7C) screened in the deep interval. Four (4) MIP borings were also located in the area around vertical profile sampling point MVP-3, where TCE had been detected in 2002 in the vicinity of the former IWTP and the wash racks. The MIP borings were advanced to the top of the confining layer as determined based on conductivity data (40 to 47 feet bgs). The

locations are presented on Figure 5-1. The results are presented as cross-sections in Figures 5-1a, b and c and in plan-view on Figure 5-1d. The MIP responses indicated that the largest CVOC mass was located on the north side of Lightning Drive across from the northwest side of Hangar T-811. MIP point H15-SB1, across Lightning Drive from the northeast side of Hangar T-811, also had a significant although lesser ECD response. There were no significant responses from the MIP detectors at points north of Hangar T-813. Overall, the ECD responses indicated CVOC mass in an area across Lightning Drive from the former grease trap location in front of Hangar T-811. The ECD responses indicate the CVOC mass extends approximately 600 feet downgradient (northwest) toward monitor well HGL-7C. MIP analysis points were not located on the Hangar side of Lightning Drive or inside Hangar T-811 due to the physical size of the DPT rig and vehicle housing the analytical unit. In the area proximate to the washracks and former water treatment facility, a MIP response indicated CVOC mass in the 40 to 45 feet bgs interval at one location (location H15-SB25).

6.3.4.2 Soil Sampling

In December 2009, soil sampling was conducted at 11 locations selected using MIP data and results from historic sampling activities. Sample intervals were also adjusted based on field screening data. All soil borings were screened from ground surface to total depth. There were no significant MIP ECD responses or field screening responses that indicated the presence of TCE source mass in the unsaturated zone. The majority of high ECD responses had occurred near the base of the surficial aquifer at 35 to 45 feet bgs in what is considered the deep zone. To maximize evaluation of potential source mass, soil samples were taken at locations indicated as impacted by MIP data. Soil sample results are more indicative of total mass in a specific location than groundwater samples would be. The soils most highly impacted with TCE were observed in samples taken directly north of Hangar T-811. Samples within boring location H15-SB03A were collected between 34-35 feet, 39-40 feet and 44-45 feet bgs to correspond to intervals with high ECD responses. Concentrations of TCE were measured at 7.4 mg/kg, 21 mg/kg and 7.6 mg/kg, respectively. The next highest TCE concentrations in soil were found at location H15-SB03C, also north (downgradient) of Hangar T-811. At this location, TCE concentrations of 1.2, 13 and 2.3 mg/kg were detected at depth intervals of 34-35 feet, 39-40 feet and 44-45 feet bgs, respectively. At location H15-SB03, TCE was detected at 5.7 mg/kg in the soil sample taken from 44-45 feet bgs. TCE concentrations between 1 and 3 mg/kg were detected in the 3 samples taken between 38 to 45 feet bgs in H15-SB-12, which is downgradient of H15-SB-03 and 3A. Continuing downgradient, H15-SB47 contained 1.7J mg/kg, 1.7J mg/kg and 1.8J mg/kg in the 3 samples taken between 29 to 43 feet bgs. East of H15-SB-03a, also in front of Hangar T-811, 1.5 mg/kg of TCE was detected in the sample taken from 34-35 feet bgs at H15-SB01. TCE concentrations in saturated and unsaturated

soil from sampling conducted in 2005 and 2009 for locations in the vicinity of Aircraft Hangar Buildings T-811 and T-813 are presented on Figure 6-3a.

In the area proximate to the washracks and former IWTP facility, TCE was not detected in shallow soil samples taken in 2005. Based on a detection of TCE in deeper groundwater in 2002 and lesser detections in 2005, MIP analysis was performed at 4 locations in 2009. One MIP ECD response at 40 to 45 feet bgs indicated the possibility of significant TCE mass. A soil sample taken at the location (H15-SB25) at 42-44 feet bgs contained 1.3 mg/kg TCE.

Also in 2009, 3 soil samples were taken for analysis of lead in the area east of boring location MCA-SO018C2, where lead had been detected in surface soil at a concentration of 5,300 J mg/kg in 2006. Samples were taken at 2 intervals (1-2 and 4-5) at each location. The maximum detected concentration was 11 mg/kg, well below the background concentration of 53 mg/kg and Type 1 RRS value of 75 mg/kg. Soil lead concentrations from sampling conducted in 2006 and 2009 for locations in the vicinity of Old Hospital Area are presented on Figure 6-3b. Table 5-6a provides a summary of the ARCADIS soil sampling results.

6.3.5 2011 Soil Investigation Results

Additional soil samples were taken in August 2011 as part of the vertical delineation investigation. The soil sample analytical results are presented on Figure 6-3c. In the area of H15-MW-02B/C/D/E across Lightning Road from Hangar 811, TCE was detected in soil at a maximum depth of 92 to 94 ft bgs. The concentration at this depth was 19 µg/kg. Analytical results for soil samples taken below this depth to 125 ft bls were non-detect for all constituents except carbon disulfide. At the location of H15-MW-20E which is near monitor well HGL-7B/C and downgradient of monitor wells H15-MW-02B/C/D/E, TCE was not detected below 58 ft bgs in samples taken to a maximum depth of 118 ft bgs. Toluene and total Xylenes were detected in the sample from 76 – 78 ft bgs at 12 and 190 µg/kg respectively. Table 5-6b provides a summary of the ARCADIS soil sampling results from vertical delineation.

6.4 Groundwater Impacts

Groundwater delineation has been completed by a combination of temporary locations followed by installation and sampling of monitor wells. Initial activities were conducted during 1999 through 2003 with additional investigations from 2005 through 2006 and from November 2009 through June 2010.

6.4.1 1999 through 2003 Groundwater Investigation Results

Groundwater sampling activities with DPT were conducted during 1999 through 2003 and resulted in detections of TCE impacts in groundwater. In 1999 through 2000, vertical-profile borings XX-01 through 26 were installed at the site to determine the extent of the chlorinated solvents detected in the groundwater samples from the initial vertical-profile borings. Sample locations are shown on Figure 4-2. Twelve of these borings were converted to 3/4-inch shallow monitoring wells and ten were converted to 2-inch deep monitoring wells. One of the monitoring well locations (XX-26) was constructed as a nested well with screened zones installed at 3 depth intervals. Monitor well locations are shown on Figure 4-3. The monitor wells were not sampled during these investigations. Based on the groundwater sampling using DPT, the chlorinated compounds were located between 10 and 45 feet bgs. Locations XX-03, XX-14, and XX-22 contained the highest concentrations of TCE at depths ranging from 20 to 40 feet. The highest detected concentrations were at location XX-14 where 3.7 mg/L was detected in a grab sample from 24-27.5 feet bgs. Most samples were taken in what was subsequently determined to be downgradient portions of the impacted area. Groundwater grab sampling using DPT was also conducted in 2002 and 2003. In 2002, 453 µg/L of TCE concentration was detected in location MVP-3 at 35 feet bgs. This detection was subsequently investigated in 2009 as described below. There was no other significant detection of VOCs in 2002. There was no significant VOC detection during the groundwater sampling in 2003.

6.4.2 2005 through 2006 Groundwater Investigation Results

Additional DPT groundwater sampling activities were conducted during the 2005 – 2006 investigation. The results are presented on Figure 6-4.

6.4.2.1 Old Hospital Area

Groundwater was sampled at DPT locations MCA-GW003, MCA-GW004, MCA-GW032 and MCA-GW047 within the Old Hospital Area. VOCs were not detected in the samples collected from DPT locations MCA-GW003 and MCA-GW-004. Samples from location MCA-GW032 contained TCE and cis-DCE in the samples from 30 and 45 feet bgs. The TCE detection of 35 • g/L in the 30 foot sample was the only detection that exceeded the Type 1 RRS concentrations. Groundwater at DPT location MCA-GW047 was sampled at 15, 30 and 40 feet bgs. Cis-DCE (2.1 • g/L), TCE (1 • g/L) and PCE (1.1 • g/L) were detected in the 15 feet bgs sample. TCE at 59 • g/L was the only VOC detection in the 30 feet bgs sample. Acetone at 96 J • g/L was the only VOC detected in the 40 feet bgs sample. This area is down-gradient of the source identified near Hangar T-811 and the low concentrations of TCE detected were not indicative of a TCE source area.

6.4.2.2 Motor Repair Shop

Also during the 2006 HGL investigation, the Motor Repair Shop area was investigated. TCE concentrations in DPT groundwater samples collected from the Motor Repair Shop area ranged from 26 • g/L at DPT location MCA-GW040 to 370 • g/L at DPT location MCA-GW002. Sample results did not indicate that the Motor Repair Shop is a source of VOC impacts. The TCE impacts in this area are likely downgradient impacts from the plume emanating from the Hangar T-811 area. East of the Motor Repair Shop in DPT location MCA-GW031, TCE was detected at concentrations of 6.8 and 3.0 • g/L in the 15 and 30 feet bgs samples, respectively. At the same location, cis-DCE was detected at a concentration of 0.88J and 1.2 • g/L in the 15 and 30 feet bgs samples, respectively. No VOCs were detected at the 45 feet bgs sample. The low concentration detections of TCE and cis-DCE also appear to be downgradient impacts and are not indicative of a source area.

6.4.2.3 Former IWTP and Aircraft Washrack Area

In the IWTP area, 5.9 µg/L of TCE was detected at 30 feet bgs (MCA-GW064). TCE was not detected in samples taken at 16 feet bgs at upgradient DPT location MCA-GW028 or down-gradient DPT locations MCA-GW016, MCA-GW017 or MCA-GW018.

In the aircraft wash rack area, TCE and cis-DCE were detected at 76 • g/L and 140 • g/L respectively at 30 feet bgs in samples taken from location MCA-GW025. Cis-DCE was detected at 29 • g/L in a 16 foot bgs sample from DPT location MCA-GW027. Other petroleum based VOCs (Xylenes, n-propylbenzene) were detected from DPT sample MCA-GW027, but only methylene chloride (6.4 • g/L at 45 feet bgs) was above the Type 1 RRS concentration.

6.4.2.4 Potential Former Debris Disposal Site

At a potential former debris disposal site located near the southwest corner of Pond #29, DPT sample location MCA-GW014 was installed in the vicinity of boring MVP-5. TCE had been detected in 2002 at a concentration of 6.83 • g/L in a sample taken at 45 feet bgs. TCE was not detected in DPT sample location MCA-GW014.

6.4.2.5 Northern Facility Boundary

Petroleum compounds, including benzene, toluene, ethylbenzene and xylenes were detected in the 30 feet bgs sample from DPT sample location MCA-GW076 located at the northern property boundary of the HAAF facility. The petroleum compound detections are not consistent with the TCE plume under investigation at the MCA Barracks Site and were ultimately designated as separate site HAA-18.

6.4.2.6 Vertical Delineation

In 2005-2006, DPT sample locations MCA-GW022, 42 and 54 were installed to depths of 55, 62 and 78 feet bgs, respectively, to evaluate the vertical extent of groundwater contamination within the TCE groundwater plume. The sample taken at 55 feet bgs contained TCE and cis-DCE at 26 µg/L and 11 µg/L, respectively. TCE was detected at 6.7 • g/L in the sample from 62 feet bgs. With the exception of methylene chloride (estimated detection of 0.44 J • g/L), VOCs were not detected in the sample from 78 feet bgs.

6.4.2.7 Hangar T-811/813

DPT groundwater sampling in the Hangar T-811 area resulted in TCE detections of 290 • g/L at 13 feet bgs and 950 • g/L at 15 feet bgs in samples MCA-GW010 and MCA-GW009 respectively. Also in MCA-GW009, TCE was detected at 490 • g/L in the sample from 30 feet bgs. These detections at Hangar T-811 along with demonstrated TCE disposal in the area and impacts downgradient pointed to this as a likely source area. Other VOCs were detected, but only cis-DCE (74 and 110 • g/L at depths of 15 and 30 feet bgs, respectively) and PCE (5.8 • g/L at a depth of 30 feet bgs) detections were above their respective Type 1 RRS concentrations.

There were minimal detections around Hangar T-813. TCE was detected at 3.3 • g/L at 30 feet bgs in front of Hangar T-813 and at 2.3 • g/L at 45 feet bgs west of Hangar T-813. These detections were likely indicative of side-gradient impacts from the plume emanating from the Hangar T-811 area. Groundwater DPT sample results for 2005 and 2006 are presented in Figure 6-4.

6.4.2.8 Monitor Well Sampling

In March 2006 as part of the HGL site investigation, monitor wells were sampled for analysis of VOCs. Dissolved TCE in groundwater was detected at concentrations of 16,000 µg/L in monitor well HGL-7C and at 3,800 µg/L in monitor well HGL-6C. Both monitor wells are downgradient of Hangar T-811. These results indicated the likely existence of a continuing source. Monitor wells down and side gradient indicated that the extent of impacts had been predominantly delineated. Results for samples taken from monitor wells screened in the shallow and deep zones of the upper aquifer are presented in Figures 6-5 and 6-6 respectively.

6.4.3 Grease Trap Sampling

In 2007, HAAF personnel sampled liquids in a grease trap connected to Hangar T-811. The sampling results indicated that elevated concentrations of TCE, cis-1,2-DCE and VC (65,000, 39,000 and 6,600 • g/L, respectively) were present in the

liquid. HAAF personnel subsequently removed all liquids from the grease trap and partially removed the grease trap on April 12, 2007. The USACE sampled soils in the vicinity of the grease trap as previously described.

6.4.4 2009 through 2011 Groundwater Investigation Results

VOCs in groundwater across the site were evaluated as part of groundwater sampling events conducted by ARCADIS between February and May 2010. A total of 39 monitor wells, including 12 wells installed in 2010, were sampled. Subsequently, 17 monitor wells were installed and sampled in 2011.

Groundwater analytical results from the 2010 and 2011 sampling events are presented based on the intervals that correspond to the shallow and deep zones of the upper aquifer. TCE impacts in the shallow and deep upper aquifer groundwater are shown on Figures 6-5 and 6-6, respectively. The vertical contaminant distribution is presented in Figures 6-7 through 6-16, which are isoconcentration contours along geologic cross-sections for constituents of concern. Monitor well sampling data are included in Tables 5-7 and 5-8.

The CVOC impacts in the shallow zone of the upper aquifer are much less than those detected in the deep zone. In the shallow zone, the highest concentrations of TCE were detected in monitor wells H15-MW-02B, located across Lightning Drive from the northwest side of Hangar T-811, and HGL-7B, located approximately 600 feet downgradient of H15-MW-02B. The samples from these two monitor wells, H15-MW-02B and HGL-7B, contained 68 and 40 ug/L of TCE respectively in February 2010. Monitor well HGL-6B, down and side gradient of H15-MW-02B, contained 17 ug/L of TCE. The other significant detection in shallow groundwater was in the sample from monitor well H15-MW-03B, which contained 120 ug/L of cis-1,2-DCE and 5.0 ug/L of TCE in April 2010. Monitor well H15-MW-03B is located in the area of the washracks and former IWTP. Six monitor wells screened in the shallow zone of the upper aquifer were installed in July and August 2011 to provide additional horizontal delineation of this interval. Results from H15-MW-15B indicate that impacts to the southeast are minimal. The results from two monitor wells (H15-MW-14B and H15-MW-16B) installed upgradient and down gradient of the shallow impacts at the washrack/former IWTP area demonstrated that the shallow impacts are limited to a small area around monitor well H15-MW-03B. Three shallow zone monitor wells were installed in the western impact area. The results from these wells confirmed that impacts in the shallow zone consist of low TCE concentrations that attenuate to non-detect in downgradient areas.

The impacts in the deep zone of the upper aquifer were much higher than those in the shallow zone. In the area where MIP and soil boring data had indicated a source in the Hangar T-811 area, TCE was detected at a concentration of 32,000 ug/L in monitor

well H15-MW-02C in April 2010. H15-MW-02C is the deep zone well located across Lightning Drive from Hangar T-811. Monitor well HGL-7C, which is approximately 600 feet downgradient of H15-MW-02C, contained 16,000 ug/L in February 2010. Also in February 2010, side gradient wells HGL-6C and XX-21 contained 850 ug/L and 230 ug/L, respectively. In the western plume area, five new monitor wells screened in the deep zone of the upper aquifer were installed in 2011. The sampling results from these new wells further refined the horizontal delineation of impacts associated with the downgradient portions of the deep zone plume. Monitor well H15-MW-10C, which was installed approximately 200 feet east of source well H15-MW-02C along Lightning Drive, contained 3,300 ug/L of TCE and 9,700 ug/L of cis-1,2-DCE.

In the former IWTP and washracks area, 2010 groundwater sampling results from deep monitor well H15-MW-01C (2,800 ug/L TCE) indicate the potential for a second source in the area. TCE was detected in upgradient well H15-MW-03C at 79 ug/L. TCE was not detected in H15-MW-07C, which is upgradient of H15-MW-03C. H15-MW-04C, which is 400 ft downgradient of H15-MW-01C, contained 2.2 ug/L of TCE in April 2010. All wells in this area which contained TCE also contained degradation product cis-1,2-DCE as a large percentage of the total CVOCs. Results from this area indicate a lower impact over a smaller area than the impacts associated with the Hangar T-811 area. Three monitor wells screened in the deep zone of the upper aquifer were installed in August 2011 to provide additional horizontal delineation of the washrack/former IWTP area. Results from H15-MW-15C indicate that impacts to the southeast are minimal. The results from two monitor wells (H15-MW-13C and H15-MW-14C) installed upgradient and down gradient of the deep zone impacts at the washrack/former IWTP area demonstrated that the deep impacts are limited to a small area around monitor well H15-MW-01C.

In August 2011, three monitor wells were installed below the deep zone of the upper aquifer to provide vertical delineation in the source areas. Two wells (H15-MW-02D, H15-MW-02E) were installed in the source area near Hangar T-811 and one (H15-MW-20E) was installed in a downgradient source location near HGL-7C. The sample from Monitor Well H15-MW-02D, which is screened from 68 to 73 ft bgs, contained 1.7 ug/L of TCE. A deeper well at the same location, H15-MW-02E, which is screened from 120 to 125 ft bgs, contained 1.1 ug/L of TCE. Monitor well H15-MW-20E, which is located in the downgradient source area and is also screened from 120 to 125 ft bgs, did not contain TCE.

6.5 Surface Water and Sediments

6.5.1 Surface water

As part of the site investigation activities conducted by HGL, surface water samples were collected from the storm water retention pond in October 2005. Six (6) samples were collected from the eastern edges of Pond 29 to provide coverage of the surface water entering the pond from the impacted side (east). No VOCs were detected in surface water above laboratory practical quantitation limits (PQLs). The PQLs were all determined to be below MCLs. Based on these results and the shallow groundwater results, it does not appear groundwater impacts in the area of the pond are affecting surface water quality. Table 5-3d provides a summary of the surface water sampling results. Surface water sampling results are shown on Figure 6-5. Additional information on Pond 29 (Oglethorpe Lake) from an USGS study conducted in 2008 and 2009 is provided in Appendix N.

6.5.2 Sediments

Sediment samples were collected from Pond 29 in October 2005 and February 2006. Nine (9) sediment samples were collected from different portions of the base of the pond. There were no VOCs detected above laboratory method detection limits, with the exception of 2-Butanone, acetone and dichlorodifluoromethane (Freon-12). The maximum detected concentrations of these compounds (0.023 mg/kg, 0.078 mg/kg and 0.011 mg/kg, respectively) were below their respective Type 1 RRS concentrations (200 mg/kg, 40 mg/kg and 100 mg/kg). Based on the sediment sampling results, it does not appear that groundwater impacts in the area of the pond are affecting sediments. Table 5-3e provides a summary of the sediment sampling results. Sediment sampling locations are shown on Figure 4-2.

Original Report – October 2010

7. Conceptual Site Model (CSM)

Based on a compilation of all data collected to date, two source areas for TCE groundwater impacts at the HAA-15 site have been identified: Hangar T-811 area and the former IWTP / washracks area. Other potential source areas previously investigated did not contain concentrations indicative of source mass. Most of the potential sources investigated are downgradient of the two areas identified and impacts are likely attributable to those 2 source areas.

The data confirm that the primary TCE source is located proximate to Hangar T-811. The highest groundwater and soil TCE concentrations were detected in DPT points and in the monitor well across Lightning Drive from Hangar T-811. These concentrations in soil and groundwater are indicative of separate phase source (DNAPL). Soil samples in and beside Hangar T-811 did not contain TCE at comparable concentrations and a significant source below or directly around Hangar T-811 was not located. Hangar T-811 was constructed in late 1940 and early 1941. Historically, TCE used at Hangar T-811 was discharged to a grease trap in front of Hangar T-811. It is not known when the grease trap was originally placed in operation. The grease trap was disconnected, cleaned, and partially removed in 2007. TCE impacts were detected around the grease trap prior to removal but not at concentrations indicative of a source. Other samples under the footprint of the former grease trap location also did not reveal any significant TCE concentrations. Based on TCE impacts directly across Lightning Drive, sufficient TCE mass was released over time to migrate to the deep interval of the upper aquifer. TCE concentrations in shallower intervals are lower and the downward migration route for the movement of TCE was not detected during investigation efforts. Source migration from the Hangar T-811 area appears to be following a preferential migration pathway and the highest concentrations of TCE currently occur in a narrow corridor in the deep zone of the upper aquifer to approximately 600 feet downgradient from the suspected source area. The geometry of the plume and the groundwater flow direction also corroborate that the primary source of the TCE impacts is associated with the area north of Hangar T-811. The down and side gradient extents have been delineated and low concentrations of TCE have been determined to have migrated approximately 1,600 feet downgradient from the source mass identified in the Hangar T-811 area.

Vertical delineation in the source area indicated that the impacts are predominantly held up in the interbedded clays between 35 and 50 ft bgs. These interbedded clays in the deeper interval of the upper aquifer and the clay of the upper Hawthorne confining unit have effectively prevented any significant vertical migration beyond 50 ft bgs. The

two potable wells in the area have open intervals below the Hawthorne confining unit in the upper Floridan Aquifer and are not at risk from the impacts at this site.

Concentrations indicative of a second source of TCE impacts were detected at one location in the area of the wash rack and former IWTP near Building 850, which was built circa 1953. The dates of construction for the wash rack and former IWTP could not be determined. The soil sample, collected at location H15-SB25, contained 1.3 mg/kg TCE at 42-44 feet bgs. A groundwater sample collected at monitor well H15-MW-01C, installed in the same location, contained 2.8 mg/L of TCE. Based on the groundwater flow direction and storm sewer routes, this impact appears to be a separate source. Concentrations indicative of source mass were not detected in the intervals above 40 feet bgs. TCE concentrations in downgradient monitor wells are minimal and the residual source mass may have attenuated since the original release.

Additional chloroethene COCs at the site are cis-DCE and VC, which are generally indicative of degradation. There are many potential biological and abiotic reactions that may degrade TCE in the subsurface, under both aerobic and anaerobic conditions. At this site, dissolved oxygen concentrations consistently at or below 0.5 mg/L and oxidation reduction potentials consistently below -100 mV indicate that the aquifer across the site is anaerobic and reductive and that anaerobic dechlorination processes are resulting in the degradation of the TCE and generation of the cis-DCE and VC.

In the plume emanating from Hangar T-811, a high percentage of the CVOCs in side and down-gradient wells are cis-DCE, a degradation product of TCE. This contrasts with the higher percentage of TCE found in source area wells. Anaerobic dechlorination of TCE depends on many factors including anaerobic conditions, presence of fermentable substrates, and appropriate microbial populations. There is likely insufficient substrate in the source areas for the high TCE concentrations. In the plume associated with the former IWTP and washracks, the magnitude of impacts is much less and a higher percentage of the CVOCs in all monitor wells is cis-DCE. The source and peripheral impacts are attenuating sufficiently to prevent significant downgradient impacts. Very little VC, a dechlorination product of cis-DCE, has been detected at the site. Microorganisms that potentially facilitate dechlorination of cis-DCE and VC to ethene may not be as prevalent as those capable of dechlorination of PCE and TCE to cis-DCE.

The distance of impacts from the suspected source location is about 1,600 feet in the Hangar T-811 area. However, due to the range of possible groundwater velocities determined with slug tests, an estimate of impact timeframe is difficult. As previously noted, the source and peripheral impacts in the wash rack and former IWTP area are apparently attenuating sufficiently to prevent significant downgradient impacts.

Other COCs in groundwater exceeding their Type 1 and 3 RRS at the site consist of methyl tert-butyl ether (MTBE), benzene, 1,1-dichloroethene; and isopropylbenzene. MTBE was an isolated detection of 7.4 µg/L in only one location in shallow groundwater. 1,1-DCE was detected at low concentrations in some deep interval wells and may be indicative of alternative TCE degradation pathways. Benzene was detected in two deep interval monitor wells at 1.1 µg/L. Other petroleum hydrocarbons including isopropylbenzene were detected at very low concentrations, mostly in the wash rack and former IWTP area.

Surface soil in the Old Hospital Area is impacted with Lead and Mercury above Type 1 RRS. Although a clear source of the lead and mercury impacts has not been identified, the impacts are in the vicinity of the boiler room that provided steam heat to the old hospital. Coal was reportedly used to fuel the boilers and may have been the source of the soil impacts. It is unknown how long the boiler room was in operation or how long coal was used as the fuel source. Other surface soil sample results in the area were much lower than the maximum lead concentration. The impacts are apparently limited to a small area and it is unlikely that the maximum lead concentration is representative of soil conditions across the site.

Revision 1 – October 2011
Original Report – October 2010

8. Human Health Risk Assessment

The human health risk assessment for HAA-15 evaluated the potential risks to human health through the derivation of RRS for each of the detected constituents in soil and groundwater and an evaluation of the potential exposure to constituents detected in surface water and sediment and the migration of volatile constituents into buildings at the site.

This section is organized as follows:

- Potential receptors
- Exposure assessment
- Toxicity assessment
- Risk reduction standards
- Vapor intrusion evaluation
- Summary and conclusions

8.1 Potential Receptors

The site area houses multiple administrative and industrial facilities and barracks. Military and civilian workers are present at the site during the work week. The barracks provide housing to transient military personnel. Family housing is not provided at the site. In the event that construction occurs at the site, construction workers could contact impacted soil.

Like many military bases, access to the site is restricted. Thus, trespassers are not expected at the site under current conditions. Similarly, it is unlikely that the site will be used for permanent, residential housing. HAA has a master plan (U.S. Army 2006) and it indicates that the nearest family housing is one mile to the southeast of this site.

Upper aquifer groundwater at the site is not used as a potable water supply. The deeper Floridan aquifer is used as the potable water supply. Two Floridan Aquifer potable water wells are located in the HAA-15 area. Well HAA Well #2 is hydrogeologically upgradient of the site while well HAA Well #1 is downgradient of the impacts. The wells may also be used for non-potable purposes. The wells are not connected hydraulically to the shallow impacted interval.

The depth to water is approximately 2 to 10 feet below ground surface. Construction workers may contact the groundwater during construction activities. Additionally, volatile organics present in the groundwater and soil may migrate into buildings at the site.

8.2 Exposure Assessment

In accordance with Georgia EPD guidance, default criteria for Types 1 and 3 RRS were identified. For Types 2 and 4 RRS, exposure factors from GAEPD guidance (GAEPD 1999) or USEPA guidance (USEPA 1997a) were used. These RRS values are therefore considered to be conservative (i.e., protective of human health) in that exposure to the identified and/or calculated concentrations is considered unlikely to cause significant carcinogenic or noncarcinogenic effects. Thus, if the soil or groundwater concentrations are less than the conservative RRS, then additional exposure scenarios will not be evaluated.

8.2.1 Soil Exposure

In accordance with GAEPD guidance, the Types 2 and 4 RRS for carcinogenic effects from potential exposure to soil are typically calculated using Equation 6 from Part B of the Risk Assessment Guidance for Superfund (RAGS) Part B (USEPA 1991). The Types 2 and 4 RRS for noncarcinogenic effects from potential exposure to soil are typically calculated using Equation 7 from RAGS Part B. Table 8-1 provides the equations used to derive the soil RRS.

The exposure factors used to calculate the Type 2 (i.e., residential) RRS include a body weight of 70 kilograms (kg) for an adult and 15 kg for a child, 30 years of exposure duration for an adult and six years for a child, a 114 milligram per day (mg/day) soil intake rate for an adult and 200 mg/day for a child, and an exposure period of 350 days per year.

The exposure factors used to calculate Type 4 (i.e., commercial) RRS are based on industrial exposure and include a body weight of 70 kg, 25 years of exposure duration, a 50 mg/day soil intake rate, and an exposure period of 250 days per year. Exposure factors for both Types 2 and 4 RRS were obtained from GAEPD guidance (GAEPD 1999; USEPA 1997a).

8.2.2 Groundwater Exposure

Types 2 and 4 RRS for carcinogenic and noncarcinogenic effects from potential exposure to groundwater were calculated using Equations 1 and 2, respectively, from RAGS Part B (USEPA, 1991). The lowest criterion from Equation 1 or 2 was used as the Types 2 and 4 RRS. The equations and parameter values used to calculate the RRS for exposure to groundwater are presented in Table 8-2.

The exposure factors used to calculate the Type 2 (i.e., residential) RRS include a body weight of 70 kg for an adult and 15 kg for a child, 30 years of exposure duration for an adult and six years for a child, a 2-liter-per-day (L/day) water intake rate for an adult and 1 L/day for a child, and an exposure period of 350 days per year.

The exposure factors used to calculate Type 4 (i.e., commercial) RRS are based on industrial exposure and include a body weight of 70 kg, 25 years of exposure duration, a 1-L/day water intake rate, and an exposure period of 250 days per year. Exposure factors for both Types 2 and 4 RRS were obtained from GAEPD guidance (GAEPD 1999; USEPA 1997a).

8.3 Toxicity Assessment

The toxicity values used to calculate Type 2 and Type 4 RRS (i.e., cancer slope factors [CSF] and reference doses [RFD]) were obtained from the USEPA Regional Screening Level (RSL) (USEPA 2010b) table. The values included in the RSL table were verified in the primary sources. The toxicity values are presented in Table 8-3.

8.4 Risk Reduction Standards

The primary objective of the risk evaluation was to compile the available analytical data on the regulated substances that were detected in soil and groundwater and to compare the data to the RRS. The Type 1 RRS was identified, and residential exposure factors were used to calculate the Type 2 RRS in soil and groundwater. The Type 3 RRS also was identified for soil and groundwater, and industrial exposure factors were used to calculate the Type 4 RRS for soil and groundwater. The physical and chemical properties used to derive the soil RRS are provided in Table 8-4.

In addition, the potential for the detected soil constituents to leach from soil to groundwater was evaluated by calculating soil screening levels (SSLs) protective of groundwater using USEPA methodology (1996, 2002b). For these calculations, the groundwater RRS were used as the groundwater criteria.

8.4.1 Soil Risk Reduction Standards

The Type 1 RRS (default residential criteria) for soil were determined using the definition in Rule 391-3-19-.07(6)(c) of GAEPD guidance (1999). The concentrations of compounds detected in soil above the water table were compared to the Type 1 RRS. The Type 1 RRS were determined as follows. If a criterion was available in Table 2 of Appendix III of the guidance, then that RRS was used. Otherwise, the largest of the Appendix I or 100 times the Type 1 groundwater criteria were compared to the calculated Type 1 carcinogenic and noncarcinogenic criteria, and the least of these values was selected as the Type 1 RRS. The default criteria were obtained from the draft revisions to the RRS. Table 8-5 includes the maximum detected constituent concentration above the water table, the location of the maximum, and the Type 1 soil RRS. Only lead and mercury exceed their Type 1 RRS.

The equations used to calculate the Type 2 RRS for soil are presented in Table 8-1. The Type 2 carcinogenic and noncarcinogenic calculated criteria are presented in

Table 8-6 for adult residential receptors and Table 8-7 for child residential receptors. In addition, for each of the constituents evaluated, the RRS was the lower of the direct contact soil RRS calculated in Tables 6 and 7 and the SSL which is protective of groundwater and was derived based on the groundwater Type 1 RRS (see Table 8-10) or the groundwater Type 2 RRS (Table 8-11). The comparison of detected concentrations and the source of the Type 2 RRS is presented in Table 8-5. The following constituents exceed their Type 2 RRS: lead and mercury.

The Type 3 RRS were derived in a manner similar to those of the Type 1 standards with the exception that industrial worker assumptions were used to derive the default direct contact RRS. The Type 3 RRS are presented in Table 8-8 together with the maximum soil concentration detected above the water table. As seen in the table, only lead exceeds its Type 3 soil RRS.

The Type 4 RRS was derived by selecting the lower of the Type 4 direct contact RRS (Table 8-9) and the Type 4 SSL (Table 8-12). As seen in the table, one constituent, lead, was detected at a maximum concentration exceeding its Type 4 RRS.

8.4.2 Groundwater Risk Reduction Standards

The calculation of RRS for groundwater included the integration of the exposure and toxicity assessments. Information on potential exposures and toxicity values was combined to generate the Types 2 and 4 RRS. These criteria, as well as the default criteria for Types 1 and 3 RRS, were then compared to the maximum detected concentrations of the constituents detected in the shallow groundwater at the site.

8.4.2.1 Residential Risk Reduction Standards

Residential RRS were calculated for groundwater as described above. The following sections further describe the Types 1 and 2 RRS.

- Type 1 RRS

  The Type 1 RRS (default residential criteria) for groundwater are defined in Rule 391-3-19-07(6)(b) (GAEPD 1999) as the concentrations listed in Table 1 of Appendix III (if available). The comparison of maximum detected groundwater concentrations to the Type 1 RRS and the source of the Type 1 RRS are presented in Table 8-13 for the shallow zone of the surficial aquifer groundwater. Four constituents were detected at concentrations greater than the Type 1 RRS for groundwater: cis-DCE; isopropylbenzene; MTBE; and TCE.

  Table 8-14 presents the comparison of the maximum deeper zone of the surficial aquifer groundwater concentrations to the Types 1 and 2 RRS. As seen in the table, seven constituents were detected at concentrations greater than the Type 1

RRS: benzene; 1,1-dichloroethene; cis-DCE; isopropylbenzene; methylene chloride; TCE; and VC.

- Type 2 RRS

  The equations and input parameters used to calculate the Type 2 RRS for the constituents of concern (COC) in groundwater are presented in Table 8-2. Calculations of the Type 2 carcinogenic and noncarcinogenic criteria for groundwater are included in Table 8-15 for adults and in Table 8-16 for children. For each detected constituent, the least of the carcinogenic and noncarcinogenic criteria was then selected as the criterion for each receptor (adults and children), and the lower of the adult or child criterion was selected as the Type 2 RRS. A comparison of the maximum detected concentrations with the Type 2 RRS, along with the source of the Type 2 RRS, is included in Table 8-13 for the shallow zone groundwater and Table 8-14 for the deep zone groundwater. Only TCE was detected in shallow groundwater at a maximum concentration exceeding the Type 2 RRS (Table 13). Four constituents were detected in the deeper zone of the surficial aquifer at concentrations greater than the Type 2 RRS: benzene; cis-DCE; TCE; and VC (see Table 8-14).

8.4.2.2 Nonresidential Risk Reduction Standards

Nonresidential RRS were calculated for groundwater as previously described in this risk evaluation. The following sections further describe the Types 3 and 4 RRS.

- Type 3 RRS

  The Type 3 RRS for groundwater are identical to the Type 1 RRS used for the residential scenario, according to GAEPD guidance (GAEPD 1999). The comparison of maximum detected concentrations to the Type 3 RRS for groundwater is presented in Table 8-17 for shallow groundwater. This comparison shows that four constituents were detected at concentrations greater than the Type 3 RRS for groundwater: cis-DCE; isopropylbenzene; MTBE; and TCE.

  Table 8-18 presents the comparison of the maximum detected deep zone groundwater constituents to the Type 3 RRS. Seven constituents were detected at concentrations greater than the Type 3 RRS: benzene; 1,1-dichloroethene; cis-DCE; isopropylbenzene; methylene chloride; TCE; and VC.

- Type 4 RRS

The equations and input parameters used to calculate a Type 4 RRS for the groundwater are presented in Table 8-2. Calculations of the Type 4 carcinogenic and noncarcinogenic criteria for groundwater are included in Table 8-19. For each

constituent, the lesser of these two criteria was selected as the Type 4 RRS for groundwater. The comparison of maximum detected concentrations to Type 4 RRS for shallow groundwater presented in Table 8-17 shows that only TCE exceeds the Type 4 RRS for groundwater. The comparison of the deeper zone of the surficial aquifer groundwater to the Type 4 RRS is presented in Table 8-18. Three constituents exceeded the Type 4 RRS: cis-DCE; TCE; and VC.

8.4.3 Sediment

Four constituents were detected in sediments: acetone, dichlorodifluoromethane, methyl ethyl ketone, and toluene. The maximum detected concentrations were compared to the soil Type 1 RRS, as seen in Table 8-20. All of the detected concentrations were well below the Type 1 RRS. Therefore, exposure to sediments is not expected to pose an unacceptable risk to receptors as the site.

8.4.4 Surface Water

Methylene chloride was the only constituent detected in surface water at the site. As seen in Table 8-21, the maximum detected concentration was compared to the groundwater Type 1 RRS. The RRS is based on the assumption that the surface water would be used as a potable water supply. The maximum concentration is less than the Type 1 RRS. Therefore, exposure to surface water is not expected to pose an unacceptable risk to receptors at the site.

8.5 Vapor Intrusion Evaluation

Volatile organic compounds were detected in soil and groundwater at the site. These constituents have the potential to migrate from the subsurface into indoor air of buildings at the site. This pathway was evaluated using the 2010 groundwater data and all of the soil data.

The USEPA version of the Johnson and Ettinger (J&E) vapor intrusion model is a conservative model that can be used to evaluate the potential for vapor intrusion, to estimate the potential associated risk, and to calculate risk-based medium-specific concentrations, including both industrial and residential settings. The USEPA vapor intrusion model was run using the maximum concentrations of each detected volatile organic constituent in soil and groundwater on site.

Thus, the soil constituents evaluated were: acetone; 1,2-dichloroethane; 1,2-dichloropropane; ethylbenzene; isopropylbenzene; toluene; 1,1,2-trichloroethane; TCE; m,p-xylene; o-xylene; acenaphthylene; anthracene; naphthalene; and phenanthrene.

The groundwater constituents evaluated for the vapor intrusion pathway were: acetone; benzene; carbon disulfide; chloroform; chloromethane; 1,2-dichlorobenzene; 1,1-

dichloroethene; cis-DCE; trans-1,2-dichloroethene; ethylbenzene; 2-hexanone; isopropylbenzene; MTBE; PCE; toluene; TCE; VC; and total xylenes.

8.5.1 Vapor Intrusion Modeling

The maximum detected concentrations of COCs in groundwater and soil were carried through to the second phase of the evaluation, use of the USEPA advanced level J&E model for vapor intrusion. Modeling was performed for three different receptors: commercial worker, residential adult, and residential child. The use of the maximum concentration presents a conservative estimate of risk and hazard because it is unlikely that the concentrations migrating into a building will be only at the maximum concentration. An average concentration would be more representative of what would be contributing to the concentrations of vapors migrating into a building.

The following assumptions were used to evaluate potential exposures of both residential receptors and site workers. Although military personnel are at this site for a short time, the standard default exposure assumptions for residential receptors, including children, were used in this assessment.

- The USEPA (2004) default values for building size, 1,000,000 square centimeters (cm^2) or 1,076 square feet was used for the building size.
- A building air exchange rate or ventilation rate of 0.48 exchanges per hour was used in the evaluation. This value was selected based on information provided by USEPA (2004). Specifically, air exchange rates distributions vary depending on season and climatic region. Therefore, a ventilation rate specific for the climatic area was selected. USEPA (2004) reported that "for the winter season and warmest climatic area (Region 4, southern California, Texas), the 10^{th}, 50^{th}, and 90^{th} percentile values were 0.24, 0.48 and 1.13 air exchanges per hour, respectively. Although building air exchange rates would be higher during the summer months, vapor intrusion during winter months (when house depressurization is expected to be most significant) would be of greatest concern" (USEPA 2004). Therefore, a ventilation rate of 0.48 corresponding to the 50^{th} percentile in the region was used in this assessment.
- The foundation thickness was set at 10 centimeter (cm) and a ceiling height of 8 feet (244 cm) for the resident and 12 feet (366 cm) for the site worker. Other default assumptions were used in the model (USEPA 2004);
- The soil collected above the first water bearing zone were used in the evaluation. The soil from depths below 8 feet were not used in the model because the model does not allow for volatilization from soil between two water bearing zones or from saturated soil. Thus, the depth of soil used in the assessment was 5 feet below

grade. The depth to shallow groundwater used in the assessment was 8 feet (241.92 cm) below grade. Since groundwater is encountered at 8 feet or 241.92 cm, this was the depth entered as the depth to the bottom of contamination;

§ An average groundwater temperature of 19.5 °C was estimated based on USEPA (2004) guidance;

§ A soil type of sand was selected conservatively to represent the soils, although lenses of clay and silt were observed during field investigations at the site;

§ A soil-building pressure differential (delta P) of 40 grams per centimeter per square second ($g/cm\text{-}s^2$) was used (USEPA 2004);

§ Adult body weight of 70 kg (USEPA 1991);

§ Exposure frequency of 250 days/year (5 workdays/week for 50 weeks/year) for a site worker and 350 days/year for a hypothetical future resident (USEPA 1991);

§ Exposure duration of 25 years for a site worker and 30 years for a hypothetical future site resident (USEPA 1991).

8.5.2 Soil

The soil data above the water table was used to estimate indoor air concentrations. The soil samples used in the evaluation were from 2005 for the volatile organic compounds and 2006 for the semi-volatile organic compounds. All of the more recent soil data were collected below the shallow water bearing zone. Table 8-22 presents the input parameters for residential exposure; Table 8-23 provides the results of the intermediate calculations, and Table 8-24 presents the results of the residential calculations. The corresponding tables for the site worker are presented in Tables 8-25 through 8-27. The results of the vapor intrusion modeling are as follows:

- Adult resident: Excess lifetime cancer risk (ELCR) = 7×10^{-6} and a noncancer hazard index (HI) = 0.7.
- Site Worker: ELCR = 1×10^{-6} and a HI = 0.1.

The calculated risks and hazards for soil vapor intrusion are below the GAEPD HSRA benchmark of 1×10^{-5} and a noncancer hazard of 1. Therefore, it is unlikely that the soil is a significant source of vapors into buildings at the site.

8.5.3 Shallow Groundwater

The shallow groundwater was used to estimate indoor air concentrations. Table 8-28 presents the input parameters for residential exposure; Table 8-29 provides the results of the intermediate calculations, and Table 8-30 presents the results of the residential

calculations. The corresponding tables for the site worker are presented in Tables 8-31 through 8-33. The results of the vapor intrusion modeling are as follows:

- Adult resident: ELCR = 2×10^{-5} and a noncancer HI = 5.
- Site Worker: ELCR = 3×10^{-6} and a noncancer HI = 0.8.

The ELCR and the HI for the site worker was less than the GAEPD HSRA benchmark of 1×10^{-5} or 1, respectively. The ELCR for the hypothetical resident of 2×10^{-5}, was slightly greater than the GAEPD HSRA benchmark due to the presence of TCE in the groundwater and the September 2011 revised toxicity values. The ELCR is within the USEPA target risk range. The noncancer HI was above the benchmark of 1 for the hypothetical resident. The risk driver was trichloroethene; none of the other constituents had noncancer HQs greater than 1. The calculations were based on the maximum detected shallow groundwater concentrations from 2010. The average TCE concentration for the shallow groundwater is approximately equal to 16 µg/L. If this concentration were used in the vapor migration model, the ELCR and HI would be less than and equal to the GAEPD HSRA benchmarks of 1×10^{-5} or 1, respectively. Based on these results, it is unlikely that the vapor intrusion pathway will pose significant risks to human health.

8.6 Summary and Conclusions for Human Health Risk Assessment

This human health risk assessment for HAA-15 (MCA Barracks Site) evaluated the potential risks to human health by comparing the maximum detected soil and groundwater constituents to the Types 1 through 4 RRS. The potential exposure to constituents detected in surface water and sediment also was evaluated by comparing the maximum detected concentrations to the Type 1 RRS. Finally, the vapor migration from soil and groundwater into buildings at the site was evaluated.

The soil data collected above the shallow groundwater were compared to the RRS. Lead and mercury exceeded the Type 1 and Type 2 standards. Only lead exceeded the Type 3 and Type 4 standards. Other surface soil sample results in the area were much lower than the maximum lead concentration. As a result, it is unlikely that maximum lead concentration is representative of soil conditions across the site.

The shallow groundwater data were compared to the Types 1 through 4 RRS. Four constituents exceeded the Type 1 and Type 3 groundwater RRS: cis-DCE; isopropylbenzene; MTBE; and TCE. Only TCE exceeded the Type 2 and Type 4 RRS for the shallow groundwater.

The deep groundwater data were compared to the RRS. Seven constituents exceeded their Type 1 and Type 3 RRS: benzene; 1,1-dichloroethene; cis-DCE; isopropylbenzene; methylene chloride; TCE; and VC. Four constituents were detected

in the deep groundwater at concentrations greater than the Type 2 RRS: benzene; cis-DCE; TCE; and VC. Three constituents exceeded their Type 4 RRS: cis-DCE; TCE; and VC.

The soil and shallow groundwater were evaluated for the vapor intrusion pathway. The maximum detected medium-specific concentrations were used in the calculations as a conservative measure. The results indicated that the risks were less than the GAEPD HSRA benchmark of 1×10^{-5} for all receptors except residents exposed to vapors migrating from groundwater. For that receptor, the calculated risk was 1×10^{-5}, just slightly greater than the GAEPD benchmark and well within the USEPA risk range. TCE was the risk driver. The noncancer hazards were less than the benchmark of 1, again with the exception of the resident exposed to vapors migrating from groundwater where the hazard was calculated to be 5, due to the presence of TCE. These risks and hazards were calculated using the updated cancer slope factors and reference doses for TCE that were released on September 28, 2011. If the average TCE concentration were used in the vapor migration model, the ELCR and HI would be less than and equal to the GAEPD HSRA benchmarks of 1×10^{-5} or 1, respectively.

Revision 1 – October 2011
Original Report – October 2010

9. Ecological Health

This section presents the Ecological Risk Assessment (ERA) that was conducted for the site pursuant to GAEPD CSR guidance and HSRA regulations. The objective of the ERA is to evaluate whether ecological receptors may be adversely affected by exposure to site-related constituents. This ERA is intended to provide input for risk management decision-making for the site, while maintaining a conservative approach protective of wildlife populations and communities.

9.1 Introduction

As previously mentioned, the site is developed with industrial, commercial, and temporary residential, administrative, maintenance, and barracks facilities. The Site also includes an active air field and green space. The green space on the Site is comprised of a landscaped, maintained area of oak trees and a 10-acre man made storm water pond (Pond 29 /Oglethorpe Lake) located at the western portion of the site which has been designated for recreational uses by the National Recreation Lake Study Commission (1999). The green space at the site provides terrestrial and aquatic habitat for ecological receptors.

Groundwater at the site occurs in the surficial aquifer at depths ranging from 2 to 15 feet bgs and the deeper Floridan aquifer. The surficial aquifer is separated from the Floridan Aquifer by a thick confining unit of clay. Recharge to the surficial aquifer occurs through precipitation on land directly above the aquifer. The surficial aquifer is used for lawn irrigation and heat pumps (USACE 2004). Therefore, the ERA assessed the effect of impacts to soil, sediment, surface water and groundwater at the site to ecological receptors. Groundwater from the surficial aquifer was assessed in the ERA because a) it could potentially discharge to surface water and b) it is used for irrigation

As recommended by GAEPD regulations for a CSR under the HSRA regulations, the ERA was conducted in accordance with USEPA guidance. As such, the ERA is comprised of a screening-level ERA (SLERA) followed by a baseline ERA (BERA) (USEPA 1997). Typically, the SLERA evaluates the potential risk to terrestrial and aquatic ecological receptors exposed to all detected constituents in surface soil, sediment, surface water, and shallow groundwater discharging to surface water. The SLERA provides a conservative estimate of potential ecological risks and compensates for uncertainty by incorporating numerous conservative assumptions. The purpose of the SLERA is to determine whether there is a high probability that there are no ecologically significant risks; otherwise, a BERA is warranted (USEPA 1997, 2000a, 2001a). If a BERA is indicated, the information developed in the SLERA is used to help focus the BERA. The BERA is more complex than the SLERA and uses more realistic

and site-specific information about potential exposures and effects in order to evaluate potential ecological risks.

The approach used to assess ecological risks associated with the site is based on the USEPA eight-step process (USEPA 1997, 2000a, 2001a), as summarized in Figure 9-1. An expanded view of the USEPA eight-step process is provided in Figure 9-2. As illustrated on Figure 9-2, the USEPA paradigm divides Step 3 into two parts, Step 3a and Step 3b (USEPA 2000a). Step 3a allows for a more refined analysis of available information, while Steps 3b and beyond focus on further evaluation(s) for only those receptors, media, and constituents that are identified in previous steps. USEPA (2000a) states, "for the majority of sites, ERA activities will cease after the completion of Step 3a." The details of each step and how they relate to the site ERA are described in the sections below.

The ERA process culminates in clearly defined scientific management decision points (SMDPs). The SMDPs represent critical steps where risk management decision-making occurs. Generally, the following types of decisions are considered at the SMDPs:

1. Whether the available information is adequate to conclude that ecological risks (if any) are negligible and, therefore, there is no need for further action on the basis of ecological risk.
2. Whether the available information is inadequate to make a decision at this point and the ecological risk assessment process should continue.
3. Whether the available information indicates a potential for adverse ecological effects and a more thorough assessment or remediation is warranted.

The remainder of the ERA is organized as follows:

- Ecological Risk Assessment Data Set Evaluation –discusses the dataset in the ERA used for each medium;
- Screening Level Ecological Risk Assessment –discusses the steps taken in the SLERA and identifies results that would indicate the need for a more refined BERA; and
- Baseline Ecological Risk Assessment–discusses the steps taken in the BERA.

9.2 Ecological Risk Assessment Dataset Evaluation

This section discusses the methods used in compiling and summarizing the ecological risk assessment datasets.

9.2.1 Data Evaluation

Data generated from the site characterization activities were evaluated for use in the ERA. The data were evaluated following USEPA guidance for data usability (USEPA 1992). The following was considered in that assessment: data quality, sample type, sample date, data qualifications, and the vertical and spatial distribution of the data.

9.2.1.1 Data Quality

Data from all site investigation activities at the site were considered for inclusion in the ERA.

9.2.1.2 Sample and Result Type

The following criteria were employed to determine whether a particular sample result is usable for risk assessment purposes

- All soil sample types (hand auger or continuous core, direct-push, Geoprobe®) were considered usable for the ERA.
- For duplicate samples, the result to be used in the ERA was selected as follows: (1) if both samples reported positive detects, the higher measured analytical concentration was used, (2) if only one result was a positive detect, that concentration was used, or (3) if both samples reported non-detects, the lower sample quantitative limit (SQL) was used as the proxy concentration. The lower SQL was used because it is not reasonable to use the higher SQL when the duplicate analysis for the sample indicated that the constituent was not present at the lower SQL.

9.2.1.3 Sample Date

All soil, sediment, and surface water were included in the ERA datasets regardless of age. Since recent groundwater data is available, groundwater data from the most recent sampling events only were included.

9.2.1.4 Evaluation of Data Qualifiers

Laboratory-qualified data with the following data qualifiers were retained within the dataset:

- J – concentration is estimated
- U – analyte was not detected at the reporting limit.

9.2.1.5 Evaluation of Vertical and Spatial Data Distribution

Surface soil data from the green space at the site was gathered to represent the ecological risk assessment dataset (Figure 9-3). The surface soil risk assessment dataset includes only those samples collected from the ground surface to a depth of

one foot bgs, consistent with the preferences of GAEPD. Soil samples collected from depths greater than one foot bgs are not considered because wildlife typically inhabit only the uppermost portion of the soil column (USEPA 1993a,b).

Groundwater data from wells in the near vicinity of the pond screened in the surficial aquifer were gathered to represent the groundwater ecological risk assessment dataset.

9.2.2 Risk Assessment Datasets

The ecological risk assessment datasets for surface soil (Table 9-1), sediment (Table 9-2), surface water (Table 9-3), and groundwater (Table 9-4) were compiled and evaluated using the methods described above. The risk assessment datasets were then summarized to identify the following descriptive statistics: the number of detects, the number of samples, the frequency of detection (FOD), the minimum and maximum detected concentrations, the location of maximum detected concentration, and the minimum and maximum reporting limits. A brief summary of the dataset for each medium is discussed below.

9.2.2.1 Surface Soil

The surface soil dataset includes samples collected from 2003 to 2006. A total of 9 samples are included in the dataset. Analytical results for these surface soil samples are presented in Table 9-1 and summarized in Table 9-5. All surface soil sample locations are depicted on Figure 9-3.

Acetone was the only VOC detected in soil. Several poly-aromatic hydrocarbons (PAHs) and metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) were detected in surface soil.

9.2.2.2 Sediment

The sediment dataset includes samples collected in October 2005 and February 2006. A total of 9 sediment samples were collected from 9 locations at the site. Analytical results for these sediment samples are presented in Table 9-2 and summarized in Table 9-6. All sediment sample locations are depicted on Figure 9-3.

Acetone and 2-butanone (methyl ethyl ketone) were detected in several samples. Dichlorodifluoromethane was detected in two samples and toluene was detected in only one sample.

9.2.2.3 Surface Water

The surface water dataset includes samples collected from 6 locations in October 2005. Analytical results for these surface water samples are presented in Table 9-3

and summarized in Table 9-7. All surface water sample locations are depicted on Figure 9-3.

The only constituent detected in surface water at the site was methylene chloride and it was detected in one sample and not detected in the duplicate.

9.2.2.4 Groundwater

Based on available hydrogeological information, the groundwater dataset includes samples collected from wells within the surficial aquifer. The surficial aquifer is the only potential discharge zone of groundwater to surface water. The groundwater dataset includes 8 samples collected in February 2010 (Table 9-4). Analytical results for these groundwater samples are presented in Table 9-4 and summarized in Table 9-8. All shallow groundwater sample locations are depicted on Figure 9-3. The constituents detected in groundwater were acetone, cis-DCE, MTBE, and TCE.

9.3 Screening Level Ecological Risk Assessment

This SLERA conservatively estimates potential risks that may affect ecological receptors, including terrestrial and aquatic organisms. The SLERA typically compensates for uncertainty in a precautionary manner by incorporating numerous conservative assumptions. The outcome of the SLERA is the conclusion that either there is a high probability that ecologically significant risks are not posed to receptors, or further investigation in the form of a BERA is warranted. Consistent with USEPA (1997) guidance, the SLERA for the site is comprised of the following steps:

§ Section 9.3.1 – Step 1: Screening-Level Problem Formation

§ Section 9.3.2 – Step 1 continued: Screening Level Ecological Effects Evaluation

§ Section 9.3.3 – Step 2: Screening Level Exposure Estimate and Risk Calculation

§ Section 9.3.4 – Scientific Management Decision Point

9.3.1 Step 1: Screening-Level Problem Formulation

Step 1 of the SLERA consists of both a screening-level problem formulation and a screening-level ecological effects evaluation. The screening-level problem formulation presents background information on site characterization, receptors, ecosystem characteristics, as well as information on the sources and effects of the stressors (USEPA 1998). This information is used to develop a CSM that illustrates the potential relationships between stressors, pathways, and receptors such as:

- Environmental Setting
- Identification of Constituents Detected
- Description of Constituent Fate and Transport Pathways

- Description of Constituent Mechanisms of Ecotoxicity
- Description of Potentially Exposed Receptors
- Identification of Potentially Complete Exposure Pathways
- Selection of Generic Assessment and Measurement Endpoints

9.3.1.1 Environmental Setting

This section describes the ecological habitat at the site. As previously mentioned, the green space on the site is comprised of a landscaped, maintained area of oak trees and a 10-acre man made storm water pond (Pond 29 /Oglethorpe Lake) located at the western portion of the site which has been designated for recreational uses by the National Recreation Lake Study Commission (1999). The green space at the site provides terrestrial and aquatic habitat for ecological receptors.

Pond 29/Oglethorpe Lake was constructed in 1985 to catch storm water. The pond is 1,200 feet long and 400 feet wide thus covering approximately 10 acres. The maximum depth is 9 feet (Find Lakes 2010, USGS 2010). The pond is of earthen construction and thus has a soil bottom and is contained by an earthen dam. According to the USGS study of ponds at HAAF (USGS, 2010), the pond captures runoff from Hickam Boulevard, Douglas Street, and Strachan Avenue. The report explains that storm water enters the pond along the eastern shore from a ditch perpendicular to Douglas Street, and after periods of prolonged, heavy rainfall, water discharges from the pond through an overflow culvert into a ditch along the western shore, downstream from the dam. The report also mentions that numerous tree stumps are present along the bottom of the pond and that the volume of water stored and its surface area varies as the pond stage changes.

The pond is maintained and the surrounding area is mowed within a few feet of the edge of the pond. The Lake is stocked with: Largemouth Bass, Bluegill Sunfish, Redear Sunfish, Channel Catfish. It is also stocked with Grass Carp for aquatic weed control but it is prohibited from harvesting (Find Lakes, 2010). Further, in the photo of the pond published in the USGS report for HAAF lakes, Canadian Geese (*Branta canadensis*) can be seen utilizing the pond (USGS, 2001).

9.3.1.2 Identification of Constituents Detected

Surface soil, sediment, surface water, and groundwater are the environmental media associated with the site with which contact by ecological receptors is possible. Groundwater collected within the surficial aquifer is evaluated in this ecological assessment because the potential exists for groundwater to discharge into surface water or to seep to the surface soil; as a result, ecological receptors could become

exposed to constituents in groundwater when groundwater seeps into surface water. A summary of data for each medium is presented in Tables 9-5 through 9-8.

9.3.1.3 Description of Constituent Fate and Transport Pathways

Knowledge about the potential constituent fate and transport pathways is vital to understanding which constituents and receptors are associated with complete exposure pathways. This is because a constituent may reach an ecological receptor in a variety of ways. In addition, the pathway and route of exposure may have a strong influence on the ecological effect of a constituent. This information is used in the development of a CSM. Constituent fate and transport pathways for the site are illustrated on the CSM (Figure 9-4).

9.3.1.4 Description of Constituent Mechanisms of Ecotoxicity

The mechanisms of ecotoxicity for constituents vary depending on a wide range of factors, such as constituent concentrations, the receptor species exposed, the exposure route (e.g., ingestion or direct contact), and physical factors (e.g., pH, temperature, oxygen levels, water hardness). Some of the effects that could be observed in wildlife are mortality, reduced reproductive ability, decreased fertility, decreased offspring survival, alteration of immune and behavioral function, decreased hatching success of eggs/larvae, and retarded growth (Sample et al. 1996, USEPA 2001b). The remainder of this subsection discusses mechanisms of ecotoxicity for VOCs, PAHs, and metals, which are the classes of compounds detected at the site. These descriptions of constituent mechanisms of toxicity are presented without consideration of constituent concentrations, as the descriptions are intended to convey an understanding of possible effects, rather than to describe the concentrations at which these effects might occur.

Volatile Organic Compounds – VOCs tend to attenuate rapidly in surface soil, sediment surface water, and groundwater due to their inherent volatility. Although the effects of VOCs on ecological receptors are not well-understood, there have been extensive inhalation studies of the effects of VOCs under laboratory conditions. Inhaled volatile organics are typically metabolized in the body (often the liver), which may cause liver damage (depending on the organism) or the release of more toxic secondary metabolites. The VOCs or their metabolites may also cause neurological damage, and many are mutagenic or carcinogenic. Additionally, some VOCs are fetotoxic and/or teratogenic (USEPA 2005; Sample et al. 1996).

Polynuclear Aromatic Hydrocarbons (PAHs) – PAHs (such as benzo(a)pyrene, chrysene, fluoranthene, and pyrene) are often released as a result of human activities, such as the incomplete combustion of fossil fuels or other organic materials. Some of

these compounds are persistent and are known to be mammalian carcinogens, though the ecological effects of PAHs that are not carcinogenic are not well understood. Primary non-point sources of PAHs to the environment are aerial fallout (or rainout), road runoff (from the wear and leaching of asphalt, tire wear, vehicle exhaust, and dripping vehicle fluids), and combined storm sewer runoff (domestic sewage contains some PAHs). Most PAHs are sorbed to solid particles in the environment, which radically reduces the bioavailability and toxicity of the sorbed PAHs. PAHs may be transformed by biotic and abiotic processes in the environment, and may bioaccumulate. PAHs have been shown to cause changes in liver enzymes and to perturb cell membranes but, in general, are not viewed as acutely toxic. Sublethal effects attributed to PAHs in aquatic animals include reduced reproductive ability and fertility, developmental abnormalities, delayed or retarded maturation, histological changes, and carcinogenesis (Neff, 1985).

Inorganics – Many trace inorganics (e.g., cobalt, copper, chromium, iron, manganese, nickel, molybdenum, selenium, and zinc) are important in plant and animal nutrition, but the optimal concentration ranges are usually narrow (Leland and Kuwabara 1985). Other inorganics are nonessential, such as lead, cadmium, and mercury, and are toxic to receptors at very low concentrations.

Mechanisms of toxicity of inorganics to plants tend to depend on the nature of the reactivity of the inorganic itself (Efroymson et al. 1997a). They may alter or inhibit enzyme activity, interfere with deoxyribonucleic acid (DNA) synthesis or electron transport, or block uptake of essential elements. Little is known about mechanisms of toxicity of constituents in earthworms (Efroymson et al. 1997b).

Trace metals (such as arsenic, barium, beryllium, chromium, copper, lead, and zinc) are better understood than some classes of organic compounds with respect to their potential adverse impacts on aquatic wildlife (Newman 1998). Chromium, copper, and zinc are essential for healthy enzyme function, and some organisms cannot survive without these metals. However, these naturally occurring constituents may cause adverse effects when exposure occurs at concentrations that significantly exceed background concentrations. The toxicity and effects of trace metals may be greatly influenced by pH, hardness, and organic carbon content of the water in which they occur (Leland and Kuwabara 1985).

Imbalances in the essential trace metals may cause a decrease in photosynthetic ability, poor spawning/hatching success, teratogenesis, susceptibility to predation and disease, reduced growth, mortality, histopathological changes, organ dysfunction of the liver or kidneys, neurological defects, changes in respiration and osmoregulation, and anemia. Some metals may bioaccumulate, but this mechanism is thought to be a less important ecological concern. Because these constituents are naturally occurring,

many organisms have a capacity (albeit limited) to biotransform and/or eliminate naturally occurring inorganics (Newman 1998; Leland and Kuwabara 1985).

9.3.1.5 Description of Potentially Exposed Receptors

The identification of the categories of receptors most likely to be exposed helps to focus the SLERA. Potentially exposed receptors are designated based on the available habitat associated with the site. Section 9.3.1.1 provides a description of the habitat associated with the site as well as wildlife observed or potentially present in these habitats. As described above and presented in the ERA CSM, potentially exposed receptors include terrestrial wildlife (i.e., mammals, birds, reptiles, and invertebrates), terrestrial plants, and aquatic biota (fish and invertebrates directly exposed to surface water and sediment).

As part of the identification of potentially exposed receptors, it is necessary to identify protected species that may be exposed to site constituents. The listings of threatened and endangered as well as tracked, rare, and unusual species were obtained from the Georgia Department of Natural Resources (GADNR, 2010) and the US Fish and Wildlife Service (USFW, 2010) online databases for Chatham County. The list of threatened and endangered species is presented in Table 9-9. No threatened or endangered species were identified at the site, and the habitat present at the site was found not to be suitable to support threatened or endangered species. The site may potentially offer foraging habitat for a wood stork. These results are also presented in Table 9-9.

9.3.1.6 Identification of Potentially Complete Exposure Pathways

A complete exposure pathway is "one in which the chemical can be traced or expected to travel from the source to a receptor that can be affected by the chemicals" (USEPA 2001c). Therefore, a constituent, its release and migration from the source, a receptor, and the mechanisms of toxicity of that constituent must be demonstrated before a complete exposure pathway can be identified. The table below summarizes the potential exposure routes for the site (also illustrated on Figure 9-4).

Organism	Possible Exposure Routes
Terrestrial wildlife	Ingestion, direct contact, and food chain
Terrestrial plants	Direct contact, uptake
Aquatic wildlife	Ingestion and direct contact with sediment and surface water, and food chain
Aquatic plants	Direct contact with and uptake from sediment and surface water

9.3.1.7 Selection of Generic Assessment and Measurement Endpoints

Assessment endpoints are the explicit expression of the ecological values to be protected (USEPA 1997). The selection of assessment endpoints depends on knowledge of the receiving environment, knowledge about the constituents released (including their toxicological properties and the relevant concentrations), and understanding of the values that will drive risk management decisions (Suter et al. 1995). Consistent with USEPA (1998) guidance, two elements are required to define an assessment endpoint: the specific valued ecological entity and the characteristic about the entity that is important to protect.

USEPA guidance provides that Superfund remedial actions should be designed not to protect organisms on an individual basis, but to protect local populations and communities of biota (USEPA 1999). Thus, the first management principle for conducting an ecological risk assessment is to provide a basis for selecting a response action "that will result in the recovery and/or maintenance of healthy local populations/communities of ecological receptors that are or should be present at or near the site" (USEPA 1999). The USEPA (1999) guidance also notes, as an exception to this rule, that threatened and endangered species may be evaluated on an individual basis. In concept, however, this focus is justified on the basis that, given the stressed nature of a threatened and endangered population, effects on individuals could impact the local population.

For the site, assessment endpoints include the following:

§ Sustainability of small mammal populations;

§ Sustainability of avian populations;

§ Sustainability of terrestrial plant communities; and

§ Sustainability of aquatic communities (i.e., fish and invertebrates)

Because direct measurement of assessment endpoints is often difficult or infeasible, surrogate endpoints, called measurement endpoints, are used to provide the information necessary to evaluate whether the values associated with the assessment endpoint are being protected. A measurement endpoint is defined as a measurable ecological characteristic and/or response to a stressor (USEPA 1998). Maximum HQs serve as the measurement endpoints for the SLERA. The maximum HQ is the ratio of the maximum concentration of a given constituent to its ESV. ESVs are chemical concentrations in environmental media below which there is negligible risk to receptors exposed to those media (USEPA 2000a).

ESVs are generally based on effects such as mortality and reproductive impairment, and are assumed to be widely applicable to sites around the United States for screening purposes (USEPA 1997). For most constituents and receptors, the data available to generate ESVs are limited and related to effects on individual organisms, rather than subpopulations or communities. Given these limitations, conservative assumptions are used to ensure that the ESVs are protective. Where ESVs are published, users are cautioned to recognize that such screening values do not constitute remediation goals, as they are sometimes based on highly conservative exposure assumptions and/or wildlife receptors that may not be applicable to a particular site. As such, their robustness and biological association with the assessment endpoint may be limited.

9.3.2 Step 1, continued: Screening-Level Ecological Effects Evaluation

The screening-level ecological effects evaluation involves the identification of ESVs for each detected constituent in each environmental medium at the site. ESVs are chemical concentrations in environmental media, below which there is negligible risk to receptors (USEPA 2000a). As described above, ESVs are based on conservative assumptions in order to ensure that the values are protective and applicable to a wide variety of sites. Regardless, ESVs provide a starting point for the SLERA as they provide an indication of the worst-case measure of the potential for adverse impacts. ESVs for groundwater are not available because ecological receptors are typically not exposed to groundwater. As a result, surface water ESVs will be used to screen groundwater concentrations that discharge into surface water or seep into surface soil.

The ESVs used for this SLERA are consistent with GAEPD recommendations for HSRA:

- Soil and sediment ESVs were identified from the USEPA Region 4 Ecological Screening Values (R4; USEPA 2001b).
- Surface water ESVs were identified from GAEPD Water Use Classifications and Water Quality Standards (GAEPD 391-3-6-.03). Where GAEPD values were not available, then the USEPA Region 4 Ecological Screening Values (USEPA 2001b) were used.

It should be noted that these values represent only highly conservative ESVs, as is appropriate for a SLERA (USEPA 1997; 1998; 2000a). These ESVs do not represent the range of ESVs that are available from a variety of other regulatory and scientific sources.

9.3.3 Step 2: Screening-Level Exposure Estimate and Risk Calculation

The screening-level exposure assessment is comprised of the identification of exposure estimates, risk calculations, and the evaluation of uncertainties (USEPA 1997, USEPA 2001a). These form the lines of evidence necessary to support the SMDP at the conclusion of the SLERA (Section 9.3.4).

9.3.3.1 Identification of Screening-Level Exposure Estimates

Exposure estimates for the SLERA use the maximum detected concentrations for each constituent (USEPA 1997, USEPA 2001a). This conservative approach (i.e., using only the maximum detected concentrations) is appropriate for a screening-level effort. Exposure estimates for surface soil, sediment, surface water, and groundwater are presented in Tables 9-4 through 9-8, respectively.

9.3.3.2 Screening-Level Risk Calculations

The screening level risk calculations provide an estimate of potential risk to ecological receptors. Risks to ecological receptors are calculated by dividing the exposure estimates (i.e., the maximum detected concentrations) by the conservative ESVs. The resulting ratio, the HQ, is a highly conservative surrogate for the assessment endpoints identified in Section 9.3.1.7. HQs equal to or less than a value of 1 (to one significant figure) indicate that adverse ecological impacts are unlikely (USEPA 1997). HQs greater than 1 indicate that further evaluation is warranted. Therefore, the constituents with HQs greater than 1 are carried forward as COPECs into Step 3a of the BERA.

The following sections discuss the SLERA COPEC selection process per media:

9.3.3.2.1 Surface Soil

Several constituents had maximum HQs greater than 1 (Table 9-10), as summarized below, and therefore these constituents were identified as SLERA COPECs for surface soil.

Summary of Maximum Hazard Quotients Greater Than 1

Constituent	Maximum HQs for Surface Soil
Benzo(a)pyrene	4
Bis(2ethylhexyl)phthalate	2
Fluoranthene	8
Total Chromium	10
Lead	100
Elemental Mercury	10

Further, there were several constituents that lacked ESVs; therefore, they were also identified as COPECs (Table 9-10) and those were: acetone, acenaphthylene, benz(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,4-cd)pyrene.

9.3.3.2.2 Sediment

Acetone , 2-butanone, dichlorodifluoromethane, and toluene were the only detected constituents in sediment. They were all identified as COPEC due to lack of ESVs (Table 9-11).

9.3.3.2.3 Surface Water

Methylene chloride was the only detected constituent in surface water and it had a maximum HQ of 0.008. Therefore, it was not identified as a SLERA COPEC (Table 9-12). Based on these considerations, risk from exposure to surface water for ecological receptor was considered acceptable. As a result surface water will not be evaluated further in the ERA.

9.3.3.2.4 Groundwater

The HQ for TCE in groundwater was at the target level of 1; therefore TCE was not considered a SLERA COPEC in groundwater (Table 9-13). Three constituents: acetone, cis-DCE, and MTBE were identified as SLERA COPECs in groundwater (Table 9-13) because they did not have ESVs identified in the SLERA.

9.3.3.3 Evaluation of Uncertainties

SLERAs are designed to provide estimates of the risks that may exist for ecological receptors and to incorporate uncertainty in a precautionary manner. Uncertainty is “the imperfect knowledge concerning the present or future state of the system under consideration; a component of risk resulting from imperfect knowledge of the degree of hazard or of its spatial and temporal distribution" (USEPA 1997). Uncertainties that may lead to either an overestimate or underestimate of risk are associated with each stage of risk assessment. Because the SLERA is intended to provide a precautionary approach to evaluating risks to ecological receptors, the majority of the SLERA uncertainties tend toward an overestimate of risk. Uncertainties associated with the SLERA are identified on Table 9-14.

9.3.4 Scientific Management Decision Point

The SMDP represents a critical step in the ecological risk assessment process where risk management decision-making occurs (Figures 9-1 and 9-2). The selection of the SMDP occurs after either Step 2 or Step 3a, so that additional evaluation of risks can

be conducted if needed and reporting can be streamlined into a single report (USEPA 2001). Generally, the following types of decisions are considered at this SMDP:

- Whether the available information is adequate to conclude that ecological risks are negligible and, therefore, there is no need for remediation to mitigate ecological risks.
- Whether the available information is not adequate to make a decision at this point, and the ecological risk assessment process should continue.
- Whether the available information indicates a potential for adverse ecological effects, and a more thorough assessment or remediation is warranted.

If the SMDP indicates that either information is not adequate to make a decision or information indicates a potential for adverse ecological effects, then the ERA process should continue.

As described above, the SLERA for the site identified several COPECs in surface soil, sediment, and groundwater due either to them having maximum HQ greater than 1 or not having identified ESVs. Therefore, the possibility of adverse ecological risks for ecological receptors cannot be ruled out, and the initial step of a BERA is warranted.

9.4 Baseline Ecological Risk Assessment

The BERA is designed to more realistically identify the nature and extent of ecological risks in order to support informed risk management decision-making (USEPA 1997, 2000a). This approach contrasts with the SLERA, which is designed to conservatively rule out further evaluation of constituents and media that clearly do not pose a significant ecological risk. As indicated on Figures 9-1 and 9-2, the BERA process involves numerous steps. These steps are executed in a manner appropriate to the conditions at any individual site (USEPA 1997, 2000a).

The USEPA process shows that the BERA begins with Step 3, the Problem Formulation (Figure 9-1). A more detailed look at the Step 3 shows that it is typically divided into Step 3a and Step 3b (Figure 9-2). “Step 3a serves to introduce information to refine the risk estimates from Steps 1 and 2. For the majority of sites, ERA activities will cease after Step 3a” (USEPA 2000a). Step 3a provides a “reality check” so that “sites that do not warrant further study are not carried forward” (USEPA 2000a). Step 3b, the “additional problem formulation” is initiated only for those sites that warrant further study.

This section presents Step 3a of the BERA for the site. This approach is consistent with the following ecological risk assessment guidance and guidelines:

§ Georgia Environmental Protection Division (GAEPD). Georgia Hazardous Sites Response Act (HSRA). Compliance Status Report (CSR) 391-3-19-.06(3) Regulations.

§ *ECO-Update: Role of Screening-level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (USEPA 2001a)

§ *Ecological Risk Assessment Guidance for Superfund* (USEPA 1997)

§ *Guidelines for Ecological Risk Assessment* (USEPA 1998)

Step 3a involves a refinement of the Step 2 exposure estimates and risk characterization and focuses only on COPECs that were not screened out in the SLERA. Step 3a is followed by a SMDP that involves the reporting of results of Steps 1 through 3a. The Step 3a discussion for the site is comprised of the following:

- Refinement of Constituents of Potential Concern
- Refinement of Risk Calculations for Direct Contact COPECs
- Assessment and Measurement Endpoints for Bioaccumulative COPECs
- Refinement of Uncertainties
- Scientific Management Decision Point

9.4.1 Refinement of COPECs

The refinement of the COPECs identified in the SLERA is necessary to help focus and streamline further risk assessment activities on the constituents that pose the greatest potential risk to ecological receptors (USEPA 1997, 2001a). It is intended as an "incremental iteration of exposure, effects, and risk characterization" (USEPA 2001a). The outcome of this screening is that constituents are either excluded as COPECs or retained for further evaluation in the BERA process. The process for refining the COPECs generally consists of two steps: 1) the comparison of maximum detected concentrations with background concentrations for each medium; and 2) the comparison of the exposure point concentration (EPC) with established conservative ESVs. The comparison to background step is applicable for inorganic constituents, and is not applicable for organic constituents, under most circumstances, unless the organic constituent(s) occurs in background or upgradient media that are unaffected by the site.

9.4.1.1 Comparison to Background

Comparison to background concentrations is not appropriate for organic compounds because these constituents are not naturally occurring. Background levels of the soil

SLERA COPECs, chromium, lead, and mercury were identified from the Final Compliance Status Report for the Fire Training Station at HAAF (Law, 2002). The maximum concentration of chromium at 5.1 mg/kg was below the background chromium level of 7.1 mg/kg; therefore, chromium was not selected as a BERA COPEC. The maximum level of mercury at 1.4 mg/kg was above the background level of 0.49 mg/kg. Mercury was detected in 2 locations out of 7 (S0018 and S0018A) at concentrations exceeding the background level of 0.39 mg/kg. As for lead, the maximum level of 5,300 mg/kg was clearly higher than background. The second highest detect was 200 mg/kg.

9.4.1.2 Exposure Point Concentrations

USEPA (1989) defines the EPC as "the arithmetic average of the concentration that is contacted over the exposure period." To ensure that the estimate of the average (or mean) is conservative and not underestimated, USEPA (1989, 1992) recommends using the 95% upper confidence limit (UCL) of the mean as an estimate for the EPC. Statistical software provided by USEPA (i.e., ProUCL) has, to some extent, automated the process of calculating 95% UCLs and selecting the most representative statistic based on characteristics of the data set such as sample size, measures of variance, and FOD. The most recent available version of the ProUCL software (version 4.00.05, USEPA 2010) was utilized to calculate EPCs for each COPEC evaluated in the BERA. ProUCL outputs are presented in Appendix H. The EPCs were then used to recalculate HQs.

9.4.2 Refinement of Risk Calculations for Direct-Contact COPECs

COPECs can be further refined for direct-contact by recalculating HQs using the EPC with an expanded range of ESVs, or alternative ESVs (ASVs), where available and appropriate.

The ASVs were selected following GAEPD HSRA guidance first and then where screening vales were not available, they were selected from various established literature sources, as follows:

- Soil ASVs were identified from the USEPA Region 5 Ecological Screening Levels (R5 ESL) (USEPA 2003a). USEPA Ecological Soil Screening Levels (EcoSSL); (USEPA 2005) were also used to refine the risk in some instances. The USEPA EcoSSLs are conservative screening values based on No Observed Adverse Effect Levels (NOAELs) for a variety of wildlife receptors (USEPA 2005).
- Sediment ASVs were identified from the USEPA Region 5 ESLs (USEPA 2003a), then from the National Oceanic and Atmospheric Administration

(NOAA) Screening Quick Reference Table (SQuiRT; NOAA 2008), in order of priority.

- Surface water ASVs were identified USEPA Region 5 ESLs (USEPA 2003a), USEPA Region 3 Ecological Screening Benchmarks (USEPA 2006), Oak Ridge National Laboratory (ORNL) screening benchmarks (Suter and Tsao, 1996), and Texas Commission on Environmental Quality (TCEQ), Texas Surface Water Quality Standards (TCEQ, 2000), in order of priority.

The following sections discuss the results of the BERA risk calculations per media:

9.4.2.1.1 Surface Soil

Several constituents were identified as SLERA COPECs because they lacked ESVs. When ASVs were identified for acetone, acenaphthylene, benz(a)anthracene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,4-cd)pyrene, none of these constituents were identified as BERA COPECs (Table 9-15) as they all had HQs lower than the target level of 1.

Benzo(a)pyrene, bis(2ethylhexyl)phthalate, fluoranthene, chromium, lead and mercury were identified as SLERA COPECs with maximum HQs of 4, 2, 8, 10, 100, and 10, respectively. When the HQs were recalculated using UCLs and ASVs, they were 0.1, 0.2, 0.003, 10, 100,000 and 10, respectively. Since the HQs for benzo(a)pyrene , bis(2-ethylhexyl)phthalate, fluoranthene were less than the target of 1, they were not identified as BERA COEPCs. As discussed in the previous section, chromium was eliminated as a COPEC because the maximum detected concentration was less than the established background level. Therefore, lead and mercury were the only two constituents identified as BERA COPECs in surface soil (Table 9-15). Risks from those two COPECs are discussed beneath:

Lead

The HQ for lead using the R5 ESLs as the ASVs was 100,000 while it was 100 using the R4 ESVs. If calculated, an HQ for background lead (53 mg/kg) using the R5 ESL (0.0537 mg/kg) is approximately 986. Further, USEPA EcoSSLs for lead range from 11 to 1,700 mg/kg, i.e., the lowest EcoSSL (11 mg/kg) is orders of magnitude larger than the R5 ESL (0.0537 mg/kg). Thus, the R5 ESL drastically overestimates risk.

Lead was detected in all 10 samples with a maximum detection of 5,300 mg/kg. Using the maximum detect, the HQ for lead was 100 and 100,000, using R4 and R5 ESVs, respectively. The second highest detect was 200 mg/kg which would result in HQs of 4 using the R4 ESV. However, calculated HQs using the second highest detect of 200

mg/kg and USEPA EcoSSL (USEPA, 2005b) ranged between 0.1 and 20 and are presented below by feeding guild:

HQs Calculated Using EcoSSLs for Lead

Receptor Group		EcoSSL (mg/kg)	2nd max HQ (unitless)
Avian			
	Herbivore	46	4
	Ground insectivore	11	20
	Carnivore	510	0.4
Mammalian			
	Herbivore	1200	0.2
	Ground insectivore	56	4
	Carnivore	460	0.4
Soil Invertebrates		1700	0.1
Plants		120	2

EcoSSLs from USEPA (2005b).

Potential risk to ecological receptors from exposure to lead in surface soil cannot be ruled out considering the current site conditions. However, the extent of elevated lead at the site has been evaluated and found to be localized.

Elemental Mercury

Elemental Mercury was detected in 9 of 9 samples, with a maximum concentration of 1.4 and a UCL of 1.04 mg/kg. The established background mercury level at the site was 0.39 mg/kg (Law, 2002). The HQ calculated using the UCL and the R4 ESV and R5 ESL (both 0.1 mg/kg) for elemental mercury is 10 (Table 9-15). When calculated, an HQ for background elemental mercury is 4. Thus the R4 ESV and the R5 ESL overestimates risk to these receptors.

The R4 ESV and R5 ESL were derived by Efroymson et al (1997a) for the toxicity of elemental mercury to soil invertebrates (i.e, earthworms). Efroymson et al. (1997) used a lowest observed effect concentration (LOEC) (based on survival) of 0.5 mg/kg and applied an uncertainty factor of 5. The benchmark of 0.1 mg/kg has low confidence due to the limited amount of data.

Given the conservative assumptions in the ESV and ESL, consideration of natural background concentrations relative to the ESV and ESL, and the fact that elemental mercury was detected in 2 locations out of 7 (S0018 and S0018A) at concentrations exceeding the background level of 0.39 mg/kg, adverse impacts associated with mercury via direct contact are not considered likely.

9.4.2.1.2 Sediment

Acetone , 2-butanone, dichlorodifluoromethane, and toluene were identified as SLERA COPECs in sediment (Table 9-11) because they lacked ESVs. In the BERA, after ASVs were identified for these constituents; their refined HQs were 7, 0.6, 0.4, and 0.007, for acetone, 2-butanone, dichlorodifluoromethane, and toluene, respectively (Table 9-16). Since the HQs for 2-butanone, dichlorodifluoromethane, and toluene were all below the target level of 1, they were not identified as BERA COPECs. However since the HQ for acetone was 7, which is greater than the target of 1, it was identified as a BERA COEPC. Risk from Acetone is discussed beneath:

Acetone

Acetone was detected in 9 of 9 samples at a maximum concentration of 0.082 mg/kg with a UCL of 0.0657 mg/kg. Acetone is a common laboratory contaminant and its detection in the sediment sample is not considered to be site related. The HQ of 7 was calculated using an EPC and the R5 ASV. The R5 sediment screening level for this VOC was calculated by the USEPA using the equilibrium partitioning approach.

The equilibrium partitioning approach was developed by USEPA (Di Toro et al., 1991) to allow the development of sediment quality values for hydrophobic organic chemicals. This standard approach uses the mass fraction of organic carbon in sediment (f_{oc}) and the chemical-specific partition coefficient between water and organic carbon (K_{oc}) to calculate sediment quality benchmarks as follows:

$$\textit{Sediment quality benchmark} = \textit{Water quality benchmark} \times K_{oc} \times f_{oc}$$

This approach assumes that the bioavailable fraction of non-polar organic chemicals is equivalent to the fraction of the sediment concentration that is freely dissolved in interstitial water, and that the freely dissolved fraction is determined primarily by the extent of partitioning to organic carbon. The applicability of the equilibrium partitioning approach to non-polar nonionic organic chemicals has been extensively validated by USEPA (2003b; 2003c).

Because acetone is less strongly hydrophobic than the compounds for which the equilibrium partitioning approach was originally developed, a modification of the equilibrium partitioning approach developed by Fuchsman (2003) was employed in the BERA. The original equilibrium partitioning equation (provided above) is ineffective for assessing less-hydrophobic organic compounds in sediment (like acetone), because it fails to account for the contribution of dissolved chemical to the total chemical concentration in sediment. For chemicals having low K_{oc} values, this results in sediment quality benchmarks that are more conservative than benchmarks calculated by assuming 100% bioavailability. The following equilibrium partitioning equation

corrects for the dissolved fraction of total chemical concentrations in sediment (Fuchsman, 2003) and this equation was used to calculate a sediment quality benchmark for acetone:

$$SQB = WQB \times \left[\left(f_{OC} \times K_{OC} \right) + \left(\frac{1 - f_{solids}}{f_{solids}} \right) \right]$$

Where SQB = Sediment quality benchmark (mg/kg);
WQB = Water quality benchmark (mg/L);
f_{oc} = Fraction of sediment present as organic carbon (unitless);
K_{oc} = Organic-carbon/water partition coefficient (L/kg); and
f_{solids} = Fraction of sediment present as solids (unitless).

The Koc value for acetone was obtained from the USEPA EPISuite program (Version 3.11; USEPA, 2004) and is 1.98. A sediment organic carbon content of 1% and a solids content of 50% were assumed (Fuchsman, 2003). The identification of the water quality benchmark is described below.

In the absence of state surface water quality standards, criteria, or benchmarks for acetone, the following USEPA R5 surface water ESL was used as the water quality benchmark for acetone: 1.7 mg/L.

The sediment quality benchmark for acetone was then calculated using these inputs and the modified equilibrium partitioning equation (Fuchsman, 2003) (provided above). The sediment quality benchmark for acetone is 1.7 mg/kg. The maximum detected sediment concentration for acetone (0.082 mg/kg) is less than the calculated sediment quality benchmark (1.7 mg/kg). Based on this evaluation, the detected concentrations of acetone in sediment samples are not expected to represent an ecological risk.

9.4.2.1.3 Groundwater

Three constituents, acetone, cis-DCE and MTBE were identified as SLERA COPECs in groundwater (Table 9-13) because they did not have ESVs identified in the SLERA. Using ASV, the HQs for acetone, cis-1,2-dichloroethene, and MTBE were 0.01, 0.002 and 0.0007, respectively. Since all constituents had a HQ lower than the target level of 1, no BERA COPECs were identified for groundwater. Therefore, risk from exposure to groundwater that would seep into surface water for ecological receptors was considered acceptable.

9.4.3 Refinement of Assessment and Measurement Endpoints for Bioaccumulative COPECs

The assessment and measurement endpoints from the SLERA can be refined for bioaccumulative COPECs carried into Step 3a of the BERA. Bioaccumulative COPECs

are those constituents that may have toxic effects when they transfer through the food chain. The SLERA assessment and measurement endpoints should be refined for bioaccumulative COPECs because the SLERA endpoints are general in nature and do not necessarily identify receptors that are susceptible to food chain exposures. BERA assessment endpoints for bioaccumulation are based on receptors appropriate to the habitat present at a site, as well as the media in which bioaccumulative COPECs are identified. The measurement endpoints will depend upon the species potentially exposed to the COPECs, the medium or media through which trophic transfer(s) may occur, and the mechanisms of ecotoxicity for the COPECs. Food chain modeling is only conducted where wildlife habitat is present, and potential for exposure to bioaccumulative constituents exists for a given receptor group.

None of the three COPECs identified (i.e., acetone, lead, and mercury) are included in the USEPA list of bioaccumulative compounds (USEPA 2000b). However, methyl mercury is considered bioaccumulative and as such mercury was also considered bioaccumulative in this assessment. However, food chain modeling was not conducted because even though mercury was identified as a COPEC using conservative ESVs, consideration of natural background concentrations relative to the ESVs, and the fact that mercury was detected in 2 locations out of 7 (S0018 and S0018A) at concentrations exceeding the background level of 0.39 mg/kg, adverse impacts associated with mercury via bioaccumulation in the food chain are not considered likely.

9.4.4 Refined Uncertainties

A BERA is designed to evaluate potential risks for ecological receptors by incorporating iterative changes that reduce uncertainty (when possible) and provides more realistic exposure assumptions. Uncertainties associated with the BERA are summarized on Table 9-14.

9.4.5 Scientific Management Decision Point

SMDPs represent critical steps in the ecological risk assessment process where risk management decision-making occurs. As was discussed previously and can be seen on Figures 9-1 and 9-2, the first SMDP is purposefully flexible (per the USEPA paradigm) to allow reporting to occur after either Step 2 or Step 3a, depending on the results obtained in Step 2. Step 2 indicated that adverse impacts to terrestrial and aquatic ecological receptors were unlikely from potential exposure to surface soil, surface water, and sediment but that groundwater needed further evaluation. Step 3a of the BERA was conducted for constituents whose maximum HQ values exceeded 1 or those who did not have ESVs. Step 3a of the BERA provides adequate information to determine that adverse impacts for ecological receptors from exposure to sediment,

surface water, and groundwater seeping into surface water are not likely. However results indicate that adverse impacts are possible for ecological receptors potentially exposed to surface soil at the site; specifically due to levels of lead and to a lesser extent mercury in soil. However, the potential risks calculated for this exposure scenario were based on the conservative assumptions that these receptors would be chronically exposed throughout their lifetime.

9.5 Summary and Conclusions

This ERA presents the results of a SLERA and Step 3a BERA for ecological receptors at the site based on HQs. An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely (USEPA 2001a). An HQ greater than 1 indicates that adverse effects of some kind may have occurred in the past or may occur in the future and that further analysis of potential ecological risks may be warranted.

Risks were characterized for ecological receptors at the site by considering direct contact with COPECs in surface soil, sediment, surface water, and shallow groundwater; and the potential for food chain exposures to bioaccumulative COPECs. The SLERA for the site identified several COPECs in surface soil, sediment, and groundwater due either to them having a maximum HQ greater than 1 or not having identified ESVs. Therefore, the possibility of adverse ecological risks for ecological receptors could not be ruled out, and the initial step of a BERA was warranted.

In Step 3a of the BERA, HQs for the COPECs were recalculated using the UCL as the EPC, where possible and by using ASVs. Three COPECs were identified in the BERA Step 3a: acetone in sediment, and lead and mercury in surface soil. After recalculating the sediment quality benchmark for acetone, using the modified equilibrium partitioning equation, it was evident that risk from acetone is not expected at the site because the maximum detected sediment concentration for acetone (0.082 mg/kg) is less than the calculated sediment quality benchmark (1.7 mg/kg). Likewise, risk from mercury in soil was not expected in consideration of the conservative ESVs used, the natural background concentrations relative to the ESVs, and the fact that mercury was detected in 2 locations out of 7 (S0018 and S0018A) at concentrations exceeding the background level. Step 3a of the BERA provides adequate information to determine that adverse impacts are possible for ecological receptors potentially exposed to surface soil at the site – specifically due to levels of lead in surface soil. However, the potential risks calculated for this exposure scenario were based on the conservative assumptions that these receptors would be chronically exposed throughout their lifetime. As additional data and information is gathered, the potential for soil to represent a potential ecological concern will be refined.

Original Report – October 2010

10. Public Involvement

The opportunity for public involvement will be provided in accordance with GAEPD, 2003. *Hazardous Site Response*, Chapter 391-3-19-.06(5). A copy of the CSR will be made available to the public at the Live Oak Public Library, Chatham County, located at 2002 Bull Street, Savannah, GA 31419. Additionally, a public notice will be published in the Savannah Daily News and in The Frontline, a Fort Stewart publication announcing that the CSR is available for inspection by the public. A statement including the following will be included in the public notice:

"*The Georgia Environmental Protection Division, Department of Natural Resources, State of Georgia (GA EPD) has placed this site on the Hazardous Site Inventory pursuant to its authority under the Hazardous Site Response Act and Rules promulgated thereunder. As required by the Rules for Hazardous Site Response, the responsible party for this site was required to investigate the site and submit a compliance status report to GAEPD summarizing the results of that investigation. GAEPD is currently reviewing the compliance status report to determine if corrective action is needed for regulated substances that have been released at this site. Before GAEPD decides whether corrective action is needed, the public has the opportunity to review the compliance status report and provide comments to GAEPD about the report.*"

The notice will also include the announcement of a 30-day public comment period beginning on the date of the notice and will provide the location of the above referenced library where the CSR can be viewed. The public notice will also provide the name, address and telephone number of the responsible party or its designated contact person and the GAEPD contact person to whom written or oral comments can be made. The GAEPD will be provided with an exact copy of the public notice within 15 days of the publication of the notice. The Chatham County government will be provided with the same written notice within 7 days of the submittal of the CSR to the GAEPD.

11. Conclusions and Recommendations

11.1 Conclusions

Based on the results of the MIP, DPT and groundwater sampling results from existing and new monitor wells, two source areas have been identified. The first source was determined to be located in the Hangar T-811 area where TCE was used as a cleaner and solvent as part of previous operations. Hangar T-811 was constructed in the early 1940's but it is unknown for how long and at what quantities TCE was utilized in this building. Historically, TCE used at Hangar T-811 was discharged to a grease trap in front of Hangar T-811. The grease trap was disconnected, cleaned, and partially removed in 2007. TCE was detected at concentrations that indicate the likely presence of dense non-aqueous phase liquid (DNAPL) across Lightning Drive from the Hangar T-811 and the former grease trap area. Soil contamination, detected below the water table in this area, appears to be a continuing source of groundwater contamination. A pathway for the downward migration of the TCE DNAPL was not located and may have dissipated through dissolution and natural attenuation following the termination of the cleaning and maintenance operations in Hangar T-811 that resulted in the TCE release.

A potential second source area was identified near the aircraft wash racks and former Industrial Waste Treatment Plant (IWTP) adjacent to Building 850, southeast of the Hangar T-811. Building 850 was built circa 1953. The dates of construction for the wash rack and former IWTP could not be determined. In this area, TCE was detected in groundwater in the deep zone of the upper aquifer at one location. The TCE concentration (2.8 mg/L) was much lower than the impacts detected near Hangar T-811. Concentrations indicative of source mass were not detected in unsaturated soil in the area or in the shallow zone of the upper aquifer.

Based on the available data, the TCE mass is located predominantly in the deeper zone of the upper aquifer from 35 to 50 feet below ground surface (bgs). Significantly lower concentrations (1 to 2 orders of magnitude) were detected in the shallow zone of the upper aquifer.

Impacts were not detected in Pond 29 during surface water and sediment sampling in 2006. Pond 29 has been drained due to a leak and storm water runoff is currently shut off. Based on historical and recent elevation data, Pond 29 periodically intercepts groundwater dependent on groundwater fluctuations. The continuing low contaminant

concentrations in the shallow zone of the aquifer indicate that surface water impacts will continue to be minimal.

Based on the 2006 surface soil investigation results, lead and mercury impacts were identified to be present at concentrations exceeding the Type 1 RRS in the Old Hospital Area. The source of the mercury impacts has not clearly been identified, but is believed to be the old hospital boiler room. Mercury impacts were delineated to below background and Type 1 RRS concentrations in 2006. Supplemental surface soil sampling performed in 2010 completed the delineation of lead impacts and confirmed that it is limited to a small area. Lead and mercury concentrations in soil exceeded the Type 1 and Type 2 standards. Lead also exceeded the Type 3 and Type 4 standards at one location.

Four constituents were detected in shallow groundwater at concentrations exceeding the Type 1 and Type 3 RRSs: cis-DCE; isopropylbenzene; methyl tert-butyl ether (MTBE); and TCE. Only TCE exceeded the Type 2 and Type 4 RRSs. Seven constituents were detected in deep groundwater at concentrations exceeding the Type 1 and Type 3 RRSs: benzene; 1,1-dichloroethene; cis-DCE; isopropylbenzene; methylene chloride; TCE; and VC. Four constituents were detected in the deep groundwater at concentrations greater than the Type 2 RRS: benzene; cis-DCE; TCE; and VC. Three constituents exceeded their Type 4 RRS: cis-DCE; TCE; and VC.

Soil and shallow groundwater results were evaluated for the vapor intrusion pathway. The maximum detected medium-specific concentrations were used in the calculations as a conservative measure. The results indicated that the risks were less than the GAEPD HSRA benchmark of 1×10^{-5} for all receptors except residents exposed to vapors migrating from groundwater. For that receptor, the calculated risk was 1×10^{-5}, just slightly greater than the GAEPD benchmark and well within the USEPA risk range. TCE was the risk driver. The noncancer hazards were less than the benchmark of 1, again with the exception of the resident exposed to vapors migrating from groundwater where the hazard was calculated to be 5, due to the presence of TCE. These risks and hazards were calculated using the updated cancer slope factors and reference doses for TCE that were released on September 28, 2011. If the average TCE concentration were used in the vapor migration model, the ELCR and HI would be less than and equal to the GAEPD HSRA benchmarks of 1×10^{-5} or 1, respectively.

Screening level and baseline ecological risk assessments (ERAs) were performed for HAA-15. Based on the available data, there is sufficient information to conclude that adverse impacts to aquatic and terrestrial wildlife and plants exposed to constituents in surface soil, surface water, sediment and shallow groundwater are unlikely. The one exception is lead at one location in surface soils. Adverse impacts are possible for ecological receptors potentially exposed to lead impacted surface soil at the site.

However, the potential risks calculated for this exposure scenario were based on the conservative assumptions that these receptors would be chronically exposed throughout their lifetime.

This CSR for HAA-15 has presented physical, analytical, and risk assessment data to support the conclusion that the potential impacts to the environment by past activities at the site have been sufficiently characterized in surface soil, subsurface soil, sediment, surface water and groundwater.

11.2 Recommendations

Based on the data provided herein, the following recommendations are submitted for consideration by the GAEPD:

- The CSR investigation has been completed, and the potential impacts to the environment by past activities at HAA-15 have been adequately characterized and delineated where necessary in surface soils, subsurface soils, sediment, surface water and groundwater to proceed with development and implementation of a Corrective Action Plan.
- A Corrective Action Plan (CAP) will be developed to address chlorinated VOC impacts in groundwater and lead impacts in surface soil. A remedy for the chlorinated VOC impacts will be developed that focuses on mitigating the mass in the deep zone that is a continuing source.

Notes:

[ ] - Indicates the analyte was detected above one or more applicable standards
BOLD - indicates the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
IS - Insufficient recovery for a groundwater sample to be collected.
J - The analyte was positively identified, UBt the associated numerical value is the approximate concentration of the analyte in the sample.
MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).
µg/L - Micrograms per Liter
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (UJly 23, 2003).
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately measure analyte in the sample.
UR - The sample result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria; and the presence or absence of the analyte cannot be verified; qualified as a non-detect at listed value.
VOCs - Volatile Organic Compounds

Notes:
* - Duplicate sample
Analyte was detected above the MCL or the Type I RRS.
BOLD - indicate the analyte was detected.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).
µg/L - Micrograms per Liter
NA - Not Analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
U - The analyte was not detected above the reporting limit.
VOCs - Volatile Organic Compounds

Notes:
* - Duplicate sample
[ ] - Indicate the analyte was detected above one of more applicable screening criteria
BOLD - indicate the analyte was detected.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).
µg/L - Micrograms per Liter
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
U - The analyte was not detected above the reporting limit.
VOCs - Volatile Organic Compounds

Notes:

* - Duplicate sample

[ ] - Analyte was detected above the HSRA Soil Notification Standard.

BOLD - indicate the analyte was detected

(1) HSRA - GAEPD HSRA Soil Notification Standards (Rule 391-3-19-.04(3)(b))

J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

mg/kg - Milligrams per Kilogram

NA - Not analyzed

U - The analyte was not detected above the reporting limit.

VOCs - Volatile Organic Compounds

Notes:

* - Duplicate sample

- Indicate the analyte was detected above one of more applicable screening criteria

BOLD - indicate the analyte was detected.

J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).

µg/L - Micrograms per Liter

RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).

U - The analyte was not detected above the reporting limit.

VOCs - Volatile Organic Compounds

Vinyl Chloride	2	2	< 1 U	< 1 U	< 1 U	**2.1**	**6.9**	< 1 U	< 1 U

Notes:

* - Duplicate sample

[ ] - Indicate the analyte was detected above one or more applicable screening criteria

B - Analyte was detected in an associated blank as well as in the sample.

BOLD - indicate the analyte was detected.

J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).

µg/L - Micrograms per Liter

RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).

U - The analyte was not detected above the reporting limit.

VOCs - Volatile Organic Compounds

Notes:
* - Duplicate sample
[ ] - Analyte was detected above the HSRA Soil Notification Standard.
BOLD - indicate the analyte was detected
HSRA - GAEPD HSRA Soil Notification Standards (Rule 391-3-19-.04(3)(b)
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
mg/kg - Milligrams per Kilogram
NA - Not analyzed.
VOCs - Volatile Organic Compounds

Metals - USEPA Method 6010 (mg/kg)												
Lead	300000	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA	NA

Notes:
* - Duplicate sample

BOLD - indicate the analyte was detected.
HSRA - GAEPD HSRA Soil Notification Standards (Rule 391-3-19-.04(3)(b).
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
mg/kg - Milligrams per Kilogram.
NA - Not analyzed.
VOCs - Volatile Organic Compounds
B - Detected in method balnk.

Notes:
* - Duplicate sample
[ ] - Indicate the analyte was detected above one or more applicable screening criteria
BOLD - indicate the analyte was detected
B - Analyte was detected in an associated blank as well as in the sample.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).
µg/L - Micrograms per Liter
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
RSL - USEPA Regional Screening Level for Tap Water (12/10/2009).
VOCs - Volatile Organic Compounds
NA - Not Analyzed

Notes:

* - Duplicate sample

[ ] - Indicate the analyte was detected above one or more applicable screening criteria

BOLD - indicate the analyte was detected

B - Analyte was detected in an associated blank as well as in the sample.

J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009).

µg/L - Micrograms per Liter

RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).

RSL - USEPA Regional Screening Level for Tap Water (12/10/2009).

VOCs - Volatile Organic Compounds

Notes:
1) µg/kg - Micrograms per kilogram
2) The compounds qualified E for the low level analysis are over the calibration range.
The result for the compound(s) over calibration should be reported from the medium level analysis (which is a diluted analys
3) The compounds qualified J are estimated.

Table 8-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

ROUTE-SPECIFIC RRSs:

Oral:

$$(RRS_o)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ BW\ x\ (AT_C\ or\ AT_{NC})\ x\ (10^6\ mg/kg)}{IRs\ x\ EF\ x\ ED\ x\ [SF_O\ or\ (1/RfD_O)]}$$

Inhalation:

$$(RRS_i)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ (AT_C\ or\ AT_{NC})\ x\ BW}{[(1/VF)\ +\ (1/PEF)]\ x\ EF\ x\ ED\ x\ [SF_i\ or\ (1/RfD_I)]}$$

where:

$$PEF = \frac{LS\ x\ V\ x\ DH}{A}\ x\ \frac{(1000\ g/kg)\ x\ (3{,}600\ sec/hr)}{RPF\ x\ (1\text{-}G)\ x\ (Um/Ut)^3\ x\ F_x}$$

$$VF = \frac{LS\ x\ V\ x\ DH}{A}\ x\ \frac{(3.14\ x\ \bullet\ x\ T)^{1/2}}{2\ x\ Dei\ x\ E\ x\ Kas\ x\ (10^{-3}\ kg/g)}$$

$$\bullet = \frac{Dei\ x\ E}{E\ +\ [ps\ x\ (1\text{-}E)/Kas]}$$

$$Dei = Di\ x\ E^{0.33}$$

$$Kas = H/(RT\ x\ Kd)$$

Cancer Effects RRS:

$$RRS_C = \frac{1}{\frac{1}{(RRS_O)_C} + \frac{1}{(RRS_I)_C}}$$

Non-Cancer Effects RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{(RRS_O)_{NC}} + \frac{1}{(RRS_I)_{NC}}}$$

RRS = Minimum result of RRS_C and RRS_{NC}.

where:

•	Alpha; calculation intermediate (cm^2/sec).
A	Contiguous area of contamination (20,250,000 cm^2; USEPA [1991] default).
AT_C	Averaging time for cancer effects (25,550 days).
AT_{NC}	Averaging time for non-cancer effects (10,950 for adult residents; 2,190 days for child residents; 9,125 days for site workers); ED x 365 days/year.
BW	Body weight (70 kg for adult receptors; 15 kg for child resident).
DH	Diffusion Height (2 m, USEPA [1991] default)
Dei	Effective diffusivity (cm^2/sec).
Di	Diffusivity in air (cm^2/sec); constituent specific.
E	Total soil porosity (0.35 unitless, USEPA default).
ED	Exposure duration (30 years for adult resident; 6 years for child resident; 25 years for site worker).
EF	Exposure frequency (350 days/year for resident receptors; 250 days/year for site worker).
Foc	Fraction organic carbon in soil (0.02 unitless, USEPA default).
Fx	Function of Ut/Um (unitless); $Fx = 0.18\ x\ [8x^3 + 12x]\ x\ \exp(-x^2)$, where $x = 0.886\ x\ (Ut/Um)$.
G	Fraction of vegetative cover (unitless) (0).
H	Henry's Law Constant (atm-m^3/mol); constituent specific.

Table 8-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

IR_{air}	Inhalation rate (15 m^3/day for residents; 20 m^3/day for site workers).
IR_{soil}	Incidental soil ingestion rate (114 mg/day for adult resident; 200 mg/day for child resident; 50 mg/day for site worker).
Kas	Soil-air partition coefficient (g soil/ cm^3 air).
Kd	Soil-water partition coefficient (cm^3/g or mL/g); constituent specific. Kd is calculated as Foc × Koc.
Koc	Organic carbon partition coefficient (cm^3/g or mL/g); constituent specific.
LS	Length of side of contaminated area (45 m, USEPA default).
PEF	Particulate emission factor (4.63 x 10^9 m^3/kg, USEPA default).
ps	True soil or particle density (2.65 g/cm^3, USEPA default).
RfDi	Reference dose for inhalation (mg/kg/day).
RfDo	Reference dose for ingestion (mg/kg/day).
RPF	Respirable particle fraction (0.036 g/m^2/hr).
RRS	Risk reduction standard for soil (mg/kg); minimum of the RRS_C (based on cancer effects) and the RRS_{NC} (based on non-cancer effects), which are based on the route-specfic RRSs (RRSo for the oral route and RRSi for the inhalation route).
RT	Product of the ideal gas constant (8.206 x 10^{-5} atm-m^3/mol/K) and the absolute temperature (K); RT = 0.02445 atm-m^3/mol at 25ºC (298 K).
SF	Cancer slope factor or oral (SF_o) or inhalation (SF_i) exposure (kg-day/mg).
T	Exposure interval (7.9 x 108 sec, USEPA default).
TCR	Target cancer risk (unitless); results presented for TCR value of 10^{-5} (10^{-4} for Class C carcinogens).
THI	Target hazard index (unitless); results presented for THI value of 1.
Um	Wind speed, annual average (3.0 m/sec).
Ut	Equivalent threshold value of windspeed at 10 meters (12.8 m/sec).
V	Wind speed in the mixing zone (2.25 m/sec, USEPA default).
VF	Volatilization factor (m^3/kg).

SAMPLE CALCULATIONS, Tetrachloroethene, Industrial Exposure (Type 4).

$$x = 0.886 \times \frac{12.8 \text{ m/sec}}{3.0 \text{ m/sec}} = 3.780$$

$$Fx = 0.18\,[(8 \times 3.780^3) + (12 \times 3.78)] \times \exp(-(3.780^2)) = 5.36E\text{-}05$$

$$Dei = 0.079 \text{ cm}^2\text{/sec} \times (0.35)^{0.33} = 0.05587 \text{ cm}^2\text{/sec}$$

$$Kas = \frac{1.03 \times 10^{-2} \text{ atm-m}^3\text{/mol}}{(0.02445 \text{ atm-m}^3\text{/mol}) \times 0.02 \times 95.5 \text{ cm}^3\text{/g}} = 2.20E\text{-}01 \text{ g/cm}^3$$

$$\bullet = \frac{0.05587 \text{ cm}^2\text{/sec} \times 0.35}{0.35 + [2.65 \text{ g/cm}^3 \times (1 - 0.35)/2.21 \times 10^{-1} \text{ g/cm}^3)]}$$

$$= 2.40E\text{-}03 \text{ cm}^2\text{/sec}$$

$$VF = \frac{45 \text{ m} * 2.25 \text{ m/s} * 2 \text{ m}}{2.03 \times 10^7 \text{ cm}^2} \times \frac{(3.14 \times 2.4 \times 10^{-3} \text{ cm}^2\text{/sec} \times 7.9 \times 10^8 \text{ sec})^{1/2}}{2 \times 0.05587 \text{ cm}^2\text{/sec} \times 0.35 \times 2.21 \times 10^{-1} \text{ g/cm}^3 \times 10^{-3} \text{ kg/g}}$$

$$= 2{,}816 \text{ m}^3\text{/kg}$$

CANCER EFFECTS:

Oral:

$$(RRS_O)_C = \frac{10^{-5} \times 70 \text{ kg} \times 25{,}550 \text{ days} \times 10^6 \text{ mg/kg}}{50 \text{ mg/day} \times 250 \text{ days/yr} \times 25 \text{ yrs} \times (5.4 \times 10^{-1} \text{ kg-day/mg})}$$

$$= 110 \text{ mg/kg}$$

Inhalation:

$$(RRS_I)_C = \frac{10^{-5} \times 70 \text{ kg} \times 25{,}550 \text{ days}}{[(1/2{,}818 \text{ m}^3\text{/kg}) + (1/4.63 \times 10^9 \text{ m}^3\text{/kg})] \times 250 \text{ days/yr} \times 25 \text{ yrs} \times 20 \text{ m}^3\text{/day} \times (2.1 \times 10^{-2} \text{ kg-day/mg})}$$

$$= 19.2 \text{ mg/kg}$$

Table 8-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

CANCER EFFECTS RRS:

$$RRS_C = \frac{1}{\frac{1}{110\ mg/kg} + \frac{1}{19.2\ mg/kg}} = 16\ mg/kg$$

NON-CANCER EFFECTS:

Oral:

$$(RRS_O)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days \times 10^6\ mg/kg}{50\ mg/day \times 250\ days/yr \times 25\ yrs \times [1/1.0 \times 10^{-2}\ mg/kg\text{-}day]}$$

$$= 20{,}440\ mg/kg$$

Inhalation:

$$(RRS_I)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{[(1/2{,}818\ m^3/kg) + (1/4.63 \times 10^9\ m^3/kg)] \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (1/7.7 \times 10^{-2}\ kg\text{-}day/mg)}$$

$$= 1{,}109\ mg/kg$$

NON-CANCER EFFECTS RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{20{,}440\ mg/kg} + \frac{1}{1{,}109\ mg/kg}} = 1{,}050\ mg/kg$$

RRS = Minumum result of RRS_C (17 mg/kg) and RRS_{NC} (1,050 mg/kg) = 16 mg/kg

Table 8-2
Risk Reduction Standard Equations for Exposure to Groundwater
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

ROUTE-SPECIFIC RRSs:

Oral:

$$(RRS_o)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ BW\ x\ (AT_C\ or\ AT_{NC})}{IR_w\ x\ EF\ x\ ED\ x\ [SF_O\ or\ (1/RfD_O)]}$$

Inhalation:

$$(RRS_i)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ (AT_C\ or\ AT_{NC})\ x\ BW}{K\ x\ IR_a\ x\ EF\ x\ ED\ x\ [SF_i\ or\ (1/RfD_I)]}$$

Cancer Effects RRS:

$$RRS_C = \frac{1}{\frac{1}{(RRS_O)_C} + \frac{1}{(RRS_I)_C}}$$

Non-Cancer Effects RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{(RRS_O)_{NC}} + \frac{1}{(RRS_I)_{NC}}}$$

RRS = Minimum result of RRS_C and RRS_{NC}.

where:

AT_C	Averaging time for cancer effects (25,550 days).
AT_{NC}	Averaging time for non-cancer effects (10,950 for adult residents; 2,190 days for child residents; 9,125 days for site workers); ED x 365 days/year.
BW	Body weight (70 kg for adult receptors; 15 kg for child resident).
ED	Exposure duration (30 years for adult resident; 6 years for child resident; 25 years for site worker).
EF	Exposure frequency (250 days/year).
IR_{air}	Inhalation rate (15 m^3/day for residents; 20 m^3/day for site workers).
IR_w	Ingestion rate of drinking water (2 L/day for adult residents; 1 L/day for child residents and site workers) (USEPA 1997a).
K	Volatilization factor for volatile organic compounds (VOCs) from household tap water (0.5 L/m^3) (USEPA 1991).
RfDi	Reference dose for inhalation (mg/kg/day).
RfDo	Reference dose for ingestion (mg/kg/day).
RRS	Risk reduction standard for soil (mg/L); minimum of the RRS_C (based on cancer effects) and the RRS_{NC} (based on non-cancer effects), which are based on the route-specfic RRSs (RRSo for the oral route and RRSi for the inhalation route).
TCR	Target cancer risk (unitless); results presented for TCR value of 10^{-5} (10^{-4} for Class C carcinogens).
THI	Target hazard index (unitless); results presented for THI value of 1.

SAMPLE CALCULATIONS, Tetrachloroethene, Industrial Exposure (Type 4).

CANCER EFFECTS:

Oral:

$$(RRS_O)_C = \frac{10^{-5}\ x\ 70\ kg\ x\ 25{,}550\ days}{1\ L/day\ x\ 250\ days/yr\ x\ 25\ yrs\ x\ (5.4\ x\ 10^{-1}\ kg\text{-}day/mg)}$$

$$= 0.0053\ mg/L$$

Table 8-2
Risk Reduction Standard Equations for Exposure to Groundwater
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

Inhalation:

$$(RRS_I)_C = \frac{10^{-5} \times 70\ kg \times 25{,}550\ days}{0.5\ L/m^3 \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (2.0 \times 10^{-2}\ kg\text{-}day/mg)}$$

$$= 0.014\ mg/L$$

CANCER EFFECTS RRS:

$$RRS_C = \frac{1}{\frac{1}{0.0053\ mg/L} + \frac{1}{0.014\ mg/L}} = 0.0039\ mg/L$$

NON-CANCER EFFECTS:

Oral:

$$(RRS_O)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{1\ L/day \times 250\ days/yr \times 25\ yrs \times [1/1.0 \times 10^{-2}\ mg/kg\text{-}day]}$$

$$= 1.0\ mg/L$$

Inhalation:

$$(RRS_I)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{0.5\ L/m^3 \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (1/7.7 \times 10^{-2}\ kg\text{-}day/mg)}$$

$$= 0.79\ mg/L$$

NON-CANCER EFFECTS RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{1.0\ mg/L} + \frac{1}{0.79\ mg/L}} = 0.44\ mg/L$$

RRS = Minumum result of RRS_C (0.00387 mg/L) and RRS_{NC} (0.445 mg/L) = 0.0039 mg/L

USEPA cancer weight-of-evidence categories are as follows:

Group A: Human Carcinogen (sufficient evidence of carcinogenicity in humans)
Group B: Probable Human Carcinogen
B1 - limited evidence of carcinogenicity in humans
B2 - sufficient evidence of carcinogenicity in animals with inadequate or lack of evidence in humans
Group C: Possible Human Carcinogen (limited evidence of carcinogenicity in animals and inadequate or lack of human da
Group D: Not Classifiable as to Human Carcinogenicity (inadequate or no evidence)
Group E: Evidence of Noncarcinogenicity for Humans (no evidence of carcinogenicity in adequate studies)

[a]	Values are for adult/child exposure. [Vinyl chloride is a carcinogen by mutagenic mode of action (MOA) but should be assessed using two different cancer tox values rather than by using the MOA method (USEPA 2005).]
[b]	Acenaphthene used as a surrogate.

CSF	Cancer Slope Factor; oral (CSFo) and inhalation (CSFi).
kg-day/mg	Kilogram-day per milligram.
mg/kg-day	Milligram per kilogram-day.
NA	Not Available.
RfD	Reference Dose; oral (RfDo) and inhalation (RfDi).
S	Surrogate used to identify toxicity values.

Table 8-10
Soil Screening Level Partitioning Equation for Migration to Groundwater - Type 1 Risk Reduction Standards
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

Equation 10 (USEPA Soil Screening Guidance, 1996):

Screening Level in Soil (mg/kg) = $Cw \times \left\{ K_d + \left[\frac{\theta_w + \theta_a H'}{\rho_b} \right] \right\}$

Cw	Type 1 RRS for groundwater x dilution factor of 20 (mg/L).	=	constituent specific
K_d	soil-water partition coefficient (L/kg).	=	$K_{oc} \times f_{oc}$
K_{oc}	soil organic carbon/water partition coefficient (L/kg).	=	constituent specific
f_{oc}	fraction organic carbon in soil (g/g).	=	0.002
θ_w	water-filled soil porosity (Lwater/Lsoil).	=	0.3
θ_a	air-filled soil porosity (Lair/Lsoil).	=	$n-\theta_w = 0.134$
ρ_b	dry soil bulk density (kg/L).	=	1.5
n	soil porosity (Lpore/Lsoil).	=	$1-(\rho_b/\rho_s) = 0.43$
ρ_s	soil particle density (kg/L).	=	2.65
HLC	Henry's Law Constant (atm-m³/mol).	=	constituent specific
H'	dimensionless Henry's Law Constant (unitless)	=	HLC x 41

[a] Type 2 RRS from Table 8-13.

Boxing indicates maximum soil concentration greater than screening level based on partitioning.

atm =	Atmosphere.	L =	Liter.	mol =	Mole.
GW =	Ground water.	m^3 =	Cubic meter.	RRS =	Risk Reduction Standard.
kg =	Kilogram.	mg =	Milligrams.

Table 8-12
Soil Screening Level Partitioning Equation for Migration to Groundwater - Type 4 Risk Reduction Standards
HAA-15 (MCA Barracks Site)
Hunter Army Airfield, Savannah, Georgia

Equation 10 (USEPA Soil Screening Guidance, 1996):

Screening Level in Soil (mg/kg) = $Cw \times \left\{ K_d + \left[\frac{\theta_w + \theta_a H'}{\rho_b} \right] \right\}$

Cw	Type 1 RRS for groundwater x dilution factor of 20 (mg/L).	=	constituent specific
K_d	soil-water partition coefficient (L/kg).	=	$K_{oc} \times f_{oc}$
K_{oc}	soil organic carbon/water partition coefficient (L/kg).	=	constituent specific
f_{oc}	fraction organic carbon in soil (g/g).	=	0.002
θ_w	water-filled soil porosity (Lwater/Lsoil).	=	0.3
θ_a	air-filled soil porosity (Lair/Lsoil).	=	$n-\theta_w = 0.134$
ρ_b	dry soil bulk density (kg/L).	=	1.5
n	soil porosity (Lpore/Lsoil).	=	$1-(\rho_b/\rho_s) = 0.43$
ρ_s	soil particle density (kg/L).	=	2.65
HLC	Henry's Law Constant (atm-m³/mol).	=	constituent specific
H'	dimensionless Henry's Law Constant (unitless)	=	HLC x 41

[a] Type 4 RRS from Table 8-17.

Boxing indicates maximum soil concentration greater than screening level based on partitioning.

atm =	Atmosphere.	L =	Liter.	mol =	Mole.
GW =	Ground water.	m^3 =	Cubic meter.	RRS =	Risk Reduction Standard.
kg =	Kilogram.	mg =	Milligrams.

Table 8-22b
Type 4 Risk Reduction Standard for Lead in Soil Based on Adult Worker Exposure Scenario
HAA-15 (MCA Barracks Site)
Fort Stewart/Hunter Army Airfield - Savannah, Georgia

$$RRS_{lead} = \left[\frac{(PbB - PbB_b) \times AT}{BSF \times EF} - C_w \times I_w \times A_w \right] (I_s \times A_s)^{-1}$$

where:

$$PbB = \frac{PbB_{fetal}}{GSD^{1.645} \times R}$$

where:

A_s	=	0.12	=	Absolute gastrointestinal absorption factor for ingested lead in soil and lead in dust derived from soil (unitless).
AT	=	365	=	Averaging time (days/year).
A_w	=	0.2	=	Absolute gastrointestinal absorption factor for ingested lead in drinking water (unitless).
BSF	=	0.4	=	Biokinetic slope factor relating increase in typical adult blood lead concentration to average daily lead uptake (µg/dL blood lead increase per µg/day lead uptake).
C_w	=	15	=	Concentration of lead in the groundwater (µg/L, Type 3 risk reduction standard).
EF	=	219	=	Exposure frequency (days/year).
GSD	=	2.04	=	Geometric standard deviation.
I_s	=	0.05	=	Ingestion rate for indoor soil-derived dust (g/day).
I_w	=	1	=	Ingestion rate of groundwater (L/day).
PbB_{fetal}	=	10	=	Goal for the 95th percentile blood lead concentration among fetuses born to female workers exposed to site soils (µg/dL).
PbB	=	Calc.	=	Goal for the cental estimate of blood lead concentration in female workers exposed to site soils, intended to ensure that the fetal blood lead concentration does not exceed 10 µg/dL (µg/dL).
PbB_b	=	1.38	=	Typical blood lead concentration in adults in the absence of site exposures (µg/dL).
R	=	0.9	=	Constant of proportionality between fetal blood lead concentration at birth and maternal blood lead concentration (unitless).
RRS_{lead}	=	Calc.	=	Risk reduction standard for lead in soil based on adult worker exposure (mg/kg).

CALCULATION:

$$PbB = \frac{(10\ \mu g/dL)}{(2.04)^{1.645} \times 0.9} = 3.44\ \mu g/dL$$

$$RGO_{lead} = \left[\frac{(3.44\ \mu g/dL - 1.38\ \mu g/dL) \times (365\ days/year)}{0.4\ (\mu g/dL)/(\mu g/day) \times (219\ days/year)} - 2.8\ \mu g/L \times 1\ L/day \times 0.2 \right] \times (0.05\ g/day \times 0.12)^{-1}$$

$$= 930\ mg/kg$$

Federal- and State-Listed and Candidate Species of Potential Occurrence
HAA-15 (MCA Barracks Site)
Hunter Army Airfield - Savannah, Georgia

Scientific Name	Common Name	Global Rank	State Rank	Federal Status	State Status	Habitat	Habitat Present?
Amphibians							
Ambystoma cingulatum	Frosted Flatwoods Salamander	G2	S2	LT	T	Pine flatwoods; moist savannas; isolated cypress/gum ponds	no
Pseudacris brimleyi	Brimley's Chorus Frog	G5	S1			Moist forests; swamps; bottomlands	no
Rana capito	Gopher Frog	G3	S3		R	Sandhills; dry pine flatwoods; breed in isolated wetlands	no
Stereochilus marginatus	Many-lined Salamander	G5	S3			Sluggish, swampy streams and bayheads with substrate of leaf litter	no
Birds							
Ammodramus maritimus	Seaside Sparrow	G4	S3			Salt marshes	no
Charadrius melodus	Piping Plover	G3	S1	LT	T	Sandy beaches; tidal flats	no
Charadrius wilsonia	Wilson's Plover	G5	S2		T	Sandy beaches; tidal flats	no
Haematopus palliatus	American Oystercatcher	G5	S2		R	Sandy beaches; tidal flats; salt marshes	no
Haliaeetus leucocephalus	Bald Eagle	G5	S2		T	Edges of lakes & large rivers; seacoasts	no
Himantopus mexicanus	Black-necked Stilt	G5	S3			Shallow ponds; lagoons	no
Lanius ludovicianus migrans	Migrant Loggerhead Shrike	G4T3Q	S3			Open woods; field edges	no
Mycteria americana	Wood Stork	G4	S2	LE	E	Cypress/gum ponds; marshes; river swamps; bays	Yes
Nyctanassa violacea	Yellow-crowned Night-heron	G5	S3S4			River swamps; marshes; cypress/gum ponds	no
Nycticorax nycticorax	Black-crowned Night-heron	G5	S4			River swamps; marshes; cypress/gum ponds	no
Passerina ciris	Painted Bunting	G5	S3			Lower coastal plain in thickets, woodland borders, and brushy areas	no
Picoides borealis	Red-cockaded Woodpecker	G3	S2	LE	E	Open pine woods; pine savannas	no
Rynchops niger	Black Skimmer	G5	S1		R	Tidal ponds; sandy beaches	no
Sterna antillarum	Least Tern	G4	S3		R	Sandy beaches; sandbars	no
Tyto alba	Barn owl	G5	S3S4			Georgia habitat information not available	no
Fish							
Acipenser brevirostrum	Shortnose Sturgeon	G3	S2	LE	E	Estuaries; lower end of large rivers in deep pools with soft substrates	no
Acipenser oxyrinchus oxyrinchus	Atlantic Sturgeon	G3T3	S3			Georgia habitat information not available	no
Moxostoma robustum	Robust Redhorse	G1	S1		E	Medium to large rivers, shallow riffles to deep flowing water; moderately swift current	no
Umbra pygmaea	Eastern Mudminnow	G5	S2S3			Sluggish streams, ponds, and sloughs with mud bottoms and heavy vegetation	no
Invertebrates							
Toxolasma pullus	Savannah Lilliput	G2	S2		T	Large rivers to small creeks, oxbows, and sloughs	no
Mammals							
Eubalaena glacialis	Northern Atlantic Right Whale	G1	S1	LE	E	Open ocean	no
Lasiurus intermedius	Northern Yellow Bat	G4G5	S2S3			Wooded areas near open water or fields	no
Pseudorca crassidens	False Killer Whale	G4	SNRN			Open ocean	no
Trichechus manatus	Manatee	G2	S1S2	LE	E	Open ocean; estuaries; tidal rivers	no
Reptiles							
Caretta caretta	Loggerhead Sea Turtle	G3	S2	LT	E	Open ocean; sounds; coastal rivers; beaches	no
Chelonia mydas	Green Sea Turtle	G3	S1	LT	T	Open ocean; sounds; coastal rivers; beaches	no
Clemmys guttata	Spotted Turtle	G5	S3		U	Heavily vegetated swamps, marshes, bogs, and small ponds; nest and possibly hibernate in surrounding uplands	no
Crotalus adamanteus	Eastern Diamond-backed Rattlesna	G4	S4			Early successional habitats on barrier islands and mainland; pine flatwoods; sandhills	no
Dermochelys coriacea	Leatherback Sea Turtle	G2	S1	LE	E	Open ocean; sounds; coastal beaches	no
Gopherus polyphemus	Gopher Tortoise	G3	S2		T	Sandhills; dry hammocks; longleaf pine-turkey oak woods; old fields	no
Lepidochelys kempii	Kemp's or Atlantic Ridley	G1	S1	LE	E	Open ocean; sounds; coastal rivers; beaches	no
Malaclemys terrapin	Diamondback Terrapin	G4	S3		U	Entire coast, estuarine and marine edge; All saltmarsh, beaches	no

Notes:
Global rarity rank: 1 = very rare to 5 = very common globally.
State rarity rank: 1 = very rare to 5 = very common.
State protection status: E = Endangered, T = Threatened, R = Rare, U = Unusual.
U.S. protection status: LE = Listed Endangered, LT = Listed Threatened, Candidate.

Table 9-14

Uncertainties in the Screening-Level and Baseline-Level Ecological Risk Assessments

HAA-15 (MCA Barracks Site)

Hunter Army Airfield - Savannah, Georgia

Assumptions	Description And Discussion Related To Uncertainties in ERA	Uncertainty in SLERA	Uncertainty in BERA
Analytical Sampling and Data Analysis			
Limited number of samples	Frequently, there are only a limited number of samples used in ERAs, and very often they are collected in a biased manner (i.e., targeting "hot spots"). This type of sampling often lacks statistical power and does not likely represent the concentrations in the environment in which wildlife exposure occurs. Similarly, limited data used to estimate uptake into organisms may overestimate exposure via the food web.	Overestimate of exposure and risk	Overestimate of exposure and risk
Use of maximum concentrations	Maximum concentrations are used to represent the upper estimate exposures. This practice compensates for uncertainty contributed by limited numbers of samples, but overestimates exposure and risk.	Overestimate of exposure and risk	Overestimate of exposure and risk
Detection limits	Detection limits may exceed ESVs (e.g., PAHs) or thresholds for adverse impacts are well below the analytical methods used in ERA (e.g., compounds that are known or suspected to cause endocrine effects).	May underestimate risk or effect on risk estimate unknown	May underestimate risk or effect on risk unknown
Degradation of chemicals not considered	ERAs are almost exclusively based on concentrations of target compounds, and little if any attention is given to degradation compounds that could be more toxic than the original chemical. Conversely, chemical concentrations may decrease over time due to natural physical processes.	Effect on risk estimate unknown	Effect on risk estimate unknown
Selection of COPCs			
Background concentrations	Chemicals may be identified as COPCs despite the fact that the detected concentrations are less than background concentrations. This occurs because the ERA process does not permit use of background until Step 3a of the BERA (USEPA 2001a; 2000).	Overestimate of risk	Not Applicable
Toxicology and ESVs			
Toxicity and exposure data for a limited number of species	Uncertainties exist in many aspects of the toxicology relied upon for conducting ERAs (Newman 1998; Lovett Doust et al. 1993). Toxicity and wildlife exposure data are only available for a limited number of species (most of them laboratory test species) under a strictly defined set of test conditions that deviate from natural conditions (Sample et al. 1996; Suter 1996; Sample et al. 1997).	Effect on risk estimate unknown	Effect on risk estimate unknown
Laboratory testing	In current practice, more than 95 percent of the resources in toxicology are focused toward the study of single chemicals (Cassee et al. 1998), while wildlife exposures rarely occur on a chemical-specific basis. Simplistic extrapolations from laboratory species to wildlife species and testing conditions to field conditions are not likely accurate, and are rarely, if ever, validated against natural conditions (Power 1996; Tannenbaum 2003).	Effect on risk estimate unknown	Effect on risk estimate unknown
Adaptation and tolerance	There is little consistency and no quantitative methodology for the consideration of the diminished bioavailability (and, thereby, diminished toxicity) even though this process is well documented (e.g., Alexander and Alexander 1999; Alexander 2000). Similarly, tolerance and adaptation are not considered directly (Millward and Klerks 2002; Grant 2002). Furthermore, the white rat often used in toxicological testing is bred to minimize differences between lab animals, thereby diminishing the genetic variability that gives wildlife some capability for adaptation and tolerance (Tannenbaum 2003).	Overestimate of risk	Overestimate of risk
Predator-prey interactions	There are relatively few studies that actually evaluate the effects of toxicity on predator-prey interactions, or on competition for scarce resources (Atchison et al. 1996), the very conditions within which all wildlife exists (Kapustka and Landis 1998).	Effect on risk estimate unknown	Effect on risk estimate unknown

Table 9-14

Uncertainties in the Screening-Level and Baseline-Level Ecological Risk Assessments

HAA-15 (MCA Barracks Site)

Hunter Army Airfield - Savannah, Georgia

Assumptions	Description And Discussion Related To Uncertainties in ERA	Uncertainty in SLERA	Uncertainty in BERA
HQs			
HQs based on maximum	The SLERA HQ is based on the maximum detected concentrations and the most conservative ESVs available (USEPA 1997; 2000). HQs in the BERA are based on the exposure point concentration (minimum of the 95% upper confidence limit on the mean and the maximum concentration).	Overestimate of risk	Overestimate of risk
Elevated HQs for background concentrations	HQs may exceed a value of 1 for background concentrations of naturally occurring metals (Tannenbaum 2003). This is due to many of the toxicology and ESV uncertainties already discussed.	Overestimate of risk	Overestimate of risk
Interpretation of HQs	An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely (USEPA 2001c). However, there is no clear guidance for interpreting the HQs that exceed a value of 1, except that this point of departure indicates that adverse effects of some kind may have occurred or may occur in the future.	Effect on risk estimate unknown	Effect on risk estimate unknown
HQs for individual used to evaluate risks to populations	HQs are based on the types of impacts that could occur to individuals (i.e., those individuals exposed to maximum concentrations) and they completely fail to address ecological exposure and risk at spatial scale of populations (Tannenbaum 2003; Durda and Preziosi 1999).	Overestimate of risk to wildlife populations	Overestimate of risk to wildlife populations
HQs with unrealistic magnitudes	HQs are seen at magnitudes that suggest that every animal should die upon acute exposure (i.e., in the hundreds or thousands) (Tannenbaum et al. 2003). Often, physical conditions at a site demonstrate that this is not the case.	Overestimate of risk	Overestimate of risk
No evaluation of dermal or inhalation pathways	The dermal and inhalation exposure pathways are generally considered “insignificant” due to protective fur and feathers. Under certain conditions, these exposure pathways may occur, but adequate information is rarely available by which to evaluate them.	Not Applicable	Potentially an underestimate of risk

BERA	Baseline Ecological Risk Assessment.
COPC	Constituent of potential concern.
ERA	Ecological risk assessment.
ESV	Ecological screening value.
HQ	Hazard quotient.
PAH	Polynuclear aromatic hydrocarbon.
RTV	Reference toxicity value.
SLERA	Screening level ecological risk assessment.

Notes:

– Not available or applicable.

mg/kg Milligrams per kilogram.

[a] Exposure point concentration (EPCs) are the minimum of the upper confidence limit (UCL) on the mean and the maximum concentration. EPCs marked with "m" are the maximum concentration.

[b] Background concentrations were from the Revised Final Compliance Status Report for the Fire Training Station at HAAF (Law, 2002).

[c] Alternative ecological soil screening values were from the following source:
USEPA Region 5 Ecological Screening Levels (USEPA 2003a; R5).

[d] The refined hazard quotient (HQ) is the ratio of the EPC to the screening level. HQs are rounded to one significant figure.

[e] Constituents with a refined hazard quotient (HQ) greater than 1 (HQ > 1) or without a screening level (NSL) were considered constituents of potential ecological concern (COPECs) for baseline level assessment.

[f] The following source was consulted to identify bioaccumulation potential: USEPA (2000b).

* Mercury is not on USEPA's list of bioaccumulative constituents, however methyl mercury is so mercury was considered a bioaccumulative constituent in this assessment.

LEGEND

- ◆ Groundwater Vertical Profile
- 15' Sample Depth (feet below ground surface)
- (ND) Duplicate Data

NOTES:
1) All soil concentrations reported in milligrams per kilogram (mg/kg).
2) Samples were taken between October 2005 and February 2006.
3) **BOLD** concentration exceeds Type I Risk Reduction Standard.
4) Concentrations shown are those detected above the practical quantitation limit (PQL).
5) J values are estimated.
6) U values indicate the analyte was not detected above the reporting limit.
7) ND – Not detected above PQL.
8) Data presented includes samples taken in both the shallow and deep zones of the upper aquifer.

PROJECT INFORMATION

Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
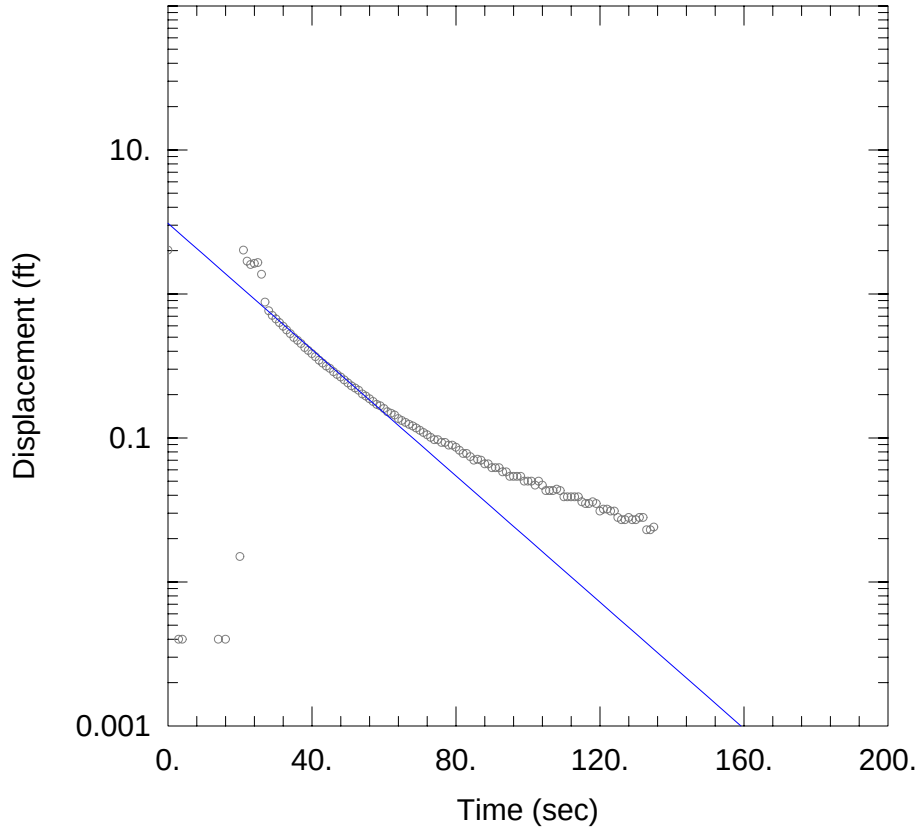
Test Well: HGL-6B(in)1
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice



K = 4.605 ft/day
y0 = 3.093 ft

AQUIFER DATA

Saturated Thickness: 17.9 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-6B(in)1)

Initial Displacement: 1.447 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25
Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 17.9 ft

HUNTER AAF MCA BARRACKS

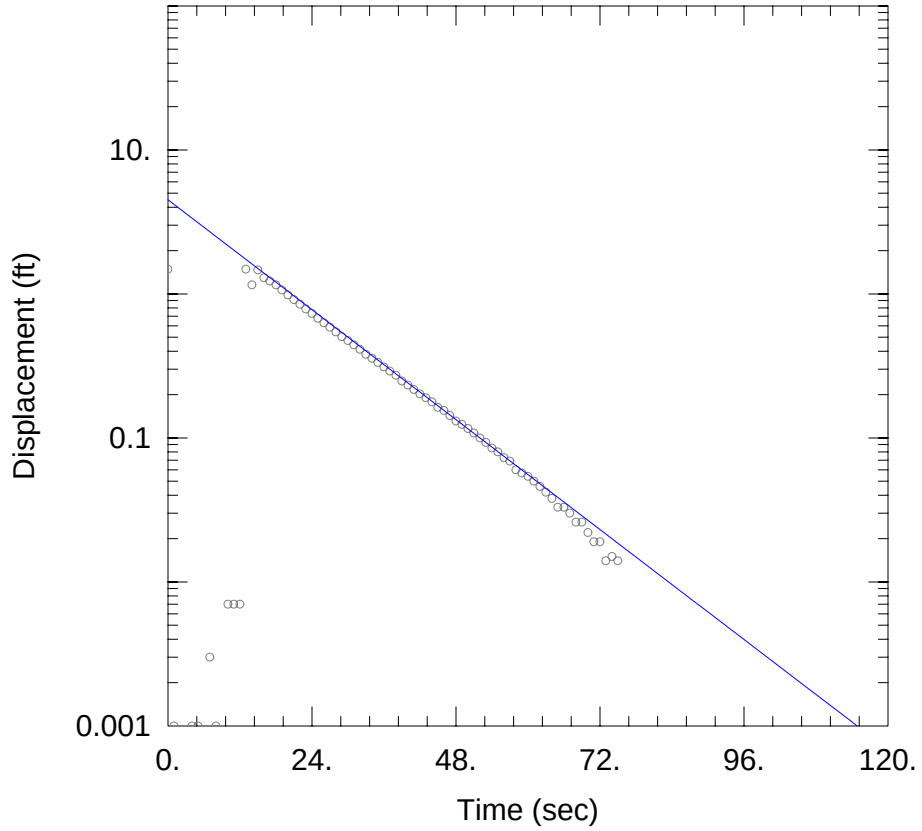
Data Set: \...\HGL6-B(in)2.aqt
Date: 01/19/07 Time: 13:09:17

PROJECT INFORMATION

Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
Test Well: HGL-6B(in)2
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice



K = 3.848 ft/day
y0 = 3.095 ft

AQUIFER DATA

Saturated Thickness: 17.9 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-6B(in)2)

Initial Displacement: 2.014 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25
Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 17.9 ft

HUNTER AAF MCA BARRACKS

Data Set: \...\HGL6-B(out)1.aqt
Date: 01/19/07 Time: 13:08:35

PROJECT INFORMATION

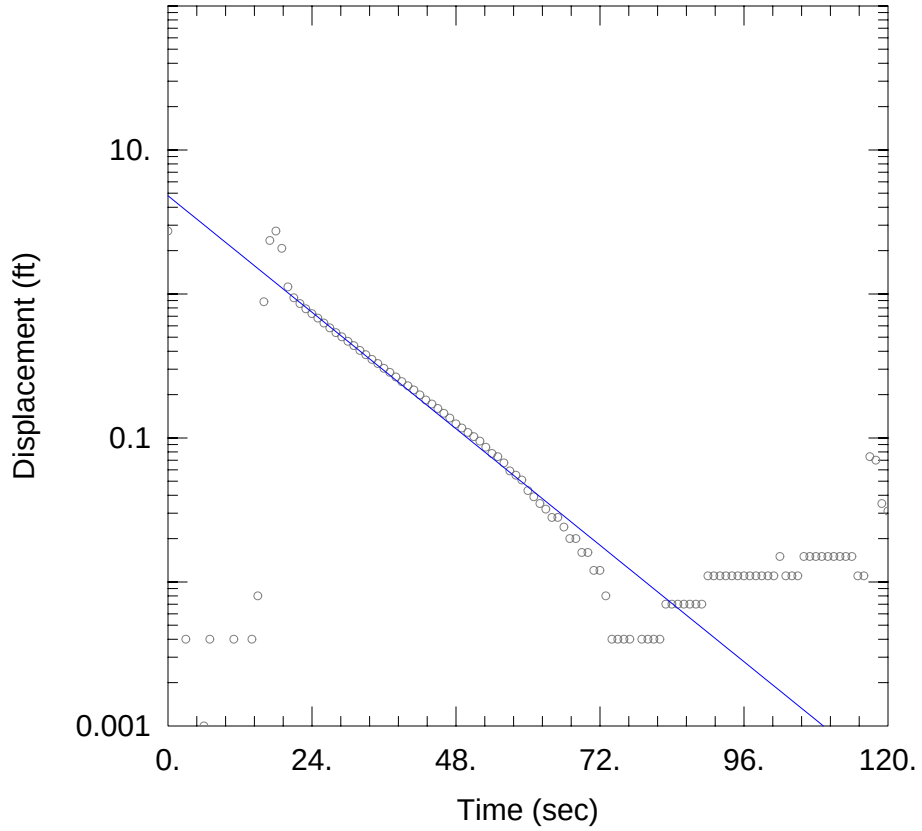
Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
Test Well: HGL-6B(out)1
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 5.581 ft/day
y0 = 4.504 ft

AQUIFER DATA



Saturated Thickness: 17.9 ft

Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-6B(out)1)

Initial Displacement: 1.483 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25

Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 17.9 ft

HUNTER AAF MCA BARRACKS

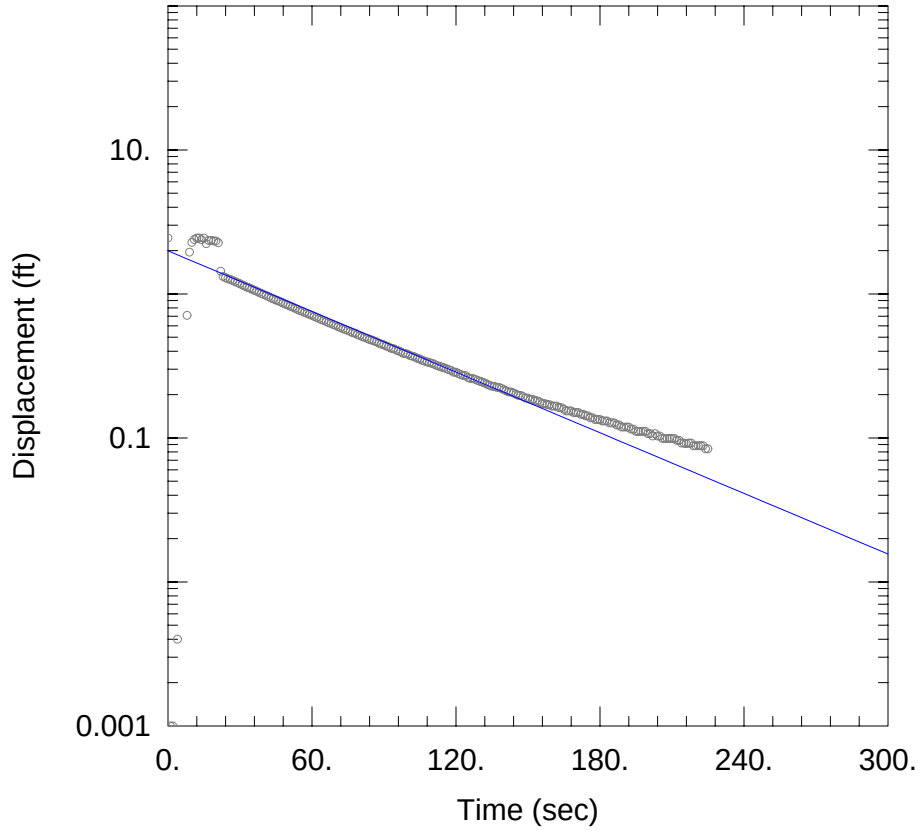
Data Set: \...\HGL6-B(out)2.aqt
Date: 01/19/07 Time: 13:08:02

PROJECT INFORMATION

Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
Test Well: HGL-6B(out)2
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice



K = 5.915 ft/day
y0 = 4.803 ft

AQUIFER DATA

Saturated Thickness: 17.9 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-6B(out)2)

Initial Displacement: 2.727 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25
Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 17.9 ft

HUNTER AAF MCA BARRACKS

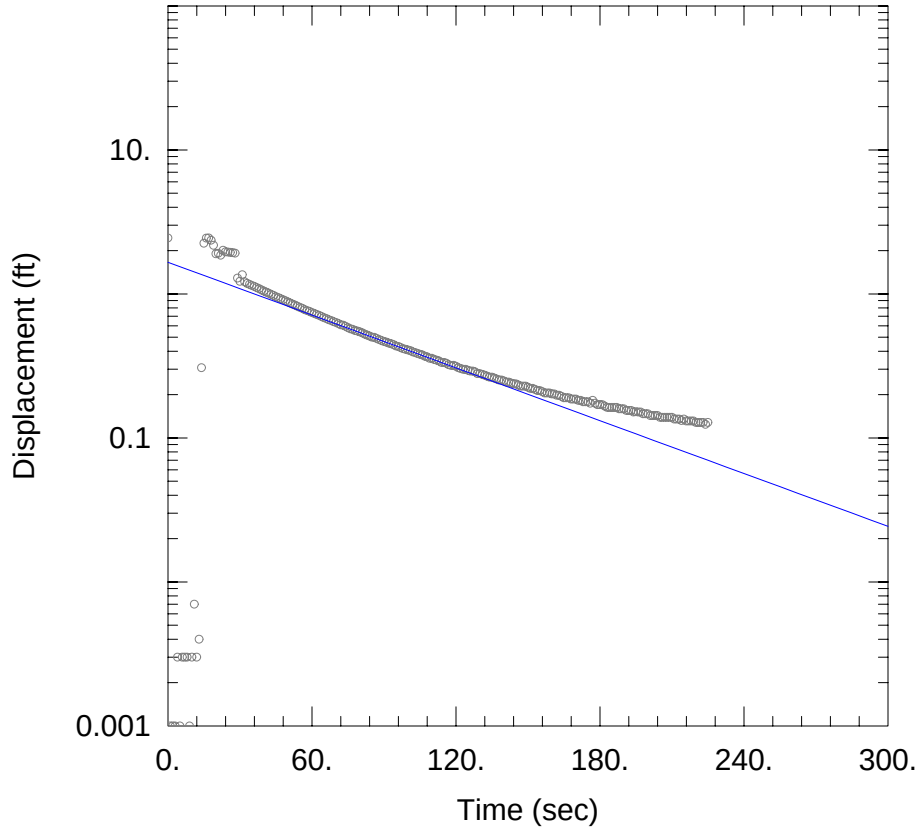
Data Set: \...\HGL7-Bin1.aqt
Date: 01/19/07 Time: 12:59:31

PROJECT INFORMATION

Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
Test Well: HGL-7B(in)1
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice



K = 1.273 ft/day
y0 = 1.992 ft

AQUIFER DATA

Saturated Thickness: 20.85 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-7B(in)1)

Initial Displacement: 2.446 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25
Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 20.85 ft

HUNTER AAF MCA BARRACKS

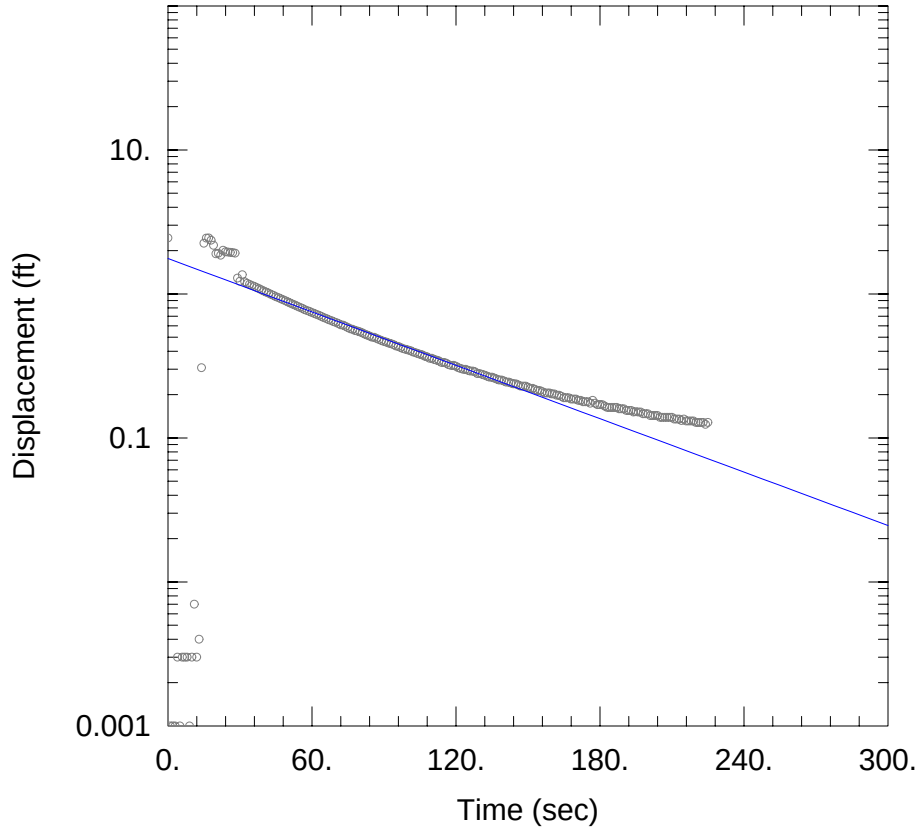
Data Set: \...\HGL7-Cin1.aqt
Date: 01/19/07 Time: 13:29:38

PROJECT INFORMATION

Company: HydroGeoLogic
Client: USACE-Savannah
Project: OMA009-001-02-02-02
Test Location: Hunter AAF
Test Well: HGL-7C(in)1
Test Date: March 30, 2006

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice



K = 1.231 ft/day
y0 = 1.69 ft

AQUIFER DATA

Saturated Thickness: 32.1 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (HGL-7C(in)1)

Initial Displacement: 2.446 ft
Wellbore Radius: 0.5 ft
Screen Length: 10. ft
Gravel Pack Porosity: 0.25
Casing Radius: 0.083 ft
Well Skin Radius: 0.5 ft
Total Well Penetration Depth: 32.1 ft

HUNTER AAF MCA BARRACKS

Borehole Log

Depth Interval (ft)	Description	Ft. Rec.	USCS Soil	PID (ppm)
46-48	Silty **SAND** with trace amounts of clay, very fine to medium grain size, soft, subangular, moist, well sorted, greenish gray (GLEY1 5/1)		SM	7.1
51-53	Silty clayey **SAND** with trace quartz, very fine grained to small pebble (river gravel), round to angular, poorly sorted, increasing clay near 52.5-53,		SM	9.4
	and at 53 a very organic clay lens, very dark brown (7.5 YR 2.5/2); colors: 51-52 dark gray (GLEY1 4) and 52-53 very dark gray (GLEY1 3)			
56-56.3	River gravel (possible sloghing on top of spoon sample), small pebble, round to subround, various colors		---	1.1
56.3-56.4	Silty **CLAY**, plastic, cohesive, very dark gray (GLEY1 3)		CL	
56.4-57	Silty clayey **SAND**, very fine grain, round, well sorted, medium stiff, moist, rapid dilatancy, very dark gray (GLEY1 3/)		SM	
57-57.3	River gravel, small pebble, round to subround, various colors		---	
57.3-58	Silty **SAND** with trace amounts of clay and phosphate, very fine grain size, soft, round moist, well sorted, dark gray (GLEY1 3/)		SM	
61-63	River gravel (possible sloghing on top of spoon sample) and some silty clayey sand, very fine, small pebble (river gravel),		---	0.0
	round to subround, various colors			
66-66.2	River gravel (possible sloghing on top of spoon sample), small pebble, round to subround, various colors		---	0.3
66.2-68	Silty clayey **SAND**, very fine grain, round, poorly sorted, very soft, moist, rapid dilatancy, very dark gray (GLEY1 3/)		SM	
	Silty **CLAY** lenses 66.4-66.5, 67.3-67.4, and 66.9-67 - clay is plastic, cohesive, very dark gray (GLEY1 3/)		CL	
71-72	Silty sandy **CLAY** and silty **CLAY**, poorly sorted, moist, medium stiff, brittle, nonplastic, not cohesive, dark greenish gray (GLEY1 4/)		CL	0.5
72-73	Silty **CLAY**, firm, brittle, nonplastic, not cohesive, dry, very dark greenish gray (GLEY1 4/1)		CL	
76-78	Silty clayey **SAND**, very fine grain, round, well sorted, very soft, moist, rapid dilatancy, very dark gray (GLEY1 3/)		SM	0.1
81-83	Silty clayey **SAND**, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenishgray (GLEY1 4/1)		SM	0.2
86-88	Silty clayey **SAND**, weak cementation, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.0
91-93	Silty clayey **SAND**, weak cementation, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.1
96-98	Silty clayey **SAND**, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.0
101-103	Silty clayey **SAND**, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.0
106-106.8	Silty clayey **SAND**, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.0
106.8-107.4	Interphase zone going to silty sandy **CLAY** (see next lithology description)		SM/CL	
107.4-108	Silty sandy **CLAY**, nonplastic, not cohesive, brittle, dry, very dark greenish gray (GLEY1 3/1)		CL	
111-111.8	Silty sandy **CLAY**, noncohesive, brittle, dry, very dark greenish gray (GLEY1 3/1)		CL	0.2
111.8-112	Silty **CLAY**, noncohesive, brittle, dry, very dark gray (GLEY1 3/)		CL	
112-113	Silty sandy **CLAY**, nonplastic, not cohesive, brittle, dry, very dark greenish gray (GLEY1 3/1)		CL	
116-118	Silty clayey **SAND**, very fine grain, round, well sorted, stiff, moist, slow dilatancy, dark greenish gray (GLEY1 4/1)		SM	0.2
123-125	Silty **CLAY**, plastic, well sorted, low plasticity, dark gray-tan		CL

Attention: Scott Bostian

Subject: Laboratory Testing Services, Hunter Army Airfield
Fort Stewart, GA, Project #GP08HAFS.H15C.GG0FI

Gentlemen:

As requested, laboratory testing has been completed on the thirteen soil samples provided by your firm. Twelve samples were received on August 22, 2011 and one sample was received on September 2, 2011 as shown on the attached chain of custody forms. The samples were sealed in 1 gallon-size plastic bags and labeled with the designation H15-MW-02E or H15-MW-20E and the depth.

Particle-size distributions were determined in general accordance with ASTM Standard D422 "Particle-Size Analysis of Soils" using sieves consistent with the Udden-Wentworth Grain-Size Classification System. The results are presented on the attached Particle-size Analysis Test Reports. Sample descriptions and group symbols shown on the test reports are in general accordance with ASTM Standard D2487 "Classification of Soils for Engineering Purposes (Unified Soil Classification System)". The percentages of soil within each Udden-Wentworth grain-size range are shown on Table 1.

The test samples were reported to be from the client-specified designations herein. The test results are indicative of only the specimens that were actually tested. The test results presented are based upon accepted industry practice as well as the test method(s) listed. Ardaman & Associates, Inc. neither accepts responsibility for, nor makes claims to the final use and purpose of the test results.

Please contact us if you have any questions about the test results or require additional information.

Very truly yours,
ARDAMAN & ASSOCIATES, INC.

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory with acceptable temperatures and properly preserved.

Qualification: None required.

Holding Times – The samples were analyzed within the required holding times for water samples.

Qualification: None required.

Laboratory Control Samples – The %R results met established control limits.

Qualification: None required.

MS/MSD – Matrix spike/matrix spike duplicate analyses were not performed on a HydroGeoLogic sample.

Qualification: None required.

ICP Method and Calibration Blanks – The method blanks associated with the samples in this SDG were contaminated with iron. The highest associated blank contamination were 0.05602 mg/L of iron (MB) leading to an action level of 0.2801 mg/L. The associated iron detections are greater than the action level and no qualification is necessary.

Qualification: None required.

Equipment Blank – No equipment blank is associated with the samples in this SDG.

Qualification: None required.

Field Duplicate – A field duplicate was not submitted with the samples in this SDG.

Qualification: None required.

Laboratory Duplicate – Laboratory duplicate analysis was not performed on a sample from this SDG.

Qualification: None required.

ICP Serial Dilutions – Serial dilutions were not performed on a sample from this SDG.

Qualification: None required.

Compound Quantitation – Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the required holding times for soil and water samples.

Qualification: None required.

Surrogates – All surrogate recoveries were within established control limits.

Qualification: None required.

Laboratory Control Samples – Two LCS are associated with the environmental samples is this SDG and the %Rs met the established control limits.

Qualification: None required.

MS/MSD – MS/MSD analyses were not performed on a sample from this SDG and no qualification is necessary.

Qualification: None required.

Method Blanks – The two method blanks associated with the samples were free from contamination.

Qualification: None required.

Trip Blanks – Trip blank TB031306 is associated with the samples in this SDG and was free from contamination.

Qualification: None required.

Equipment Blanks – Equipment blanks EB030806, EB030906, EB031006, EB031106 and EB031206 are associated with the samples in this SDG and were free from contamination.

Qualification: None required.

Field Duplicate – Sample MCA-GWDUP201-0306 is a field duplicate of sample MCA-GWHGL-10B-0306. The %D met the QC criteria and no qualification is necessary.

Qualification: None required.

Compound Quantitation – Results detected between the MDL and the Practical Quantitation Limit (PQL) have been qualified J. A secondary dilution was run on sample MCA-GWXX-21-0306 due to the high level of cis-1,2-dichloroethene and trichloroethene and on sample MCA-GWXX-22-0306 due to the high level of trichloroethene detected in the sample. The results and reporting limits were adjusted to account for the dilution performed.

Qualification Summary Table: (All values reported in µg/L.)

No qualification required

Wet Chemistry
Sulfate (E300.0), Nitrate+Nitrite (E353.2), Alkalinity (E310.1),

MCA-GWHGL-9C-0306	245017-22	176364/176879/176835/176053/176648	Water

Note: Control limits for wet chemistry analyses are not presented in the project specific QAPP. For this reason, the laboratory's internal QC limits will be employed for evaluation of the data.

Sample Delivery and Condition – The sample arrived at the laboratory in acceptable condition and temperature, and was properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – The sample was analyzed within the required holding times.

Qualification: None required.

Method Blanks - The method blanks were all free from contamination with the exception of the phosphorous method blank associated with batch 176053. The highest associated blank contamination was 0.008 mg/L of phosphorous, leading to an action level of 0.04 mg/L. All phosphorus results are greater than the action level and no qualification is required.

Qualification: None required.

Rinsate Blanks – A rinsate blank is not associated with the sample in this SDG.

Qualification: None required.

Laboratory Control Samples - All LCSs had acceptable recoveries.

Qualification: None required.

MS/MSD - MS/MSD analyses were performed on sample MCA-GWHGL-2C-0306 for sulfate and Nitrate+Nitrite. The %Rs and calculated RPDs met the QC criteria with the exception of a low %R Nitrate+Nitrite in the MSD and a high RPD for the MSD. All associated Nitrate+Nitrite results in batch 175819 are non-detect and should be UJ qualified.

Qualification: **Nitrate+Nitrite was qualified UJ in all samples analyzed in batch 175819.**

Field Duplicates - A field duplicate was not submitted with the sample in this SDG.

Qualification: None required.

Compound Quantitation - Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Qualification Summary Table – (Units in mg/L)

MCA-GWHGL-9B-0306	661282	Water
MCA-GWHGL-9C-0306	661283	Water

Note: Control limits for dissolved gas analyses are not presented in the project specific QAPP. For this reason, the laboratory's internal QC limits will be employed for evaluation of the data.

Sample Delivery and Condition – The sample arrived at the laboratory in acceptable condition and temperature, and was properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – The sample was analyzed within the required holding times.

Qualification: None required.

Method Blanks - The method blanks were all free from contamination.

Qualification: None required.

Rinsate Blanks – A rinsate blank is not associated with the sample in this SDG.

Qualification: None required.

Laboratory Control Samples - All LCSs had acceptable recoveries.

Qualification: None required.

MS/MSD - MS/MSD analyses were not performed on a HydroGeoLogic sample.

Qualification: None required.

Field Duplicates – A field duplicate was not submitted with this SDG.

Qualification: None required.

Compound Quantitation - Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Qualification Summary Table – (Units in µg/L).

No qualification necessary.

Metals Analysis (6010B)

MCA-GWHGL-7B-0306	245096-8	Water
MCA-GWHGL-7C-0306	245096-9	Water

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory with acceptable temperatures and properly preserved.

Qualification: None required.

Holding Times – The samples were analyzed within the required holding times for water samples.

Qualification: None required.

Laboratory Control Samples – The %R results met established control limits.

Qualification: None required.

MS/MSD – MS/MSD analyses were performed on sample MCA-GWHGL-5B-0306. The %Rs and calculated RPDs met the QC criteria with the exception of aluminum and iron. Iron was present in the original sample four times greater than the spike concentration and requires no qualification. Aluminum detects were J qualified in all water samples.

Qualification: **Aluminum detects were J qualified.**

ICP Method and Calibration Blanks – The method blanks associated with this SDG was contaminated with iron. The action level based on the highest detect in the blanks is 0.28 mg/L of iron. All associated samples have iron results greater than the action level and no qualification was necessary.

Qualification: None required.

Equipment Blank – No equipment blank was included for metals analyses in this SDG.

Qualification: None required.

Field Duplicate – No field duplicate was included in this SDG.

Qualification: None required.

Laboratory Duplicate – Lab duplicate analysis was performed on a sample MCA-GWHGL-5B-0306. The %D met the QC criteria.

Qualification: None required.

ICP Serial Dilutions – Serial dilutions were performed on sample MCA-GWHGL-5B-0306. The %D met the QC criteria with the exception of aluminum. Aluminum detects were J qualified and non-detects were UJ qualified for all samples.

***Qualification:* Aluminum detects were J qualified and non-detects were UJ qualified for all samples.**

Compound Quantitation – Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Qualification Summary Table: (All values reported in mg/L.)

Sample ID	Analyte	Lab Val	Lab Qual	HGL Val	HGL Qual

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the required holding times for water samples.

Qualification: None required.

Surrogates – All surrogate recoveries were within established control limits.

Qualification: None required.

Laboratory Control Samples – The LCS %Rs met the established control limits.

Qualification: None required.

MS/MSD – No MS/MSD analyses was performed on a sample from this SDG.

Qualification: None required.

Tuning – All relative abundance criteria was met for the environmental samples in this SDG and no qualification is necessary.

Qualification: None required.

Internal Standard Performance – All internal standards met area and retention time criteria for the environmental samples in this SDG and no qualification is necessary.

Qualification: None required.

Initial Calibration – One initial calibration is associated with the environmental samples in this SDG. The initial calibration had acceptable mean RRFs for all SPCCs and %RSDs for all CCCs [note: an r^2 value was presented for CCC 1,1-dichloroethene; raw data was not provided and the %RSD value could not be recalculated]. All target analytes had %RSDs below 15% or were quantified using a calibration curve with $r^2 > 0.990$.

Qualification: None required

Initial Calibration Verification – All %Rs met the established control limits with the exception of low %R for dichlorodifluoromethane, carbon disulfide, and 1,2-dibromo-3-chloropropane and high %R for acetone.

Qualification: **Dichlorodifluoromethane, carbon disulfide, 1,2-dibromo-3-chloropropane, and acetone detects were J qualified and non-detects were UJ qualified.**

Continuing Calibration Verification – All %Ds and RRFs met the established control limits.

Qualification: None required.

Method Blanks – The method blanks associated with the samples were free from contamination.

Qualification: None required.

Trip Blanks – Trip blank TB031506 is associated with the samples in this SDG and was free from contamination.

Qualification: None required.

Equipment Blanks – Equipment blanks EB031306 and EB031406 are associated with the water samples in this SDG and were free of contamination with the exception of 2.9J µg/L and 2.4J µg/L acetone, respectively. Water samples with detections below the action level of 29 µg/L for acetone (collected 3.13.06) or 24 µg/L (collected 3.14.06) were U qualified.

Qualification: **Water samples with detections below the action level of 29 µg/L for acetone were U qualified.**

Field Duplicate – No field duplicate was included in this SDG.

Qualification: None required.

Compound Quantitation – Results detected between the MDL and the Practical Quantitation Limit (PQL) have been qualified J. Samples MCA-GWHGL-7B-0306 and MCA-GWHGL-7C-0306 required secondary dilutions due to high levels of trichloroethene. The water results and reporting limits were adjusted to account for the dilutions performed.

Qualification Summary Table: (All values reported in µg/L.)

Sample ID	Analyte	Lab Val	Lab Qual	HGL Val	HGL Qual
MCA-GWHGL-5B-0306	Dichlorodifluoromethane	1.0	U	1.0	UJ

Level II QC Review

Site: Hunter AAF	SDG #: 245170
Laboratory: STL – Chicago	Date: 5/12/06
HydroGeoLogic, Inc. Reviewers: Carol Cady/Ken Rapuano 8.26.06	Project: OMA009-001-02-02-03

Client Sample ID	Laboratory Sample ID	Matrix
MCA-GWHGL-3B-0306	245170-2	Water
MCA-GWHGL-3C-0306	245170-3	Water
MCA-GWHGL-8B-0306	245170-4	Water
MCA-GWHGL-8C-0306	245170-5	Water
MCA-GWHGL-4B-0306	245170-8	Water
MCA-GWHGL-4C-0306	245170-9	Water
MCA-GWHGL-6B-0306	245170-10	Water
MCA-GWHGL-6C-0306	245170-11	Water

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory with acceptable temperatures and properly preserved.

Qualification: None required.

Holding Times – The samples were analyzed within the required holding times for water samples.

Qualification: None required.

Laboratory Control Samples – The %R results met established control limits.

Qualification: None required.

MS/MSD – Matrix spike/matrix spike duplicate analyses was performed on MCA-GWHGL-3B-0306 and MCA-GWHGL-4B-0306. The %Rs and RPDs met the QC criteria with the exception of a high %R aluminum in the MS and MSD. Calcium and iron were outside the QC criteria, but the analytes were present in the original sample greater than four times the spiked amount so qualification was required. All associated aluminum results should be J qualified and no qualification is necessary on non-detects.

***Qualification:* Aluminum detections were qualified J in all associated samples.**

ICP Method and Calibration Blanks – The method blank associated with the samples in this SDG were contaminated with calcium. The highest associated blank contamination concentrations were 0.1184 mg/L of calcium (MB), leading to an action level of 0.592 mg/L; 0.03057 mg/L aluminum, leading to an action level of 0.15285 mg/L; and 0.00073 mg/L manganese, leading to an action level of 0.00365 mg/L. The associated

metals detections are greater than the action levels, with the exception of the aluminum result in sample MCA-GWHGL-8C-0306.

Qualification: **The aluminum result in sample MCA-GWHGL-8C-0306 is qualified U. Due to the discrepancies in the associated MS/MSD, the final qualifier is UJ**

Equipment Blank – No equipment blank is associated with the samples in this SDG.

Qualification: None required.

Field Duplicate – A field duplicate was not submitted with the samples in this SDG.

Qualification: None required.

Laboratory Duplicate – Laboratory duplicate analysis was performed on MCA-GWHGL-3B-0306 and MCA-GWHGL-4B-0306. The RPDs met the QC criteria and no qualification is necessary.

Qualification: None required.

ICP Serial Dilutions – Serial dilutions were performed on MCA-GWHGL-3B-0306 and MCA-GWHGL-4B-0306. The %Ds met the QC criteria and no qualification is necessary.

Qualification: None required.

Compound Quantitation – Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Qualification Summary Table: (All values reported in µg/L.)

Sample ID	Analyte	Lab Val	Lab Qual	HGL Val	HGL Qual
MCA-GWHGL-3B-0306	Aluminum	0.75		0.75	J
MCA-GWHGL-3C-0306	Aluminum	0.43		0.43	J

TB031706	245170-14	Water

Narrative and Completeness Review – The case narrative was reviewed and the package was checked for completeness. No discrepancies noted.

Qualification: None required.

Sample Delivery and Condition – The samples arrived at the laboratory in acceptable condition. Proper custody was documented.

Qualification: None required.

Holding Times – All samples were analyzed within the required holding times for water samples with the exception of the reanalysis of sample MCA-GWHGL-3B-0306 which was analyzed 4 days past the recommended hold time.

Qualification: **All MCA-GWHGL-3B-0306 reanalysis detects are J qualified and non-detects are UJ qualified.**

Surrogates – All surrogate recoveries were within established control limits.

Qualification: None required.

Laboratory Control Samples – Three LCS are associated with the environmental samples is this SDG and the %Rs met the established control limits.

Qualification: None required.

MS/MSD – MS/MSD analyses were performed on MCA-GWHGL-3B-0306 and MCA-GWHGL-4B-0306S. Due to the poor match between the MS and MSD, the both parent samples and MS/MSD pairs were reanalyzed. The original results for MCA-GWHGL-4B-0306S matched the reanalysis. However, the original results for MCA-GWHGL-3B-0306 did not match the reanalysis. MCA-GWHGL-3B-0306 was reanalyzed again with the results only matching the initial reanalyzed sample. It is suspected that the original analysis of MCA-GWHGL-3B-0306, the MSD for MCA-GWHGL-3B-0306, and the MS for MCA-GWHGL-4B-0306S were contaminated with a vial or syringe carry over.

Qualification: **The reanalyzed results for sample MCA-GWHGL-3B-0306 are considered the definitive results for this sample.**

Method Blanks – The three method blanks associated with the samples were free from contamination.

Qualification: None required.

Trip Blanks – Trip blank TB031706 is associated with the samples in this SDG and was free from contamination.

Qualification: None required.

Equipment Blanks – Equipment blanks EB031506, EB031606, and EB031706 are associated with the samples in this SDG and were free from contamination.

Qualification: None required.

Field Duplicate – Sample MCA-GWDUP202-0306 is a field duplicate of sample MCA-GWHGL-8B-0306 and sample MCA-GWDUP203-0306 is a field duplicate of sample MCA-GWHGL-6B-0306. The %D met the QC criteria and no qualification is necessary.

Qualification: None required.

Compound Quantitation – Results detected between the MDL and the Practical Quantitaion Limit (PQL) have been qualified J. A secondary dilution was run on sample MCA-GWHGL-6C-0306 due to the high level of trichloroethene. The results and reporting limits were adjusted to account for the dilution performed.

Qualification Summary Table: (All values reported in µg/L.)

Sample ID	Analyte	Lab Val	Lab Qual	HGL Val	HGL Qual
MCA-GWHGL-3B-0306 (original analysis)	All analytes	Varies	U / ---	Varies	UX / X
MCA-GWHGL-3B-0306 (reanalysis)	All analytes	Varies	U / ---	Varies	UJ / J

Note: This table only shows qualifications of analytes for QC discrepancies. See the data reporting forms for those detections below the PQL which are qualified J.

Note: Control limits for wet chemistry analyses are not presented in the project specific QAPP. For this reason, the laboratory's internal QC limits will be employed for evaluation of the data.

Sample Delivery and Condition – The sample arrived at the laboratory in acceptable condition and temperature, and was properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – The sample was analyzed within the required holding times.

Qualification: None required.

Method Blanks - The method blanks were all free from contamination with the exception of the alkalinity method blank associated with batch 176556. The highest associated blank contamination was 2.55B mg/L of alkalinity, leading to an action level of 12.75 mg/L. All alkalinity results are greater than the action level and no qualification is required.

Qualification: None required.

Rinsate Blanks – A rinsate blank is not associated with the sample in this SDG.

Qualification: None required.

Laboratory Control Samples - All LCSs had acceptable recoveries.

Qualification: None required.

MS/MSD - MS/MSD analyses were performed on sample MCA-GWHGL-3B-0306 for sulfate, Nitrate+Nitrite, phosphorous, and TOC. MS/MSD analyses were performed on sample MCA-GWHGL-4B-0306 for Nitrate+Nitrite, phosphorous, and TOC. The %Rs and calculated RPDs met the QC criteria with the exception of a low %R phosphorous in a MS and a high RPD. The phosphorus result associated with Batch 177175 is detect and should be J qualified

Qualification: **Phosphorus was qualified J in sample MCA-GWHGL-4B-0306.**

Field Duplicates - A field duplicate was not submitted with the sample in this SDG.

Qualification: None required.

Laboratory Duplicate – The alkalinity laboratory duplicate performed on sample MCA-GWHGL-4B-0306 (associated with Batch 176556) had an RPD of 30.7%, which is above the control limit of 20%.

Qualification: **All alkalinity results associated with batch 176556 are qualified J (detections) or UJ (non-detections).**

Compound Quantitation - Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results.

Qualification Summary Table – (Units in mg/L).

Sample ID	Analyte	Lab Val	Lab Qual	HGL Val	HGL Qual
MCA-GWHGL-3B-0306	No qualification required				
MCA-GWHGL-3C-0306	No qualification required				
MCA-GWHGL-8B-0306	No qualification required				
MCA-GWHGL-8C-0306	Alkalinity	16	--	16	J
MCA-GWHGL-4B-0306	Alkalinity	29	--	29	J
	Nitrate+nitrite	0.027	B	0.027	J
	Phosphorus	1.5	---	1.5	J

USEPA Level II Review

Site: Hunter AAF	SDG #: 245171
Laboratory: STL – Burlington	Date: 5/16/06
HydroGeoLogic, Inc. Reviewers: Carol Cady/Ken Rapuano 8.27.06	Project: OMA009-001-02-02-03

Client Sample ID	Laboratory Sample ID	Matrix
MCA-GWHGL-3B-0306	661874	Water
MCA-GWHGL-3C-0306	661875	Water
MCA-GWHGL-8B-0306	661876	Water
MCA-GWHGL-8C-0306	661877	Water
MCA-GWHGL-4B-0306	661878	Water
MCA-GWHGL-4C-0306	661879	Water
MCA-GWHGL-6B-0306	661880	Water
MCA-GWHGL-6C-0306	661881	Water

Note: Control limits for dissolved gas analyses are not presented in the project specific QAPP. For this reason, the laboratory's internal QC limits will be employed for evaluation of the data.

Sample Delivery and Condition – The samples arrived at the laboratory in acceptable condition and temperature, and were properly preserved. Proper custody was documented.

Qualification: None required.

Holding Times – The sample was analyzed within the required holding times.

Qualification: None required.

Method Blanks - The method blanks were all free from contamination.

Qualification: None required.

Rinsate Blanks – A rinsate blank is not associated with the sample in this SDG.

Qualification: None required.

Laboratory Control Samples - All LCSs had acceptable recoveries.

Qualification: None required.

MS/MSD - MS/MSD analyses were performed on MCA-GWHGL-3B-0306 for methane, ethane, and ethene. The %Rs and calculated RPDs met the QC criteria.

Qualification: None required.

Field Duplicates – A field duplicate was not submitted with this SDG.

Qualification: None required.

Compound Quantitation - Analytes detected below the PQL were reported as B qualified results. These results have subsequently been changed to J qualified results. A secondary dilution was required for samples MCA-GWHGL-3C-0306 and MCA-GWHGL-8B-0306 due to high levels of methane. The results and reporting limits have been adjusted to account for the dilutions performed.

Qualification Summary Table – (Units in µg/L).

University Park, IL 60466

Re: Laboratory Project No. 26002
Case: HUNTAAF; SDG: 245035

Dear Ms. Mackley:

Enclosed are the analytical results for the samples that were received by STL Burlington on March 16th, 2006. Laboratory identification numbers were assigned, and designated as follows:

Lab ID	Client Sample ID	Sample Date	Sample Matrix
	Received: 03/16/06 ETR No: 113165		
661276	MCA-GWHGL-1B-0306	03/11/06	Water
661277	MCA-GWHGL-1C-0306	03/11/06	Water
661278	MCA-GWHGL-2B-0306	03/11/06	Water
661279	MCA-GWHGL-2C-0306	03/12/06	Water
661280	MCA-GWHGL-10B-0306	03/12/06	Water
661281	MCA-GWHGL-10C-0306	03/12/06	Water
661282	MCA-GWHGL-9B-0306	03/13/06	Water
661283	MCA-GWHGL-9C-0306	03/13/06	Water

Documentation of the condition of the samples at the time of their receipt and any exception to the laboratory's Sample Acceptance Policy is documented in the Sample Handling section of this submittal. In order to accommodate field length limitations in processing the data summary forms, the laboratory did, in certain instances, abbreviate the sample identifier. The electronically formatted data provides for the full sample identifier.

The samples were analyzed for methane, ethane and ethene by Method RSK-175. Matrix spike and matrix spike duplicate analyses were not performed on samples in this sample set. A laboratory control sample was prepared and analyzed in the analytical sequence, and the target compounds were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

The samples were additionally analyzed for carbon dioxide by Method RSK-175. Matrix spike and matrix spike duplicate analyses were not performed on samples in this sample set. A laboratory control sample was prepared and analyzed in the analytical sequence, using oxygen and nitrogen as the components. These gases were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

The analytical results associated with the samples presented in this test report were generated under a quality system that adheres to requirements specified in the NELAC standard. Release of the data in this test report and any associated electronic deliverables is authorized by the Laboratory Director's designee as verified by the following signature.

If there are any questions regarding this submittal, please contact me at 802 655-1203.

Sincerely,

Kristine Dusablon

Kristine A. Dusablon
Project Manager

STL Burlington Data Qualifier Definitions

Organic

U: Compound analyzed but not detected at a concentration above the reporting limit.

J: Estimated value.

N: Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds (TICs) where the identification of a compound is based on a mass spectral library search.

P: Greater than 25% difference for detected concentrations between two GC columns. Unless otherwise specified in project QA plan, the lower of the two values is reported on the Form I.

C: Pesticide result whose identification has been confirmed by GC/MS.

B: Analyte is found in the sample and the associated method blank. The flag is used for tentatively identified compounds as well as positively identified compounds.

E: Compounds whose concentrations exceed the upper limit of the calibration range of the instrument for that specific analysis.

D: Concentrations identified from analysis of the sample at a secondary dilution.

A: Tentatively identified compound is a suspected aldol condensation product.

X,Y,Z: Laboratory defined flags that may be used alone or combined, as needed. If used, the description of the flag is defined in the project narrative.

Inorganic/Metals

E: Reported value is estimated due to the presence of interference.

N: Matrix spike sample recovery is not within control limits.

* Duplicate sample analysis is not within control limits.

B: The result reported is less than the reporting limit but greater than the instrument detection limit.

U: Analyte was analyzed for but not detected above the reporting limit.

Method Codes:

P	ICP-AES
MS	ICP-MS
CV	Cold Vapor AA
AS	Semi-Automated Spectrophotometric

Statement of Stipulation

STL Chicago attests to the following stipulations in regards to all data submitted in the final report(s) for the State of Georgia:

Laboratory Name: STL Chicago

Accrediting Agency: IL EPA NELAP

Scope of Accreditation: SDWA, CWA, RCRA

NELAP Accreditation Number: 100201

Issued On: 04/12/2005

Expires On: 04/30/2006

Signature of Authorizing Agent | Title: QA Specialist | Date: 08/02/05

Severn Trent Laboratories Chicago
GC/MS Case Narrative

HydroGeoLogic, Inc.
Hunter AAF-OMA009-001
Job Number: 245017
VOA DATA:

1. All samples were analyzed within the method required hold-time.

2. All Method Blanks had all target compounds below the reporting limits.

3. All LCS (Laboratory Control Samples) samples had spike recoveries within the QAPP specified QC limits. The ICV 16S0315 had Dichlorodifluoromethane (79.10%) outside the QAPP specified QC limits of 80-120. All other compounds were within the QAPP specified QC limits.

4. MS/MSD (Matrix Spike/Matrix Spike Duplicate) analyses were not performed on this sample set.

5. All volatile samples had surrogate recoveries within the QAPP specified QC limits.

6. The water samples were prepared using the 5030 water method. All samples were analyzed following SW846 Method 8260B and 8000B. CCV (Continuing Calibration Verification) standard 16c0322 had Bromomethane (36.1%D) and 2,2-Dichloropropane (22.8%D) above the QAPP specified calibration criteria of less than 20%D. All other calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. The volatile samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

8. The water samples were analyzed using a 10-mL purge volume. Samples 6 and 7 required secondary dilutions for target compounds. The water results and reporting limits were adjusted to account for the dilution and analytical procedure.

Brian D. Werner

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

U	Analyte was not detected at or above the stated limit.
<	Not detected at or above the reporting limit.
J	Result is less than the RL, but greater than or equal to the method detection limit.
B	Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
S	Result was determined by the Method of Standard Additions.
F	AFCEE: Result is less than the RL, but greater than or equal to the method detection limit.

Inorganic Flags (Flag Column)

-	ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
*	LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
+	MSA correlation coefficient is less than 0.995.
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
E	SD: Serial dilution exceeds the control limits.
H	MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
N	MS, MSD: Spike recovery exceeds the upper or lower control limits.
W	AS(GFAA) Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

U	Analyte was not detected at or above the stated limit.
ND	Compound not detected.
J	Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
Q	Result was qualitatively confirmed, but not quantified.
C	Pesticide identification was confirmed by GC/MS.
Y	The chromatographic response resembles a typical fuel pattern.
Z	The chromatographic response does not resemble a typical fuel pattern.
E	Result exceeded calibration range, secondary dilution required.
F	AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC)

Organic Flags (Flags Column)

B	MB: Batch QC is greater than reporting limit.
*	LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits.
-	EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit
A	Concentration exceeds the instrument calibration range
a	Concentration is below the method Reporting Limit (RL)
B	Compound was found in the blank and sample.
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
H	Alternate peak selection upon analytical review
I	Indicates the presence of an interfence, recovery is not calculated.
M	Manually integrated compound.
P	The lower of the two values is reported when the % difference between the results of two GC columns is

greater than 25%.

Abbreviations

AS	Post Digestion Spike (GFAA Samples - See Note 1 below)
Batch	Designation given to identify a specific extraction, digestion, preparation set, or analysis set
CAP	Capillary Column CCB Continuing Calibration Blank
CCV	Continuing Calibration Verification
CF	Confirmation analysis of original
C1	Confirmation analysis of A1 or D1
C2	Confirmation analysis of A2 or D2
C3	Confirmation analysis of A3 or D3
CRA	Low Level Standard Check - GFAA; Mercury
CRI	Low Level Standard Check - ICP
CV	Calibration Verification Standard
Dil Fac	Dilution Factor - Secondary dilution analysis
D1	Dilution 1
D2	Dilution 2
D3	Dilution 3
DLFac	Detection Limit Factor
DSH	Distilled Standard - High Level
DSL	Distilled Standard - Low Level
DSM	Distilled Standard - Medium Level
EB1	Extraction Blank 1
EB2	Extraction Blank 2
EB3	DI Blank
ELC	Method Extracted LCS
ELD	Method Extracted LCD
ICAL	Initial calibration
ICB	Initial Calibration Blank
ICV	Initial Calibration Verification
IDL	Instrument Detection Limit
ISA	Interference Check Sample A - ICAP
ISB	Interference Check Sample B - ICAP
Job No.	The first six digits of the sample ID which refers to a specific client, project and sample group
Lab ID	An 8 number unique laboratory identification
LCD	Laboratory Control Standard Duplicate
LCS	Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest
MB	Method Blank or (PB) Preparation Blank
MD	Method Duplicate
MDL	Method Detection Limit
MLE	Medium Level Extraction Blank
MRL	Method Reporting Limit Standard
MSA	Method of Standard Additions
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not Detected
PREPF	Preparation factor used by the Laboratory's Information Management System (LIMS)
PDS	Post Digestion Spike (ICAP)
RA	Re-analysis of original
A1	Re-analysis of D1
A2	Re-analysis of D2
A3	Re-analysis of D3
RD	Re-extraction of dilution
RE	Re-extraction of original
RC	Re-extraction Confirmation
RL	Reporting Limit
RPD	Relative Percent Difference of duplicate (unrounded) analyses
RRF	Relative Response Factor
RT	Retention Time

RTW	Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number
SCB	Seeded Control Blank
SD	Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL)
UCB	Unseeded Control Blank
SSV	Second Source Verification Standard
SLCS	Solid Laboratory Control Standard(LCS)
PHC	pH Calibration Check LCSP pH Laboratory Control Sample
LCDP	pH Laboratory Control Sample Duplicate
MDPH	pH Sample Duplicate
MDFP	Flashpoint Sample Duplicate
LCFP	Flashpoint LCS
G1	Gelex Check Standard Range 0-1
G2	Gelex Check Standard Range 1-10
G3	Gelex Check Standard Range 10-100
G4	Gelex Check Standard Range 100-1000

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)

Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Re: Laboratory Project No. 26002
Case: HUNTAAF; SDG: 245097

Dear Ms. Mackley:

Enclosed are the analytical results for the samples that were received by STL Burlington on March 17th, 2006. Laboratory identification numbers were assigned, and designated as follows:

Lab ID	Client Sample ID	Sample Date	Sample Matrix
	Received: 03/17/06 ETR No: 113190		
661490	MCA-GWHGL-5B-0306	03/14/06	Water
661491	MCA-GWHGL-5C-0306	03/14/06	Water
661492	MCA-GWHGL-11B-0306	03/14/06	Water
661493	MCA-GWHGL-11C-0306	03/14/06	Water
661494	MCA-GWHGL-7B-0306	03/15/06	Water
661495	MCA-GWHGL-7C-0306	03/15/06	Water

Documentation of the condition of the samples at the time of their receipt and any exception to the laboratory's Sample Acceptance Policy is documented in the Sample Handling section of this submittal. In order to accommodate field length limitations in processing the data summary forms, the laboratory did, in certain instances, abbreviate the sample identifier. The electronically formatted data provides for the full sample identifier.

The samples were analyzed for methane, ethane and ethene by Method RSK-175. Matrix spike and matrix spike duplicate analyses were not performed on sample in this sample set. A laboratory control sample was prepared and analyzed in the analytical sequence, and the target compounds were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

The samples were additionally analyzed for carbon dioxide by Method RSK-175. Matrix spike and matrix spike duplicate analyses were not performed on sample in this sample set. A laboratory control sample was prepared and analyzed in the analytical sequence, using oxygen and nitrogen as the components. These gases were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

The analytical results associated with the samples presented in this test report were generated under a quality system that adheres to requirements specified in the NELAC standard. Release of the data in this test report and any associated electronic deliverables is authorized by the Laboratory Director's designee as verified by the following signature.

If there are any questions regarding this submittal, please contact me at 802 655-1203.

Sincerely,

Kristine A. Dusablon
Project Manager

Enclosure

STL Burlington Data Qualifier Definitions

Organic

U: Compound analyzed but not detected at a concentration above the reporting limit.

J: Estimated value.

N: Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds (TICs) where the identification of a compound is based on a mass spectral library search.

P: Greater than 25% difference for detected concentrations between two GC columns. Unless otherwise specified in project QA plan, the lower of the two values is reported on the Form I.

C: Pesticide result whose identification has been confirmed by GC/MS.

B: Analyte is found in the sample and the associated method blank. The flag is used for tentatively identified compounds as well as positively identified compounds.

E: Compounds whose concentrations exceed the upper limit of the calibration range of the instrument for that specific analysis.

D: Concentrations identified from analysis of the sample at a secondary dilution.

A: Tentatively identified compound is a suspected aldol condensation product.

X,Y,Z: Laboratory defined flags that may be used alone or combined, as needed. If used, the description of the flag is defined in the project narrative.

Inorganic/Metals

E: Reported value is estimated due to the presence of interference.

N: Matrix spike sample recovery is not within control limits.

* Duplicate sample analysis is not within control limits.

B: The result reported is less than the reporting limit but greater than the instrument detection limit.

U: Analyte was analyzed for but not detected above the reporting limit.

Method Codes:

P	ICP-AES
MS	ICP-MS
CV	Cold Vapor AA
AS	Semi-Automated Spectrophotometric

Statement of Stipulation

STL Chicago attests to the following stipulations in regards to all data submitted in the final report(s) for the State of Georgia:

Laboratory Name: STL Chicago

Accrediting Agency: IL EPA NELAP

Scope of Accreditation: SDWA, CWA, RCRA

NELAP Accreditation Number: 100201

Issued On: 04/12/2005

Expires On: 04/30/2006

Signature of Authorizing Agent | QA Specialist (Title) | 08/02/05 (Date)

Severn Trent Laboratories - Chicago
METALS CASE NARRATIVE

Client: Hydrogeologic, Inc.
Project ID: OMA009-001
STL Job# 245096

Date Recd: 03/16/06

1. This narrative covers the Metals analysis of samples in the above STL Job.

   Method Ref: USEPA SW-846

2. All analyses were performed within the required holding times.

3. All Initial and Continuing Calibration Verification (ICV/CCV's) were within control limit.

4. All Initial and Continuing Calibration Blanks (ICB/CCB's) were within control limits.

5. All ICP Interference Check Samples (ICSA and ICSAB) were within control limits.

6. Laboratory Control Sample (LCS) recoveries were within the 80-120% control limits.

7. Method Blank concentrations were less than the Reporting Limits.

8. Matrix QC was performed on Sample 2.

   Serial Dilution analysis was within control limits except for Al.

   Matrix Spike (MS/MSD) recoveries were within 75-125% control limits (control limits are not applicable when the sample concentration exceeds the spike added concentration by a factor of 4 or more) except for Al (MS/MSD).

   Duplicate results were within the 20% RPD control limits for sample concentrations greater than 5X the R.L. or +\- the R.L for sample concentrations less than 5X the R.L.

Jodi L. Gromala
Metals Section Manager

3-29-06
Date

Severn Trent Laboratories Chicago
GC/MS Case Narrative

HydroGeoLogic, Inc.
Hunter AAF-OMA009-001
Job Number: 245096
VOA DATA:

1. All samples were analyzed within the method required hold-time.

2. The Method Blank had all target compounds below the reporting limits.

3. The LCS (Laboratory Control Sample) had all spike recoveries within the QAPP specified QC limits. The ICV 18S0323b had Dichlorodifluoromethane (78.71%), Acetone (122.96%), Carbon Disulfide (79.28%), and 1,2-Dibromo-3-Chloropropane (79.38%) outside the QAPP specified QC limits of 80-120%. All other compounds were within the QAPP specified QC limits.

4. MS/MSD (Matrix Spike/Matrix Spike Duplicate) analyses were not performed on this sample set.

5. The MB (prep batch 176808) had one surrogate outside the QAPP specified QC limits. All other volatile samples had surrogate recoveries within the QAPP specified QC limits.

6. The water samples were prepared using the 5030 water method. All samples were analyzed following SW846 Method 8260B and 8000B. All calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. The volatile samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

8. The water samples were analyzed using a 10-mL purge volume. Samples 8 and 9 required secondary dilutions for target compounds. The water results and reporting limits were adjusted to account for the dilutions performed.

JoAnn Petruszak-Kmetty
GC/MS VOA Dept.

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

U Analyte was not detected at or above the stated limit.
< Not detected at or above the reporting limit.
J Result is less than the RL, but greater than or equal to the method detection limit.
B Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
S Result was determined by the Method of Standard Additions.
F AFCEE: Result is less than the RL, but greater than or equal to the method detection limit.

Inorganic Flags (Flag Column)

^ ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
* LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
+ MSA correlation coefficient is less than 0.995.
4 MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
E SD: Serial dilution exceeds the control limits.
H MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
N MS, MSD: Spike recovery exceeds the upper or lower control limits.
W AS(GFAA) Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

U Analyte was not detected at or above the stated limit.
ND Compound not detected.
J Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
Q Result was qualitatively confirmed, but not quantified.
C Pesticide identification was confirmed by GC/MS.
Y The chromatographic response resembles a typical fuel pattern.
Z The chromatographic response does not resemble a typical fuel pattern.
E Result exceeded calibration range, secondary dilution required.
F AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC)

Organic Flags (Flags Column)

B MB: Batch QC is greater than reporting limit.
* LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits.
- EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit
A Concentration exceeds the instrument calibration range
a Concentration is below the method Reporting Limit (RL)
B Compound was found in the blank and sample.
D Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
H Alternate peak selection upon analytical review
I Indicates the presence of an interfence, recovery is not calculated.
M Manually integrated compound.
P The lower of the two values is reported when the % difference between the results of two GC columns is

greater than 25%.

Abbreviations

AS	Post Digestion Spike (GFAA Samples - See Note 1 below)
Batch	Designation given to identify a specific extraction, digestion, preparation set, or analysis set
CAP	Capillary Column CCB Continuing Calibration Blank
CCV	Continuing Calibration Verification
CF	Confirmation analysis of original
C1	Confirmation analysis of A1 or D1
C2	Confirmation analysis of A2 or D2
C3	Confirmation analysis of A3 or D3
CRA	Low Level Standard Check - GFAA; Mercury
CRI	Low Level Standard Check - ICP
CV	Calibration Verification Standard
Dil Fac	Dilution Factor - Secondary dilution analysis
D1	Dilution 1
D2	Dilution 2
D3	Dilution 3
DLFac	Detection Limit Factor
DSH	Distilled Standard - High Level
DSL	Distilled Standard - Low Level
DSM	Distilled Standard - Medium Level

ICB	Initial Calibration Blank
ICV	Initial Calibration Verification
IDL	Instrument Detection Limit
ISA	Interference Check Sample A - ICAP
ISB	Interference Check Sample B - ICAP
Job No.	The first six digits of the sample ID which refers to a specific client, project and sample group
	Lab ID An 8 number unique laboratory identification
LCD	Laboratory Control Standard Duplicate
LCS	Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest
MB	Method Blank or (PB) Preparation Blank
MD	Method Duplicate
MDL	Method Detection Limit
MLE	Medium Level Extraction Blank
MRL	Method Reporting Limit Standard
MSA	Method of Standard Additions
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not Detected
PREPF	Preparation factor used by the Laboratory's Information Management System (LIMS)
PDS	Post Digestion Spike (ICAP)
RA	Re-analysis of original
A1	Re-analysis of D1
A2	Re-analysis of D2
A3	Re-analysis of D3
RD	Re-extraction of dilution
RE	Re-extraction of original
RC	Re-extraction Confirmation
RL	Reporting Limit
RPD	Relative Percent Difference of duplicate (unrounded) analyses
RRF	Relative Response Factor
RT	Retention Time

RTW	Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number
SCB	Seeded Control Blank
SD	Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL)
UCB	Unseeded Control Blank
SSV	Second Source Verification Standard
SLCS	Solid Laboratory Control Standard(LCS)
PHC	pH Calibration Check LCSP pH Laboratory Control Sample
LCDP	pH Laboratory Control Sample Duplicate
MDPH	pH Sample Duplicate
MDFP	Flashpoint Sample Duplicate
LCFP	Flashpoint LCS
G1	Gelex Check Standard Range 0-1
G2	Gelex Check Standard Range 1-10
G3	Gelex Check Standard Range 10-100
G4	Gelex Check Standard Range 100-1000

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)
Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Re: Laboratory Project No. 26002
Case: HUNTAAF; SDG: 245171

Dear Ms. Mackley:

Enclosed are the analytical results for the samples that were received by STL Burlington on March 21st, 2006. Laboratory identification numbers were assigned, and designated as follows:

Lab ID	Client Sample ID	Sample Date	Sample Matrix
	Received: 03/21/06 ETR No: 113241		
661874	MCA-GWHGL-3B-0306	03/16/06	Water
661874MS	MCA-GWHGL-3B-0306MS	03/16/06	Water
661874MD	MCA-GWHGL-3B-0306MSD	03/16/06	Water
661875	MCA-GWHGL-3C-0306	03/16/06	Water
661876	MCA-GWHGL-8B-0306	03/16/06	Water
661877	MCA-GWHGL-8C-0306	03/16/06	Water
661878	MCA-GWHGL-4B-0306	03/17/06	Water
661879	MCA-GWHGL-4C-0306	03/17/06	Water
661880	MCA-GWHGL-6B-0306	03/17/06	Water
661881	MCA-GWHGL-6C-0306	03/17/06	Water

Documentation of the condition of the samples at the time of their receipt and any exception to the laboratory's Sample Acceptance Policy is documented in the Sample Handling section of this submittal. In order to accommodate field length limitations in processing the data summary forms, the laboratory did, in certain instances, abbreviate the sample identifier. The electronically formatted data provides for the full sample identifier.

The samples were analyzed for methane, ethane and ethene by Method RSK-175. Samples MCA-GWHGL-3C-0306 and MCA-GWHGL-8B-0306 were analyzed for methane at a dilution in order to provide for quantification with the range of calibrated instrument response. Matrix spike and matrix spike duplicate analyses were performed on sample MCA-GWHGL-3B-0306 in this sample set. The spiked compounds were recovered well in the matrix spike analyses and the analyses did yield results with good correspondence in the interanalysis comparison. A laboratory control sample was prepared and analyzed in the analytical sequence, and the target compounds were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

Designated samples were additionally analyzed for carbon dioxide by Method RSK-175. Matrix spike and matrix spike duplicate analyses were performed on sample EMG-MW-2D in this sample set. The spiked carbon dioxide was recovered well in the matrix spike analyses and the

analyses did yield results with good correspondence in the interanalysis comparison. A laboratory control sample was prepared and analyzed in the analytical sequence, using oxygen and nitrogen as the components. These gases were recovered well in that analysis. The method blank that was analyzed in association with the samples was free of contamination.

The analytical results associated with the samples presented in this test report were generated under a quality system that adheres to requirements specified in the NELAC standard. Release of the data in this test report and any associated electronic deliverables is authorized by the Laboratory Director's designee as verified by the following signature.

If there are any questions regarding this submittal, please contact me at 802 655-1203.

Sincerely,

Kristine A. Dusablon
Project Manager

Enclosure

STL Burlington Data Qualifier Definitions

Organic

U: Compound analyzed but not detected at a concentration above the reporting limit.

J: Estimated value.

N: Indicates presumptive evidence of a compound. This flag is used only for tentatively identified compounds (TICs) where the identification of a compound is based on a mass spectral library search.

P: Greater than 25% difference for detected concentrations between two GC columns. Unless otherwise specified in project QA plan, the lower of the two values is reported on the Form I.

C: Pesticide result whose identification has been confirmed by GC/MS.

B: Analyte is found in the sample and the associated method blank. The flag is used for tentatively identified compounds as well as positively identified compounds.

E: Compounds whose concentrations exceed the upper limit of the calibration range of the instrument for that specific analysis.

D: Concentrations identified from analysis of the sample at a secondary dilution.

A: Tentatively identified compound is a suspected aldol condensation product.

X,Y,Z: Laboratory defined flags that may be used alone or combined, as needed. If used, the description of the flag is defined in the project narrative.

Inorganic/Metals

E: Reported value is estimated due to the presence of interference.

N: Matrix spike sample recovery is not within control limits.

* Duplicate sample analysis is not within control limits.

B: The result reported is less than the reporting limit but greater than the instrument detection limit.

U: Analyte was analyzed for but not detected above the reporting limit.

Method Codes:

P	ICP-AES
MS	ICP-MS
CV	Cold Vapor AA
AS	Semi-Automated Spectrophotometric

Statement of Stipulation

STL Chicago attests to the following stipulations in regards to all data submitted in the final report(s) for the State of Georgia:

Laboratory Name: STL Chicago

Accrediting Agency: IL EPA NELAP

Scope of Accreditation: SDWA, CWA, RCRA

NELAP Accreditation Number: 100201

Issued On: 04/12/2005

Expires On: 04/30/2006

Signature of Authorizing Agent | Title: QA Specialist | Date: 08/02/05

Severn Trent Laboratories - Chicago
METALS CASE NARRATIVE

Client: Hydrogeologic, Inc.
Project ID: OMA009-001
STL Job# 245170

Date Recd: 03/18/06

1. This narrative covers the Metals analysis of samples in the above STL Job.

   Method Ref: USEPA SW-846

2. All analyses were performed within the required holding times.

3. All Initial and Continuing Calibration Verification (ICV/CCV's) were within control limit.

4. All Initial and Continuing Calibration Blanks (ICB/CCB's) were within control limits.

5. All ICP Interference Check Samples (ICSA and ICSAB) were within control limits.

6. Laboratory Control Sample (LCS) recoveries were within the 80-120% control limits.

7. Method Blank concentrations were less than the Reporting Limits except for Ca (0.12 mg/l). Please note: The sample concentrations were all greater than ten times the MB concentration for Ca, therefore reanalysis was not performed.

8. Matrix QC was performed on Samples 2 and 8.

   Serial Dilution analysis was within control limits.

   Matrix Spike (MS/MSD) recoveries were within 75-125% control limits (control limits are not applicable when the sample concentration exceeds the spike added concentration by a factor of 4 or more) except for Al (MS/MSD).

   Duplicate results were within the 20% RPD control limits for sample concentrations greater than 5X the R.L. or +\- the R.L for sample concentrations less than 5X the R.L.

Jodi L. Gromala
Metals Section Manager

3-24-06
Date

Severn Trent Laboratories Chicago
GC/MS Case Narrative

HydroGeoLogic, Inc.
Hunter AAF-OMA009-001
Job Number: 245170
VOA DATA:

1. The reanalysis of sample 2 was analyzed 4 days past the recommended 14 day hold time. All of the other samples were analyzed within the method required hold-time.

2. The Method Blank had all target compounds below the reporting limits.

3. The LCS (Laboratory Control Sample) had all spike recoveries within the QAPP specified QC limits. The ICV 16S0315 had Dichlorodifluoromethane (79.10%) outside the QAPP specified QC limits of 80-120%. The ICV 1820327 had Dichlorodifluoromethane (52.10%) outside the QAPP specified QC limits of 80-120%. All other compounds were within the QAPP specified QC limits.

4. MS/MSD (Matrix Spike/Matrix Spike Duplicate) analyses were performed on samples 2 and 8. The MS for sample 2 had 3 out of 59 compound recoveries outside the QAPP specified QC limits. The MSD for sample 2 had 5 out of 59 compound recoveries outside the QAPP specified QC limits. The MS for sample 8 had 5 out of 59 compound recoveries outside the QAPP specified QC limits. The MSD for sample 8 had 1 out of 59 compound recoveries outside the QAPP specified QC limits. The MS and MSD for sample 2 and 8 were reanalyzed with only 1 out of 59 compounds outside of the QAPP specified QC limits. Only the reanalysis of sample 2 was reported. The LCS samples associated with the matrix spike/matrix spike duplicate samples had all spike recoveries within the QAPP specified QC limits.

5. All volatile samples had surrogate recoveries within the QAPP specified QC limits.

6. The water samples were prepared using the 5030 water method. All samples were analyzed following SW846 Method 8260B and 8000B. The CCV (Continuing Calibration Verification) 18c0328 had Dichlorodifluoromethane (27.7%) and trans-1,3-Dichloropropene (22.9%) above the QAPP specified calibration criteria of less than 20%D. All other calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. The volatile samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

8. The water samples were analyzed using a 10-mL purge volume. Sample 11 required an initial dilution due to the sample matrix. Sample 11 required a secondary dilution for target compounds. The water results and reporting limits were adjusted to account for the dilutions performed.

9. Due to the poor match between the MS and MSD of samples 2 and 8 the samples and the MS and MSD were reanalyzed. The original results for sample 8 matched the reanalysis therefore corrective action was not taken on sample 8. The original results for sample 2 did not match the reanalysis. Sample 2 was reanalyzed again with results only matching the reanalyzed sample. Both the original analysis and the first reanalysis for sample 2 were reported. The original analysis of sample 2, the MSD for sample 2, and the MS for sample 8 are suspected to be contaminated with a vial or syringe carry over. Further corrective action was not required.

John Nagel

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

U	Analyte was not detected at or above the stated limit.
<	Not detected at or above the reporting limit.
J	Result is less than the RL, but greater than or equal to the method detection limit.
B	Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
S	Result was determined by the Method of Standard Additions.
F	AFCEE: Result is less than the RL, but greater than or equal to the method detection limit.

Inorganic Flags (Flag Column)

^	ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
*	LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
+	MSA correlation coefficient is less than 0.995.
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
E	SD: Serial dilution exceeds the control limits.
H	MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
N	MS, MSD: Spike recovery exceeds the upper or lower control limits.
W	AS(GFAA) Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

U	Analyte was not detected at or above the stated limit.
ND	Compound not detected.
J	Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
Q	Result was qualitatively confirmed, but not quantified.
C	Pesticide identification was confirmed by GC/MS.
Y	The chromatographic response resembles a typical fuel pattern.
Z	The chromatographic response does not resemble a typical fuel pattern.
E	Result exceeded calibration range, secondary dilution required.
F	AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC)

Organic Flags (Flags Column)

B	MB: Batch QC is greater than reporting limit.
*	LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits.
^	EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit
A	Concentration exceeds the instrument calibration range
a	Concentration is below the method Reporting Limit (RL)
B	Compound was found in the blank and sample.
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
H	Alternate peak selection upon analytical review
I	Indicates the presence of an interfence, recovery is not calculated.
M	Manually integrated compound.
P	The lower of the two values is reported when the % difference between the results of two GC columns is

greater than 25%.

Abbreviations

AS	Post Digestion Spike (GFAA Samples - See Note 1 below)
Batch	Designation given to identify a specific extraction, digestion, preparation set, or analysis set
CAP	Capillary Column CCB Continuing Calibration Blank
CCV	Continuing Calibration Verification
CF	Confirmation analysis of original
C1	Confirmation analysis of A1 or D1
C2	Confirmation analysis of A2 or D2
C3	Confirmation analysis of A3 or D3
CRA	Low Level Standard Check - GFAA; Mercury
CRI	Low Level Standard Check - ICP
CV	Calilbration Verification Standard
Dil Fac	Dilution Factor - Secondary dilution analysis
D1	Dilution 1
D2	Dilution 2
D3	Dilution 3
DLFac	Detection Limit Factor
DSH	Distilled Standard - High Level
DSL	Distilled Standard - Low Level
DSM	Distilled Standard - Medium Level
EB1	Extraction Blank 1
EB2	Extraction Blank 2
EB3	DI Blank
ELC	Method Extracted LCS
ELD	Method Extracted LCD
ICAL	Initial calibration
ICB	Initial Calibration Blank
ICV	Initial Calibration Verification
IDL	Instrument Detection Limit
ISA	Interference Check Sample A - ICAP
ISB	Interference Check Sample B - ICAP
Job No.	The first six digits of the sample ID which refers to a specific client, project and sample group Lab ID An 8 number unique laboratory identification
LCD	Laboratory Control Standard Duplicate
LCS	Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest
MB	Method Blank or (PB) Preparation Blank
MD	Method Duplicate
MDL	Method Detection Limit
MLE	Medium Level Extraction Blank
MRL	Method Reporting Limit Standard
MSA	Method of Standard Additions
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not Detected
PREPF	Preparation factor used by the Laboratory's Information Management System (LIMS)
PDS	Post Digestion Spike (ICAP)
RA	Re-analysis of original
A1	Re-analysis of D1
A2	Re-analysis of D2
A3	Re-analysis of D3
RD	Re-extraction of dilution
RE	Re-extraction of original
RC	Re-extraction Confirmation
RL	Reporting Limit
RPD	Relative Percent Difference of duplicate (unrounded) analyses
RRF	Relative Response Factor
RT	Retention Time

RTW	Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number
SCB	Seeded Control Blank
SD	Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL)
UCB	Unseeded Control Blank
SSV	Second Source Verification Standard
SLCS	Solid Laboratory Control Standard(LCS)
PHC	pH Calibration Check LCSP pH Laboratory Control Sample
LCDP	pH Laboratory Control Sample Duplicate
MDPH	pH Sample Duplicate
MDFP	Flashpoint Sample Duplicate
LCFP	Flashpoint LCS
G1	Gelex Check Standard Range 0-1
G2	Gelex Check Standard Range 1-10
G3	Gelex Check Standard Range 10-100
G4	Gelex Check Standard Range 100-1000

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)
Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Statement of Stipulation

STL Chicago attests to the following stipulations in regards to all data submitted in the final report(s) for the State of Georgia:

Laboratory Name: STL Chicago

Accrediting Agency: IL EPA NELAP

Scope of Accreditation: SDWA, CWA, RCRA

NELAP Accreditation Number: 100201

Issued On: 04/12/2005

Expires On: 04/30/2006

Signature of Authorizing Agent | Title: QA Specialist | Date: 08/02/05

Severn Trent Laboratories Chicago
GC/MS Case Narrative

HydroGeoLogic, Inc.
Hunter AAF
Job Number: 244449
VOA DATA:

1. All samples were analyzed within the method required hold-time.

2. All Method Blanks and Extraction Blanks had all analytes undetected.

3. All LCS/LCD (Laboratory Control/ Duplicate Samples) had all five control spike recoveries within the QC limits.

4. A MS/MSD (Matrix Spike/Matrix Spike Duplicate) was performed on sample 2 of this sample set. All five controlled compounds had spike recoveries within QC limits.

5. The LCD (prep 174321) had one surrogate above the QC limit. All other volatile samples had surrogate recoveries within the QAPP specified QC limits.

6. The water samples were prepared using the 5030 water method. The soil samples were prepared in water using the low level Method 5035. All samples were analyzed following SW846 Method 8260B and 8000B. All calibration criteria were met per method or SOP (for minimum R values for certain compounds). The low point in the initial calibration verifies the base reporting limits. The target compounds were quantitated using the initial calibration.

7. The volatile samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

8. The water samples were analyzed using a 10-mL purge volume. The soil samples were analyzed using the low-level method 5035 procedure. The soil results and reporting limits were adjusted to account for the sample weights, analytical procedure, and on a dry weight basis.

Gary Rynkar
GC/MS Section Manager

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

U	Analyte was not detected at or above the stated limit.
<	Not detected at or above the reporting limit.
J	Result is less than the RL, but greater than or equal to the method detection limit.
B	Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
S	Result was determined by the Method of Standard Additions.
F	AFCEE: Result is less than the RL, but greater than or equal to the method detection limit.

Inorganic Flags (Flag Column)

^	ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
*	LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
+	MSA correlation coefficient is less than 0.995.
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
E	SD: Serial dilution exceeds the control limits.
H	MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
N	MS, MSD: Spike recovery exceeds the upper or lower control limits.
W	AS(GFAA) Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

U	Analyte was not detected at or above the stated limit.
ND	Compound not detected.
J	Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
Q	Result was qualitatively confirmed, but not quantified.
C	Pesticide identification was confirmed by GC/MS.
Y	The chromatographic response resembles a typical fuel pattern.
Z	The chromatographic response does not resemble a typical fuel pattern.
E	Result exceeded calibration range, secondary dilution required.
F	AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC)

Organic Flags (Flags Column)

B	MB: Batch QC is greater than reporting limit.
*	LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits.
^	EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit
A	Concentration exceeds the instrument calibration range
a	Concentration is below the method Reporting Limit (RL)
B	Compound was found in the blank and sample.
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
H	Alternate peak selection upon analytical review
I	Indicates the presence of an interfence, recovery is not calculated.
M	Manually integrated compound.
P	The lower of the two values is reported when the % difference between the results of two GC columns is

greater than 25%.

Abbreviations

AS	Post Digestion Spike (GFAA Samples - See Note 1 below)
Batch	Designation given to identify a specific extraction, digestion, preparation set, or analysis set
CAP	Capillary Column CCB Continuing Calibration Blank
CCV	Continuing Calibration Verification
CF	Confirmation analysis of original
C1	Confirmation analysis of A1 or D1
C2	Confirmation analysis of A2 or D2
C3	Confirmation analysis of A3 or D3
CRA	Low Level Standard Check - GFAA; Mercury
CRI	Low Level Standard Check - ICP
CV	Calilbration Verification Standard
Dil Fac	Dilution Factor - Secondary dilution analysis
D1	Dilution 1
D2	Dilution 2
D3	Dilution 3
DLFac	Detection Limit Factor
DSH	Distilled Standard - High Level
DSL	Distilled Standard - Low Level
DSM	Distilled Standard - Medium Level
EB1	Extraction Blank 1
EB2	Extraction Blank 2
EB3	DI Blank
ELC	Method Extracted LCS
ELD	Method Extracted LCD
ICAL	Initial calibration
ICB	Initial Calibration Blank
ICV	Initial Calibration Verification
IDL	Instrument Detection Limit
ISA	Interference Check Sample A - ICAP
ISB	Interference Check Sample B - ICAP
Job No.	The first six digits of the sample ID which refers to a specific client, project and sample group
	Lab ID An 8 number unique laboratory identification
LCD	Laboratory Control Standard Duplicate
LCS	Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest
MB	Method Blank or (PB) Preparation Blank
MD	Method Duplicate
MDL	Method Detection Limit
MLE	Medium Level Extraction Blank
MRL	Method Reporting Limit Standard
MSA	Method of Standard Additions
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not Detected
PREPF	Preparation factor used by the Laboratory's Information Management System (LIMS)
PDS	Post Digestion Spike (ICAP)
RA	Re-analysis of original
A1	Re-analysis of D1
A2	Re-analysis of D2
A3	Re-analysis of D3
RD	Re-extraction of dilution
RE	Re-extraction of original
RC	Re-extraction Confirmation
RL	Reporting Limit
RPD	Relative Percent Difference of duplicate (unrounded) analyses
RRF	Relative Response Factor
RT	Retention Time

RTW	Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number
SCB	Seeded Control Blank
SD	Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL)
UCB	Unseeded Control Blank
SSV	Second Source Verification Standard
SLCS	Solid Laboratory Control Standard(LCS)
PHC	pH Calibration Check LCSP pH Laboratory Control Sample
LCDP	pH Laboratory Control Sample Duplicate
MDPH	pH Sample Duplicate
MDFP	Flashpoint Sample Duplicate
LCFP	Flashpoint LCS
G1	Gelex Check Standard Range 0-1
G2	Gelex Check Standard Range 1-10
G3	Gelex Check Standard Range 10-100
G4	Gelex Check Standard Range 100-1000

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)

Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Statement of Stipulation

STL Chicago attests to the following stipulations in regards to all data submitted in the final report(s) for the State of Georgia:

Laboratory Name: STL Chicago

Accrediting Agency: IL EPA NELAP

Scope of Accreditation: SDWA, CWA, RCRA

NELAP Accreditation Number: 100201

Issued On: 04/12/2005

Expires On: 04/30/2006

Signature of Authorizing Agent | QA Specialist (Title) | 08/02/05 (Date)

Severn Trent Laboratories Chicago
GC/MS Case Narrative

HydroGeoLogic, Inc./OMA009-001
Hunter AAF
Job Number: 241470
VOA DATA:

1. All samples were analyzed within the required hold-time.

2. The MB (Method Blank) and EB (5035 extraction blank) samples had all analytes undetected.

3. The LCS (Laboratory Control Sample) samples had all five control spike recoveries within the QC limits.

4. The MS/MSD (Matrix Spike/Matrix Spike Duplicate) for sample 1 had all five control spike recoveries and RPD values within the QC limits. The MS/MSD for sample 13 did not provide usable data due to an instrument malfunction. Due to insufficient sample, a re-analysis could not be performed.

5. Samples 1, 2, 4, 5, MB (prep 164819) and MB (prep 165291)had one surrogate recovery above the QC limits and sample 3, 9, 1 MS and LCD (prep 165291) had two surrogate recovery limits above the QC limits. Samples 1, 2, 3, 4 & 5 were re-analyzed, again with the surrogate recoveries above the QC limits. Sample 9 was re-analyzed past the hold time by 3:15 hours with acceptable surrogate recoveries. No further corrective action was required and the original analyses were reported for 1, 2, 4, 5 and 9. All other samples had all surrogate recoveries within the QC limits. The soil LCS had one surrogate recovery below the QC limits and the EB had four surrogate recoveries below the QC limits. No corrective action was required.

6. The samples were prepared and analyzed following SW846 Methods 5030, 5035 & 8260B. All calibration criteria were met per method or SOP (for minimum R-values for certain compounds). The low point in the initial calibration verifies the base reporting limits.

7. All samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

Gary Rynkar
GC/MS Section Manager

REPORT COMMENTS

1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 100201
5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviations (any number of which may appear in the report)

Inorganic Qualifiers (Q-Column)

U	Analyte was not detected at or above the stated limit.
<	Not detected at or above the reporting limit.
J	Result is less than the RL, but greater than or equal to the method detection limit.
B	Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
S	Result was determined by the Method of Standard Additions.
F	AFCEE: Result is less than the RL, but greater than or equal to the method detection limit.

Inorganic Flags (Flag Column)

^	ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
*	LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
+	MSA correlation coefficient is less than 0.995.
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
E	SD: Serial dilution exceeds the control limits.
H	MB, EB1, EB2, EB3: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
N	MS, MSD: Spike recovery exceeds the upper or lower control limits.
W	AS(GFAA) Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

U	Analyte was not detected at or above the stated limit.
ND	Compound not detected.
J	Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
Q	Result was qualitatively confirmed, but not quantified.
C	Pesticide identification was confirmed by GC/MS.
Y	The chromatographic response resembles a typical fuel pattern.
Z	The chromatographic response does not resemble a typical fuel pattern.
E	Result exceeded calibration range, secondary dilution required.
F	AFCEE:Result is an estimated value below the reporting limit or a tentatively identified compound (TIC)

Organic Flags (Flags Column)

B	MB: Batch QC is greater than reporting limit.
*	LCS, LCD, ELC, ELD, CV, MS, MSD, Surrogate: Batch QC exceeds the upper or lower control limits.
^	EB1, EB2, EB3, MLE: Batch QC is greater than reporting Limit
A	Concentration exceeds the instrument calibration range
a	Concentration is below the method Reporting Limit (RL)
B	Compound was found in the blank and sample.
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
H	Alternate peak selection upon analytical review
I	Indicates the presence of an interfence, recovery is not calculated.
M	Manually integrated compound.
P	The lower of the two values is reported when the % difference between the results of two GC columns is

greater than 25%.

Abbreviations

AS	Post Digestion Spike (GFAA Samples - See Note 1 below)
Batch	Designation given to identify a specific extraction, digestion, preparation set, or analysis set
CAP	Capillary Column CCB Continuing Calibration Blank
CCV	Continuing Calibration Verification
CF	Confirmation analysis of original
C1	Confirmation analysis of A1 or D1
C2	Confirmation analysis of A2 or D2
C3	Confirmation analysis of A3 or D3
CRA	Low Level Standard Check - GFAA; Mercury
CRI	Low Level Standard Check - ICP
CV	Calibration Verification Standard
Dil Fac	Dilution Factor - Secondary dilution analysis
D1	Dilution 1
D2	Dilution 2
D3	Dilution 3
DLFac	Detection Limit Factor
DSH	Distilled Standard - High Level
DSL	Distilled Standard - Low Level
DSM	Distilled Standard - Medium Level
EB1	Extraction Blank 1
EB2	Extraction Blank 2
EB3	DI Blank
ELC	Method Extracted LCS
ELD	Method Extracted LCD
ICAL	Initial calibration
ICB	Initial Calibration Blank
ICV	Initial Calibration Verification
IDL	Instrument Detection Limit
ISA	Interference Check Sample A - ICAP
ISB	Interference Check Sample B - ICAP
Job No.	The first six digits of the sample ID which refers to a specific client, project and sample group Lab ID An 8 number unique laboratory identification
LCD	Laboratory Control Standard Duplicate
LCS	Laboratory Control Standard with reagent grade water or a matrix free from the analyte of interest
MB	Method Blank or (PB) Preparation Blank
MD	Method Duplicate
MDL	Method Detection Limit
MLE	Medium Level Extraction Blank
MRL	Method Reporting Limit Standard
MSA	Method of Standard Additions
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ND	Not Detected
PREPF	Preparation factor used by the Laboratory's Information Management System (LIMS)
PDS	Post Digestion Spike (ICAP)
RA	Re-analysis of original
A1	Re-analysis of D1
A2	Re-analysis of D2
A3	Re-analysis of D3
RD	Re-extraction of dilution
RE	Re-extraction of original
RC	Re-extraction Confirmation
RL	Reporting Limit
RPD	Relative Percent Difference of duplicate (unrounded) analyses
RRF	Relative Response Factor
RT	Retention Time

RTW	Retention Time Window Sample ID A 9 digit number unique for each sample, the first six digits are referred as the job number
SCB	Seeded Control Blank
SD	Serial Dilution (Calculated when sample concentration exceeds 50 times the MDL)
UCB	Unseeded Control Blank
SSV	Second Source Verification Standard
SLCS	Solid Laboratory Control Standard(LCS)
PHC	pH Calibration Check LCSP pH Laboratory Control Sample
LCDP	pH Laboratory Control Sample Duplicate
MDPH	pH Sample Duplicate
MDFP	Flashpoint Sample Duplicate
LCFP	Flashpoint LCS
G1	Gelex Check Standard Range 0-1
G2	Gelex Check Standard Range 1-10
G3	Gelex Check Standard Range 10-100
G4	Gelex Check Standard Range 100-1000

Note 1: The Post Spike Designation on Batch QC for GFAA is designated with an "S" added to the current abbreviation used. EX. LCS S=LCS Post Spike (GFAA); MSS=MS Post Spike (GFAA)

Note 2: The MD calculates an absolute difference (A) when the sample concentration is less than 5 times the reporting limit. The control limit is represented as +/- the RL.

Job Number: 241470
VOA DATA:

1. All samples were analyzed within the required hold-time.

2. The MB (Method Blank) and EB (5035 extraction blank) samples had all analytes undetected.

3. The LCS (Laboratory Control Sample) samples had all five control spike recoveries within the QC limits.

4. The MS/MSD (Matrix Spike/Matrix Spike Duplicate) for sample 1 had all five control spike recoveries and RPD values within the QC limits. The MS/MSD for sample 13 did not provide usable data due to an instrument malfunction. Due to insufficient sample, a re-analysis could not be performed.

5. Samples 1, 2, 4, 5, MB (prep 164819) and MB (prep 165291)had one surrogate recovery above the QC limits and sample 3, 9, 1 MS and LCD (prep 165291) had two surrogate recovery limits above the QC limits. Samples 1, 2, 3, 4 & 5 were re-analyzed, again with the surrogate recoveries above the QC limits. Sample 9 was re-analyzed past the hold time by 3:15 hours with acceptable surrogate recoveries. No further corrective action was required and the original analyses were reported for 1, 2, 4, 5 and 9. All other samples had all surrogate recoveries within the QC limits. The soil LCS had one surrogate recovery below the QC limits and the EB had four surrogate recoveries below the QC limits. No corrective action was required.

6. The samples were prepared and analyzed following SW846 Methods 5030, 5035 & 8260B. All calibration criteria were met per method or SOP (for minimum R-values for certain compounds). The low point in the initial calibration verifies the base reporting limits.

7. All samples had all internal standard areas and retention times within the SOP acceptance limits as compared to the corresponding calibration verification standard.

Gary Rynkar
GC/MS Section Manager
