PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: EC / 4/13/10 Lot #: LD13007

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other

Yes ☑	No ☐	NA ☐	1. Were custody seals present on the cooler?
Yes ☑	No ☐	NA ☐	2. If custody seals were present, were they intact and unbroken?

Cooler ID/temperature upon receipt 4.0 °C / ___ °C ___ / ___ °C ___ / ___ °C ___ / ___ °C ___ / ___ °C ___ / ___ °C ___ / ___ °C

Method: ☐ Temperature Blank ☑ Against Bottles
Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other: ___. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☐	No ☑	NA ☐	5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	6. Were sample IDs listed?
Yes ☑	No ☐	NA ☐	7. Was collection date & time listed?
Yes ☑	No ☐	NA ☐	8. Were tests to be performed listed on the COC or was quote # provided?
Yes ☑	No ☐	NA ☐	9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐	NA ☐	10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐	NA ☐	11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐	NA ☐	12. Was adequate sample volume available?
Yes ☑	No ☐	NA ☐	13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑	NA ☐	14. Were any samples containers missing?
Yes ☐	No ☑	NA ☐	15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☐	16. Were bubbles present >"pea-size" (¼" or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L) and toxicity (<0.1mg/L) samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) ___ were received incorrectly preserved and were adjusted accordingly in sample receiving with ___ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) ___ were received with bubbles >6 mm in diameter.

Sample(s) ___ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Toxicity sample(s) ___ analyzed by method 350.5.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐

SESI employee: ___

Comments: ___

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive
Suite 155
Greenville, SC 29615
Attention: Allison Fang

Project Name: HAA-15

Project Number: GP08HAFS.H15C.GGOFI

Lot Number: MG26023

Date Completed: 08/02/2011

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MG26023

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MG26023

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

The trip blank sample was analyzed and had detection for chloroform above the detection limit. The trip blank was re-analyzed yielding the same results. Client was notified.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Volatile Organic Compounds by GC/MS

Client: ARCADIS U.S., Inc.
Laboratory ID: MG26023-003
Description: Trip Blank(072211)
Matrix: Aqueous
Date Sampled: 07/26/2011 0910
Date Received: 07/26/2011

Surrogate	Q	Run 2 % Recovery	Acceptance Limits
1,2-Dichloroethane-d4		103	70-130
Bromofluorobenzene		106	70-130
Toluene-d8		96	70-130

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: EW 7/26/11 Lot #: MG26023

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other			
Yes ☑	No ☐		1. Were custody seals present on the cooler?
Yes ☑	No ☐		2. If custody seals were present, were they intact and unbroken?
Cooler ID/temperature upon receipt 3.8 °C / °C / °C / °C / °C / °C / °C / °C			
Method: ☐ Temperature Blank ☑ Against Bottles Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None			
If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.			
Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☑	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	5a Were samples relinquished by client to commercial courier?
Yes ☑	No ☐		6. Were sample IDs listed?
Yes ☑	No ☐		7. Was collection date & time listed?
Yes ☑	No ☐		8. Were tests to be performed listed on the COC?
Yes ☑	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐		12. Was adequate sample volume available?
Yes ☐	No ☑		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑		14. Were any samples containers missing?
Yes ☐	No ☑		15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s)_____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number) _____.

Sample(s)_____ were received with bubbles >6 mm in diameter.

Sample(s)_____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

This portion can be removed for recipient's records.

Case Narrative
ARCADIS U.S., Inc.
Lot Number: LF16005

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Sample Receipt Checklist (SRC)

Client: Arendi's Cooler Inspected by/date: EA 4/16/16 Lot #: LF-16005

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other

Yes ☑	No ☐	NA ☐	1. Were custody seals present on the cooler?
Yes ☑	No ☐	NA ☐	2. If custody seals were present, were they intact and unbroken?

Cooler ID/temperature upon receipt 1.6 °C / °C / °C / °C / °C / °C / °C / °C

Method: ☐ Temperature Blank ☑ Against Bottles
Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other: _____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☐	No ☑	NA ☐	5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	6. Were sample IDs listed?
Yes ☑	No ☐	NA ☐	7. Was collection date & time listed?
Yes ☑	No ☐	NA ☐	8. Were tests to be performed listed on the COC or was quote # provided?
Yes ☑	No ☐	NA ☐	9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐	NA ☐	10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐	NA ☐	11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐	NA ☐	12. Was adequate sample volume available?
Yes ☑	No ☐	NA ☐	13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑	NA ☐	14. Were any samples containers missing?
Yes ☐	No ☑	NA ☐	15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L) and toxicity (<0.1mg/L) samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) _____ were received with bubbles >6 mm in diameter.

Sample(s) _____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Toxicity sample(s) _____ were received with TRC >0.1 mg/L and were analyzed by method 330.5.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐ Did client respond: Yes ☐ No ☐

SESI employee: _____ Date of response: _____

Comments: _____

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH13005

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH13005

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Volatile Organic Compounds by GC/MS

Client: ARCADIS U.S., Inc.
Laboratory ID: MH13005-001
Description: H15-MW-13C (081211)
Matrix: Aqueous
Date Sampled: 08/12/2011 0818

/ °C / °C / °C / °C

Method: ☐ Temperature Blank ☒ Against Bottles
Method of coolant: ☒ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes ☐	No ☐	NA ☒	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☒	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☐	No ☒		5. Were proper custody procedures (relinquished/received) followed?
Yes ☐	No ☒	NA ☐	5a Were samples relinquished by client to commercial courier?
Yes ☒	No ☐		6. Were sample IDs listed?
Yes ☒	No ☐		7. Was collection date & time listed?
Yes ☒	No ☐		8. Were tests to be performed listed on the COC?
Yes ☒	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☒	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☒	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☒	No ☐		12. Was adequate sample volume available?
Yes ☐	No ☐		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☒		14. Were any samples containers missing?
Yes ☐	No ☒		15. Were there any excess samples not listed on COC?
Yes ☐	No ☒	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☒	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☒	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☒	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☒	NA ☐	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s)_____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s)_____ were received with bubbles >6 mm in diameter.

Sample(s)_____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐

SESI employee:_____

Comments:_____

This portion can be removed for Recipient's records.

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive
Suite 155
Greenville, SC 29615
Attention: Allison Fang

Project Name: HAA-15

Project Number: GP08HAFS.H15C.GGOFI

Lot Number: MH12008

Date Completed: 08/17/2011

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH12008

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH12008

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: EC 8/12/11 Lot #: MH12608

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other			
Yes ☑	No ☐		1. Were custody seals present on the cooler?
Yes ☐	No ☐		2. If custody seals were present, were they intact and unbroken?
Cooler ID/temperature upon receipt / 3.1 °C / °C / °C / °C / °C / °C / °C / °C			
Method: ☐ Temperature Blank ☑ Against Bottles Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None			
If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.			
Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☑	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☐	No ☑	NA ☐	5a Were samples relinquished by client to commercial courier?
Yes ☑	No ☐		6. Were sample IDs listed?
Yes ☑	No ☐		7. Was collection date & time listed?
Yes ☑	No ☐		8. Were tests to be performed listed on the COC?
Yes ☑	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐		12. Was adequate sample volume available?
Yes ☐	No ☑		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑		14. Were any samples containers missing?
Yes ☐	No ☑		15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s)_____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number) _____.

Sample(s)_____ were received with bubbles >6 mm in diameter.

Sample(s)_____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

This portion can be removed for recipient's records.

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive
Suite 155
Greenville, SC 29615
Attention: Allison Fang

Project Name: HAA-15

Project Number: GP08HAFS.H15C.GG0F1

Lot Number: MH23016

Date Completed: 08/30/2011

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH23016

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH23016

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The MS/MSD recoveries in batch 66464 were outside acceptance criteria. All other QA/QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required.
The LCSD recovery for 1,2-Dichloroethane-d4 and Toluene-d8 was outside method control limits in batch 66672. The LCS results were within limits. Therefore the associated sample results were reported and no corrective action was required.

The LCS/LCSD recovery for Acetone exceeded method control limits in batch 66677; however, all other QA/QC criteria for the LCS/LCSD were within acceptance criteria and method control limits. The associated sample results were non-detect, therefore the results were reported and no corrective action was required.

Sample Summary

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Surrogate	Q	% Rec	Acceptance Limit
Bromofluorobenzene		123	47-138
1,2-Dichloroethane-d4	N	174	53-142
Toluene-d8	N	153	68-124

PQL = Practical quantitation limit
ND = Not detected at or above the MDL
P = The RPD between two GC columns exceeds 40%
J = Estimated result < PQL and ≥ MDL
N - Recovery is out of criteria
+ - RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Volatile Organic Compounds by GC/MS - MB

Sample ID: MQ66677-001
Batch: 66677
Analytical Method: 8260B

Matrix: Aqueous
Prep Method: 5030B

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: EC 3/23/11 Lot #: MH230 N

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other			
Yes ☑	No ☐		1. Were custody seals present on the cooler?
Yes ☑	No ☐		2. If custody seals were present, were they intact and unbroken?
Cooler ID/temperature upon receipt 1 / 4 °C ___/___°C ___/___°C ___/___°C ___/___°C ___/___°C ___/___°C ___/___°C ___/___°C Method: ☑ Temperature Blank ☐ Against Bottles Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None			
If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.			
Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☑	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	5a Were samples relinquished by client to commercial courier? No times
Yes ☑	No ☐		6. Were sample IDs listed?
Yes ☑	No ☐		7. Was collection date & time listed?
Yes ☑	No ☐		8. Were tests to be performed listed on the COC?
Yes ☑	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☐	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐		12. Was adequate sample volume available?
Yes ☑	No ☐		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑		14. Were any samples containers missing?
Yes ☐	No ☐		15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☒ 3/23/11	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number) _____.

Sample(s) _____ were received with bubbles >6 mm in diameter.

Sample(s) _____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH18016

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH18016

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The LCS/LCSD recovery for Methylene chloride was slightly outside method control limits in batch 66167. As per method, it is statistically likely that a few analytes will be outside control limits; up to five analytes may marginally exceed the control limits. Therefore the associated sample results were reported and no corrective action was required.

The MS/MSD recoveries for sample -003 in batch 66167 were outside acceptance criteria. All other QA/QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Volatile Organic Compounds by GC/MS

Client: ARCADIS U.S., Inc.
Laboratory ID: MH18016-020
Description: Trip Blank (081911)
Matrix: Aqueous
Date Sampled: 08/19/2011
Date Received: 08/20/2011

Surrogate	Q	Run 1 % Recovery	Acceptance Limits
1,2-Dichloroethane-d4		109	70-130
Bromofluorobenzene		102	70-130
Toluene-d8		106	70-130

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit

P = The RPD between two GC columns exceeds 40%

N - Recovery is out of criteria

ND = Not detected at or above the MDL

J = Estimated result < PQL and ≥ MDL

+ - RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Surrogate	Q	% Rec	Acceptance Limit
Bromofluorobenzene		102	70-130
1,2-Dichloroethane-d4		110	70-130
Toluene-d8		106	70-130

PQL = Practical quantitation limit

P = The RPD between two GC columns exceeds 40%

N - Recovery is out of criteria

ND = Not detected at or above the MDL

J = Estimated result < PQL and ≥ MDL

+ - RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Volatile Organic Compounds by GC/MS - LCSD

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive
Suite 155
Greenville, SC 29615
Attention: Allison Fang

Project Name: HAA-15

Project Number: GP08HAFS.H15C.GGOFI

Lot Number: MH25003

Date Completed: 08/29/2011

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH25003

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH25003

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The LCS/LCSD recovery for Acetone exceeded method control limits in batch 66677; however, all other QA/QC criteria for the LCS/LCSD were within acceptance criteria and method control limits. The associated sample results (-003 H15-MW-08C) were non-detect, therefore the results were reported and no corrective action was required.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

To: Nisreen Saikaly
Subject: ARCADIS sample ID correction

M H36003

Hi Nisreen,

As we discussed, please change HAA-15 soil sample ID H15-MW-20E should read H15-MW-02E.

The correct H15-MW-20E might be shipped next week but the one you received today should be H15-MW-02E.

Thanks!

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH24010

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH24010

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The LCS/LCSD recovery for Chloromethane (Methyl chloride) and the the LCS recovery of Vinyl chloride exceeded method control limits in batch 66505; however, all other QA/QC criteria for the LCS/LCSD were within acceptance criteria and method control limits. The associated sample results were non-detect, therefore the results were reported and no corrective action was required.

The MS/MSD recoveries in batch 66505 were outside acceptance criteria. All other QA/QC criteria for the batch were within acceptance criteria and method control limits. The MS/MSD recovery results are attributed to matrix interference. The associated sample results were reported and no corrective action was required.

Sample Summary

ARCADIS U.S., Inc.

Lot Number: MH24010

Sample Number	Sample ID	Matrix	Date Sampled	Date Received

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Xylenes (total)	100	100		1	102	70-130	08/29/2011 0802

Surrogate	Q	% Rec	Acceptance Limit
Bromofluorobenzene		98	70-130
1,2-Dichloroethane-d4		107	70-130
Toluene-d8		105	70-130

PQL = Practical quantitation limit
ND = Not detected at or above the MDL
P = The RPD between two GC columns exceeds 40%
J = Estimated result < PQL and ≥ MDL
N - Recovery is out of criteria
+ - RPD is out of criteria

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: Etg 8/24/11 Lot #: M 142408

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other			
Yes ☑	No ☐		1. Were custody seals present on the cooler?
Yes ☑	No ☐		2. If custody seals were present, were they intact and unbroken?
Cooler ID/temperature upon receipt 3.6 °C / °C / °C / °C / °C / °C / °C / °C / °C Method: ☑ Temperature Blank ☑ Against Bottles Method of coolant: ☐ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None			
If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.			
Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☑	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	5a Were samples relinquished by client to commercial courier? times not indicated on (1) COC
Yes ☑	No ☐		6. Were sample IDs listed?
Yes ☑	No ☐		7. Was collection date & time listed?
Yes ☑	No ☐		8. Were tests to be performed listed on the COC?
Yes ☑	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐		12. Was adequate sample volume available?
Yes ☑	No ☐		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑		14. Were any samples containers missing?
Yes ☐	No ☑		15. Were there any excess samples not listed on COC?
Yes ☐	No ☑	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number) _____.

Sample(s) _____ were received with bubbles >6 mm in diameter.

Sample(s) _____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐ Did client respond: Yes ☐ No ☐

SESI employee: _____ Date of response: _____

Comments: _____

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MI10009

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MI10009

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: [illegible] 9/10/11 Lot #: WI10009 (2)

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☒ FedEx ☐ Airborne Exp ☐ Other

Yes ☒	No ☐		1. Were custody seals present on the cooler?
Yes ☒	No ☐		2. If custody seals were present, were they intact and unbroken?

Cooler ID/temperature upon receipt 1 2 °C / °C / °C / °C / °C / °C / °C / °C

Method: ☐ Temperature Blank ☒ Against Bottles
Method of coolant: ☒ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes ☐	No ☐	NA ☒	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☒	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☒	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☒	No ☐	NA ☐	5a Were samples relinquished by client to commercial courier?
Yes ☒	No ☐		6. Were sample IDs listed?
Yes ☒	No ☐		7. Was collection date & time listed?
Yes ☒	No ☐		8. Were tests to be performed listed on the COC?
Yes ☒	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☒	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☒	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☒	No ☐		12. Was adequate sample volume available?
Yes ☐	No ☒		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☒		14. Were any samples containers missing?
Yes ☐	No ☒		15. Were there any excess samples not listed on COC?
Yes ☒	No ☐	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☒	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☒	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☒	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☒	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s)_____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) 2 3 (2) were received with bubbles >6 mm in diameter.

Sample(s)_____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐

SESI employee:_____

Comments:_____

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

MH26027

Case Narrative
ARCADIS U.S., Inc.
Lot Number: MH26027

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Shealy is not NELAC certified for Phosphorus by 365.1 but is certified in SC and NC.

Shealy is not NELAC certified for VPH, but is certified for VPH in NC.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The LCS recovery for Acetone exceeded method control limits in batch 66677; however, all other QA/QC criteria for the LCS were within acceptance criteria and method control limits. The associated sample results were non-detect, therefore the results were reported and no corrective action was required.

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: LA 18/26/11 Lot #: MHX627

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☒ FedEx ☐ Airborne Exp ☐ Other			
Yes ☒	No ☐		1. Were custody seals present on the cooler?
Yes ☒	No ☐		2. If custody seals were present, were they intact and unbroken?
Cooler ID/temperature upon receipt 3.7 °C / °C / °C / °C / °C / °C / °C / °C Method: ☒ Temperature Blank ☒ Against Bottles Method of coolant: ☒ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None			
If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.			
Yes ☐	No ☐	NA ☒	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other:_____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☒	No ☐	NA ☒	4. Is the commercial courier's packing slip attached to this form?
Yes ☒	No ☐		5. Were proper custody procedures (relinquished/received) followed?
Yes ☒	No ☐	NA ☒	5a Were samples relinquished by client to commercial courier?
Yes ☒	No ☐		6. Were sample IDs listed?
Yes ☒	No ☐		7. Was collection date & time listed?
Yes ☒	No ☐		8. Were tests to be performed listed on the COC?
Yes ☒	No ☐		9. Did all samples arrive in the proper containers for each test?
Yes ☒	No ☐		10. Did all container label information (ID, date, time) agree with COC?
Yes ☒	No ☐		11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☒	No ☐		12. Was adequate sample volume available?
Yes ☐	No ☒		13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☒		14. Were any samples containers missing?
Yes ☐	No ☒		15. Were there any excess samples not listed on COC?
Yes ☒	No ☐	NA ☐	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☒	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☒	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☒	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L)samples free of residual chlorine?
Yes ☐	No ☐	NA ☒	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s)_____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) 002 (2) were received with bubbles >6 mm in diameter.

Sample(s)_____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

This portion can be removed for recipients records.

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive
Suite 155
Greenville, SC 29615
Attention: Janet Christy

Project Name: HAA-15

Project Number: GP08HAFS.H15B.DG0F1

Lot Number: KL06005

Date Completed: 12/18/2009

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

KL06005

Case Narrative
ARCADIS U.S., Inc.
Lot Number: KL06005

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

Dilution greater than 5X impact surrogate recoveries, thus negating their usefulness concerning quality control. Sample results are reported and no corrective action is required.

The RPD for Acetone exceeded method control limits in batch 23661; however, all other QA/QC criteria for the LCS/LCSD were within acceptance criteria and method control limits. The associated sample results were reported and no corrective action was required.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

Sample Receipt Checklist (SRC)

Client: ARCADIS Cooler Inspected by/date: pmp / 12/6/09 Lot #: KL06005

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other

Yes ☐	No ☑	NA ☐	1. Were custody seals present on the cooler?
Yes ☐	No ☐	NA ☑	2. If custody seals were present, were they intact and unbroken?

Cooler ID/temperature upon receipt 4.2 °C / °C / °C / °C / °C / °C / °C / °C

Method: ☐ Temperature Blank ☑ Against Bottles
Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes ☐	No ☐	NA ☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other: _____. (For coolers received via commercial courier, PMs are to be notified immediately.
Yes ☑	No ☐	NA ☐	4. Is the commercial courier's packing slip attached to this form?
Yes ☐	No ☑	NA ☐	5. Were proper custody procedures (relinquished/received) followed?
Yes ☑	No ☐	NA ☐	6. Were sample IDs listed?
Yes ☑	No ☐	NA ☐	7. Was collection date & time listed?
Yes ☑	No ☐	NA ☐	8. Were tests to be performed listed on the COC or was quote # provided?
Yes ☑	No ☐	NA ☐	9. Did all samples arrive in the proper containers for each test?
Yes ☑	No ☐	NA ☐	10. Did all container label information (ID, date, time) agree with COC?
Yes ☑	No ☐	NA ☐	11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
Yes ☑	No ☐	NA ☐	12. Was adequate sample volume available?
Yes ☑	No ☐	NA ☐	13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
Yes ☐	No ☑	NA ☐	14. Were any samples containers missing?
Yes ☐	No ☑	NA ☐	15. Were there any excess samples not listed on COC?
Yes ☐	No ☐	NA ☑	16. Were bubbles present >"pea-size" (¼" or 6mm in diameter) in any VOA vials?
Yes ☐	No ☐	NA ☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
Yes ☐	No ☐	NA ☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
Yes ☐	No ☐	NA ☑	19. Were all applicable NH3/TKN/cyanide/pheno/BNA/pest/PCB/herb (<0.2mg/L) and toxicity (<0.1mg/L) samples free of residual chlorine?
Yes ☐	No ☐	NA ☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) _____ were received with bubbles >6 mm in diameter.

Sample(s) _____ were received with TRC >0.2 mg/L for NH3/TKN/cyanide/BNA/pest/PCB/herb.

Toxicity sample(s) _____ were received with TRC >0.1 mg/L and were analyzed by method 330.5.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐ Did client respond: Yes ☐ No ☐

SESI employee: _____ Date of response: _____

Comments: _____

Report of Analysis

ARCADIS U.S., Inc.
30 Patewood Drive

Greenville, SC 29615
Attention: Janet Christy

Project Name: Hunter Stewart

Project Number: GP08HAFS

Lot Number: KL04038

Date Completed: 12/16/2009

Nisreen Saikaly
Project Manager

This report shall not be reproduced, except in its entirety, without the written approval of Shealy Environmental Services, Inc.

The following non-paginated documents are considered part of this report: Chain of Custody Record and Sample Receipt Checklist.

KL04038

Case Narrative
ARCADIS U.S., Inc.
Lot Number: KL04038

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatile Organic Compounds

The surrogate recovery for sample -004, -008, -009, -010, 017, -018 and -019 was outside the acceptance limit. These sample were diluted. The dilution impacted the surrogate recoveries, thus negating their usefulness concerning quality control. The sample results are reported and no corrective action is required.

The RPD for Acetone and Chloroethane exceeded method control limits in batch 23151; however, all other QA/QC criteria for the LCS/LCSD were within acceptance criteria and method control limits. The associated sample results were reported and no corrective action was required.

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

1,1,1-Trichloroethane	71-55-6	8260B	ND		3.7	0.64	ug/kg	1

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
P = The RPD between two GC columns exceeds 40%
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"
N = Recovery is out of criteria
H = Out of holding time

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

PQL = Practical quantitation limit
P = The RPD between two GC columns exceeds 40%
N - Recovery is out of criteria
ND = Not detected at or above the MDL
J = Estimated result < PQL and ≥ MDL
+ - RPD is out of criteria
Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W"

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Sample Receipt Checklist (SRC)

Client: Arcadis Cooler Inspected by/date: DMP 7/4/09 Lot #: KL04038

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Airborne Exp ☐ Other

Yes	No	NA	
☑	☐	☐	1. Were custody seals present on the cooler?
☑	☐	☐	2. If custody seals were present, were they intact and unbroken?

Cooler ID/temperature upon receipt 4.6 °C / °C / °C / °C
/ °C / °C / °C / °C

Method: ☐ Temperature Blank ☑ Against Bottles
Method of coolant: ☑ Wet Ice ☐ Blue Ice ☐ Dry Ice ☐ None

If response is No (or Yes for 14, 15, 16), an explanation/resolution must be provided.

Yes	No	NA	
☐	☐	☑	3. If temperature of any cooler exceeded 6.0°C, was Project Manager notified? PM notified by SRC, phone, note (circle one), other: _____. (For coolers received via commercial courier, PMs are to be notified immediately.
☑	☐	☐	4. Is the commercial courier's packing slip attached to this form?
☐	☑	☐	5. Were proper custody procedures (relinquished/received) followed?
☑	☐	☐	6. Were sample IDs listed?
☑	☐	☐	7. Was collection date & time listed?
☑	☐	☐	8. Were tests to be performed listed on the COC or was quote # provided?
☑	☐	☐	9. Did all samples arrive in the proper containers for each test?
☑	☐	☐	10. Did all container label information (ID, date, time) agree with COC?
☑	☐	☐	11. Did all containers arrive in good condition (unbroken, lids on, etc.)?
☑	☐	☐	12. Was adequate sample volume available?
☐	☑	☐	13. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐	☑	☐	14. Were any samples containers missing?
☐	☑	☐	15. Were there any excess samples not listed on COC?
☐	☐	☑	16. Were bubbles present >"pea-size" (¼"or 6mm in diameter) in any VOA vials?
☐	☐	☑	17. Were all metals/O&G/HEM/nutrient samples received at a pH of <2?
☐	☐	☑	18. Were all cyanide and/or sulfide samples received at a pH >12?
☐	☐	☑	19. Were all applicable NH3/TKN/cyanide/phenol/BNA/pest/PCB/herb (<0.2mg/L) and toxicity (<0.1mg/L) samples free of residual chlorine?
☐	☐	☑	20. Were collection temperatures documented on the COC for NC samples?

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with _____ (H_2SO_4,HNO_3,HCl,NaOH) with the SR # (number)

Sample(s) _____ were received with bubbles >6 mm in diameter.

Sample(s) _____ were received with TRC >0.2 mg/L for NH3/ TKN/cyanide/BNA/pest/PCB/herb.

Toxicity sample(s) _____ were received with TRC >0.1 mg/L and were analyzed by method 330.5.

Corrective Action taken, if necessary:

Was client notified: Yes ☐ No ☐ Did client respond: Yes ☐ No ☐
SESI employee: _____ Date of response: _____
Comments: _____

HUNTER STEWART
ELECTRONIC VALIDATION REVIEW REPORT
SDG: LD13007 and LE14026
HAA-15

Analytical data were evaluated in accordance with applicable USEPA SW-846 method requirements, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review" (October 1999), analytical method control criteria, the analytical laboratory Quality Assurance Control Limits, the Fort Stewart Military Reservation and Hunter Army Airfield Quality Assurance Project Plan (ARCADIS-2008), and professional judgment.

The data review summarized in this report includes a review of all sample collection documentation and the electronic data validation of the analytical data housed in the project database. Sample collection documentation included sample collection logs and chains of custody. The electronic data validation was performed utilizing the EQuIS Data Qualification Module (DQM). DQM checks for the following parameters:

- Holding times and preservation;
- Blank contamination;
    1. Method blanks,
    2. Trip blanks,
    3. Equipment blanks;
- Matrix spike and Duplicate sample recovery;
- Matrix Spike and Matrix Spike Duplicate relative percent differences;
- Laboratory Control Sample and Duplicate recovery;
- Laboratory Control Sample and Duplicate relative percent differences;
- Surrogate recovery (organic analyses only); and
- Field duplicate relative percent difference.

Manual review was performed for the following items:

- Sample dilutions and reporting limits;
- Case Narratives; and
- Laboratory Duplicates

Data was generated by Shealy Environmental Services, Inc. – West Columbia, South Carolina. Data qualifiers were applied electronically to the database with any additional qualifiers added manually. A summary of the data as amended by data qualifiers is included with the original hard copy reports.

The attached table summarizes the data that were qualified due to QC deficiencies. The table indicates compounds/analytes qualified based on electronic and manual validation. Refer to the associated method section of the validation checklist for a detailed explanation of qualification. All other data in these SDGs are considered usable as reported.

ARCADIS

HUNTER STEWART
ELECTRONIC VALIDATION REVIEW REPORT
SDG: LD13007 and LE14026
HAA-15

The following list of data qualifiers and definitions were applied in accordance with qualification criteria defined in the greater than guidance documents:

UB Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.

J The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was not detected greater than the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.

R The sample result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria; and the presence or absence of the analyte cannot be verified.

U Not detected at the quantitative reporting limit

Comments:
This section presents a discussion of any additions or changes to the electronic data validation for compounds analyzed by Method 8260B.

2. Several samples required dilutions due to elevated concentrations of target analytes. There were elevated reporting limits for non-detect results.

3A. SDG (LD13007) The compound methylene chloride was detected in the method blank for batches 31615 and 31703. The associated field samples were qualified as non-detect if the sample results was less than ten times the blank result.

5A. SDG (LE14026) The recoveries of the compounds carbon tetrachloride and cyclohexane were below the control limit in the LCS for batch 33911. The associated field samples analyzed in this analytical batch were qualified as estimated for these compounds.

5C. SDG (LE14026) The RPD between the LCS/LCSD pair was above the control limit for the compound tetrachloroethane in batch 33911. The associated field samples analyzed in this analytical batch were qualified as estimated for this compound.

7. SDG (LD13007) Sample location DUP-1(041210) was collected as a field duplicate of H15-MW-03C. The RPDs were acceptable at less than 40%.

SDG (LE14026) Sample location DUP-1(051310) was collected as a field duplicate of H15-MW-07B(051310). The RPD for carbon disulfide was above the control limit. The parent and the duplicate were qualified as estimated for this compound.

The data review summarized in this report includes a review of all sample collection documentation and the electronic data validation of the analytical data housed in the project database. Sample collection documentation included sample collection logs and chains of custody. The electronic data validation was performed utilizing the EQuIS Data Qualification Module (DQM). DQM checks for the following parameters:

- Holding times and preservation;
- Blank contamination;
    1. Method blanks,
    2. Trip blanks,
    3. Equipment blanks;
- Matrix spike and Duplicate sample recovery;
- Matrix Spike and Matrix Spike Duplicate relative percent differences;
- Laboratory Control Sample and Duplicate recovery;
- Laboratory Control Sample and Duplicate relative percent differences;
- Surrogate recovery (organic analyses only); and
- Field duplicate relative percent difference.

Manual review was performed for the following items:

- Sample dilutions and reporting limits;
- Case Narratives; and
- Laboratory Duplicates

Data was generated by Shealy Environmental Services, Inc. – West Columbia, South Carolina. Data qualifiers were applied electronically to the database with any additional qualifiers added manually. A summary of the data as amended by data qualifiers is included with the original hard copy reports.

The attached table summarizes the data that were qualified due to QC deficiencies. The table indicates compounds/analytes qualified based on electronic and manual validation. Refer to the associated method section of the validation checklist for a detailed explanation of qualification. All other data in these SDGs are considered usable as reported.

HAA-15

The following list of data qualifiers and definitions were applied in accordance with qualification criteria defined in the greater than guidance documents:

UB Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.

J The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was not detected greater than the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.

R The sample result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria; and the presence or absence of the analyte cannot be verified.

U Not detected at the quantitative reporting limit

Comments:
This section presents a discussion of any additions or changes to the electronic data validation for compounds analyzed by Method 8260B.

2. Several samples were analyzed at dilutions due to elevated concentrations of target analytes. There were elevated reporting limits for non-detect results.

3A. SDG (MH18016) The compound 2-hexanone was detected in the method blank for batch 66029. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

SDG (MH23016) The compound acetone was detected in the method blank for batch 66464. The associated field samples were qualified as non-detect for this compound if the sample concentrations were less than ten times the blank values. The compound 2-hexanone was detected in the method blanks for batch 660586 and 66652. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

SDGs (MH24010 and MH25003) The compound 2-hexanone was detected in the method blank for batch 66586 and 4-methyl-2-pentanone was detected in the method blank for batch 66671. The associated field samples were non-detect for these compounds; therefore, qualification of the data was not warranted.

3C. SDG (MG26023) The compounds bromodichloromethane, chloroform and dibromochloromethane were detected in the trip blank. The associated field samples were non-detect for these compounds; therefore, qualification of the data was not warranted.

SDG (MH18016) The compound methylene chloride was detected in the trip blanks collected on 08/1711 and 08/18/11. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

SDG (MH23016) The compound methylene chloride was detected in the trip blank. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

5. SDG (MH18016) The recovery of the compound methylene chloride was below the control limit in the LCS and the LCSD for batch 66167. The associate field samples were qualified as estimated for methylene chloride.

SDG (MH18016) The recovery of acetone was above the control limit in the LCS for batches 66218 and 66224. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

SDG (MH18016) The RPD between the LCS/LCSD pair was above the control limit for bromomethane for batch 66224. The associated field samples were qualified as estimated for this compound.

SDGs (MH23016, MH25003, MH26027) The RPD between the LCS/LCSD pair was above the control limit for trichloroethene for batch 66672. The associated field samples were qualified as estimated for this compound. The recovery of acetone was above the control limit in the LCS for batch 66677. The associated field sample was non-detect for this compound; therefore, qualification of the data was not warranted.

SDG (MH24010) The recoveries of chloromethane and vinyl chloride were above the control limit in the LCS and/or the LCSD for batch 66505. The associated field samples were non-detect for this compound; therefore, qualification of the data was not warranted.

6. SDG (MH18016) Sample location H15-MW-02E(97-99) was used as the MS. The recoveries of trans-1,3-dichloropropene, cis-1,3-dichloropropene and methyl acetate were below the control limit. The parent sample was qualified as estimated for these compounds.

SDG (MH23016) Sample location H15-MW-20E(71-73) was used as the MS. The recoveries of acetone and carbon disulfide were above the control limit in the MS. These compounds were detected in the parent sample and qualified as estimated. The recovery of 1,2,4-trichlorobenzene was below the control limit in the MS. The parent sample was qualified as estimated for this compound.

SDG (MH24010) Sample location H15-MW-12C was used as the MS. Several MS recoveries were outside the control limit. The parent sample was qualified as estimated when applicable. See the attached qualification summary for details of the qualifications.

7. SDG (MH18016) Sample location H15-MW-02E(92-94) was used as the laboratory duplicate. The RPDs were acceptable.

SDG (MH23016) Sample location H15-MW-20E(66-38) was used as the laboratory duplicate. The RPDs for acetone and carbon disulfide were above the laboratory control limit. The parent sample was qualified as estimated for these compounds.

ELECTRONIC VALIDATION REVIEW REPORT
SDG: LB04013
HAA-15

Analytical data were evaluated in accordance with applicable USEPA SW-846 method requirements, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review" (October 1999), analytical method control criteria, the analytical laboratory Quality Assurance Control Limits, the Fort Stewart Military Reservation and Hunter Army Airfield Quality Assurance Project Plan (ARCADIS-2008), and professional judgment.

The data review summarized in this report includes a review of all sample collection documentation and the electronic data validation of the analytical data housed in the project database. Sample collection documentation included sample collection logs and chains of custody. The electronic data validation was performed utilizing the EQuIS Data Qualification Module (DQM). DQM checks for the following parameters:

- Holding times and preservation;
- Blank contamination;
    1. Method blanks,
    2. Trip blanks,
    3. Equipment blanks;
- Matrix spike and Duplicate sample recovery;
- Matrix Spike and Matrix Spike Duplicate relative percent differences;
- Laboratory Control Sample and Duplicate recovery;
- Laboratory Control Sample and Duplicate relative percent differences;
- Surrogate recovery (organic analyses only); and
- Field duplicate relative percent difference.

Manual review was performed for the following items:

- Sample dilutions and reporting limits;
- Case Narratives; and
- Laboratory Duplicates

Data was generated by Shealy Environmental Services, Inc. – West Columbia, South Carolina. Data qualifiers were applied electronically to the database with any additional qualifiers added manually. A summary of the data as amended by data qualifiers is included with the original hard copy reports.

The attached table summarizes the data that were qualified due to QC deficiencies. The table indicates compounds/analytes qualified based on electronic and manual validation. Refer to the associated method section of the validation checklist for a detailed explanation of qualification. All other data in these SDGs are considered usable as reported.

HAA-15

The following list of data qualifiers and definitions were applied in accordance with qualification criteria defined in the greater than guidance documents:

UB Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.

J The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was not detected greater than the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.

R The sample result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria; and the presence or absence of the analyte cannot be verified.

U Not detected at the quantitative reporting limit

Comments:
This section presents a discussion of any additions or changes to the electronic data validation for compounds analyzed by Method 8260B.

2. Several samples required dilutions due to elevated concentrations of target analytes. There were elevated reporting limits for non-detect results.

3A. The compounds benzene, toluene and xylenes were detected in the method blank for batch 27091. The associated field samples were qualified as non-detect for these compounds if the sample results were less than five times the blank results.

3C. The compound acetone was detected in both trip blanks. The associated field samples were qualified as non-detect for acetone if the sample results were less than ten times the blank result.

5A. The recovery of dichlorodifluoromethane was below the control limit in the LCS for batch 27307. The associated field samples analyzed in this analytical batch were qualified as estimated for this compound.

5C. The RPD between the LCS/LCSD pair was above the control limit for dichlorodifluoromethane and acetone. The associated field samples analyzed in this analytical batch were qualified as estimated for these compounds.

6. Sample location HGL-10C(020210) was used as the MS/MSD. The recoveries of several compounds were below the control limit in the MS and the MSD. The parent sample was qualified as estimated for these compounds. See the attached qualification summary for details of the qualifications.

Sample location HGL-7B(020410) was used as the MS/MSD. The recoveries of acetone and cyclohexane were below the control limit in the MS and/or the MSD. The RPD between the MS/MSD pair was above the control limit for cyclohexane. The parent sample was qualified as estimated for these compounds.

7. Sample location DUP-H15(020310) was collected as a field duplicate of HGL-4C(020210). The RPDs were acceptable at less than 40%.

   Sample location DUP2-H15(020210) was collected as a field duplicate of HGL-5C(020310). The RPDs were acceptable at less than 40%.

   Sample location DUP3-H15(020210) was collected as a field duplicate of HGL-8C(020210). The RPDs were acceptable at less than 40%.

Comments:
This section presents a discussion of any additions or changes to the electronic data validation for compounds analyzed by Methods 6010C.

6. SDG (LB18061) Sample location DUP-2(021710) was collected as a field duplicate of AT-MW-3(2-17-10). The RPDs were acceptable at less than 40%.

HUNTER STEWART
ELECTRONIC VALIDATION REVIEW REPORT
SDG: KL06005
HAA-15

Analytical data were evaluated in accordance with applicable USEPA SW-846 method requirements, "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review" (October 1999), analytical method control criteria, the analytical laboratory Quality Assurance Control Limits, the Fort Stewart Military Reservation and Hunter Army Airfield Quality Assurance Project Plan (ARCADIS-2008), and professional judgment.

The data review summarized in this report includes a review of all sample collection documentation and the electronic data validation of the analytical data housed in the project database. Sample collection documentation included sample collection logs and chains of custody. The electronic data validation was performed utilizing the EQuIS Data Qualification Module (DQM). DQM checks for the following parameters:

- Holding times and preservation;
- Blank contamination;
    1. Method blanks,
    2. Trip blanks,
    3. Equipment blanks;
- Matrix spike and Duplicate sample recovery;
- Matrix Spike and Matrix Spike Duplicate relative percent differences;
- Laboratory Control Sample and Duplicate recovery;
- Laboratory Control Sample and Duplicate relative percent differences;
- Surrogate recovery (organic analyses only); and
- Field duplicate relative percent difference.

Manual review was performed for the following items:

- Sample dilutions and reporting limits;
- Case Narratives; and
- Laboratory Duplicates

Data was generated by Shealy Environmental Services, Inc. – West Columbia, South Carolina. Data qualifiers were applied electronically to the database with any additional qualifiers added manually. A summary of the data as amended by data qualifiers is included with the original hard copy reports.

The attached table summarizes the data that were qualified due to QC deficiencies. The table indicates compounds/analytes qualified based on electronic and manual validation. Refer to the associated method section of the validation checklist for a detailed explanation of qualification. All other data in these SDGs are considered usable as reported.

SDG: KL06005
HAA-15

The following list of data qualifiers and definitions were applied in accordance with qualification criteria defined in the above guidance documents:

UB Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.

J The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.

UJ The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.

R The sample result is rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria; and the presence or absence of the analyte cannot be verified.

U Not detected at the quantitative reporting limit

Comments:
This section presents a discussion of any additions or changes to the electronic data validation for compounds analyzed by Method 8260.

2. Several samples required dilutions due to elevated concentrations of target analytes. There were no elevated reporting limits for non-detect results.

4. The three surrogate recoveries were less than the control limit in the 50x dilutions of H15-SB12A(120409)-(34-35), H15-SB12A(120409)-(42-43), and H15-SB12A(120409)-(49-50). All results reported from these dilutions were qualified as estimated. See the attached qualification summary for details of the qualifications.

   The three surrogate recoveries were less than the control limit in the 100x dilution of H15-SB47(120409)-(29-30) and the 200x dilutions of H15-SB47(120409)-(34-35) and H15-SB47(120409)-42-43). All results reported from these dilutions were qualified as estimated. See the attached qualification summary for details of the qualifications.

5C. The RPD between the LCS/LCSD pair was greater than the control limit for acetone. The associated field samples are qualified as estimated for acetone. See the attached qualification summary for details of the qualifications.

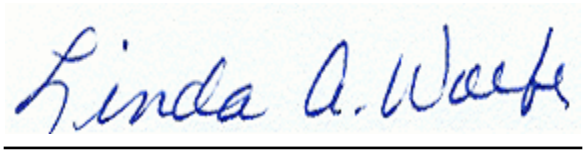
ANALYTICAL REPORT

Job Number: 680-13810-1



SDG Number: HAAF03

Job Description: HGL (Hunter AAF Project)

For:

Severn Trent Laboratories, Inc.
2417 Bond Street
University, IL 60466

Attention: Linda Mackley

Linda Wolfe

Project Manager I

lwolfe@stl-inc.com

02/23/2006

cc: Mr. Eric Evans
Mr. Mike Jackson

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this test report should be directed to the STL Project Manager who signed this test report.

SEVERN TRENT STL

COMMERCIAL LABORATORY STIPULATION

Georgia Rules for Commercial Environmental Laboratory Accreditation
Chapter 391-3-26

LABORATORY:	STL Savannah
ACCREDITOR:	NELAC: State of Florida, Department of Health, Bureau of Laboratories
ACCREDITATION ID:	E87052
SCOPE:	Safe Drinking Water Act (SDWA) Clean Water Act (CWA) Resource Conservation and Recovery Act (RCRA) Clean Air Act (CAA)
EFFECTIVE:	July 1, 2004 **EXPIRATION DATE:** June 30, 2006

LABORATORY:	STL Savannah
ACCREDITOR:	American Association of Laboratory Accreditation (A2LA)
ACCREDITATION ID:	6883
SCOPE:	Safe Drinking Water Act (SDWA) Clean Water Act (CWA) Resource Conservation and Recovery Act (RCRA) Clean Air Act (CAA)
EFFECTIVE:	August 24, 2005 **EXPIRATION DATE:** February 28, 2007

LABORATORY:	STL Savannah
ACCREDITOR:	NELAC: State of New York, Department of Health
ACCREDITATION ID:	10842
SCOPE:	Safe Drinking Water Act (SDWA)
EFFECTIVE:	March 31, 2005 **EXPIRATION DATE:** April 1, 2006

As per the Georgia EPD Rules and Regulations for Commercial Laboratories, STL Savannah is accredited by the Florida Department of Health and the New York Department of Health under the National Environmental Laboratory Approval Program (NELAC) and by the American Association for Laboratory Accreditation (A2LA). If you have any further questions regarding accreditation status for STL Savannah, please contact your STL Savannah Project Manager.

DATA REPORTING QUALIFIERS

Client: Severn Trent Laboratories, Inc.

Job Number: 680-13810-1
Sdg Number: HAAF03

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Analyte was not detected at or above the reporting limit.
	*	LCS, LCSD, MS, MSD, MD, or Surrogate exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Client: Severn Trent Laboratories, Inc.

Job Number: 680-13810-1
Sdg Number: HAAF03

LOGIN SAMPLE RECEIPT CHECK LIST

Client: Severn Trent Laboratories, Inc.

Job Number: 680-13810-1
Sdg Number: HAAF03

Login Number: 13810

Question	T/F/NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	NA	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	NA	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	NA	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	NA	
If necessary, staff have been informed of any short hold time or quick TAT needs	NA	
Multiphasic samples are not present.	NA	
Samples do not require splitting or compositing.	NA	

Result (acetone)

General Statistics

Number of Valid Observations	9	Number of Distinct Observations	9

Raw Statistics

Minimum	0.0065
Maximum	0.082
Mean	0.0477
Median	0.05
SD	0.029
Coefficient of Variation	0.608
Skewness	-0.354

Log-transformed Statistics

Minimum of Log Data	-5.036
Maximum of Log Data	-2.501
Mean of log Data	-3.331
SD of log Data	0.939

Warning: There are only 9 Values in this data

Note: It should be noted that even though bootstrap methods may be performed on this data set, the resulting calculations may not be reliable enough to draw conclusions

The literature suggests to use bootstrap methods on data sets having more than 10-15 observations.

1. Introduction

This Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan (QAPP) was prepared by ARCADIS U.S., Inc. (ARCADIS) to provide field personnel with detailed instructions and procedures regarding field activities to be performed in support of Resource Conservation and Recovery Act (RCRA) and Hazardous Site Response Act (HSRA) remedial activities and to document the performance of all environmental field activities at the Fort Stewart Military Reservation and Hunter Army Airfield in Georgia.

This site-wide SAP provides a detailed description of the field investigation methodologies that will be used to complete the RCRA and HSRA remedial process at the Sites included in ARCADIS' Performance Based Contract (PBC) contract. The QAPP, included as Appendix A, presents the policies, organization, objectives, functional activities, and specific quality assurance/ quality control (QA/QC) procedures. The QA/QC procedures will be employed by ARCADIS to ensure that all technical data generated are accurate and representative, and the data will be of known and usable quality for the intended purpose. Site-specific work plans that further define the scope of activities to be performed at each individual Site will reference this plan for the general procedures to be used in completing the prescribed field activities.

ARCADIS field personnel will use the procedures described in this SAP to produce accurate, comparable, and reproducible data for reduction and evaluation. This SAP is divided into four sections. A brief description of each section is provided below:

- **Section 1, Introduction** – Summarizes the purpose and organization of the plan.

- **Section 2, Site Preparation and Mobilization Procedures** – Describes the tasks to be performed prior to mobilization to the field, including notification and coordination requirements.

- **Section 3, Field Investigation Procedures** – Presents a detailed discussion of the procedures to be used in completing the field tasks, including information on drilling, well construction, sampling, decontamination, investigation derived waste, and the site survey.

- **Section 4, Field Documentation Procedures** – Outlines the methods to be used for sample designation, chain-of-custody (COC) procedures, and field documentation.

Throughout this SAP, reference is made to standard forms and logs used by ARCADIS field personnel to record field observations and measurements. Examples of each of these forms are provided in Appendix B of this SAP.

2. Site Preparation and Mobilization Procedures

Initial project coordination, subcontractor coordination, and utility clearance activities will be conducted prior to initiating the field sampling activities. These pre-mobilization activities are discussed in the following subsections.

2.1 Initial Coordination

The Fort Stewart and Hunter Army Airfield environmental staff will be notified at least 2 weeks before the start of any field work.

2.2 Mobilization and Subcontractor Coordination

The subcontractors, including drillers, laboratories, and surveyors, will be selected and contracts will be executed in advance of beginning the field activities.

2.3 Utility Clearance

Prior to mobilization, all underground utility lines, and other underground structures will be clearly marked. ARCADIS personnel will be responsible for making certain the underground utilities and structures are located and marked. ARCADIS is responsible for submitting a utility locate request through the Georgia Utility Protection Center (UPC). UPC will accept these locate request either by phone or internet. The phone number is (800) 282-7411. The UPC web address is www.gaupc.com and click on IRTH login to make the request. In order to submit a request using the website, pre-registration will be required. The contractor must mark the boundaries of the proposed work site using either white paint, flags or stakes. Department of Public Works (DPW) will accept responsibility for accuracy of the locates pertaining to gas and fuel lines, water lines, electrical lines to include secondary electricity, airfield lighting, low voltage, fire systems, sewer lines, roof drain lines, storm drain lines, industrial waste lines, chilled water lines, high temperature water lines, irrigation systems, and DPW non-fiber computer lines. These requests will be forwarded to all utility companies with services present within the proposed work site.

Permits will be issued within 48 hours of the next business day following the receipt of the request by UPC. The permits will only be valid for 21 days and renewal requests should be submitted a minimum of 3 days prior to expiration. Requesting contractors are responsible for maintaining marks during the 21-day period. If, after acquiring a

permit, a utility is damaged during field activities, the appropriate utility company must be notified. DPW's utilities are listed above and the points of contact are:

Fort Stewart	Carletha Joyce	(912) 767-6669
HAAF	Tony West	(912) 315-5523

The contractor should be prepared to submit proof of a valid permit at that time.

ARCADIS personnel will be responsible for notifying the Fort Stewart and Hunter Army Airfield environmental office of planned intrusive activities at least 2 weeks prior to the initiation of field activities. Upon arrival at the installation, the field operations leader will check the proposed drilling, sampling, and trenching locations for marked underground utilities, other underground structures, and above-ground pipe racks or power lines. A Utilities and Structures Checklist (Appendix B) will be completed by the Field Operations Leader for each area to be sampled prior to commencement of field activities. A copy of the completed checklist will be retained in the ARCADIS project file.

2.4 Site Reconnaissance

Prior to startup of drilling or sampling activities in a particular area, field personnel will conduct a brief site reconnaissance to determine if any problems with the drilling or sampling locations will be encountered. The sampling locations will be sketched on the Location Sketch Form (Appendix B). In addition, at the start of field activities at each Site, the field personnel will notify the Fort Stewart and Hunter Army Airfield environmental staff of the work schedule, and sampling and drilling locations.

2.5 Field Operations Contingency Plans

If during the field program, any unforeseen problems or conditions are encountered that require re-evaluation or corrective action, such as, but not limited to, extreme precipitation events, site emergencies that require evacuation of field personnel, changes in site conditions, security problems, loss of power or communications, or community relations problems, the following contingencies will be put into place:

- For any problem or condition encountered by the field team, the team personnel will immediately notify the Fort Stewart and Hunter Army Airfield environmental staff and/or the ARCADIS Project Manager for direction or approval of corrective action.

- If the problem or condition requires downtime at the site and re-evaluation of any site conditions, assumptions made about the site conditions, or plans prepared for the site, the field team will contact the ARCADIS Project Manager and the Fort Stewart and Hunter Army Airfield environmental staff for consultation.

- If after consultation, the problem or condition continues, the field program will remain on hold until direction is received from the Fort Stewart and Hunter Army Airfield representative and/or ARCADIS Project Manager. The field program will not continue until the problem is resolved.

- Any time these contingency procedures are implemented, the following will be documented in the daily log of activities:

  - Problem or condition encountered;
  - Personnel involved;
  - Management personnel contacted;
  - Corrective actions taken, if any; and
  - Dates and times involved.

2.6 On-Site ARCADIS Representative

A qualified ARCADIS representative will be on-site during all probing, drilling and sample collection activities. The ARCADIS representative will have in their possession a copy of the Site-Specific Work Plan and the associated Site-Wide Work Plans, including the SAP, QAPP, and Health and Safety Plan (HASP). The Site-Wide Work Plans encompass work at all Fort Stewart and Hunter Army Airfield PBC sites. The ARCADIS representative will also have on-site any equipment, tools, references, and documentation necessary to collect, describe, and document the information generated from the field activities.

2.7 Contractor Compliance and Permitting

The contractors selected for this project shall comply with any and all installation, local, state, and federal health and safety regulations and requirements. The contractors are responsible, per ARCADIS' contractual agreements, for securing and/or complying with permits required by state or local authorities. The selected contractors will have the necessary license(s) or certifications required to perform such work in Georgia.

2.8 Adherence to Technical Specifications

All work performed by ARCADIS or a contractor, whether it be drilling, sampling, equipment decontamination or other related activities will be in accordance with the procedures described in this SAP, and properly and completely documented by the on-site ARCADIS representative on forms provided herein (Appendix B).

3. Field Investigation Procedures

A detailed discussion of the field procedures that will be employed to complete the field tasks is provided in the following sections. All field procedures are in accordance with the United States Environmental Protection Agency (USEPA) Field Branches Quality System Technical Procedures (USEPA, 2008).

All soil, groundwater, and surface water samples collected will be analyzed by a certified Georgia Laboratory as listed in the Site-Wide QAPP (Appendix A). Samples will be preserved according to the selected analytical method. Specific method preservation requirements, size and type of sample containers to be used, and holding times for each parameter are listed in the Site-Wide QAPP (Appendix A).

3.1 Lithologic Logging

The lithology of the soil and bedrock samples collected will be described through visual observations of the soil/bedrock cores using the Unified Soil Classification System (USCS) and/or the American Society for Testing and Materials (ASTM) International Standard D 2488 for Description and Identification of Soils. The Boring/Well Construction Log (Appendix B) will be used to record lithologic logging observations. The following logging sequence will be used for the description of unconsolidated materials:

- Describe major soil type and percentage;
- Describe composition of the soil;
- Describe the moisture, texture, and color of the soil;
- Document other geologic observations such as bedding characteristics, structure and orientation, and primary and secondary permeability/porosity (if possible); and
- Document observations on drilling progress including sample interval loss and recovery.

3.2 Direct Push Borings and Sample Collection

Direct-push soil sampling consists of hydraulically pushing or driving a small diameter, hollow steel rod to a target depth and collecting a soil or groundwater sample. The equipment necessary for the collection of samples using the direct push technique is mounted on a regular van or truck for ease of mobility. The steel probe rods, 3 feet (ft) to 4 ft in length, are threaded for easy connection and have tight seals to provide a continuous length of rod. The rods are hydraulically driven or hammered to target depths. The steel rods can be driven to depths of up 150 ft through unconsolidated sediments.

3.2.1 Soil Sample Collection

The following procedures will be used during the collection of soil samples from direct push borings:

1. Record borehole location and intended sample depth intervals on the Boring/Well Construction Log (Appendix B).
2. Line the 3-ft or 4-ft steel soil sampler core barrel with an acetate, polyethylene or Teflon liner and attach sampler to end of steel rods.
3. Hydraulically push or drive the 3-ft or 4-ft soil sampler and rods to intended depth. Soil samples will be collected from intervals specified in the Site-Specific Work Plan.
4. Open the core barrel and disassemble revealing the soil core sample within the liner. Label the depths on each end of liner and mark the top and bottom to maintain proper core orientation
5. Remove a portion of the liner over the entire length of the core using an appropriate cutting tool.
6. Screen soils immediately in the field using a photoionization detector (PID) or flame ionization detector (FID) to document the levels of organic vapors present. To collect volatile organic headspace readings, place the soil sample in a sealed plastic bag approximately two-thirds full allowing for approximately 30 percent headspace. Place the bag in a dry area, which is as close to room temperature (70º F) as practical. After 10 minutes, use a PID or FID to measure the vapors that accumulate in the bag due to off-gassing from the sample. Base PID/FID usage on the target analytes. If a PID is used, select

the appropriate lamp based on the target analyte. Record the measurement on the Sample/Core Log.

7. Collect soil sample(s) for laboratory analysis. Don a clean pair of disposable gloves immediately prior to sample collection. VOC samples will be collected directly from the target depth interval of the soil core to minimize disturbance using an EnCore™ sampler or equivalent (Terra Core). Transfer the remaining soil from the target depth interval to a stainless steel bowl. Mix the soil using a stainless steel spoon until the sample is visually uniform. Remove any debris or larger rocks observed during mixing using the spoon. Collect non-VOC analysis samples from the bowl and place in appropriate sample container, label the container, and place on ice. Note on the field sample log the depth interval from which the sample aliquot was collected. The container and preservative requirements for soil samples are outlined in the Site-Wide QAPP (Appendix A). Double-bag the ice used for sample shipment in self-sealing bags prior to placement in the cooler.
8. Extract from the liners the portion of the soil core not submitted to the laboratory for analysis and use for logging purposes.
9. Describe the soil samples in the field. The lithology of the soil will be described by a qualified and experienced ARCADIS representative through visual observations of the soil core using the USCS or ASTM designation.
10. Place all soil cuttings in drums or roll-off box.
11. Properly decontaminate all down-hole sampling equipment prior to subsequent use in consecutive sample collection. Decontamination procedures are described in Section 3.12.

3.2.2 Groundwater Sample Collection

The following procedures will be used during the collection of shallow groundwater samples from direct push borings. When sampling for metals from direct push borings, both total and dissolved metals will be analyzed to assess the effect of turbidity on the sample results. Polychlorinated biphenyl (PCB) samples will not be collected from direct push borings.

1. Record sampling location and intended sample depth intervals on the Geoprobe® Groundwater Sampling Form (Appendix B).

2. Drive a stainless steel retractable screen attached to the bottom of the hollow steel rods to the target depth beneath the groundwater table. Target depths will be specified in the Site-Specific Work Plan for each Site.
3. Raise rods to approximately 2 to 4 ft to allow the screen to be exposed at the target depth, thus allowing collection of groundwater samples at the target depth.
4. Insert polyethylene or Tygon tubing (1/4-inch diameter) into the hollow rods to allow for collection of grab groundwater samples with a peristaltic pump or dedicated tubing with a check valve assemblage. The tubing with check valve method will be used as the sole means of collecting samples for volatiles organic analysis.
5. Don a clean pair of disposable gloves immediately prior to sample collection. Collect groundwater samples directly into laboratory-prepared, preserved sample bottles and place directly on ice. Fill the sample bottles in the following order: volatile organic compounds (VOCs) first, then remaining analytes.
6. Prepare sample containers according to the container and preservative requirements outlined in the QAPP (Appendix A). Include on the sample label the following: sample identifier, laboratory methodology requested, the sample matrix, date, time, project name, and name of sampler.

3.2.3 Membrane Interface Probe Borings

The Membrane Interface Probe (MIP) is a type of direct push tool, advanced by a standard direct push rig that logs both total VOC concentrations and soil conductivity with depth. The following procedures will be used during the completion of direct push borings using the MIP.

1. Record borehole location on the Boring/Well Construction Log (Appendix B).
2. Hydraulically push the MIP and rods to intended target depth, typically not greater than 60 ft below ground surface (bgs). Because the MIP probe cannot be hydraulically hammered, the MIP probe cannot be driven as deep as conventional Geoprobe® borings.

3.2.4 Temporary Piezometer Installation

Temporary piezometers may be installed in selected Geoprobe® groundwater boring locations in accordance with the Official Code of Georgia Annotated (OCGA) Well

Standards 12-5-134 (State of Georgia, 2008). The temporary piezometer installation procedures are discussed below.

1. After the collection of groundwater samples from the selected Geoprobe® groundwater borings, a temporary piezometer will be installed in the borehole and will be constructed with 10 ft sections of 1-inch to 1¼-inch diameter polyvinyl chloride (PVC) screen and riser.
2. The natural formation will be allowed to collapse around the piezometers.
3. The annular space around the upper 10 ft of the piezometer will be filled with granular bentonite and then hydrated to prevent possible interference from surface water leakage.
4. Because the piezometer is considered temporary, a concrete surface pad will not be installed. Unless otherwise approved by the Georgia Environmental Protection Division (GAEPD), temporary piezometers will be converted to permanent monitoring points or abandoned within 5 days.
5. Each piezometer will be closed with a PVC cap.

3.2.5 Temporary Piezometer Fluid Gauging

Static fluid levels in each temporary piezometer will be gauged using an electronic water-level indicator. Fluid-level measurements will be documented on the Water Level Measurement Form (Appendix B) and will later be converted to mean sea level for reporting purposes.

The following procedures will be implemented when collecting fluid-level measurements:

1. Remove the piezometer cap and document the general condition of the piezometer. In areas where non-aqueous phase liquids (NAPLs) are known to exist or have been present in the past, a PID or FID will be used to check the well for build-up of potentially hazardous gases.
2. Measure static fluid-level elevation using an electronic water-level indicator from fixed reference point (generally the north side of the top of the PVC casing).
3. Repeat the measurements every 5 minutes until two consecutive measurements are obtained that are within 0.01 ft.

Fluid-level measurements will be referenced to a surveyed elevation point located on the top of the piezometer casing. All fluid-level measurements will be taken at least two times to check the reproducibility of the measurement data. If it is found that the measurement cannot be reproduced, a second set of data will be collected. Fluid levels will be collected until the data can be reproduced. This measurement validation process ensures the accuracy of the fluid-level data.

Equipment used to measure the fluid level will be properly decontaminated before first use and between use at each well using the procedures described in Section 3.12.

3.2.6 Direct Push Boring Abandonment

Direct push soil borings installed at the site will be abandoned by allowing the saturated portion of the formation (i.e., unconsolidated sands and gravel) to collapse back into the 2-inch diameter borehole as the Geoprobe® rods are retracted. The upper 10 ft of the borehole will be plugged with granular bentonite and hydrated with potable water to make an impermeable seal.

3.2.7 Temporary Piezometer Abandonment

After the well casing and screen materials from the temporary piezometers have been pulled out of the ground, the borehole will either be filled with granular bentonite or a high solids bentonite-cement slurry mix to within at least three feet of ground surface. If bentonite is used, it will be hydrated with potable water, and the remainder of the borehole will be filled with native soil or clay.

3.3 Drilling Techniques

All soil borings and monitoring wells will be drilled and installed by a Georgia licensed water well driller.

3.3.1 Hollow-Stem Auger Techniques in Soil

Dependent on subsurface soil conditions at the Sites, shallow soil borings may be drilled using hollow-stem auger techniques (ASTM 1452). Soil samples can be collected continuously (if so scoped in a site-specific work plan) using a continuous sampler, or split-spoon sampler (ASTM 1586 and 1587) depending upon percent recovery realized using the continuous core sampler. The following steps outline the

procedures that will be used to drill a shallow borehole for geotechnical or analytical purposes and for the installation of a monitoring well.

1. Record borehole location on the Location Sketch form and intended sample depth intervals on a Boring/Well Construction Log (Appendix B).

2. Clean and assemble the continuous sampler. The continuous core sampler (5 ft in length by 6 inches outside diameter (O.D.) is advanced in the borehole ahead of the augers (8-inch O.D.) and retrieved through the hollow-stem portion of the augers after each 5 ft drilled.

3. Disassemble the core barrel, revealing the soil core sample. Screen the soil samples with a PID/FID and describe in the field using the logging method described in Section 3.1.

4. Collect discrete samples from the core sample based on field screening data (prior to logging) and place in laboratory-prepared glass jars for analytical purposes. The preservation and handling of the samples is discussed in Section 3.4.3.

5. If continuous core sampling is not possible due to the character of the subsurface material encountered, collect samples every 5 ft using a standard split-spoon sampler (2 ft by 2 inch O.D.). Attach the split spoon to the drill rods, insert within the hollow-stem auger, and drive into the unconsolidated deposits using a standard 140-pound drop hammer and rig-driven cathead. Record blow counts for each 6-inch penetration of the split spoon. Drive each split spoon a total of 24 inches.

6. Collect all soil cuttings generated during the drilling of the boreholes and store temporarily on plastic or in a drum or roll-off box while awaiting characterization.

3.3.2 Mud Rotary Drilling

The mud-rotary system consists of a drilling fluid mixture of potable water and bentonite that is pumped down the inside of the drill pipe, and then returned to the surface through the annulus between the drill pipe and the borehole wall. This fluid cools the drill bit, carries the cuttings to the surface, prevents excessive fluid loss into the formation, and

prevents the formation from collapsing. The drilling fluid flows into a mud pit where the cuttings settle out and then is pumped back down the drill rods.

The following steps outline the procedures that will be used for mud rotary drilling.

1. Record borehole location and intended sample depth intervals (if appropriate) on the Boring/Well Construction Log (Appendix B).

2. Drill the deep boreholes from the surface to 1 to 2 ft into the bedrock using a mud rotary drilling rig equipped with a six-inch bit and stabilizer. No formation sampling will be conducted in the deep boreholes.

3. Record any significant or sudden fluid loss or production and soil cutting observations from drilling mud on the Boring/Well Construction Log (Appendix B).

4. Terminate the borehole within the upper 1 to 2 ft of the bedrock surface, which will be determined by the detection of the bedrock fragments in the return mud.

5. Collect all drill cuttings generated during the deep borehole drilling and temporarily stage in either 55-gallon steel drums or a roll-off box while awaiting chemical characterization as discussed in Section 3.13.

3.3.3 Rotasonic Drilling Methodology

Monitoring wells and the soil borings (other than those drilled using direct push methods) will have the option to also be drilled using rotasonic drilling methods. The rotasonic drilling method uses a combination of rotary power, hydraulic pull down pressure, and mechanically generated oscillations to advance a dual line of drill pipe. The top mounted hydraulically powered drill head transmits the rotary power, hydraulic down pressure, and vibratory power directly to the dual line of pipe. The inner drill pipe, measuring from 3-inch to 9-inch I.D., contains a core bit and represents the core barrel sampler. The outer pipe, measuring 4 inches to 12 inches, is used to prevent the collapse of the borehole and is therefore used in the construction of monitoring wells from 1 inch to 8 inches in diameter. This combination of forces advances the inner core barrel sampler through typically difficult unconsolidated deposits and some consolidated formations without the use of mud or air.

Water is not necessary during drilling but may be used in small quantities to help lubricate the drill pipe as it is advanced. Drilling rates are equal to or greater than other conventional rotary methods when they include some method of continuous sampling. The inner drill pipe is always advanced in front of the outer drill pipe. Continuous core samples of 1 foot to 20 ft can be completed depending on job specifications and site conditions.

During typical borehole advancement, the first step is to advance the inner drill pipe and core bit about 6 ft or 10 ft into the ground. Once the inner drill pipe is set, the outer drill pipe is advanced down over the inner drill pipe to hold the boring open. The inner drill pipe is mechanically lifted by the drill head to the surface for core sample recovery. The core sample is vibrated out of the inner drill pipe into a plastic sheath or a stainless steel sample tray. The core sample also can be collected in a split stainless steel or a lexan core barrel liner. The inner drill pipe is then advanced to the top of the next sample interval. These steps are repeated until the desired total depth is reached. Installation of a well would be performed inside the outer drill pipe, which would be removed as the well materials are installed. This will keep the borehole walls from collapsing and ensure that a good sand pack is installed. Monitoring well construction details are discussed in Section 3.5.

All drilling and sampling equipment will be decontaminated according to the procedures outlined in Section 3.12 of this report between each borehole location.

3.4 Collection of Samples for Geotechnical and Chemical Analyses

The procedures for the collection of soil samples during hollow stem auger drilling for geotechnical and chemical analyses are described below.

3.4.1 Geotechnical Samples in Soil and Unconsolidated Deposits

1. Record the soil sample location, depth, date and time of collection, sample identification, name of sampling personnel, and type of drilling and sampling equipment on the Boring/Well Construction Log (Appendix B).

2. Clean and assemble the continuous or split-spoon sampler. The sampler will be fitted with 6-inch long California (brass) rings or equivalent sampler liners, so that soil samples can be retrieved with minimum disturbance for geotechnical analyses.

3. Lower the sampler through the drill stem to the desired sampling depth. If using a split-spoon sampler, drive the sampler with a standard 140-pound hammer free-falling 30 inches in accordance with ASTM Method D1586. Record the number of blows per foot required to drive the split spoon.

4. After the continuous core barrel or split-spoon sampler is retrieved and opened, mark with indelible ink the depths of the sample at the top and bottom of each brass ring. Don a clean pair of disposable gloves immediately prior to sample collection. Using a stainless steel spatula or knife, cut the soil sample between the brass rings. Using plastic caps, cap each end of each ring. Label each ring with the appropriate sample designation.

5. The geotechnical samples do not have to be placed on ice or chilled.

6. Submit to geotechnical laboratory using COC procedures (Section 4.3).

7. From the remaining soil core, conduct field screening and describe soil sample lithology using procedures outlined in Section 3.1.

8. Alternate methodologies that may be used to obtain geotechnical samples, such as the use of a Shelby tube, will be described in the Site-Specific Work Plan for each Site.

3.4.2 Geotechnical Samples in Sediment

The procedures for the collection of geotechnical samples from shallow and deep sediments are outlined below.

1. If standing water is located over the sampling location and a deep sediment sample is to be collected, then the upper sediment and surface water should be removed prior to sample collection. Drive a minimum 4-inch O.D. schedule 40 PVC blank casing into sediment sampling location. Place a wooden board on top of PVC casing while driving casing into sediment to prevent breaking the casing. Use peristaltic pump to remove surface water from casing.

2. If collecting the geotechnical sample at 1.5 to 2.0 ft bgs, remove overburden with a decontaminated stainless steel bucket auger to a depth just above top of sampling depth (i.e., 1.5 ft bgs).

3. Drive a decontaminated 1 to 2-inch diameter stainless steel soil sampler lined with a plastic or acetate liner to depth required. A disposable acetate or thin walled stainless steel soil probe may also be used.

4. If a gravelly substrate is encountered, a decontaminated bucket auger may be used to collect the sample from 1.5 to 2.0 ft bgs.

5. Cap the liner and retract the sampler. The sample core may not remain in the sampler or tube if the top is not capped.

6. Cap the bottom of the sample. If a liner is used, remove the liner from the sampler, then cap the bottom of the sample.

7. If freestanding water was also captured in the sampling tube or liner, remove the top cap and gently pour off the water without disturbing the sediment sample.

8. Don a clean pair of disposable gloves immediately prior to sample collection. If using a bucket auger to collect the geotechnical sample, remove sample from bucket and pack into laboratory container.

9. Document the sample on a Soil/Sediment Sample Log (Appendix B).

10. The geotechnical samples do not have to be placed on ice or chilled.

11. Submit to geotechnical laboratory using COC procedures (Section 4.3).

3.4.3 Samples for Chemical Analyses

The procedures for collection of samples for chemical analyses are outlined below.

1. Record the soil sample location, depth, date and time of collection, sample identification, name of sampling personnel, and type of drilling and sampling equipment on the Boring/Well Construction Log (Appendix B).

2. Clean and assemble the continuous core barrel or split-spoon sampler.

3. Lower the sampler through the drill stem to the desired sampling depth. If using a split-spoon sampler, drive the sampler with a standard 140-pound

hammer free-falling 30 inches in accordance with ASTM Method D1586. Record the number of blows per foot required to drive the split spoon sampler.

4. After the continuous core barrel or split-spoon sampler is retrieved and opened, collect soil samples for chemical analysis. Don a clean pair of disposable gloves immediately prior to sample collection. Collect VOC samples directly from the core barrel or spit spoon sampler using an EnCore™ sampler or equivalent (Terra Core) to minimize sample disturbance. Place the remaining soil sample volume into a stainless steel bowl. Mix the soil using a stainless steel spoon until the sample is visually uniform. Remove any debris or larger rocks from the soil during the mixing process using the spoon. Place the remaining soil samples into their appropriate containers. If the sample material is of size or consistency that an EnCore sampler cannot be used, place the material in a glass 4-ounce container. Immediately store the containers in a cooler on ice at 4º C. Complete the sample label for soil samples selected for analyses.

5. Document the sample on a Soil/Sediment Sample Log.

3.5 Monitoring Well Construction

3.5.1 Shallow and Intermediate Well Construction

The shallow and intermediate wells will be installed in boreholes drilled using hollow-stem auger techniques. Monitoring well construction details will be documented on the appropriate Well Construction Log (Appendix B). No water will be introduced during monitoring well construction unless the borehole conditions require stabilization. If required, the water will be obtained from the Fort Stewart or Hunter Army Airfield potable water system.

1. The screened interval for all monitoring wells is anticipated to be 5- to 10 foot-sections of factory-milled 10-slot, 2-inch O.D., schedule 40 PVC screen, placed in the bottom of each well. The well screen attached to threaded, flush joint, 2-inch O.D., schedule 40 PVC casing will be inserted in the borehole through the minimum 6.25-inch O.D. hollow-stem auger.

2. The screened interval of the monitoring wells will be specified in the Site-Specific Work Plan for each Site.

3. PVC casing will be threaded to the screen and brought to a height of 3 ft above ground level for completion.

4. The annular space between the well and the borehole wall will be backfilled with a clean, graded, size 20 to 40 silica sand pack that will extend from the bottom of the borehole to a minimum of 2 ft above the top of the screened interval. The sand pack will be placed by tremie pipe from the bottom of the borehole through the hollow-stem augers to ensure complete placement around the well screen. The hollow stem auger will be retrieved as the sand pack is emplaced and can typically serve as the tremie pipe for filter pack placement.

5. Approximately 1 ft of very fine sand grade size 50 or smaller may be emplaced above the filter pack to prevent the migration of the bentonite slurry into the well screen.

6. A minimum thickness of 3 ft of bentonite pellets or chips will be placed on top of the filter pack as a seal. If the seal is within the unsaturated zone at the time of installation, granular bentonite will be placed in one-foot lifts, saturated with potable water, and allowed to hydrate. Hydration time will conform to the manufacturer's recommendations before further work on the well is performed.

7. The annular space from the top of the bentonite seal to within 1 foot beneath the frost line (approximately 30 to 36 inches bgs) will be filled with a cement and bentonite slurry containing high solids mixed to the manufacturer's specifications. Alternatively, cement/bentonite slurry consisting of 8 gallons water and 5 percent bentonite by weight per bag of Portland cement will be used, with a target density of 14 to 15 pounds per gallon. The bentonite slurry will be placed with a tremie pipe from the bottom of the annular area to be grouted to ensure proper placement of the slurry.

8. The remaining annular space near land surface will be filled with concrete. All wells will be completed above grade using a protective steel cover. A concrete apron will be installed around the cover. The apron will be a minimum of 2 ft by 2 ft and 6 inches in thickness, and shall be sloped to promote drainage away from the well. The wells will also be equipped with locking caps.

9. At selected locations, steel guard posts or protective barriers will be installed around the wells in a manner designed to prevent vehicles from accidentally damaging the well.

3.5.2 Pre-pack Screen Monitoring Well Construction

For shallow to intermediate monitoring wells where heaving (flowing) sands are expected to be encountered, an alternative method of monitoring well construction would include the use of pre-packed screens during well construction. Figure 3-1 shows the well schematic for the prepacked screens. The construction of these wells would follow the same steps detailed in Section 3.5.1 with the following exceptions.

1. The screened portion of the monitoring well will consist of 5- to 10-foot sections of pre-packed screen. In the case of 2-inch diameter well, the screen will have a 2.0-inch I.D. and a 3.63-inch O.D. Previous site investigations have shown that the 12-slot screen with a 10 by 20 sand pack will be more than adequate for construction of the monitoring well.

2. Formation material will be allowed to collapse around the screen upon removal of the augers to a point 2 ft above the screened interval.

3.5.3 Monitoring Well Construction Beneath a Confining or Semi-Confining Layer

Installation of monitoring wells beneath a confining or semi-confining layer is outlined in the procedures below. Monitoring well construction details will be documented on the appropriate Well Construction Log.

1. An 8-inch PVC casing will be set 1 foot into the top of the confining unit. The casing will then be grouted around the annulus of the casing to the land surface to seal off the casing from the aquifer. The grout will be allowed to set for a period of time in accordance with the manufacturer's specifications to ensure a proper seal is set.

2. Inside of the casing the bore hole will be completed through the confining layer to the aquifer below to the target depth.

3. Inside of the 8-inch casing, the well will be constructed with 2-inch threaded flush joint, Schedule 40 PVC casing and 2-inch threaded flush joint, Schedule 40 PVC, 0.010-inch continuously mill-slotted screen. Schedule 80 well material

will be used for monitoring wells deeper than 100 ft. Pipe joint compound (glue) will not be used in constructing the monitoring wells. If the depth of the well is to be greater than 50 ft, centralizers above the screened interval may be used to aid in well construction.

4. Casing will be added to the well screen and brought from the top of the screened interval to a height of 3 ft above ground level for completion.

5. The annular space between the well and the borehole wall will be backfilled with a clean, graded, size 20 to 40 silica (or alternative gradation based on site-specific data) sand pack that will extend from the bottom of the borehole to a minimum of 2 ft above the top of the screened interval. The sand pack will be placed by tremie pipe from the bottom of the borehole through the hollow-stem augers to ensure complete placement around the well screen.

6. Approximately 1 ft of very fine sand may be emplaced above the filter pack to prevent the migration of the bentonite slurry into the well screen.

7. A minimum thickness of 3 ft of bentonite pellets or chips will be placed on top of the filter pack as a seal. If the seal is within the unsaturated zone at the time of installation, the bentonite will be saturated with potable water and allowed to hydrate. Hydration time will conform to the manufacturer's recommendations before further work on the well is performed.

8. The annular space from the top of the bentonite seal to within 1 foot beneath the frost line will be filled with a cement and bentonite slurry containing high solids mixed to the manufacturer's specifications. The bentonite slurry will be placed with a tremie pipe from the bottom of the annular area to be grouted to ensure proper placement of the slurry.

9. The remaining annular space near land surface will be filled with concrete. All wells will be completed above grade using a protective steel cover. A concrete apron will be installed around the cover. The apron will be a minimum of 2 ft by 2 ft and 6 inches in thickness, and shall be sloped to promote drainage away from the well. The wells will also be equipped with locking caps.

10. At selected locations, steel guard posts or protective barriers will be installed around the well in a manner designed to prevent vehicles from accidentally damaging the well.

3.5.4 Borehole and Well Abandonment

A Georgia licensed water well driller will abandon all boreholes not used for monitoring well installation, temporary wells, or permanent wells in accordance with the OCGA Georgia Well Standards 12-5-134 (State of Georgia, 2008).

3.5.5 Temporary Well Abandonment

Temporary wells will be abandoned by the following procedures.

1. The monitoring well riser pipe and well screen will be removed from each borehole. The riser pipe and screen will be decontaminated by steam cleaning at the designated decontamination area and will be discarded in a sanitary waste landfill.

2. The entire borehole will be grouted with a cement and bentonite slurry containing high solids mixed to the manufacturer's specifications. The bentonite slurry will be placed with a tremie pipe from the bottom of the annular area to be grouted to ensure proper placement of the slurry.

3. The abandoned borehole will be marked with a flag or stake.

3.5.6 Soil Boring Abandonment

The procedures for abandoning boreholes are as follows:

1. The entire borehole will be grouted with a cement and bentonite slurry containing high solids mixed to the manufacturer's specifications. The bentonite slurry will be placed with a tremie pipe from the bottom of the annular area to be grouted to ensure proper placement of the slurry.

2. The abandoned borehole will be marked with a flag or stake to allow for surveying.

3.6 Groundwater Level Measurements and Sampling

3.6.1 Groundwater Level Measurements

Water level measurements will be referenced to a surveyed elevation point located on the top of the well casing. This measurement point will be surveyed by a Certified Land Surveyor and referenced to ft above mean sea level (amsl). An electronic water level probe will be used to gauge the water level in the new wells, in addition to the existing monitoring wells and piezometers at the facility.

Water levels will be recorded in the new monitoring wells, existing monitoring wells and piezometers within 24 hours prior to each groundwater sampling event. The total well depth may also be measured at this time to determine if sediment has accumulated in the well thereby reducing the effective well depth. Water level measurements at each Site will begin with the upgradient wells (i.e., inferred least contaminated wells) and proceed to the downgradient wells (i.e., inferred most contaminated wells). Water-level measurements will be collected within a single 24-hour period and will be measured twice to check the reproducibility of the measurement data. This measurement validation helps ensure accuracy with regard to the water level data collection. The procedure for obtaining water level measurements is as follows:

1. Describe the area surrounding the well, whether or not the lock was secure (if applicable), if the well could have been impacted by surface water runoff, ambient weather conditions and other factors that could affect the final data analysis. This documentation is recorded on a Water Level Measurement Form) Appendix B).

2. Decontaminate the electronic water probe prior to initiating water level measurements and between all wells and piezometers. Decontamination procedures are described in Section 3.12.

3. Unlock the protective casing and remove the inner cap on the riser.

4. Check the probe to verify that it is operational, then lower down the monitoring well.

5. If the well is not vented, allow the water level to equilibrate for a few minutes prior to collecting the first measurement. Take fluid level measurements from a

fixed reference point (the north side of the top of the PVC riser) using an electric tape graduated in 0.01-foot intervals.

6. Repeat the measurements until two measurements are obtained that are within 0.01 ft.

7. Remove and decontaminate the probe, replace the inner cap, and lock the protective casing.

3.6.2 Low-Flow Groundwater Purging and Sample Collection

The following protocol has been developed to obtain groundwater samples that are representative of formation conditions and is intended for use in sampling monitoring wells during the field activities. New monitoring wells will not be sampled for at least 24 hours following non-stressful means of well development (e.g., purging with submersible pump or bailer) and 48 hours following stressful means of well development (e.g., air lift, surge and purge). Monitoring wells will be purged prior to collecting groundwater samples to ensure that representative formation water is being sampled. The monitoring wells will be purged and sampled in the same order as that for water-level measurements (upgradient to downgradient, or least contaminated to most contaminated where known based upon prior sampling results). Prior to introduction into the well, all non-dedicated equipment and materials will be decontaminated in accordance with the procedures outlined in Section 3.12.

The following procedures will be implemented when performing well purging prior to sample collection:

1. Put on clean latex or vinyl surgical gloves or nitrile gloves.

2. Unlock the metal protective casing, remove the well cap, and document the general condition of the well.

3. Determine static fluid-level elevation using electronic probe. Record on Groundwater Sampling Form (Appendix B).

4. Compute the volume of water in the well (0.162 gallon/foot for a 2-inch diameter well). The volume of water to be purged will be computed based on the total well depth recorded upon the completion of well installation. The total depth will be measured periodically during the monitoring program to determine if

sediment has accumulated in the well thereby reducing the effective well volume. If it is determined that sediment has accumulated in the well, then the new well depth will be used to compute the volume of water to be purged.

5. Insert the pre-cleaned bladder (or peristaltic) pump and tubing into the well to the midpoint of the well screen. Record installation time in field notes. Dedicated Teflon and/or PVC bailers may be used to facilitate sample collection where site conditions warrant, such as low recovery wells.

6. Start pump at the lowest possible flow rate and adjust the pumping rate to approximately 100 milliliters per minute (mL/min). Record pump start time in field notes. Verify the flow rate with the graduated cylinder or equivalent by collecting the water from the discharge line for one minute. Record results in field notes. Based on the recovery rate of the well, the pump may need to be raised or lowered to adequately purge the entire well column. Adjustments will be recorded in the field notes.

7. Monitor water level to verify that little or no drawdown (0 to 0.3 ft) is occurring in the well. If desired, the flow rate may be increased to up to 300 mL/min in more permeable formations as long as little or no drawdown is observed in the well. Record measurements and flow rates in field notes.

8. Obtain field parameter measurements (temperature, specific conductance, pH, dissolved oxygen, oxidation-reduction potential [ORP], and turbidity) every 5 minutes and record on the Groundwater Sample Log. Purge until the criteria listed below have been met (unless low well recovery precludes this):

    - The field parameters stabilize to within +/- 10 percent of three consecutive meter readings taken at least 5 minutes apart.

    - The measured turbidity is less than 10 nephelometric turbidity units (NTUs), unless low recovery precludes this.

9. Collect VOC samples for laboratory analysis (if required) at a low flow rate (100 mL/min) directly into the appropriate sample container. If a peristaltic pump is used, the downhole tubing will be filled using suction and removed from the well to prevent the sample from contacting the pump head. The pump speed is reduced and the direction reversed to push the sample out of the tubing and into the sample containers. Ensure that no air bubbles are present in the vial.

Secure sample container lid and store sample containers in chilled cooler after filling out the sample label.

10. Collect additional samples for non-VOC analysis (collecting in the order of explosives, metals, and indicator parameters). If samples are being collected usig a persitaltic pump following VOC sample collection, repeat steps 1 through 8. Collect non-VOC samples at low flow rate (100 mL/min). Flow rates of up to 500 mL/min can be used if all stabilization criteria are achieved. Unless specified in the site-specific work plan, metals samples will be collected unfiltered. If site conditions require filtration for metals analysis, an in-line 45 micron filter will be used. Secure sample container lids and store sample containers in chilled cooler.

11. Complete sampling documentation on the Groundwater Sampling Form, record the collection date and time on the sample key, and fill out the Well Sampling Summary form (Appendix B).

12. If inadequate water is present in the well to fill the required sample containers, return periodically within 24 hours until adequate sample volume is obtained and field parameters measured. Collect groundwater for individual analyses in the appropriate sample order. If required, collect VOCs and store first, then metals and other indicator parameters.

13. If drawdown in the well cannot be maintained within the 0.3-foot requirement, sample collection will be performed after three well volumes of groundwater have been purged. Begin sample collection with VOC analysis unless otherwise noted in the site-specific work plan. For wells that purge dry before all of the samples are collected, allow the well to recover and then make one more attempt to collect the remaining samples within a 24-hour period.

14. Turn off pump. Remove portable pump from well and decontaminate or dispose. Tubing will be left as dedicated tubing in the well or disposed of after use.

15. Determine the total depth of the well. Compare the measurement of the total depth of the well with previous measurements and well construction log to determine available screen length. Record on water sampling log. If more than 20 percent of a well screen is occluded by sediment, the well must be redeveloped prior to collecting future groundwater quality samples. Samples

collected prior to the total well depth measurement will be representative only if the field data indicate that the well met stabilization criteria prior to sampling.

16. Replace cap on well and protective casing lock well.

3.6.3 Slug Test

This procedure defines the requirements for conducting a slug test in a monitoring well. The purpose of this procedure is to provide a uniform basis for conducting slug tests and to ensure the continuity between field personnel. A water level indicator will be used to measure the change in water levels versus time during the slug test. However, for slug tests completed in wells screened in very permeable formations, a transducer and data logger may be used to measure and record water level changes over time.

1. Open the locking and vented caps and inspect the wellhead. Note in particular the condition of the surveyed reference mark, if any.

2. Measure and record the static water level and the depth to the bottom of the well. Record this data on the Water Level/Pumping Test Record (Appendix B).

3. Lower the slug into the water until it is fully submerged. Allow the well to equilibrate to static water level.

4. Verify the static water level has been reestablished with an electronic water-level indicator.

5. Withdraw the slug quickly, but avoid surging. Record the time of withdrawal to the second. Start the stopwatch, if used, at the instant the slug is withdrawn.

6. Using an electronic water level indicator, measure and record the initial displacement of water as soon as the slug has been withdrawn.

7. Measure and record the rise in water level vs. time. Using the water-level indicator and a stopwatch, record depth-time data at the fastest rate possible for the first 5 minutes of well recovery. Generally the water levels should be recorded every 30 seconds for the first 5 minutes, then every minute for the next 5 minutes. Subsequent recording intervals may be adjusted to suit the rate of well recovery. An electronic data logger and pressure transducer may be used in lieu of manual water level measurements.

8. Continue recording depth-time data until the well has recovered to nearly the static water level or at least 90 percent of the static water level. If 90 percent of the static water level has not been achieved within 2 hours, then field personnel may return periodically within the next 24 hours to record the water level.

9. Record the time of test completion in the field data forms.

10. Decontaminate all equipment according to the procedures outlined in Section 3.12. Close and lock the well before leaving.

3.6.4 Constant Rate Pump Test

1. Upon arriving at the site, collect a round of static water levels from all site monitoring wells. Record this data on the Water Level/Pumping Test Record (Appendix B).

2. Place the pump in the pumping well and connect to the electrical service. The pump discharge will be connected to 1) a control valve, 2) inline filter (optional), and 3) flow meter. Dependent on site conditions, treatment systems (i.e., flow-through vessels, carbon units) may be used prior to water storage or discharge.

3. Initiate a short step test beginning at 2 gallons per minute (gpm). The initial step test pumping rate may be altered depending on site specific conditions. The pumping rate will be increased in two subsequent steps (the amount of increase will be determined in the field based on the drawdown achieved at 2 gpm). Measure water levels in the pumping well and the three closest monitoring wells during the step test.

4. Based on the results of the step test, determine a pumping rate that will 1) achieve significant drawdown in the pumping well, and 2) will not result in dewatering the well during the pumping test.

5. Begin the pumping test after the water levels in the pumping well and observation wells have returned to static conditions.

6. Turn on the pump in the test well and operate at a constant rate during the remainder of the test.

7. Collect water levels at a logarithmic interval in the pumping well, monitoring wells within 100 ft of the pumping well, piezometers within 100 ft of the pumping well, and at least one background well. Collect the water levels using a handheld electronic water level indicator or through the use of pressure transducers.

8. After the test has been conducted for a period of 24 hours, evaluate the pump test data to determine if continuation of the pump test is justified. If so, continue the test for a total of 48 hours, or until the data indicate that asymptotic conditions were achieved.

9. When the determination has been made to stop the pumping test, initiate the recovery portion of the test.

10. After the pump has been shut off, measure water levels at a logarithmic interval in the pumping well, monitoring wells within 100 ft of the pumping well, piezometers within 100 ft of the pumping well, and the selected background well. Continue measurements until the water level in the pumping well has recovered at least 90 percent.

3.6.5 LNAPL Bail Down Test

This procedure defines the requirements for conducting an LNAPL Bail Down Test in a monitoring well. The purpose of this procedure is to measure the thickness and depth to free product in the well as it recovers. The results of these tests are analyzed in accordance with techniques described in "How to Effectively Recover Free Product at Leaking Underground Storage Tank Sites," (EPA 510-R-96-001) to assist choice of potential free product recovery methods. The following steps will be used:

1. Measure the depth to LNAPL and groundwater.

2. Remove as much LNAPL from the well as possible using a weighted disposal bailer.

3. Measure the recovery rate of free product and groundwater using a hydrocarbon probe. Record the LNAPL thickness and recovery time in the well at regular intervals until the recovery rate has stabilized.

4. Determine 80 percent of the maximum LNAPL recovery thickness.

5. Interpolate the recovery time for 80 percent recovery.

6. Compute gallons per foot of LNAPL thickness in the well screen.

7. Compute the average recovery rate in gallons per day to 80 percent recovery.

3.7 Test Pit Excavations

The following procedures may be used to install test trenches, if deemed necessary to characterize waste materials.

1. Complete a trench to approximately 4 ft bgs with a track hoe or equivalent piece of excavation equipment.

2. Describe the profile of waste based on visual observations of the material removed from the trench and record on a Boring/Well Construction Log (Appendix B).

3. Backfill the trench with waste material after the trench has been completed.

4. Cover the trench with compacted soil.

5. Mark the trench area with a stake for surveying purposes.

3.8 Sediment Sampling

The following procedures will be used to collect sediment samples during the field activities at the Fort Stewart and Hunter Army Airfield.

3.8.1 Shallow Ditch Sediment Sampling

1. Sediment samples will be collected with a decontaminated stainless steel trowel or hand auger. Decontamination procedures are outlined in Section 3.12. A stainless steel hand auger or trowel will be used to collect sedimentsoils from the 0 to 0.5-foot (6-inch) interval.

2. The sediment sample will be placed directly into a stainless steel bowl. The sediment will be mixed using a stainless steel spoon until the sample is

visually uniform. During the mixing process any debris or larger rocks will be removed using the spoon.

3. The sample will be transferred from the bowl into a laboratory-prepared sampling containers supplied by the laboratory.

4. The sample will be documented on a Soil/Sediment Sample Log and the Soil Sample Summary Form.

Surficial soil samples will be collected from ditch areas that may be dry or have no freestanding water at the time of sampling. The following dry ditch sediment sampling procedures should be used only if the ditch is dry or has no freestanding water:

1. Prior to sample collection, any rocks, vegetation or debris will be removed with a stainless steel trowel.

2. Surficial soil samples will be collected with a decontaminated stainless steel trowel or hand auger. Decontamination procedures are outlined in Section 3.13. A stainless steel hand auger or trowel will be used to collect soils from the 0 to 0.5-foot (6-inch) interval.

3. The soil sample will be placed directly into a stainless steel bowl. The soil will be mixed using a stainless steel spoon until the sample is visually uniform. During the mixing process any debris or larger rocks will be removed using the spoon.

4. The sample will then be transferred from the container into the laboratory-prepared sampling containers supplied by the laboratory. The sampling activities will be documented on a Soil/Sediment Sample Log and the Soil Sample Summary Form.

5. Following sampling, the sample location will be filled in and any removed rocks or vegetation replaced.

3.8.2 Deep Ditch Sediment Sampling

1. Remove overburden with a decontaminated stainless steel bucket auger to just above the top of the prescribed sampling depth.

2. Drive a decontaminated 1 to 2-inch diameter stainless steel soil sampler lined with a plastic or acetate liner an additional 6 inches in depth. A disposable acetate or thin walled stainless steel soil probe may also be used.

3. Use a decontaminated bucket auger to collect the sample from 1.5 to 2.0 ft bgs if a gravelly substrate is encountered.

4. Cap the liner and retract the sampler. The sample core may not remain in the sampler or tube if the top is not capped.

5. Cap the bottom of the sample. If a liner is used, remove the liner from the sampler, then cap the bottom of the sample.

6. If freestanding water was also captured in the sampling tube or liner, remove the top cap and gently pour off the water without disturbing the sediment sample. Place the sediment sample directly into a stainless steel bowl. Mix the sediment using a stainless steel spoon until the sample is visually uniform. Remove any debris or larger rocks from the sediment during the mixing process using the spoon.

7. The sample will then be transferred from the container into the laboratory-prepared sampling containers supplied by the laboratory.

8. Document the sample on a Soil/Sediment Sample Log and the Soil Sample Summary Form.

Subsurface soil samples may be collected from ditch areas that may be dry or have no freestanding water at the time of sampling. The following dry ditch sediment sampling procedures described below should be used only if the ditch is dry or has no freestanding water:

1. Prior to sample collection, any rocks, vegetation or debris will be removed with a stainless steel trowel.

2. A decontaminated stainless steel hand auger will be used to collect soils from the prescribed depth interval. The collected soil sample will be placed directly into a stainless steel bowl. The soil will be mixed using a stainless steel spoon until the sample is visually uniform. During the mixing process any debris or larger rocks will be removed from the soil using the spoon.

3. The sample will then be transferred from the container into the laboratory-prepared sampling containers supplied by the laboratory. The sampling activities will be documented on a Soil/Sediment Sample Log and the Soil Sampling Summary Form.

4. Following sampling, the sample location will be filled in with surrounding sediment.

3.8.3 Shallow Stream Sediment Sampling

Stream sediment samples may be collected along predetermined transects upstream, adjacent to, and downstream of the area of interest in conjunction with surface water sampling for the characterization of the aquatic environment. Please note that the sediment samples may have to be collected by personnel outfitted with waders.

The sediment sampling procedures are described below and assume that all samples can be collected by personnel outfitted with waders that can access all sampling locations on a transect.

1. Position identification markers for the sediment and surface sampling locations along the stream bank prior to sampling. At each transect, mark and stake opposite banks of the stream to support a rope premarked at least at 10-foot intervals or measuring tape pulled taut across the stream slightly above water level. Each tape mark will become a station for a depth sounding of the river and a point for flow velocity measurements. For streams that are 10 ft in width or less, only one sampling station is required at the stream mid-point.

2. Measure the water velocity and flow using a current meter. Measure flow velocity at each station and at each 5-foot depth interval to the base of the stream. In every case, collect a flow measurement at the base and upper surface of the stream.

3. Briefly describe the substrate beneath each station as marked on the rope, such as silt, sand, gravel, and bedrock. In this manner, select the site for sediment sampling. Preferred sediment sample collection locations are areas of deposition, where fine-grained materials, such as clay, silt, or fine sand, collect. In addition, collect samples in pools, rather than riffles. The dredge sampler may not function properly if the substrate being sampled contains a large amount or large pieces of gravel.

4. Approach the sampling location from downstream to avoid disturbing the sediment prior to sampling.

5. Collect the sediment samples using an Ekman or Ponar dredge or equivalent. Gently advance the dredge approximately 6 inches into the sediment. The dredge closes with a messenger weight and the spring-loaded jaws shut to collect the sediment sample. A minimum of three aliquots will be collected at each sampling location.

6. Place the sediment samples directly into a clean stainless steel bowl. If VOC samples are to be collected, they should be taken directly from the sampling device using an EnCore™ sampler or equivalent (Terra Core). If the VOC samples cannot be collected from the sample device, they can be collected immediately after placement of the sediment in the stainless steel bowl. Following VOC sample collection, the remaining sediment will be mixed using a stainless steel spoon until the sample is visually uniform. During the mixing process any debris or larger rocks will be removed using the spoon.

7. Fill the appropriate laboratory jars for the non-VOC parameters specified in the Site-Specific Work Plan. Attach the lids and label appropriately. Complete the Soil Sample Summary Log (Appendix B).

8. With the remaining sediment sample, record the sediment characteristics, such as texture, odor, color, and other distinguishing factors on a Soil/Sediment Sample Log (Appendix B).

9. Remove the rope marking the transect, if not collecting deep sediment samples. Do not remove the stakes marking the transect. Survey the elevation of the stakes to a known elevation datum to provide a depth profile of the river.

3.9 Surface Water Sampling

Surface water samples may be collected along predetermined transects upstream, adjacent to, and downstream of the area of interest in conjunction with stream sediment sampling for the characterization of the aquatic environment. Please note that the surface water samples will have to be collected using a small boat or by personnel outfitted with waders. The optimum time to collect the surface water samples will be at a low stream flow so that personnel outfitted with waders can collect the samples.

Using a boat to collect the samples introduces special health and safety concerns and typically doubles the amount of time required to complete the task.

The surface water sampling procedures are described below and assume that all samples can be collected by personnel outfitted with waders that can access all sampling locations on a transect.

1. Follow steps 1 and 2 outlined in the stream sediment sampling procedure outlined in Sections 3.8.3.

2. At each transect, collect a surface water sample near the top of the water column with a clean Pyrex sampling cup or equivalent for field measurement of temperature, pH, specific conductance, and dissolved oxygen. An equivalent flow-through meter may also be used for each field parameter.

3. At locations that are deeper than 5 ft, collect the field measurements at each 5-foot depth interval using a Van Dorn or Kemmerer Type sampler.

4. Record the field measurements in a Surface Water Sample Log (Appendix B).

5. If the stream does not exhibit thermal or chemical stratification as determined by the field measurements (temperature and pH), collect a surface water sample with a clean Pyrex sampling cup or equivalent near the top of the water column. Immerse the Pyrex cup at an angle such that water gently flows in with minimal disturbance. Use the sample to fill laboratory-prepared sample bottles for analysis.

6. If the stream exhibits thermal or chemical stratification as determined by the field measurements (temperature and pH), then collect surface water samples every 5 ft using a Van Dorn or Kemmerer style water sampler.

7. Record the sampling location, date and time of collection, sample collection method, sample identification, sample preservative, methods of analysis, and initials of the sampling personnel on the Surface Water Sample Log (Appendix B).

8. Decontaminate the sampling equipment as described in Section 3.12.

3.10 Field Analytical Measurements

Several instruments may be used to collect field analytical data. These instruments include a pH meter, specific conductance meter, a thermometer, dissolved oxygen meter, and turbidity meter (nephelometer). The following equipment (including model number and manufacturer) will be used:

- pH meter (model SA-230) manufactured by Orion Research, Inc. or equivalent;
- Specific conductivity meter (model 0148-40) manufactured by Cole-Palmer Instrument Company or equivalent;
- Digital thermometer that meets the National Bureau of Standards requirements;
- Dissolved oxygen meter (model 810) manufactured by Orion Research, Inc. or equivalent; and
- Turbidity meter (model 800) manufactured by Engineered Systems or equivalent.

Field instruments will be calibrated at least once a day, and more often if conditions warrant. Calibration procedures will follow manufacturer's specifications and will be documented by field personnel on the Field Instrument Calibration Log (Appendix B).

3.11 Quality Control Samples

To monitor sampling and laboratory performance it may be necessary to collect several types of field QA/QC samples. The field QA/QC samples include trip blanks, equipment rinsate blanks, and field duplicates. The specific number and type of QA/QC samples that will be collected at each Site are outlined in the Site-Specific Work Plans and may be more or less than the criteria stated below based upon data quality objectives and professional judgment.

A trip blank is a container filled with distilled and organic-free water prepared in, and provided by, the analytical laboratory. A trip blank is sent from the analytical laboratory to the field-sampling site, and is returned to the laboratory for analysis. The trip blank results are used to evaluate whether contamination by VOCs occurred during shipment of samples and/or during container transport. One trip blank is required in each sample cooler transporting samples for VOC analysis.

An equipment rinsate blank is a sample of organic free water (for VOC analyses) poured into, or over, or pumped through the sampling device, collected in the sample bottle, and transported to the laboratory for analysis. Equipment rinsate blanks are used to assess the effectiveness of equipment decontamination procedures.

Equipment rinsate blanks are collected immediately after the equipment has been decontaminated. Equipment rinsate blanks are collected by gently pouring distilled or deionized water over selected clean non-dedicated equipment and collected for laboratory analysis. For example, the equipment rinsate blank for soil and sediment sampling programs will be collected by gently pouring distilled or deionized water over clean core barrels or soil core samplers. The equipment rinsate blank for surface water and groundwater sampling programs will be collected by gently pouring distilled or deionized water over clean non-dedicated bailers or sampling cups. Equipment rinsate blanks will be collected at a frequency of 5 percent of the field samples at critical points in the sampling program, such as the sampling of a background well or the end of the sampling program.

The frequency requirements for collecting equipment rinsate blanks are a minimum of five percent of the environmental samples. The blank shall be analyzed for all laboratory analyses requested for the environmental samples collected at the Site. When an analyte is detected in the equipment rinsate blank the appropriate validation flag, as described in the data validation section, shall be applied to all sample results from samples collected. It should be noted that the laboratory will supply the organic free water. A sample aliquot of the organic free water will be submitted for the analysis of all parameters of interest.

A field duplicate sample is a second sample collected at the same location as the original sample. Duplicate samples are collected simultaneously or in immediate succession, using identical recovery techniques, and treated in an identical manner during storage, transportation, and analysis. The sample containers are assigned an identification number in the field such that they cannot be identified (blind duplicate) as duplicate samples by laboratory personnel performing the analysis. Specific locations are designated for collection of field duplicate samples prior to the beginning of sample collection. A field duplicate will be collected at a rate of one per twenty samples or one per sampling event, if less than twenty samples.

Field duplicate sample results are used to assess precision, including variability associated with both the laboratory analysis and the sample collection process. Field duplicates will be collected at a frequency of 5 percent of samples collected. Analytical

results for field duplicate will be assessed during the data validation process. Specific locations will be designated for collection of field duplicate samples prior to the beginning of sample collection. Control limits for evaluation of precision for field duplicates will be 40 percent for aqueous samples and 70 percent for soil/sediment samples.

Laboratory quality assurance protocols including the performance of laboratory control samples and matrix spikes relating to method acceptance criteria are included in Section 2.7 of the Site-Wide QAPP (Appendix A). The QAPP also defines the data qualification guidelines for evaluating potential matrix interferences identified during matrix spike analyses. The parent and field duplicate sample will be included in all reporting.

3.12 Field Equipment Decontamination

The cleaning procedures outlined in this section will be used by all personnel to clean sampling and other field equipment to prevent cross-contamination during separate phases of the investigation. Documentation regarding decontamination will be recorded on the Daily Log (Appendix B). Specific cleaning procedures are presented in the following section.

A decontamination area will be established where steam cleaning of the drilling and well construction equipment and materials can occur and containment and proper disposal of wash water is possible. An impervious decontamination area will be utilized and the water used to clean the equipment will be containerized for offsite disposal.

3.12.1 Cleaning Materials

The laboratory detergent used to wash the equipment will be a standard brand of phosphate-free laboratory-grade detergent such as Micro or Liquinox. The use of any other detergent must be justified and documented in the field logbooks and inspection or investigative reports.

Potable water is defined as tap water fit for human consumption from a known source. Deionized water is defined as tap water that has been treated by passing through a standard deionizing resin column. The deionized water should contain no metals or other inorganic compounds (i.e., at or above analytical detection limits). The brushes used to clean equipment as outlined in the following sections, will be stiff plastic bristled and will not be wire-wrapped.

3.12.2 Marking and Segregation of Used Field Equipment

Field or sampling equipment that needs to be repaired shall be identified with a tag indicating date repair requested, problem if known, personnel requesting repair, and if the equipment has been decontaminated. Field equipment needing cleaning or repairs will not be stored with clean equipment or sample containers. Field equipment and/or disposable sample containers that are not used during the course of an investigation may not be placed in storage without being recleaned unless it is the opinion of the field investigator that the materials have not become contaminated during the course of the field investigation. However, equipment and sample containers must be labeled as such.

3.12.3 Safety Procedures to be Utilized During Cleaning Operations

The materials used to implement the cleaning procedures outlined in this section can be dangerous if improperly handled. Caution must be exercised by all personnel, and all applicable safety procedures shall be followed. At a minimum, the following precautions will be taken in the field during these cleaning operations:

- Safety glasses with side shields or goggles, and latex or vinyl surgical gloves or nitrile rubber gloves will be worn during all cleaning operations;
- All rinsing operations will be conducted in the open (never in a closed room); and
- No eating, smoking, drinking, chewing, or any hand-to-mouth contact shall be permitted during cleaning operations.

3.12.4 Storage of Field Equipment and Sample Containers

Decontaminated field and sampling equipment will be stored in covered containers or wrapped in aluminum foil to minimize contamination. All decontaminated equipment, when not in use, will be kept in a designated storage area. Sampling equipment and sample containers will not be stored or transported with any gasoline, diesel, or other fuel containers or gasoline or diesel fuel powered equipment. Decontaminated equipment shall be clearly identified by labeling the wrapping material. Field equipment and reusable sampling containers requiring cleaning or repairs shall not be stored with clean equipment. Instead, equipment requiring repairs will be clearly identified and the repairs documented on the daily field log. Field equipment that requires cleaning

will be segregated from clean equipment and will be stored on plastic sheeting pending cleaning.

3.12.5 Cleaning Procedures

3.12.5.1 Drilling and Direct Push Equipment

All drilling and direct push equipment used during completion of soil borings or installation of the monitoring wells will be steam-cleaned prior to initiating drilling or direct push activities. This will include, but is not limited to, the drill stem, augers, drill bits, direct push rods, core barrels, and tools utilized by the contractor.

The drill rig or direct push rig utilized for the installation of the borings and wells will be decontaminated at the decontamination area prior to the initiation of the drilling or direct push activities. The drill rig or direct push rig itself will not be decontaminated between soil boring or monitoring well locations. Augers and other drilling, direct push, or sampling equipment will be returned to the decontamination area to be cleaned after each use. Cleaning of equipment will be performed using a high-pressure steam cleaner to prevent cross-contamination of the soil borings and monitoring wells. Potable water for steam cleaning will be obtained from the installation water supply system.

Tools and equipment used to measure the depth of well completion materials and water levels (i.e., measuring tapes, electric/electronic probes, tampers, tremie pipes) also will be decontaminated by steam cleaning between well locations to avoid cross-contamination. All equipment and tools will be isolated from contact with the ground by placing them onto sheets of polyethylene plastic.

3.12.5.2 Teflon™, Stainless Steel, or Glass Field Sampling Equipment

When Teflon™, stainless steel, or glass sampling equipment is used to collect samples that contain hard to remove materials, it may be necessary to steam clean the field equipment before proceeding with Step 1. If the field equipment cannot be cleaned utilizing these procedures, it should be discarded.

1. Wash equipment thoroughly with laboratory detergent and tap water using a plastic brush to remove any particulate matter or surface film.

2. Teflon™, stainless steel, or glass sampling equipment will be rinsed thoroughly with potable water from an approved onsite source.

3. Rinse thoroughly with analyte free water.

4. Rinse thoroughly with solvent. Do not solvent rinse PVC or plastic items.

5. Rinse thoroughly with organic/analyte free water. If organic/analyte free water is not available, equipment should be allowed to completely dry. Do not apply a final rinse with analyte water.

6. Wrap equipment completely with aluminum foil or store in Ziploc™ plastic bags to prevent contamination during storage and/or transport to the field.

3.12.5.3 Other Sampling Equipment

Miscellaneous sampling equipment will be washed with laboratory detergent, rinsed with potable water, followed by a thorough deionized water rinse, and dried before being stored. This procedure is not used for any equipment utilized for the collection of samples for trace organic compounds analyses.

3.12.5.4 Trace Organic Sampling Equipment

The following procedures are to be used for all sampling equipment used to collect routine samples undergoing trace organic or inorganic constituent analyses:

- Clean with tap water and soap using a brush if necessary to remove particulate matter and surface films. Equipment may be steam cleaned (soap and high pressure hot water) as an alternative to brushing. Sampling equipment that is steam cleaned should be placed on racks or saw horses at least two ft above the floor of the decontamination pad. PVC or plastic items should not be steam cleaned;

- Rinse thoroughly with tap water;

- Rinse thoroughly with analyte free water;

- Rinse thoroughly with solvent. Do not solvent rinse PVC or plastic items;

- Rinse thoroughly with organic/analyte free water. If organic/analyte free water is not available, equipment should be allowed to completely dry; and

- Remove the equipment from the decontamination area and cover with plastic. Equipment stored overnight should be wrapped in aluminum foil and covered with clean, unused plastic.

3.12.5.5 Field Analytical Equipment and Other Field Instruments

The exterior of sealed, watertight equipment should be washed with a mild detergent (for example, liquid dishwashing detergent) and rinsed with tap water before storage. The interior of such equipment may be wiped with a damp cloth if necessary. Other field instrumentation should be wiped with a clean, damp cloth. Conductivity probes, pH meter probes, etc., should be rinsed with deionized water before storage.

3.12.5.6 Ice Chests and Shipping Containers

If the ice chests (labeled accordingly for sampling use) and reusable containers that will be used to store or ship samples and sample containers are believed to be contaminated, the containers should be washed with laboratory detergent (interior and exterior) and rinsed with potable water and air dried before storage. In the event that an ice chest or other reusable container becomes severely contaminated with concentrated waste or suspected hazardous material, it shall be cleaned as thoroughly as possible, rendered unusable, and disposed of properly.

3.12.6 Disposable Materials

Disposable materials generated from the decontamination and sampling activities will be contained in plastic garbage bags. These materials include, but are not limited to gloves, Tyvek suits, latex booties, paper and plastic. A waste determination will be made on a site by site basis for the disposable materials generated during the sampling programs. The waste determination will be based on both process knowledge of the contents of the site and on existing analytical data from the site, if available. The wastes will be disposed off-site in accordance with all applicable federal and state regulations.

3.13 Characterization and Disposal of Investigative Derived Wastes

Investigative derived wastes (IDW) including soil and waste cuttings and decontamination, development, and purge water will be collected and characterized with the procedures described below.

3.13.1 Soils/Sediment/Waste

Soil, sediment, and waste cuttings (not including material excavated from test trenches during waste characterization) will be collected at the borehole and stockpiled on plastic sheeting or placed in appropriate containers, such as a roll-off box or 55-gallon drum for temporary storage. The temporarily stored solid material will be covered to prevent runoff.

Specific disposal options will be made on a site by site basis, taking into account the types of compounds known to be present, and will conform to applicable installation, local, state, and federal requirements.

3.13.2 Water

Investigative derived water, which will consist of decontamination wash, well development, and purge water, will be temporarily containerized in a portable poly tank. Based on previous and/or current analyses, liquids that would not fail Toxicity Characteristic Leaching Procedure (TCLP) analysis will be properly disposed of in accordance with Georgia State laws. Disposal options will be evaluated on a site by site basis.

3.14 Site Survey

A site survey will be conducted by a registered land surveyor to measure elevations (X, Y, and Z coordinates) of any new monitoring wells. The north side of the top of the casing and the land surface adjacent to each well will be surveyed relative to mean sea level to the nearest 0.01 ft. The horizontal location of each monitoring point and well will also be determined relative to the Georgia state plane system and the Fort Stewart and Hunter Army Airfield installation grid to the nearest 1.0 foot. All surveying will be performed by a certified land surveyor, and will be tied into the existing on-site benchmark.

The location of each soil and waste boring, test pit location, sediment, surface water, and stream gauging location may also be surveyed by hand-held global positioning system (GPS) equipment, as conventional land surveying will be difficult to complete at these areas.

4. Field Documentation Procedures

Information on the sample designation, field documentation, COC, and sample shipment activities are discussed in the following three sections.

4.1 Sample Designation

A numbering system was developed for each type of environmental sample collected during the field investigation for the unique identification of each individual sample. This number system will provide a tracking procedure to allow ease of data retrieval, reduction, and evaluation, and to ensure that sample identifiers are not duplicated. The most important aspect of any sample numbering system that is developed is ensuring the uniqueness of an individual sample number. A listing of the sample identification numbers will be maintained by the project manager and the field task supervisor will ensure that it is universally applied to samples collected during the project.

The numbering system for this project consists of the following components described below:

- The Site number in the format “HA##” for Hunter Army Airfield and “FS##” for Fort Stewart;
- The location type;
- The sample number;
- Water and sediment sample IDs will end with the date (in “mmddyy” format); or
- Soil samples will end with the depth range (in ft).

Blind duplicate samples will be labeled sequentially starting at 1 in the form D1(mmddyy).

Examples of the numbering system are provided below:

- Surface water sample 1 taken from HAA-01 on November 8, 2009 would be: HA01SW001(110809);

- Surface soil sample 4 taken from FST-13 at a depth of 0 to 6 inches would be: FS13SS004(0-0.5).

The location type codes are listed below:

MW – monitoring well;
TW – temporary well;
SB – soil boring (by drilling);
SS – surface soil by trowel or other hand collection method;
SW – surface water by any collection method; and
SE – sediment by any collection method.

In addition to the above nomenclature, the COC will be completed to include both the Sample Type and Sample Matrix using the codes defined below:

Acceptable sample type codes are listed below:

N = normal or primary sample;
FD = field duplicate;
EB = equipment blank;
MS = matrix spike;
SD = matrix spike duplicate; and
TB = trip blank.

The sample matrix will be identified using the following codes:

SO = soil sample;
SE = sediment sample;
WG = groundwater;
WS = surface water;
WB = water collected from borehole or during Geoprobe® investigation; and
WL = leachate.

Field duplicate samples will be given a unique number that is completely different from the original sample following the normal sample pattern. Duplicate samples will be labeled sequentially starting at 1 in the form D1(mmddyy). This number will be recorded in the field logbook, so that the duplicates can be identified at a later date. Samples collected with an additional volume for matrix spike/matrix spike duplicates (MS/MSDs) will be designated on the COC in the remarks column.

Equipment and trip blanks will be identified using the sample type code (i.e., EB or TB) followed by the date as MMDDYY. For trip blanks, if more than one trip blank is submitted to the laboratory on a given day, the sample code will be followed by the a number starting with 1. For example the second trip blank submitted on December 1, 2003 would be identified as follows: TB2(120103).

4.2 Field Activity Documentation

Documentation of field operations and sample custody is achieved through use of ARCADIS pre-printed forms and a bound field logbook. The field log consists of notes and drawings describing the location, field conditions, and method of sample collection and identification. Examples of the pre-printed forms that will be used for this project are provided in Appendix B.

All aspects of sample collection and handling as well as visual observations shall be documented on the forms or in the field logbooks. All sample collection equipment (where appropriate), field analytical equipment, and equipment utilized to make physical measurements shall be identified in the field logbooks. All calculations, results, and calibration data for field sampling, field analytical, and field physical measurement equipment shall be recorded on the forms or in the field logbooks.

In addition, the Field Operations Leader will fill out a daily site activity log that details the activities and/or issues that occurred that day.

All entries in field logbooks or the preprinted sampling logs shall be dated, legible, and contain accurate and inclusive documentation of an individual's project activities. At the end of each day's activity, or of a particular event as appropriate, all documents in the field will be secured by the Field Operations Leader for each task. Once completed, these field logbooks and/or preprinted forms will be maintained as a part of the project files.

All data forms will be completed in indelible black ink. Make an entry in each blank. Where there is no data entry, enter "UNK" for Unknown, "NA" for Not Applicable, or "ND" for Not Done. To change an entry, the person making the change will draw a single line through the mistake, add the correct information above or adjacent to it, and initial the change.

4.2.1 Utilities and Structures Checklist

The Field Operations Leader will check the proposed drilling, sampling, and trenching locations for marked underground utilities, other underground structures and above-ground pipe racks or power lines. A Utilities and Structures Checklist will be completed by the Field Operations Leader for each area to be sampled prior to commencement of field activities.

4.2.2 Location Sketch

All drilling, sampling, and trenching locations will be drawn on a Location Sketch, if a reasonable site map is not available for the area of interest.

4.2.3 Boring/ Well Construction Logs

All soil borings, boreholes, and monitoring well installations completed by the field team will be documented on Boring/Well Construction Logs. The logs document the drilling location, drilling dates and times, drilling personnel, logging personnel, soil descriptions, sample depths, recovery, boring location and volatile organic vapor content. The log also documents the well identification, drilling method, development technique, well construction materials, material depths, and abandonment, if any.

4.2.4 Water Level Measurement Form

All water level measurements will be recorded on a Water Level Measurement Form. The log identifies the measurement location, and measurement date and time.

4.2.5 Sample Key

All samples to be collected will be recorded on the Sample Key. The form identifies all sample locations, sample date and time, and analytical parameters to be collected.

4.2.6 Sampling Location Survey Summary

The sampling location survey summary is to be completed prior to field activities. It will provide northing, easting, and elevation information for site monitoring wells.

4.2.7 Water Sample Log

All surface water samples collected by the field team will be documented on a Water Sample Log. The log identifies the sample identification, duplicate identification, if any, sampling times, location, equipment used, color, odor, appearance, sample parameters, container description, sample preservative, and sampling personnel.

4.2.8 Groundwater Sampling Form

The results of field measurements while purging monitoring wells, prior to collecting a groundwater sample, will be recorded on the Groundwater Sampling Form. This form records time series measurements of conductivity, temperature, turbidity, redox potential, and dissolved oxygen. The form also provides a record of the volume of water purged prior to sample collection.

4.2.9 Well Sampling Summary

A summary of the results of field measurements while purging monitoring wells, prior to collecting a groundwater sample, will be recorded on the Well Sampling Summary Form. This form records collection date and time and the final measurements of conductivity, temperature, turbidity, redox potential, and dissolved oxygen. The form also provides a record of the volume of water purged prior to sample collection.

4.2.10 Water Level/Pumping Test Record

The data from slug tests and pumping tests completed in monitoring wells will be documented on a Water Level/Pumping Test Record. The log identifies the well the test is conducted in, the static water level, the initial displacement, and changes in the water level versus time.

4.2.11 Soil/Sediment Sample Log

All soil samples collected by the field team will be documented on a Soil/Sediment Sample Log. The log identifies the sample identification number, soil type, duplicate

identification, if any, sampling times, depth and location of sample, sampling equipment used, color, odor, appearance, sample parameters, container description, sample preservative, and sampling personnel.

4.2.12 Soil Sampling Summary

All soil samples collected by the field team will be documented on Soil Sampling Summary form. The form identifies the sample identification, sampling times, depth and location of the sample.

4.2.13 Surface Water Sample Log

All surface water samples collected by the field team will be documented on a Surface Water Sample Log. The log identifies the sample identification, duplicate identification, if any, sampling times, sampling location, equipment used, color, odor, appearance, sample parameters, container description, sample preservative, and sampling personnel.

4.2.14 Field Instrument Calibration Form

The field team will record all daily calibration results for field instrumentation on the Field Instrument Calibration Form.

4.2.15 Daily Log

The Daily Log form is used by the Site Manager to record all pertinent sampling events, field observations or other information pertinent to the field effort. The following types of information are generally entered into the Daily Log:

- Date
- Client
- Field Location
- Ambient Weather Conditions
- Field Team
- Instrument Problems
- Site Visitors
- Delays
- Unusual Situations
- Well Damage
- Accidents
- Work Progress
- Quality Control
- Site Schedule

4.2.16 Sample Label

All samples collected by the field team will be properly identified by labeling. Labels will be affixed to the sample bottle prior to the filling of the container(s). Labels are never affixed to lids or caps, although the sample identification information may duplicated on the cap for ease of sample identification. The following labeling information is supplied for every sample bottle.

- Sample Identification Number
- Initials of Sample Collector
- Date and Time of Collection
- Project Number
- Project Location
- Requested Analyses

4.2.17 Chain-of-Custody Form

The COC form is a multi-copy record, which documents the custody of the samples from sample collection through laboratory analysis. It has spaces for signatures of those receiving and relinquishing the samples. The sampler, the individual preparing the samples for shipment, and the receiving individual at the laboratory normally sign the form. An example of this form is provided in Appendix B.

The field personnel collecting the sample will fill out the COC forms. The COC process will be initiated upon sample collection. The field personnel who sign the form will be responsible for the samples until they are transferred to the custody of the laboratory or another custodian. Once the form has been completed, all remaining field sample identification spaces will be crossed through to prevent unauthorized addition of sample information.

The information required on the COC form includes the complete sample identification, date and time of sample collection, number of sample containers, analyses and method required, container type, project number, sample collection personnel, complete name, address, and telephone number of the person analytical reports will be sent to, turnaround time, and signatures of all sample custodians, excluding shippers, such as Federal Express. In addition, the method of shipment, courier name and air bill number must be included. The back copy of the form will be retained. The original form will accompany the sample shipment to the laboratory.

4.2.18 Chain-of-Custody Seal

All coolers submitted to analytical laboratories containing samples collected during the field investigations will be sealed with two signed and dated COC seals. The seals ensure that the samples have not been tampered with during shipment.

4.2.19 Bill of Lading

A bill of lading (air bill) documents receipt of the samples by the carrier. It is not possible for the carrier's representative to sign the COC because it is sealed in the ice chest. Bills of lading are kept on file as part of the sample COC documentation.

4.3 Chain-of-Custody Procedures

The primary objective of the COC process is to create an accurate written record that can be used to trace the possession and handling of the sample from the moment of its collection through analysis. A sample is considered to be in custody when one of the criteria listed below has been satisfied:

- The sample is in one's actual possession.
- The sample is in one's view after being in one's physical possession.
- The sample is in one's physical possession and is then locked up so that no one can tamper with it.
- The sample is kept in a secured area that is restricted to authorized personnel.

Strict COC procedures will be followed for all collection, handling, and shipping of environmental samples. The field personnel are responsible for the care and custody of the sample collected until the samples are properly and formally transferred to another person or a courier for shipment to the laboratory. To simplify the COC record, as few people as possible will handle the sample during the investigation or inspection and an inventory of the sample containers will be maintained.

A COC form will be completed for all samples collected. A separate COC record will be utilized for each cooler of samples shipped to each laboratory used during this investigation. During the data validation activities, it will be determined whether these procedures were adequately followed.

4.3.1 Transfer of Custody

A COC form will accompany all samples. Prior to shipment or transfer of custody, all samples will be maintained in the custody of the Field Operations Leader. Upon transfer of custody, the Field Operations Leader will verify the information on each sample label and assure that each container is intact and sealed. The Field Operations Leader will then sign and date the COC form. The individuals receiving the samples shall sign, date, and note the time that they reviewed the samples on the COC form. This form documents transfer of custody of samples from the field investigator to another person to the laboratory.

4.3.2 Sample Preparation and Shipment

All samples will be stored at approximately 4°C from immediately after collection until analysis. In the field and during transportation to the laboratory, samples will be kept in coolers on ice, not "blue ice". Ice for coolers will be double-bagged in self-sealing plastic bags. Protective foam or Styrofoam packing will be used to minimize the risk of breakage during transport. When packaging samples for commercial transport, individual bottles will be wrapped separately in padded materials.

The samples are then placed in an ice chest, in direct contact with the ice, lined with a plastic trash bag or other barrier to prevent leakage and Styrofoam, bubble wrap, or similar packaging to prevent breakage. The top two copies of the original COC form will be placed in a plastic bag secured inside the shipping container closed with a chain-of-custody seal.

4.3.3 Laboratory Sample Receiving

After the ice chests are delivered to the laboratory, the samples are logged in, the COC is signed, and the samples are checked for breakage or leakage. The temperature of the ice bath is checked. If the temperature exceeds 4º C or if any other problems are noted, this information is recorded on the COC and the Field Operations Leader or Project Manager will be notified of the problem.

Introduction

The Installation Restoration Program (IRP) activities at Fort Stewart and Hunter Army Airfield (HAAF) are performed in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) as amended by the Hazardous and Solid Waste Amendments (HSWA) of 1984. The Georgia Environmental Protection Division (GA EPD) issued Hazardous Waste Management Permit No, HW-045(S) which addresses the corrective action requirements for all Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs) at Fort Stewart. Hazardous wastes generated at HAAF are transferred to the Fort Stewart Defense Reutilization Market Office (DRMO) yard. Corrective action activities performed at HAAF are executed under either the Georgia Hazardous Site Response Act (HSRA) or the Georgia Underground Storage Tank Management Program (USTMP). The goal of the Performance Based Acquisition (PBA) contract is to meet the corrective action requirements for all sites, as defined in the contract and summarized in the Project Management Plan (PMP) (ARCADIS 2008). The full scope of services for this contract is defined in the Contract W91ZLK-05-D-0015: Task 0003 as executed between the Army Environmental Command (USAEC) and ARCADIS U.S., Inc. (ARCADIS). All work performed under the contract will be consistent with all applicable regulatory requirements, and relevant Department of Defense (DoD) and Army policy.

This Quality Assurance Project Plan (QAPP) presents the policies, organization, functions, and Quality Assurance (QA) requirements designed to achieve the data quality objectives for additional contaminant delineation, groundwater monitoring, and remedial attainment to be performed in support of the environmental restoration as identified in the PBA contract This QAPP has been prepared for use by field personnel, data quality reviewers, and laboratories who perform environmental activities to ensure that the data are scientifically valid and usable for the intended purpose. Analytical protocols and documentation requirements will ensure that the data are collected, reviewed, and analyzed in a consistent manner. The method performance criteria and the analytical laboratory quality management program, as well as the protocols set forth in this QAPP, will be employed to establish data usability.

The general guidelines followed in the preparation of this QAPP are presented in EPA Requirements for QAPPs for Environmental Data Operations, EPA QA/R-5 (United States Environmental Protection Agency [USEPA], March 2001). The EPA document was used as guidance and this QAPP presents only the applicable components. Other documents that have been referenced in this QAPP are presented in Section 5.

Personnel participating in the work effort will review this document. All personnel are required to comply with procedures documented in this QAPP and supporting project documents to ensure usability of the data produced.

1. Project Management

1.1 Project

This section provides a description of the ARCADIS organizational structure of personnel involved with this project. The lines of authority are defined and key personnel identified for various activities of the project. The project organization is illustrated in Figure A-1. Table A-1 presents contact information for key ARCADIS personnel. The Project Manager will communicate with the client and regulatory agencies and oversee project execution. The Associate Project Manager and Site Managers will implement project tasks and coordinate with the technical personnel.

ARCADIS, Project Manager

Mr. Charles A. Bertz, P.E.. The ARCADIS Project Manager (PM) is responsible for the overall implementation of the project. The Project Manager is responsible for allocating resources to assure successful execution and completion of the scope of work (SOW). Other duties, as required, may include:

- Approving project-specific procedures and internally prepared plans, drawings, and reports;
- Ensuring technical, schedule, and budget requirements are met;
- Coordinating manpower and other necessary resources with ARCADIS Assistant Project Manager, Site Managers, and technical personnel;
- Reviewing project progress;
- Reviewing all final documents, plans, and drawings; and
- Coordinating document delivery and attaining project milestones.

ARCADIS, Associate Project Manager

Ms. Shelley Gibbons. The ARCADIS Assistant Project Manager (APM) will support the Project Manager in contract management as well as task implementation, document preparation, personnel coordination, and budget management. Ms. Gibbons will perform a key role in ensuring compliance with quality performance objectives. Other duties, as required, may include:

- Coordinating schedules and deliverables with the Site Managers and the Project Manager;
- Ensuring project budget and deliverable schedule compliance;
- Assisting with quality program implementation and coordinating document preparation and submittals;
- Serving as the "collection point" for the project staff reporting any changes or deviations from the project work plan;
- Determining the significance of these changes or deviations to specific work plans and the appropriateness of reporting such items to the corresponding regulatory and facility representatives;
- Arranging subcontractor services; and
- Preparing status update reports and revisions to the project work plan.

ARCADIS, Site Managers

Mr. Andy Davis, P.E. and Mr. Scott Bostian, P.E.. The ARCADIS Site Managers are principally responsible for overseeing day-to-day of task performance including all technical and administrative operations. Other duties required may include:

- Preparing the work plans;
- Selecting and monitoring technical staff;
- Assigning duties to the project staff and orienting the staff to the requirements of the project;
- Coordinating and scheduling field activity resources;

- Performing assessment and oversight duties as described in the PMP, Sampling and Analysis Plan (SAP), and QAPP;
- Reviewing and approving all final reports and other work products;
- Monitoring staff and subcontractor progress; and
- Distributing the QAPP to the ARCADIS technical staff.

ARCADIS, Quality Assurance Officer

Mr. Kurt Beil, P.E.. The ARCADIS Quality Assurance Officer (QAO) is responsible for oversight of all QA/QC activities. He will remain independent of day-to-day direct project involvement, but will have the responsibility for ensuring that all project and task-specific QA/QC requirements are met. He will have direct access to corporate staff, as necessary, to resolve any QA/QC problems, disputes, or deficiencies. The QA Officer's duties include:

- Reviewing and approving the Site-Wide QAPP and site-specific work plans;
- Reviewing and approving substantive changes to the QAPP, SAP, and work plans;
- Reviewing any new work orders with the Project Manager to determine if the QAPP requires modification;
- Providing external review of field and analytical activities by performance of assessment and oversight duties as described in the QCP; and
- Conducting or delegating responsibility for field audits in conjunction with the corporate QA office and maintaining written records of those audits.

ARCADIS, Health and Safety Officer

Mr. Sam Moyers. The ARCADIS Health and Safety Manager reviews and internally approves the Health and Safety Plan (HSP) that will be designed to the specific needs and operations associated with this project. In consultation with the PM, the Health and Safety Manager will ensure that an adequate level of personal protection exists for anticipated potential hazards for field personnel. Identify the Field Health and Safety Officer (FHSO) for each field operation. On-site health and safety will be the responsibility of the FHSO. The FHSO will work in coordination with the PM and the

project Health and Safety Manager to ensure that all activities are conducted safely and in accordance with the HSPA as well as facility requirements.

ARCADIS, Project Chemist

Ms. Jane Kennedy. The Project Chemist is responsible for laboratory selection and oversight, data validation and verification, and hard copy and electronic analytical data oversight. The Project Chemist's specific duties include:

- Developing the Site-Wide QAPP and QA aspects of site-specific work plans;
- Providing external review of analytical activities by performance of assessment and oversight duties;
- Coordinating with the Project Manager, Task Managers, and laboratory management to ensure that QA objectives appropriate to the project are set and that laboratory and field personnel are aware of these objectives;
- Recommending, implementing, and/or reviewing corrective actions taken in the event of QA/QC failures in the laboratory or field;
- Reporting nonconformance with either QC criteria or QA objectives (including an assessment of the impact on data quality or work assignment objectives) to the appropriate managers; and
- Assisting with preparation of reports summarizing data quality.

Technical Staff

The technical staff for this program will be drawn from a pool of technical resources within ARCADIS. The technical staff will implement project and site tasks, analyze data, and prepare reports/support materials. All technical personnel assigned will be experienced professionals who possess the degree of specialization and technical competence required to perform the required work effectively and efficiently. All technical staff will be familiar with the HASP and all relevant Work Plans, standard operating procedures (SOPs), and policies applicable to the field work performed.

Laboratories

Independent laboratories providing analytical services will be chosen as appropriate for the various project requirements including routine monitoring, confirmation sampling,

remedial system monitoring, air analyses, and pilot/benchscale studies. Geotechnical laboratories may be selected based on project requirements and will be identified in the site-specific work plans. Selection criteria for geotechnical laboratories will be based on previous performance on ARCADIS projects or satisfactory recommendations. Analytical chemistry laboratories shall be accredited under the National Environmental Laboratory Accreditation Program (NELAP) and in accordance with Georgia requirements for the project analytical parameters for which accreditation is available through the primary accrediting state. The laboratory QA programs will be reviewed by the ARCADIS Project Chemist, as appropriate. The laboratory will assign an experienced Project Manager to coordinate analytical support for field operations with the ARCADIS Field Operations Manager and Project Chemist.

The analytical chemistry laboratories will provide services under a specified SOW and contractual agreement with ARCADIS. This QAPP incorporates by reference the laboratory, reporting and detection limits, and quality control limits. SOPs will be evaluated by the project chemist to ensure that method performance is acceptable. Appropriate data will be uploaded to the electronic project database for use by the ARCADIS Project Manager and task managers.

The laboratory staff will include a qualified QA Manager, who reports directly to laboratory management independently of the technical operations of the laboratory, to oversee technical adherence to the laboratory QA programs and this QAPP.

The specific duties of the laboratory Project Manager and QA Manager include:

- Reviewing the QAPP and other project requirements to verify that analytical operations will meet project requirements as defined in the project documents;
- Documenting and implementing project QA/QC requirements in the laboratory and reviewing analytical data (10 percent for the QA Manager) to verify that the requirements were met;
- Reviewing receipt of all sample shipments and notifying the Project Chemist of any discrepancies within 1 day of receipt;
- Conducting internal laboratory audits to assess implementation of the laboratory Quality Assurance Manual (QAM) and procedures and providing written records of those audits;
- Rapidly notifying the Project Chemist regarding laboratory nonconformance with the QAPP or analytical QA/QC problems affecting project samples; and

- Coordinating with the project and laboratory management to implement corrective actions as required by the QAPP and internal laboratory QAM.

The principal contract laboratory QAM will be incorporated in this QAPP by reference when the laboratory subcontract is executed. Microseeps Laboratories, Inc. (Microseeps), will provide analytical support for the monitored natural attenuation (MNA) dissolved gas and biogeochemical parameters, and Air Toxics, Ltd. (Air Toxics), will provide analysis of air samples as required. The QAMs for these laboratories shall be retained by the ARCADIS Project Chemist. Ozark Underground Laboratories will provide dye tracer analyses associated with remedial system performance assessments.

Other Subcontractors

Other subcontractors will provide services under the direct supervision or direction of the ARCADIS Project Manager or Task Managers or appropriate designated staff. The drilling, surveying, geotechnical laboratory, and other subcontractors are responsible for performance in accordance with the individual subcontracts and applicable portions of the QAPP and Quality Control Plan (QCP) as defined in each subcontract package. Subcontractors are responsible for rapidly notifying the Site Manager regarding nonconformance with the QAPP or QA/QC problems encountered or observed. Subcontractors must coordinate with the Site Managers to implement corrective actions.

1.2 Problem Definition/Background

Detailed project information is included in the PMP, the SAP, and the PBA contract or, if necessary, will be included in the appropriate work plans that define a particular SOW to be completed.

1.3 Project Description

The field sampling program and field procedures are described in detail in the SAP, and therefore are not repeated in this QAPP. Additional work plans will be prepared as sampling and analytical requirements are defined. Any additional specific QA requirements will be included in specific plans.

The purpose of this QAPP is to provide field, laboratory, and quality assessment personnel with general instructions regarding activities to be performed before, during, and after each sampling effort to ensure generation of usable data. This QAPP

contains general and specific details regarding field sampling, laboratory analytical methods, and data management that apply to the Site. The collection and documentation of data will be performed as described in the following sections to ensure the quality of the collected data.

1.4 Data Quality Objectives for Measurement Data

Table A-2 presents the overall project Data Quality Objectives (DQOs). Additional analytical performance and data review DQOs include precision, accuracy, representativeness, completeness, and comparability (PARCC). These criteria represent qualitative and quantitative objectives that ensure the data are generated that are scientifically valid and usable for the intended purpose. As discussed in *USEPA Guidance on Systematic Planning Using the Data Quality Objectives Process; USEPA QA/G-4*, dated February 2006 and *USEPA Requirements for Quality Assurance Project Plans; USEPA QA/G-5*, dated March 2001, the DQOs are dependent on the intended uses of the data and are based on the premise that the ultimate use(s) of a particular data set should dictate the quantity and quality of these data. These DQOs in conjunction with criteria set forth in this QAPP will be used as a guide for data quality assessment by establishing analytical protocols and documentation requirements that will allow the analytical data to be collected, analyzed, and verified/validated in a consistent manner.

1.4.1 Precision, Accuracy, Representativeness, Completeness, and Comparability

The basis for assessing the elements of data quality is discussed in the following subsections. The contract analytical laboratory precision and accuracy QC limits will be incorporated into the QAPP and updated as appropriate.

Precision measures the reproducibility of repetitive measurements. It is strictly defined as the degree of mutual agreement among independent measurements as the result of repeated application of the same process under similar conditions.

Analytical precision is a measurement of the variability associated with duplicate (two) or replicate (more than two) analyses of the same sample in the laboratory and is determined by analysis of laboratory control samples/laboratory control sample duplicate (LCS/LCSD), matrix spikes/matrix spikes duplicate (MS/MSD), laboratory duplicates and field duplicates. If the recoveries of analytes in the LCS are comparable within established control limits, then laboratory precision is within limits. The contract laboratory control limits will be utilized to evaluate analytical precision.

Total precision is a measurement of the variability associated with the entire sampling and analysis process. It is determined by analysis of duplicate or replicate field samples and measures variability introduced by both the laboratory and field operations. Field duplicate samples and matrix duplicate spike samples are analyzed to assess field and analytical precision. Field duplicate samples will be collected at a minimum 5 percent frequency.

Duplicate results are assessed using the relative percent difference (RPD) between duplicate measurements. The formulas for the calculation of precision are provided in Table A-3 as RPD (used for two measurements), average RPD, relative standard deviation (RSD), and pooled RSD (used for more than two measurements). The proposed precision objective for soil and sediment field duplicates is an RPD of 70 percent and the precision objective for groundwater and surface water field duplicates is an RPD of 40 percent for all parameters analyzed.

Accuracy is a statistical measurement of correctness and includes components of random error (variability due to imprecision) and systematic error. It reflects the total error associated with a measurement. A measurement is accurate when the value reported does not differ from the true value or known concentration of the spike or standard. Analytical accuracy is measured by determining the percent recovery (%R) of known target analyses that are spiked into a LCS to a control limit. For organic parameters analyzed by GC and GC/MS surrogate compound recoveries are also used to assess accuracy and method performance for each sample analyzed.

Both accuracy and precision are calculated for preparation or analytical batches, and the associated sample results are interpreted by considering these specific measurements. The formula for the calculation of accuracy is included in Table A-3 as %R from pure and sample matrices. Laboratory precision and accuracy control limits will be incorporated by reference into this QAPP upon selection of the contract laboratory.

Representativeness is achieved through use of the standard field, sampling, and analytical procedures. Representativeness is also determined or influenced by appropriate program design, with consideration of proper sampling locations and collection techniques.

Completeness is calculated for the aggregation of data for each analyte measured for any particular sampling event or other defined set of samples. The number of valid results divided by the number of possible individual analyte results, expressed as a percentage, determines the completeness of the data set. For completeness

requirements, valid results are all results not qualified with an "R" flag/reject or unusable data. For any instances of samples that could not be analyzed for any reason (e.g., holding time violations in which re-sampling and analysis were not possible, or samples spilled or broken), the numerator of this calculation becomes the number of valid results minus the number of possible results not reported.

The formula for calculation of completeness is presented, as follows:

$$\% \text{ completeness} = \frac{\text{number of valid results}}{\text{number of possible results}}$$

The completeness objective for sample matrices collected during these investigations will be at least 90 percent.

Comparability is the confidence with which one data set can be compared to another data set. The objective for this aspect of the QA/QC program is to produce data with the greatest possible degree of comparability. The number of matrices that are sampled and the range of field conditions encountered are considered in determining comparability. Comparability is achieved using standard methods for sampling and analysis, reporting data in standard units, and using standard and comprehensive reporting formats. Complete field documentation using standardized data collection forms shall support the assessment of comparability. Historical comparability is achieved through consistent use of methods throughout the project. EPA approved methods will be utilized for analytical chemistry determinations as available.

1.4.2 Objectives for Laboratory Analyses

The laboratory DQOs include method performance and reporting consistent with criteria presented in the USEPA document entitled "Test Methods for Evaluating Solid Waste-Physical/Chemical Methods," SW-846, Third Edition (as updated) the laboratory QAM and SOPs, this QAPP, and other applicable performance requirements published in EPA method guidance.

1.4.3 Objectives for Field Measurements

Field measurement DQOs for precision, accuracy, and completeness criteria presented in Table A-4 are consistent with the industry acceptance criteria.

Trip blanks (TBs) will accompany samples to be analyzed for volatile organic compounds (VOCs). Field duplicate samples will be collected at a frequency of 5 percent for each analysis and each sample matrix collected. Equipment blanks (EBs) and additional sample volume for MS analysis will be collected at a minimum five percent frequency for each analysis. Temperature blanks will be placed in each sample cooler and the temperature recorded upon laboratory receipt. Frequency for collection of field QC samples is presented in Table A-4.

The field sampling team will also be responsible for collecting additional sample quantities at a frequency of five percent for MS and MSD analyses.

1.5 Specialized Training and Certification

Training shall be provided to all project personnel to ensure compliance with the site specific Health and Safety Plan and technical competence in performing the work effort. Documentation of this training shall be maintained in the records of the contracted organizations. ARCADIS employees who participate in the types of activities defined in the Occupational Safety and Health Administration (OSHA) requirements under Code of Federal Regulations (CFR) 1910.120 complete the 40-hour health and safety training program. Each employee must successfully complete a minimum of 8 hours of refresher training annually to maintain the certification. Employee training records are maintained in the ARCADIS office where the employee resides. Any special requirements for personal possession of certification cards will be adhered to as program appropriate.

All analytical chemistry laboratories performing analyses will be required to maintain current NELAP accreditation for the parameters of interest if accreditation is available. Accreditation certificates, audit reports, and performance testing (PT) data will be reviewed by the Project Chemist, as appropriate to ensure that laboratory capabilities meet or exceed project requirements. Laboratories must also maintain internal training records for technical staff in accordance with standard laboratory practices and certification requirements. The laboratory will provide the applicable training records, including Initial Demonstration of Competence documentation, for review, as deemed necessary, by the ARCADIS Project Chemist.

All subcontractors and their employees will have current and applicable performance and certifications required to perform the assigned SOW. Subcontract agreements will include the specific training and certification requirements and applicable records will be reviewed as appropriate. Subcontractor training and certification documentation will be maintained at the subcontractors' offices.

1.6 Documents and Records

The primary documentation for the project includes field records, analytical data packages, and summary reports. This section describes the level of documentation and record keeping for the central project file that will be maintained by the ARCADIS office in Raleigh, North Carolina.

1.6.1 Document Control

All planning documents will be clearly identified by the document title, revision number, date, and page number in the header of each document page. Planning documents currently in use will be reviewed on an annual basis and any necessary revisions or updates will be amended and distributed to each participating party. Documents prepared in support of the PBA contract will be prepared and distributed as required.

Original field records and laboratory analytical data will be maintained in the ARCADIS Raleigh, NC office.

1.6.2 Field Documentation

Field documentation will include field logbook or daily logs, field sampling logs, instrument calibration logs, and data forms as necessary to provide sufficient information to allow review of field conditions, performance, and sample collection, to evaluate potential impacts to sample and data integrity, and to enable participants to reconstruct events that occurred during the field operations when necessary. Daily logs will also document any deviations from the SAP, QAPP, site or task specific work plans or other applicable planning documents and describe the rationale for the changes.

All entries will be made in waterproof ink, and the time of the entry will be recorded. The top of each page of the field documents will contain the date that the entries on that page were recorded. No pages will be removed from a bound logbook for any reason. Additional details on field documentation are provided in the SAP.

All documentation associated with field activities will be retained in the project file in accordance with the document retention policy stated in this QAPP and the QCP as applicable to the document type.

1.6.3.1 Corrections to Field Documentation

As with all bound data logbooks, no pages will be removed for any reason. If corrections are necessary on any field documentation, they will be made by drawing a single line through the original entry (so that the original entry can still be read) and writing the corrected entry alongside it. The correction must be initialed and dated. As necessary, corrected errors will include a footnote explaining the correction.

1.6.3.2 Photographs

Photographs will be taken as directed by the Site Manager. Documentation by a photograph will ensure the validity as a visual representation of an existing situation. A log will be developed to track the media that the photos are filed on (e.g., compact disc, floppy disk). Photographs, as developed or transferred to electronic media, shall be compiled into a photograph log and information recorded in field notebooks added to the log with appropriate photographs.

1.6.3 Laboratory Data Reporting/Record Retention

Analytical data reports for all samples will be prepared by the laboratory as a Level II Data Package. The Level II Data Packages will include a fully-executed COC Record, sample receipt checklist, cross-reference table of field samples with laboratory sample number, preparation and analytical batch numbers, analytical results, collection and analysis dates and times, reporting limits (RLs), dilution factors, surrogate recoveries, method blank data. Summary QC data will be provided for LCS, MS accuracy and precision, laboratory replicate precision, laboratory control limits. The analytical report shall include the method detection limits (MDL), and the quantitative RLs. Appropriate data flags identifying any QC result reported outside control limits and an explanation of all data flags applied by the laboratory. The case narrative will present an explanation of all QC results reported outside control limits and samples analyzed at dilutions where all results are non-detect.

Where detailed data validation is required, analytical data reports will include the following items in addition to the elements of the Level II data package, sample aliquots, final extract volumes, run logs, quantitation reports, ion spectra, chromatograms, batch identification report clearly linking all QC results to field sample results, and instrument calibration and tuning information. The laboratory report will include copies of any nonconformance or corrective action forms associated with data generation. This level of analytical report components will be defined as a Level IV data package.

The RLs will be corrected for percent moisture (soils only) and all dilution factors. Any compounds found less than the RL, but greater than the MDL will be reported and qualified with a "J" flag as estimated. Soils will be reported on a dry weight basis.

The laboratory will provide an electronic data deliverable (EDD) that matches all data reported on the hard copy analytical report. Electronic data report requirements are described in Section 2.12.

The laboratory is required to retain all information associated with the analytical operations for samples associated with this project for a minimum of 6 years.

1.6.4 Electronic Data Retention

Electronic data and media retention policies will correlate with hard copy data retention at the laboratories as well as other points of electronic data generation. Additionally, electronic data will be subject to back-up routines that will enable recovery of data that may become corrupted or lost due to instrument, computer, and/or power failures. Electronic media will be stored in climate-controlled areas to minimize potential for degradation. Storage areas will be access limited.

2. Data Generation and Acquisition Elements

2.1 Sampling Process Design

The sampling process design will be presented in future work plans and in the SAP.

2.2 Sampling Methods

The field sampling procedures, sampling methods and equipment are also discussed in detail in the associated SAP. Calibration will be documented on a Field Equipment Calibration form, where each instrumented calibrated is identified along with the date, time, calibration reading, and field staff initials. The field sampling methods are referenced in the following section.

2.3 Sample Handling and Custody

Procedures to insure the custody and integrity of the samples begin at the time of sampling and continue through transport, sample receipt, preparation, analysis and storage, data generation and reporting, and sample disposal. Records concerning the custody and condition of the samples are maintained in field and laboratory records. All samples will be uniquely identified, labeled, and documented in the field at the time of collection and recorded on the Chain-of-Custody (COC) form. Samples collected for laboratory QC will be clearly identified on the COC (e.g. MSs). Details for completing the COC are included in Section 4.2.17 of the SAP. Field custody procedures are presented in Section 4.3 of the SAP.

Samples collected in the field will be transported to the laboratory or field testing site as expeditiously as possible. Samples requiring preservation at 4 degrees +/- 2 degrees Celsius (^{o}C) will be packed in ice or chemical refrigerant to keep them cool during collection and transportation. Any concerns and/or deviations will be reported to the contractor immediately.

Once the samples reach the laboratory, they will be checked against information on the COC form for anomalies. The condition, temperature, and appropriate preservation of the samples will be recorded by the laboratory on a sample receipt checklist, and will be made part of the permanent project custody records. The occurrence of any anomalies in the received samples and their resolution shall be documented in laboratory records. All sample information shall then be entered into the laboratory tracking and data management system. The laboratory PM shall review the log-in for accuracy and compliance with project requirements. Procedures ensuring internal

laboratory COC shall also be implemented and documented by the laboratory. Specific instructions concerning the analysis specified for each sample shall be communicated to the analysts. Analytical batches shall be created, and laboratory QC samples shall be introduced into each batch.

While in the laboratory, samples shall be stored in limited access, temperature controlled areas. Refrigerators, coolers and freezers used for sample storage will be monitored for temperature 7 days a week. Acceptance criteria for the temperatures of the refrigerators and coolers are 4°C to 2°C. Acceptance criteria for the temperatures of the freezers shall be less than 0°C. All of the cold storage areas shall be monitored by thermometers that have been calibrated with a NIST traceable thermometer. As indicated by the findings of the calibration, correction factors shall be applied to each thermometer. Records that include acceptance criteria shall be maintained. Samples shall be stored separately from standards. Samples shall be stored after analysis until disposed of in accordance with applicable local, state, and federal regulations. Disposal records shall be maintained by the laboratory. SOPs describing sample control, custody, and disposal shall be maintained by the laboratory.

2.4 Sample Containers

The volumes and containers required for the sampling activities are listed in Table A-5. The laboratory will provide new, pre-cleaned sample containers. The laboratory shall use an approved specialty container supplier that prepares the containers in accordance with USEPA bottle preparation procedures. TBs will be transported to the site inside the same cooler/box as the VOC vials.

Sample container lids will not be mixed. All sample lids must stay with the original containers as provided by the supplier. Bottle lids (with any associated bottle) exhibiting cracks, splits, or chips shall be appropriately discarded.

2.5 Sample Preservation and Holding Times

New and pre-preserved (as appropriate) containers obtained from the laboratory shall be used for all samples requiring preservation. Chemicals used by the laboratory for preservation will be reagent-grade chemicals. The laboratory shall maintain traceability records for all preservatives in the event of potential contamination of samples. The laboratory must ensure that preservatives used in containers supplied will not expire within the anticipated time of sample collection completion. Each bottle received from the laboratory must be clearly labeled with the type of chemical preservative in the bottle and the test parameters that will be determined from the sample collected in the

container. Sample containers will not be stored at the site for longer than 30 days. Bottle orders and any additional preservative requirements will be submitted to the laboratory 5 working days prior to commencement of field operations to allow supplies of clean, fresh containers and preservatives to be shipped to the facility.

Sample preservation will be verified on receipt at the laboratory with the exception of aqueous VOC samples. VOC sample preservation shall be verified prior to analysis. The preservation or pH check will be recorded on the sample receipt form or other appropriate logbook. If the samples are improperly preserved, a corrective action form will be submitted to the laboratory project manager for follow-up action. The laboratory will notify the ARCADIS Site Manager or Project Chemist to implement corrective actions in the field to ensure sufficient preservative is added at the time of sample collection.

Sample holding times will be based on published USEPA guidance and will be calculated for the date and time of collection. A list of preservatives and holding times for each type of analysis are presented in Table A-5. Additional preservation requirements and holding times for non-target analyses are listed in 40 CFR Part 136. Preservatives and holding times not listed in Table A-5 applicable to a specific task will be listed in the applicable SAP or work plan.

2.6 Analytical Methods

The primary analytical methods anticipated to be utilized for samples collected Table A-5. All methods will be USEPA approved/published. Additional USEPA approved methods, which may be utilized, are published in references listed below. Specific performance criteria, including QA protocols, for each analytical method, are documented in the published methods, laboratory SOPs, and the laboratory QAM. The QAM for each analytical laboratory performing work be reviewed as part of the procurement process and laboratory SOPs will be examined during onsite audits or as necessary. QAM is a generic term for the laboratory QA document, which describes the laboratory program to ensure data of known quality are generated. The contracted laboratory QAM will be incorporated by reference into this QAPP upon execution of the contract for analytical support.

2.6.1 Standard Laboratory Analytical Procedures

All standard analytical methods performed will be USEPA approved. The analytical methods are referenced in:

- *Test Methods for Evaluating Solid Waste, Physical Chemical Methods*, 3rd edition, SW-846, 1997.

- 40 CFR Part 136, *Guidelines Establishing Test Procedures for the Analysis of Pollutants under the Clean Water Act*; and

- *Methods for Chemical Analysis of Water and Wastes*, EPA-600/4-79-020, Revised March 1983.

The laboratory will perform all methods in accordance with the appropriate USEPA-approved methods and the laboratory specific SOPs for compliance with this QAPP and other project-specific requirements. The laboratory shall have method specific SOPs for all methods performed. The SOPs will detail method set-up, calibration, performance, and reporting criteria in accordance with SOP preparation under NELAP guidance and requirements. Method performance will be in strict compliance with the SOP and referenced method. Laboratory SOPs will include any modifications to the published method and will indicate actual performance protocols performed by the laboratory. The laboratory will update SOPs in accordance with NELAP requirements. The ARCADIS Project Chemist must approve any changes to the method performance acceptance criteria

The laboratory must notify the Project Chemist of any updated or revised RLs or performance control criteria prior to initiation of field operations. Required sample or extract dilutions to complete the analyses within method performance criteria may impact RLs. All required sample dilutions will be noted in the analytical report and explained in the case narrative. The laboratory shall make every effort to report all compounds/analytes at the lowest technically achievable limit to meet the risk screening standard requirements. The changes/elevations in limits will be evaluated to determine potential impact on DQOs. Any additional methods required for future projects will be specified in the SAP or Work Plan.

2.7 Elements of Quality Control

This section presents QC requirements relevant to analysis of environmental samples that shall be followed. The purpose of this QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QC materials.

Laboratory QC samples (e.g., blanks and LCSs) shall be included in the preparation batch with the field samples. Preparation batch is a number of samples (not to exceed 20 samples) similar in composition (matrix) and that are extracted or digested at the same time and with the same lot of reagents. MS and MSD samples do not count as environmental samples. The term analytical batch also extends to cover samples that do not need separate extraction or digestion (e.g., VOCs analysis by purge and trap). The identity of each preparation batch will be unambiguously reported with the analyses so that a reviewer can identify the QC samples and the associated environmental samples. The type of QC samples and the frequency of use of these samples are discussed in the following section. The laboratory will provide spike results from site-specific field samples of groundwater and soil, not from another client or site. Additional QC samples may be added to those required by the method to ensure accurate and precise data. The frequency of analysis of laboratory QC samples is presented in Table A-6.

2.7.1 Laboratory Control Samples

The LCS is analyte free water (aqueous samples) or clean sand (soil/sediment matrix) spiked with known concentrations of specific analytes. The LCS shall be carried through the complete sample preparation and analysis procedure. The LCS is used to evaluate each preparation batch and to determine if the method is in statistical control. One LCS will be included with every analytical batch. All target analytes will be spiked in the LCS.

In accordance with method criteria and laboratory SOPs, an LCS analyte outside the recovery acceptance limit mandates corrective action unless the out of control scenario does not impact data usability. Where corrective action is required and after the system problems have been resolved with system control re-established, all samples in the analytical batch will be reanalyzed for the out of control analyte(s). When an analyte in an LCS exceeds the upper or lower control limit and no corrective action is performed, the appropriate validation flag, as described in the data validation section, will be applied to all affected results. LCS results will be compared to the laboratory LCS control limits.

2.7.2 Matrix Spike and Matrix Spike Duplicate

An MS is an aliquot of sample spiked with known concentrations of specific compounds. The spiking occurs prior to sample preparation and analysis. The laboratory will provide the results at a minimum of one MS and one MSD sample for every 20 environmental samples. The MS and MSD samples will be designated on the

chain of custody (COC) form. Additional sample quantities will be collected so that MS and MSD analyses can be performed on the environmental samples collected at the Site. The full list of target analytes will be spiked into the samples utilized for the MS and MSD.

An MS is used to document the bias of a method in a given sample matrix. MS and MSD results are used to evaluate the matrix effect, not to control the analytical process. The recoveries of analytes in the MS/MSD will be compared to the laboratory QC acceptance limits 2. If the recoveries for the MS or the MSD are outside the QC acceptance limits, sample data will be evaluated by the Project Chemist to determine extent of impact.

2.7.3 Surrogates

Surrogates are organic compounds that are similar to the target analyte(s) in chemical composition and behavior in the analytical process, but that are not normally found in environmental samples. Surrogates are used to evaluate accuracy, method performance, and extraction efficiency. Surrogates are added to samples, controls, and blanks, in accordance with the method requirements.

When the recovery of a surrogate is outside the acceptance limits, corrective action steps must be taken. After the system problems have been resolved and system control has been re-established, the sample is re-prepared and re-analyzed. Re-preparation and re-analysis is not required if the laboratory is able to provide objective evidence with the case narrative of the final report documenting matrix interference (that is, unresolved co-eluting peaks on reconstructed ion chromatograms, or observations about visibly oily samples). If corrective actions are not performed or are ineffective, the appropriate validation flags are applied to the sample results. Re-extractions will be done within the holding times. Laboratory surrogate recovery limits will be included in each analytical report.

2.7.4 Internal Standards

Internal Standards (ISs) are measured amounts of certain compounds added after preparation or extraction of a sample. They are used in an IS calibration method to correct sample results affected by column injection losses, purging losses, or viscosity effects. ISs are added to samples, controls, and blanks, in accordance with the method requirements.

When the IS results are outside of the acceptance limits, corrective actions shall be performed. After the system problems have been resolved and system control has been re-established, samples analyzed while the system was malfunctioning are re-analyzed. If corrective actions are not performed, the appropriate validation flag, as described in the data validation section of this QAPP.

2.7.5 Retention Windows

Retention time windows are used in GC analysis for qualitative identification of analytes. They are calculated from replicate analyses of a standard on multiple days. The procedure and calculation method are given in SW-846 Method 8000A.

When the retention time is outside of the acceptance limits, corrective actions will be performed. After the system problems have been resolved and system control has been re-established, samples analyzed since the last acceptable retention time check are re-analyzed. If corrective actions are not performed, the appropriate validation flag, as described in the validation section, will be applied to the sample results.

2.7.6 Method Blank

A method blank is an analyte free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank will be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process. A method blank will be included in every analytical batch and representative for each sample matrix.

The presence of analytes in a method blank at concentrations greater than the MDL or RL for common laboratory contaminants indicates a need for corrective action. Corrective actions will be performed to eliminate the source of contamination prior to proceeding with analysis. After the source of contamination has been eliminated, all samples in the analytical batch will be re-prepared and re-analyzed. No analytical data will be corrected for the presence of analytes in blanks. When an analyte is detected in the method blank, but not in the associated samples, no corrective action is necessary. When an analyte is detected in the blank and in the associated samples and corrective actions are not performed, the appropriate validation flag, as described in the data validation section, will be applied to the sample results.

2.7.7 Equipment Blank

An EB is a sample of organic free water (for VOCs analyses) poured into, or over, or pumped through the sampling device, collected in the sample bottle, and transported to the laboratory for analysis. EBs are used to assess the effectiveness of equipment decontamination procedures.

EBs are collected immediately after the equipment has been decontaminated. The frequency requirements for collecting EBs are a minimum of five percent of the environmental samples. The blank shall be analyzed for all laboratory analyses requested for the environmental samples collected at the Site. When an analyte is detected in the EB the appropriate validation flag, as described in the data validation section, shall be applied to all sample results from samples collected. It should be noted that the laboratory will supply the organic free water. A sample aliquot of the organic free water will be submitted for the analysis of all parameters of interest.

2.7.8 Trip Blank

The TB consists of a VOC sample vial filled in the laboratory with ASTM Type II reagent grade water, transported to the sampling site, handled like an environmental sample and returned to the laboratory for analysis. TBs are not opened in the field. TBs are prepared only when VOC samples are taken and are analyzed only for VOC analytes. TBs are used to assess the potential introduction of contaminants from sample containers or during the transportation and storage procedures.

When an analyte is detected in the TB the appropriate validation flag as described in the validation section, shall be applied to all sample results from samples in the cooler with the affected TB. One TB of either soil or liquid matrix shall accompany each cooler of samples submitted to the laboratory for VOC analysis.

2.7.9 Field Duplicates

A field duplicate sample is a second sample collected at the same location as the original sample. Duplicate samples are collected simultaneously or in immediate succession, using identical recovery techniques, and treated in an identical manner during storage, transportation, and analysis. The sample containers are assigned an identification number in the field such that they cannot be identified (blind duplicate) as duplicate samples by laboratory personnel performing the analysis. Specific locations are designated for collection of field duplicate samples prior to the beginning of sample collection.

Field duplicate sample results are used to assess precision, including variability associated with both the laboratory analysis and the sample collection process. Field duplicates will be collected at a frequency of 5 percent of samples collected. Analytical results for field duplicate will be assessed during the data validation process. Specific locations will be designated for collection of field duplicate samples prior to the beginning of sample collection. Control limits for evaluation of precision for field duplicates will be 40 percent for aqueous samples and 70 percent for soil/sediment samples.

2.8 Instrument/Equipment Testing, Inspection, and Maintenance

Field equipment testing (calibration) and inspection will be completed daily and documented on the daily calibration form. Field equipment maintenance will be completed on an as needed basis.

Maintenance responsibilities for laboratory instruments are assumed by the respective Laboratory Facility Manager. The managers then establish maintenance procedures and schedules for each major equipment item. This responsibility may be delegated to field or laboratory personnel, although the managers retain responsibility for ensuring adherence to the prescribed protocols. All field instrument/equipment will be inspected prior to the project initiation.

2.8.1 Maintenance Schedules

The effectiveness of any maintenance program depends to a large extent on adherence to specific maintenance schedules for each major equipment item. Other maintenance activities are conducted as needed. Manufacturers' recommendations provide the primary basis for the established maintenance schedules, and manufacturers' service contracts provide the primary maintenance for many major instruments.

2.8.2 Spare Parts

Along with a schedule for maintenance activities, an adequate inventory of spare parts is required to minimize equipment downtime. The inventory includes those parts (and supplies) that are subject to frequent failure, have limited useful lifetimes, or cannot be obtained in a timely manner should failure occur.

Field sampling task leaders and the respective laboratory managers are responsible for maintaining an adequate inventory of spare parts. In addition to spare parts and

supply inventories, the contractor shall maintain an in house source of backup equipment and instrumentation.

2.9 Instrument/Equipment Calibration and Frequency

Field equipment will be calibrated at the frequency recommended by the manufacturer's specifications and/or described by the analytical method.

Analytical instruments will be calibrated in accordance with the procedure specified in the analytical methods. All analytes that are reported shall be present in the initial and continuing calibrations, and these calibrations must meet the acceptance criteria specified in the analytical method. Records of standard preparation and instrument calibration will be maintained by the laboratory. Records shall unambiguously trace the preparation of standards and their use in calibration and quantitation of sample results. Instrument calibration will be checked using all of the analytes. All calibration criteria will satisfy SW-846 requirements at a minimum. The initial calibration will be checked at the frequency specified in the methods using materials prepared independently of the calibration standards.

2.10 Inspection/Acceptance of Supplies and Consumables

The laboratory will inspect supplies and consumables prior to their use in analysis. The materials description in the methods of analysis shall be used as a guideline for establishing the acceptance criteria for these materials. Introduction of interfering compounds into the analytical process will be monitored by analysis of method blanks. Purity and efficiency of reagents shall be monitored by analysis of LCSs. An inventory and storage system for these materials will assure use before manufacturers' expiration dates and storage under safe and chemically compatible conditions.

Sample containers will be laboratory supplied. All containers will be certified clean and the certificates will be retained by the laboratory. Containers are stored in clean areas to prevent exposure to fuels, solvents, and other contaminants.

2.11 Non-Direct Measurements

Non-direct measurement data will be entered into the project file. Data will be entered from forms, tables and data packages as presented in the documents/reports. All data entry will be peer reviewed prior to finalization.

2.12 Data Management

The data reduction, review, reporting, and validation procedures described in this section will ensure that (1) complete documentation is maintained, (2) transcription and data reduction errors are minimized, (3) the data are reviewed and documented, and (4) the reported results are qualified, as necessary. Laboratory data reduction and verification procedures are required to ensure that the overall objectives of analysis and reporting meet method and project specifications.

2.12.1 Electronic Data Management

Data management protocols track samples and results from work plan implementation to the final report. The field data include approved work planning tables, labels, field sampling forms, COC, and logbooks. Geographic coordinates will be generated for all sample locations in electronic format. The Field Operations Leader or designee will review all field data for accuracy. Field data will be collected using portable data acquisition (PDA) devices or manually entered into a database or spreadsheet.

The laboratory will provide an EDD for all analytical reports. The EDD will be in the format required for the project environmental database and include, at a minimum, the following information:

- Laboratory information – Laboratory name, client name, laboratory work order, client project number, and date received;
- Sample information – Laboratory project number, sample identification, laboratory sample identification, date sampled, time sampled, matrix;
- Analytical Data – Sample Delivery Group (SDG), test code, test name, analyte, analyte type, sample type, CAS number, date and time prepared, date and time analyzed, preparation batch identification, analytical batch identification, result, laboratory qualifier, MDL, RL, and dilution factor; and
- QC Data – All fields provided for analytical data will also be populated for method blanks, surrogates for all samples, LCS, MS/MSD, and laboratory replicates. QC sample data will also include QC Sample Type, recoveries, RPDs, control limits, and any associated qualifiers. Calibration data are not required.

The Project Chemist, Data Manager, or designee will review approximately 5 percent of electronic laboratory and field data to verify the results against the hard copy and check for transcription errors. A greater than 15 percent discrepancy rate in two consecutive datasets will require additional review and verification. Electronic data will match the hard copy data for all results. Significant figures and rounding routines may differ slightly based on the program utilized to generate hard copy reports and electronic files, but may not differ to the point of impacting data integrity or usability. The results will be transferred to a centralized database. The ARCADIS Data Manager or data validator will add any data qualifiers. The Data Manager will generate data tables for the project team as required. The Project Chemist and Site Manager will resolve discrepancies between the planned activities and actual data collected and document the findings in the data report. The central database will be stored in a secure area with access limited to data management specialists designated by the Project Manager. The central database will be electronically linked to a geographic information system/computer-aided design (GIS/CAD) systems, risk assessment programs, and other final data user models and statistical programs. Data users may enter additional electronic data such as risk-based criteria for comparison of the results. This data will be stored in separate tables in the database and linked to the actual results. Any data from outside sources will include a description of the data, a reference to the source, and the date updated. The outside data will be checked prior to use in order to verify that the most current values are used.

2.12.2 Field Data Review

All field data and the required forms will be reviewed by the author prior to submittal to the Site Manager or designee for review. Any field forms or documentation requiring amendments and/or corrections will be clearly documented on the corresponding day's field form or logs and initialed. Corrections will be made by a single line, followed by initials. The Site Manager or designee will verify the field review then submit the documents for data entry and/or retention in the project file.

2.12.3 Laboratory Data Review

The analytical laboratory will perform a series of internal reviews/audits prior to submittal of the final data package.

2.12.3.1 Laboratory Internal Review

In each laboratory analytical section, the analyst performing the tests shall review 100 percent of the data. After the analyst's review has been completed, 100 percent of the data shall be reviewed independently by a senior analyst or by the supervisor of the respective analytical section using the same criteria.

Data qualifiers shall be added by the laboratory supervisor of the respective analytical section, after the first and second level of laboratory data reviews have been performed. Analytical batch comments shall be added to the first page/Case Narrative of the data report packages to explain any non-conformance or other issues. When data are qualified, the laboratory supervisor shall apply a final qualifier to any data that have been affected by multiple qualifiers. This final qualifier shall reflect the most severe qualifier that was applied to the data, that is, all data will have only one data qualifying flag associate with it.

The laboratory QA section shall review 10 percent of the completed data packages, and the laboratory project manager shall perform a sanity check review on all the completed data packages. The laboratory shall apply appropriate data qualifying flags to any impacted field sample including field QC samples.

The laboratory will submit the analytical data package and EDD to ARCADIS via email and on compact disk. The analytical report will be complete and signed and submitted in portable document format (pdf). The EDD shall be prepared in accordance with the protocols defined by ARCADIS for input into the electronic data management system.

2.12.3.2 Analytical Report and Data Management

Upon submittal of the data package (report and EDD), the data will be logged in by the data manager as received and the EDD loaded into the project database. The Data Manager will forward the analytical data to the Project Chemist or designee for review and validation in accordance with Section 3 of this QAPP. The data package, at a minimum, will be reviewed to assure completeness and that the EDD matches the report. Once the analytical data package is determined to be final and complete and as validated, the data with any applicable data qualifiers will be added to the project database. Any data validation reports will be submitted to the Data Manager archiving with the analytical report. The data will then be available for distribution to the project team. Upon completion, the analytical data package, EDD, and validation report will be submitted to the project file.

2.12.4 Archiving

The laboratory shall maintain electronic and hardcopy records sufficient to re-create each analytical event conducted for a minimum of 6 years. Data will be accessible within 7 working days upon request. ARCADIS will retain the project files for at least 6 years.

3. Assessment and Oversight

3.1 Assessment and Response Actions

Assessment activities include management and assessments, technical systems audits, and performance evaluations. Management assessments include routinely scheduled meetings and conference calls to evaluate staff utilization. Assignment of qualified personnel to projects, maintenance of schedules and budgets, and quality of project deliverables are verified as part of these assessments. Performance evaluations are used to ensure that trained and qualified staff is utilized for the project. Technical assessment activities include peer review, data quality reviews, and technical system audits (i.e., laboratory and field). Technical systems audits include review and evaluation of field and laboratory performance to assess the implementation of quality programs and directives specifically for the project. Procedures for assessment and audit of data quality are described in Section 4 of this QAPP. Procedures for peer review and technical assessments are summarized briefly below. Both the overall and direct technical assessment activities may result in the need for corrective action. The procedure for corrective action response is summarized below.

3.1.1 Peer Review

All project deliverables including work plans, SAPs, draft and final reports, and technical memoranda will be peer reviewed by ARCADIS. The peer review process provides for a critical evaluation of the deliverable by an individual or team to determine whether the deliverable will meet the established criteria, DQOs, technical standards, and contractual obligations. The PM or APM will assign peer reviewers, depending on the nature and complexity of the project, when the publication schedule is established. The PM will be responsible for ensuring all peer reviewers participate in the review process and approve all final deliverables. The QA Manager is responsible for verifying that project documents were generated in accordance with the project requirements.

3.2 Corrective Action

Corrective actions will be implemented as necessary to insure that project activities are performed and data are generated in accordance with the project quality documents. In conjunction with the QA Manager and Project Chemist, the Project Manager and Site Managers are responsible for initiating and implementing corrective action in the field and in the office. The laboratory project manager, in conjunction with the laboratory technical staff and QA manager, is responsible for implementing corrective action in

the laboratory. It is the combined responsibility to insure that all analytical procedures are followed as specified and that the data generated meet the prescribed acceptance criteria. Specific corrective actions necessary will be clearly documented in the logbooks or analytical reports.

In all cases in which corrective actions of field procedures are required, a written report describing the nature of the problem, an evaluation of the cause, if known, and the action taken will be prepared by the ARCADIS Site Manager or the ARCADIS QAO. The report will be distributed to the ARCADIS PM, the ARCADIS QAO (if not preparing the report), and the ARCADIS Project Director.

Any corrective actions taken by the contract laboratory will be reported to the ARCADIS Project Chemist. The laboratory will include in each data package a discussion of the problems encountered and corrective actions taken. In addition, the laboratory will maintain a file that documents all corrective actions taken. Reports of corrective actions undertaken during laboratory analysis will be documented, as appropriate, in the Data Validation Report.

3.3 Performance and Data Quality Reports

Data Validation Reports - Data validation reports will be completed by the Project Chemist as soon as possible after receipt of the data from the laboratory (i.e., the goal is within 3 weeks). Impacts on the usability of the data will be tracked by adding qualifiers to individual data points as described in Section 4.

Serious analytical problems will be reported immediately to the ARCADIS Project Chemist by the laboratory PM. The ARCADIS Project Chemist will notify the ARCADIS Site Manager and PM to evaluate necessity for resampling or additional sample collection. Time and type of corrective action (if needed) will depend on the severity of the problem and will be related to overall project importance of the data points. Corrective actions may include altering procedures in the field, conducting an audit, resampling or modifying laboratory protocol.

Project Status Reports - Project status reports are completed by the PM to document the overall assessment of the project on a monthly basis. The Project Status Report tracks the overall quality of performance relative schedule, budgets and other issues.

4. Data Validation and Usability

The general procedures for data validation and usability are described below. These procedures will be adapted, if necessary, to meet project-specific or activity-specific requirements. Data validation and usability criteria set forth in this QAPP shall be followed unless otherwise amended in the SAPs or Work Plans which will address any modifications to data review criteria not included in this QAPP.

4.1 Data Review, Verification, and Validation

Data generated will be reviewed for conformance with the QAPP, SAP and other applicable work plans, as well as specific project requirements. QA information provided by the laboratory will be evaluated relative to the methods performed, the laboratory SOPs, the laboratory QAM, COC requests, Laboratory Task Orders (LTOs) or similar directive document, and this QAPP, as appropriate. The laboratory will be responsible for internal review of all calibrations, raw data, and calculations. The final analytical report will be reviewed by the laboratory PM and other appropriate laboratory management personnel for compliance with the above listed documents including peer and supervisory review prior to releasing data to ARCADIS.

The ARCADIS Project Chemist and data validation team will perform additional verification and validation of laboratory data to assess the quality and usability of the data generated. Field record review will include instrument calibration logs, sampling logs, COC records, field notes, and field parameter results. The field information assessment will evaluate the potential for impact to sample integrity and chemical data quality.

Chemical analytical data collected will be reviewed and, as appropriate, qualified using guidelines established in the USEPA National Functional Guidelines (NFGs) modified to incorporate method and project-specific requirements. The analytical data review will be performed under either of two levels: Tier 2 or Tier 3. The frequency and components included in each tier are defined in Sections 4.2.2.1 and 4.2.2.2.

4.2 Verification and Validation Methods

The data review scheme for analytical results from the receipt of the analytical data through the validated report is described below. The laboratory is responsible for performing internal data review. The data review by the analytical laboratory will include 100 percent analyst review, 100 percent peer review, and 100 percent review by the laboratory project manager to verify that all project-specific requirements are

met. The laboratory QA Officer will perform a review on 10 percent of the data packages. All levels of laboratory review will be fully documented and available for review if requested or if a laboratory audit is performed.

After receipt from the laboratory, project data will be verified and validated by ARCADIS or experienced contract personnel using the following steps.

4.2.1 Evaluation of Completeness

The Project Chemistry Team will verify the following report content for all data, as appropriate, for the required level of data validation:

- Laboratory information matches the field information;
- Fully executed COC records;
- Report completeness and conformance with COC, LTO, QAPP, Site-Specific Work Plan, and other project requirements;
- Case narrative describing any out-of-control events and summarizing analytical observation or non-conformances;
- Sample receipt information;
- Data report forms;
- QA/QC summary data;
- Initial and continuing calibration information (Tier 3 validation);
- Instrument tuning data (Tier 3 validation);
- Quantitation reports (Tier 3 validation);
- Batch and/or run logs (Tier 3 validation);
- Chromatograms (Tier 3 validation); and
- Documentation of any QC problems.

If the data package is incomplete, the Project Chemist will contact the laboratory, which must provide all missing information within a reasonable timeframe (i.e., 1 to 2 days).

4.2.2 Evaluation of Compliance

The data validation procedures are briefly outlined below:

- Electronic checking routines (Tier I validation) will be utilized to check 100 percent of the field and laboratory QC data (LCS, MS/MSD, blanks) to verify that holding times and acceptance and performance criteria were met and to note any anomalous values. Appropriate data qualifiers (Section 4.3) will be applied to the data where deficiencies are identified;

- All chemistry data generated with the exception of waste characterization, storm water discharge, and remedial system operational monitoring will undergo a Tier 2 validation. Initially, one SDG for each matrix will undergo the detailed Tier 3 validation to ensure laboratory performance;

- All data will be checked to ensure all analytical problems and corrections are reported in the case narrative and that appropriate laboratory qualifiers are added; and

- For any problems identified, review concerns with the laboratory, obtain additional information if necessary, and check all related data to determine the extent of the error. Data qualifiers will be applied to the analytical results to indicate potential limitations on data usability.

The data validation team will follow qualification guidelines in USEPA *Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review*, EPA 540/R-99/008, October 1999; USEPA *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA 540/R-01/008, July 2002; USEPA *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA 540/R-04/004, October 2004; Laboratory QAM; Laboratory Methods; and the QAPP with performance criteria based on the published analytical methods and laboratory established control limits.

4.2.2.1 Tier 2 Verification

Tier 2 data verification includes a review of all sample documentation coupled with electronic data screening and manual review. The analytical report will be assessed for completeness and for compliance with COC requests, LTO, SAP, and any additional work plan documents. The electronic data compliance will be conducted utilizing the EQuIS Data Qualification Module (DQM), a module within the Earthsoft suite of environmental data management products. All analytical data will be managed within

the EQuIS Chemistry database via electronic uploading of laboratory data. The DQM is written in Visual Basic for the EQuIS database and checks for the following parameters:

- Blank contamination;
- MS and MSD recoveries;
- MS/MSD RPD;
- LCS and LCSD recoveries;
- LCS/LCSD RPDs (when available);
- Surrogate recoveries;
- Field duplicate RPDs; and
- Holding times.

The DQM routines apply appropriate qualifiers to the data. Select manual reviews will verify appropriate qualifier application. Data Qualifiers will not be manually applied to original hard copy analytical reports. The validation reports will be included with any submittal of analytical reports to agencies or other required party

4.2.2.2 Tier 3 Validation

One SDG for each matrix collected during the initial phases of the project will undergo a detail data validation which will include the complete Tier 2 assessment and review of the additional following information relative to target compounds/analytes:

- Instrument tune;
- Initial calibration;
- Continuing calibration;
- Interference check standards (metals only);
- Serial dilutions (metals only);
- Quantitation reports;

- Internal standard area (organics only);
- Retention times (as applicable by method);
- Chromatograms (as applicable by method);
- Ion spectra for compound identification;
- Data transcription from instrument report to hard copy report; and
- A subset of calculations will be verified for each sample.

4.2.3 Data Validation Reporting

The Project Chemist will perform the following reporting functions:

- Alert the QA Manager and the Site Manager to any QC problems, obvious anomalous values, or discrepancies between the field and laboratory data and resolve any issues;
- Discuss QC problems in a data validation memo for each laboratory report;
- Review the laboratory EDD and electronic field data, enter the data qualifiers into the database, and oversee preparation of analytical data summary tables. The tables will summarize those samples and analytes for which detectable concentrations were exhibited as well as complete analytical summary tables. The tables will include field QC samples; and
- Prepare a summary of the quality control information at the completion of all field and laboratory efforts for the site. The report will summarize planned versus actual field and laboratory activities and data usability concerns.

The Project or Task Manager provides the final Data Quality Assessment during the technical review of the data report.

4.2.4 Validation Reports

Reports will be generated for each data package or combination of data packages for a single sampling event to record the results of the validation effort. The reports will identify all deficiencies and the impact on the results. The data validator or the Database Manager will append qualifiers generated during the verification/validation

process to the EQuIS database and a summary table of the data qualifiers will be included with the analytical report.

4.3 Reconciliation with Data Usability Requirements

For routine assessments of data quality, ARCADIS will implement the data verification/validation procedures described in Section 4.2 and assign appropriate data qualifiers to indicate limitations on the data. The Project Chemist will be responsible for evaluating precision, accuracy, representativeness, comparability, and completeness of the data using procedures described in Section 1.4. Any deviations from the analytical DQOs for the project will be documented in the data verification/validation memo and provided to the data users for the project. The Project Chemist will work with the final users of the data in performing data quality assessments. The data quality assessment may include some or all the following steps:

- Data that are determined to be incomplete or not usable for the project will be discussed with the project team. If critical data points are involved which impact the ability to complete the project objectives, the data users will report immediately to the Site Manager. The Site Manager will discuss the resolution of the issue with the ARCADIS Project Manager and implement the necessary corrective actions (for example, resampling);

- Data that are non-detect but have RLs elevated due to blank contamination or matrix interference will be compared to screening values (see Appendices B and C). If RLs exceed the screening values, then the results will be handled as appropriate for data use; and

- Data qualified as estimated will be utilized if it is determined that the data are useable for their intended purpose. If an estimated result is close to a screening value, then there is uncertainty in any conclusions as to whether the result exceeds the screening value. The data user must evaluate the potential uncertainty in developing recommendations for the site. If estimated results become critical data points in making final decisions on the site, the Site Manager should evaluate the use of the results and may consider the data point incomplete.

In the validation process there are two types of data validation codes that may be applied, those related to identification (confidence concerning the presence or absence of compounds) and those related to quantitation. Each of the standard data validation codes is defined below:

R	Data point is unusable due to serious deficiencies in analytical and QC criteria. The presence or absence of the analyte/compound cannot be verified
UB	Not detected substantially above the level reported in laboratory or field blanks. For organics - 5X (10X for common lab contaminants) or for metals - 10X. Data point considered non-detect at the value qualified.
U	Analyte/Compound not detected. The associated value indicates the concentration above which the result would be considered a quantitative value.
J	Reported value is considered an approximate concentration.
UJ	Analyte/compound not detected above the quantitation limit. However, the reported quantitation limit is approximate.

The ultimate data assessment process involves comparing analytical results to screening values and background concentrations to determine whether the contamination present is site related (i.e., above background levels) or significant (i.e., above screening values). Additional data assessment may be performed on site-by-site basis. Any additional procedures for data quality assessment will be provided in the OU-Specific Work Plan.

Table A-2. Data Quality Objectives for Site Characterization.

Data Quality Objective	Project Specific Action
Problem statement	Historical activities have contributed to environmental impacts to surface and subsurface soil, surface water and groundwater at the military facilities. The project goals include delineation of environmental impacts and achieving remedy in place or response complete in accordance with the timeline set forth in the performance based contract. To achieve these goals, characterization activities shall be performed in accordance with the sampling and analysis plans, implementation of remedial actions, monitoring of remedial performance, and confirmation of attainment of clean-up goals.
Identify the decisions	• Do constituent concentrations exceed the screening criteria? • Has the Site been delineated? • What remedial system will be used to reduce constituent concentrations? • Does the remedial system meet the performance goals?
Identify the inputs to the decision	• Complete additional delineation sampling and compare identified CoC data to screening levels; and define extent of contamination. • Design and implement remedial systems • Monitor remedial system performance • Confirm reduction in contaminant levels to below clean-up goals.
Develop the decision rule	• If soil and groundwater quality data indicate concentrations above screening levels, the affected media will be addressed by additional site investigation to delineate the nature and extent of impact to the affected media. • When the Site is delineated, the soil and groundwater quality data will be evaluated to determine if an active remediation is required to reduce the concentrations below the clean-up goals. • If the remedial system does not meet the performance goals, modifications to the existing system and/or an additional or alternative remedial system will be implemented.
Specify limits on decision errors	Data quality and usability will be determined in accordance with the criteria set forth in the QAPP. Rejected data will not be used for decision-making purposes.

CoC Constituent of Concern.
QAPP Quality Assurance Project Plan.

Table A-3 Statistical Calculations

Statistical	Symbol	Formula	Definition	Uses
Mean	X	$\frac{\left(\sum_{i=1}^{\eta} x_i\right)}{n}$	Measure of central tendency	
Standard Deviation	S	$S_x = \left(\frac{n\Sigma\chi 2 - (\Sigma\chi)^2}{n(n-1)}\right)^{1/2}$	Measure of relative scatter of the data	
Relative Standard Deviation		$(S / \overline{X}) \times 100$	Relative standard deviation, adjusts for magnitude of observations	Used to assess precision for replicate results
Pooled RSD	RSD_p	$\left(\frac{\sum_{i=1}^{\eta} (RSDi)^2 \, df\, i}{\sum_{i=1}^{\eta} dfi}\right)^{1/2}$	Measure of overall variability of a series	Used to assess overall performance for compounds with multiple measurements
Relative Percent Difference	RPD	$\left(\frac{(X_1 - X_2)}{(X_1 + X_2)/2}\right) \times 100$	Measure of variability that adjusts for the magnitude of observations	Used when there are only two observations; mathematically related to RSD

Table A-3 Statistical Calculations

Statistical	Symbol	Formula	Definition	Uses
Average Relative Percent Difference	RPD	$\frac{\text{RPD}}{n}$	Average relative percent difference - analogous to pooled RSD for duplicate measurements	Used to assess overall performance for compounds with multiple measurements
Confidence Interval	CI	$\frac{X \pm t\langle \alpha, n-1 \rangle^{S}}{n^{1/2}}$	Interval about X that contains the true value, with probability α	Assign intervals or error bars to measurement data
Percent Recovery	R	$\left(\frac{X_{meas}}{X_{true}}\right) \times 100$	Recovery of spiked compound in pure matrix	Recovery of Quality Control check sample, method spikes
Percent Recovery	R	$\frac{\begin{pmatrix}\text{value of} & \text{value of}\\ \text{spiked} & \text{unspiked}\\ \text{sample} & \text{sample}\end{pmatrix}}{\text{Value of added spike}} \times 100$	Recovery of spiked compound in sample matrix	Matrix spike and matrix spike/matrix spike duplicate recovery

X = Observation (concentration)
n = Number of observations
df = Degrees of freedom, usually
t = Statistical from students' "t" distribution

Table A-4. Field Quality Control Sample Collection Guidelines.

QC Sample	Description
Field Duplicate	One per matrix per 20 samples for each analysis.
Equipment Rinsate Blank	One per equipment set per 20 samples collected for each analysis. Only equipment sets that are dedicated or disposed of do not require equipment blanks.
Trip Blank	One per shipment for each cooler in which samples for volatile analysis are shipped. Trip blanks are analyzed for all volatile methods designated for the samples. Trip blanks are shipped for both solid and aqueous matrices.
Field Blank	One per 20 samples collected for each analysis if/when field conditions warrant evaluation of air borne contaminants. Collection decision by the Site Manager.

Field Analyses Data Quality Objectives

Parameter	Method	Precision	Accuracy % Recovery	Completeness %

Table A-5. Summary of Methods, Containers, Preservatives, and Holding Times.

Parameter	Matrix	Preparation Method	Analytical Method [a]	Container [b]	Preservative	Holding Time [c]
Organic and Metals Methods						
VOCs	Water	5030, 5032	8260	4 x 40-mL vial with Teflon-lined septum	pH < 2 with HCl, Cool 4°C	14 days
	Water	5030, 5032	8260	4 x 40-mL vial with Teflon-lined septum	If effervescence is observed, eliminate HCl preservative and Cool 4°C	7 days
	Solid	5035	8260	3 x Encore™ OR 2 x Sodium Bisulfate vial and 1 x Methanol vial	Cool 4°C	48 hours to preservation for Encore™, then 14 days to analysis
SVOCs	Water	3510, 3520 [d]	8270 (Low Level)	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
	Solid	3540, 3550 [d]	8270 (Low Level)	1 x 4-oz or 8-oz G	Cool 4°C	14 days to extraction and 40 days to analysis
PAHs	Water	3510, 3520 [d]	8270 SIM)	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
	Solid	3540, 3525 [d]	8270 SIM	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
Organochlorine Pesticides	Water	3510, 3520 [d]	8081/608	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
	Solid	3540, 3550 [d]	8081	1 x 4-oz or 8-oz G	Cool 4°C	14 days to extraction and 40 days to analysis
Organochlorine Herbicides	Water	8151 [d]	8151	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
	Solid	8151 [d]	8151	1 x 4-oz or 8-oz G	Cool 4°C	14 days to extraction and 40 days to analysis
Metals (except Mercury)	Water	3005, 3010	6010/6020	1 x 500mL HDPE	pH < 2 with HNO_3, Cool 4°C	6 months
	Solid	3050, 3051	6010	1 x 8-oz G	Cool 4°C	6 months
Mercury	Water	NA	7470	1 x 500mL HDPE	pH < 2 with HNO_3, Cool 4°C	28 days
	Solid	NA	7471	1 x 8-oz G	Cool 4°C	28 days

Table A-5. Summary of Methods, Containers, Preservatives, and Holding Times.

Parameter	Matrix	Preparation Method	Analytical Method [a]	Container [b]	Preservative	Holding Time [c]
Total Petroleum Hydrocarbons as GRO	Water	5030, 5032	8015 Modified	4 x 40-mL vial with Teflon-lined septum	pH < 2 with HCl, Cool 4°C	14 days
	Solid	5035	8015 Modified	3 x Encore™ OR 2 x Sodium Bisulfate vial and 1 x Methanol vial	Cool 4°C	48 hours to preservation for Encore™, then 14 days to analysis
Total Petroleum Hydrocarbons as DRO/ORO	Water	3510, 3520 [d]	8015 Modified	2 x 1-L amber G	Cool 4°C [e]	7 days to extraction and 40 days to analysis
	Solid	3540, 3550 [d]	8015 Modified	1 x 4-oz or 8-oz G	Cool 4°C	14 days to extraction and 40 days to analysis
Waste Characterization Parameters						
TCLP Metals [f] (including Mercury)	Solid Waste Material	1311 for Leach/ 3005, 3010	6010 and 7470 (for Leachate)	1 x 8-oz wide-mouth G	Cool 4°C	28 days from collection to Leach; 28 days to analysis of Leachate
TCLP VOCs [f]	Solid Waste Material	1311 for Leach/ 5030	8260 for Leachate	1 x 4-oz G packed full	Cool 4°C	14 days from collection to Leach; 14 days to analysis of Leachate when preserved with HCl to pH < 2
TCLP SVOCs [f]	Solid Waste Material	1311 for Leach/ 3510, 3520	8270 for Leachate	1 x 8-oz wide-mouth G	Cool 4°C	14 days from collection to Leach; 40 days to analysis of Leachate
TCLP Pesticides [f]	Solid Waste Material	1311 for Leach/ 3510, 3520	8081 for Leachate	1 x 8-oz wide-mouth G	Cool 4°C	14 days from collection to Leach; 40 days to analysis of Leachate
TCLP Herbicides [f]	Solid Waste Material	1311 for Leach/ 8151	8151 for Leachate	1 x 8-oz wide-mouth G	Cool 4°C	14 days from collection to Leach; 40 days to analysis of Leachate
Ignitability	Aqueous Waste	NA	1010	500 mL G	NA	NA
	Solid Waste Material	NA	ASTM D-92	1 x 8-oz wide-mouth G	NA	NA

Table A-5. Summary of Methods, Containers, Preservatives, and Holding Times.

Parameter	Matrix	Preparation Method	Analytical Method [a]	Container [b]	Preservative	Holding Time [c]
Reactivity	Aqueous Waste	NA	USEPA Region 4 Guidance for Sulfide	500 mL HDPE	pH > 9 with 2 mL ZnAc and NaOH, Cool 4°C	7 days
	Aqueous Waste	NA	9010/9012/9014 for Cyanide	1 x 120 mL HDPE	pH > 12 with NaOH	14 days
	Solid Waste Material	NA	USEPA Region 4 Guidance for Sulfide	1 x 8-oz wide-mouth G	Cool 4°C	7 days
	Solid Waste Material	NA	9010/9012/9014 for Cyanide	1 x 1-L HDPE	Cool 4°C	Sulfide 7 days
Corrosivity (pH)	Aqueous Waste	NA	9040	120 mL HDPE	NA	24 hours
	Solid Waste Material	NA	9045	1 x 8-oz wide-mouth G	NA	24 hours
General Chemistry Parameters						
Alkalinity	Water	NA	SM 2320 B	500 mL HDPE	Cool 4°C	14 days
Ammonia	Water	NA	SM 4500-NH3 D	500 mL HDPE	pH < 2 with H_2SO_4, Cool 4°C	28 days
Biochemical Oxygen Demand (BOD)	Water	NA	405.1	1 x 1-L HDPE	Cool 4°C	48 hours
Chloride	Water	NA	SM4500-CL/300.0/9056	500 mL HDPE/ 2 x 40 mL vial	Cool 4°C	28 days
Cyanide	Water	NA	9010/9012/9014	1 x 120 mL HDPE	pH > 12 with NaOH, Cool °4C	14 days
	Solid	NA	9010/9012/9014	1 x 4-oz or 8-oz G	Cool 4°C	14 days
Hardness	Water	NA	SM 2340B/6010	500 mL HDPE	Cool 4°C for 130.2/ pH < 2 with HNO_3, Cool 4°C for 6010	6 months
Nitrate	Water	NA	353.2/300.0/9056	120 mL HDPE/	Cool 4°C	2 days
Nitrite	Water	NA	353.2/300.0/9056	120 mL HDPE/	Cool 4°C	2 days
Nitrate/Nitrite	Water	NA	353.2	500 mL HDPE	pH < 2 with H_2SO_4	28 days

Table A-5. Summary of Methods, Containers, Preservatives, and Holding Times.

Parameter	Matrix	Preparation Method	Analytical Method [(a)]	Container [(b)]	Preservative	Holding Time [(c)]
Phosphate	Water	NA	365.3/300.0/9056	500 mL HDPE/ 2 x 40 mL vial	pH < 2 with H_2SO_4	28 days
Sulfate	Water	NA	ASTM 516-90/300.0/9056	500 mL HDPE/ 2 x 40 mL vial	Cool 4°C	28 days
Sulfide	Water	NA	SM 4500-SULFIDE	1-L HDPE	2 mL ZnAc and NaOH to pH > 9, Cool 4°C	7 days
Total Dissolved Solids (TDS)	Water	NA	SM 2540C	500 mL HDPE	Cool 4°C	7 days
Total Suspended Solids (TSS)	Water	NA	SM 2540D	1-L HDPE	Cool 4°C	7 days
Total Organic Carbon (TOC)	Water	NA	415.2/9060	500 mL HDPE	pH < 2 with HCl or H_2SO_4, Cool 4°C	28 days
Dissolved Organic Carbon (DOC)	Water	NA	415.2/9060	500 mL HDPE	AFTER FILTRATION: pH < 2 with HCl or H_2SO_4, Cool 4°C	28 days
Chemical Oxygen Demand	Water	NA	410.4	500 mL HDPE	pH <2 with H_2SO_4	28 days

(a) The 8000 series methods will be used for assessment and remediation; the 600 series methods will be used only for wastewater.
(b) Sample volumes may be combined for parameters where preservatives are the same and adequate sample volume is supplied to the laboratory. Volumes listed are based on sample containers and not minimum volumes required for some of the General Chemistry Parameters listed. All other volumes are minimum volumes required to be submitted to the laboratory.
(c) Maximum holding time allowed from date of collection.
(d) Cleanup methods may be applicable if matrix interference is encountered. Cleanup methods may include alumina (Method 3610), florisil (Method 3620), silica gel (Method 3630), gel permeation chromatography (GPC) (Method 3640), and sulfur (Method 3660). Selection of appropriate method is based on nature of interference and target compounds.
(e) If residual chlorine is present, requires sodium thiosulfate in each sample container.
(f) Waste Characterization addresses solid (soils, drilling mud) material analysis for waste disposal purposes. Liquid (aqueous or organic) wastes will be characterized using the appropriate methods for determination of total constituent concentrations in accordance with waste disposal requirements under the Resource Conservation and Recovery Act (RCRA). TCLP analyses will be performed as required on wastes containing > 0.5% solids in accordance with RCRA waste characterization and disposal requirements.

°C – Degrees Centigrade.
DRO – Diesel Range Organics
GRO – Gasoline Range Organics
H_2SO_4 – Sulfuric acid.
HCl – Hydrochloric acid.
HDPE – High Density Polyethylene.
HNO_3 – Nitric acid.
L – Liter.
mL – Milliliter.

NA – Not Applicable.
NaOH – Sodium hydroxide.
ORO – Oil Range Organics
PAHs – Polycyclic Aromatic Hydrocarbons
SVOCs – Semivolatile Organic Compounds.
TAL – Target Analyte List.
TCL – Target Compound List.
TCLP – Toxicity Characteristic Leaching Procedure.
VOCs – Volatile Organic Compounds.
ZnAc – Zinc acetate.

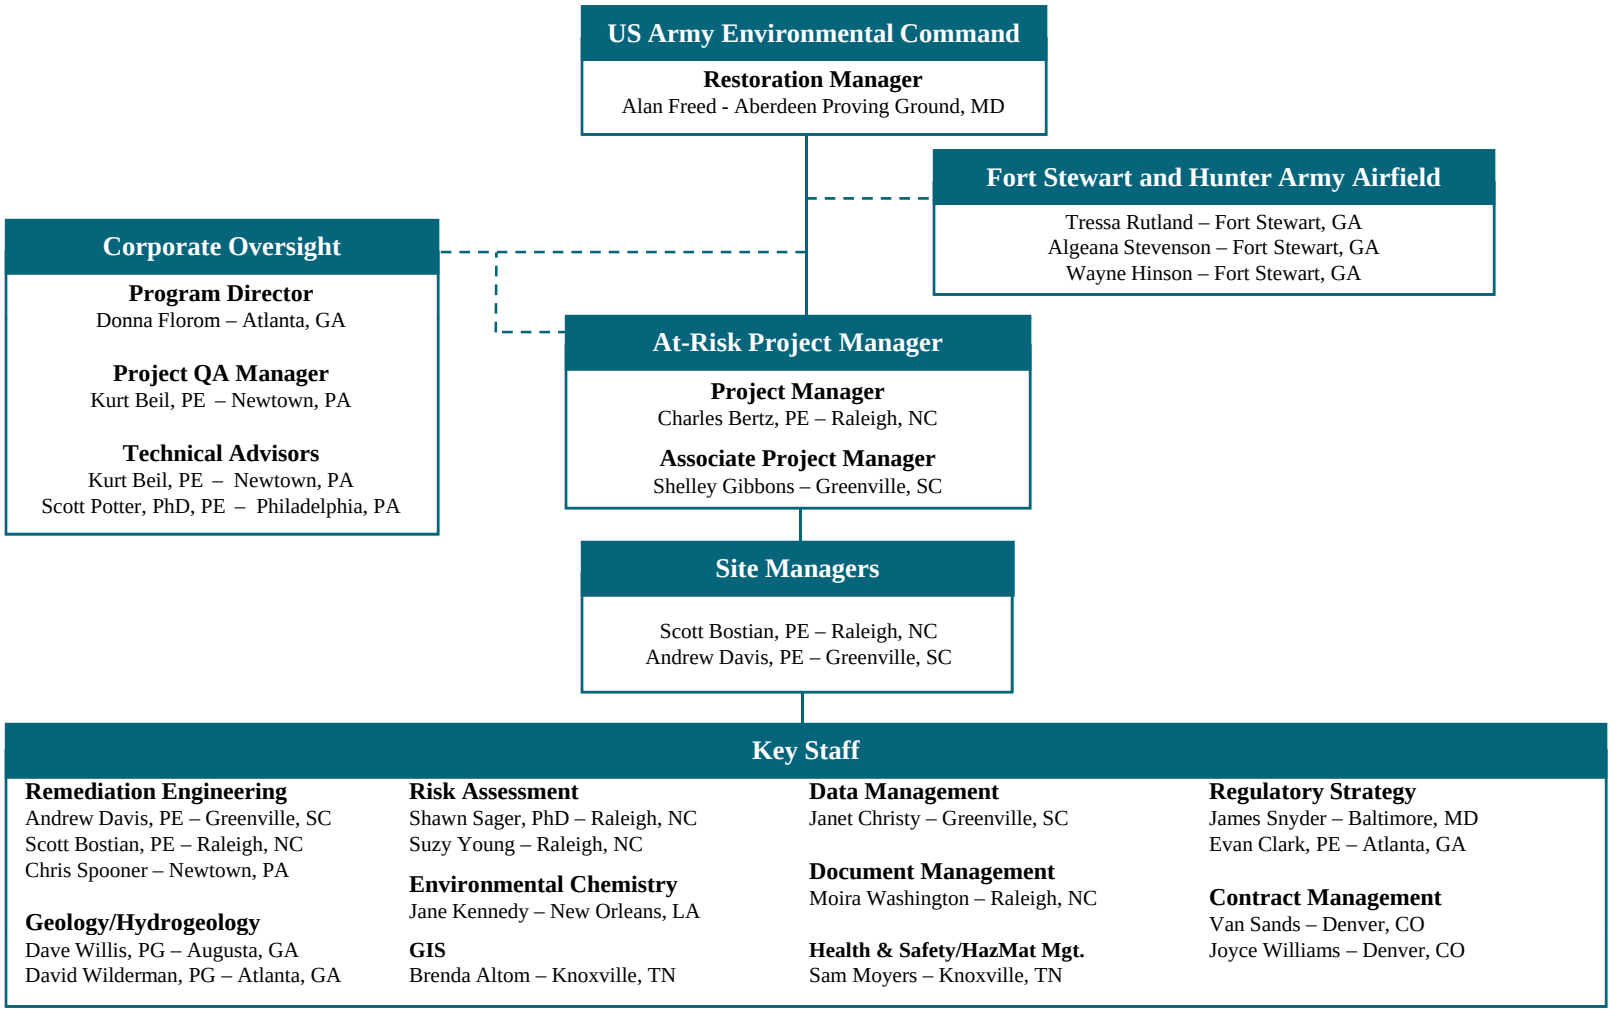

Table A-6. Laboratory Quality Control Sample Analysis Guidelines.

QC Sample	Description
Method Blank	One per matrix per preparation batch for each analysis.
Lab Replicate	One per matrix per preparation batch for each analysis.
Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD)	One LCS per matrix per preparation batch for each analysis. LCSD performance is optional.
Surrogate Spiking	All samples analyzed for organic methods as method and Standard Operating Procedure (SOP) appropriate.
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One pair per matrix per preparation batch for each analysis. The spike solution will contain a broad range of the analytes of concern, but may not contain all due to incompatibility, interaction, breakdown, availability, or multi-component compounds. The overall frequency of MS/MSD on the project samples must be at least 1 set per 20 samples.

Utilities and Structures Checklist

Project: Fort Stewart / Hunter Army Airfield

Prepared By:

Location:

Date:

Instructions: This checklist must be completed by an ARCADIS staff member as a safety measure to insure that all underground utility lines, other underground structures, as well as aboveground power lines are clearly marked out in the area selected for boring or excavation. **DRILLING OR EXCAVATION WORK MAY NOT PROCEED UNTIL LINES ARE MARKED AND THIS CHECKLIST HAS BEEN COMPLETED.** Arrangements for underground utility markouts are best made at the time of the preliminary site visit to allow client and/or utility company sufficient time. Keep completed checklist and maps onsite; send copy to Project Manager.

Assignment of Responsibility: ARCADIS is responsible for having underground utilities and structures located and marked. Preferably, the utilities themselves should mark out the lines.

Emergency Procedures: Follow emergency procedures outlined in site-specific Health and Safety Plan.

Utilities and Structures

Type	Not Present	Present	How Marked? (flags, paint, wooden stakes, etc.)
Natural Gas Line			
Electric Power Line			
Telephone Cable			
Sewer Line			
Storm Drain			
Water Line			
Steam Line			
Petroleum Product Lines			
Product Tank			
Septic Tank/Drain Field			
Overhead Power Line			

Name and Affliation of person who marked or cleared underground lines or structures

during storage in laboratory refrigerators. Because trichlorofluoromethane was only detected in soil samples by ESE in 1992, and is not indicative of fire training activities, possible contamination of samples during storage is likely. The presence of these compounds detected in samples is believed to be laboratory artifact or indicative of the concrete/asphalt construction debris fill materials present at the Site. Therefore, the focus of the 1999/2000 CSR assessment activities was the complete delineation of arsenic, barium, lead, VOCs and PAHs in groundwater, and VOCs, PAHs, barium, chromium, organochlorine pesticides, and PCBs in soils. As required by the Georgia EPD January 2001 comments, the 2001 CSR assessment activities for soils included the delineation of the previously detected acetone, methylene chloride, and phthalates along with VOCs, SVOCs, barium, and chromium. The 2001 CSR assessment activities for ground water were focused on VOCs.

Concentrations of regulated substances detected in surface and subsurface soil samples collected during the CSR assessment activities conducted in 1999 to 2001 are summarized in Tables 4.3 and 4.4. Concentrations of regulated substances detected in groundwater samples collected during the CSR activities and previous investigations are summarized in Tables 4.5. Figures 4.8A, 4.8B, 4.8C, 4.9A, 4.9B, 4.9C, 4.10, and 4.11 present the distribution and extent of site-specific regulated substances detected in surface and subsurface soil. Figure 4.12 presents the distribution and extent of site-specific regulated substances detected in groundwater.

4.3.1 Background Concentrations

Soil

During the course of the investigation of the former FTA, 63 soil samples were obtained and analyzed for RCRA metals (arsenic, barium, cadmium, lead, mercury, nickel, selenium and silver). Since there was no known release of metals at the Site, it could not be determined which, if any, of the samples were representative of a release, and which were representative of background conditions. Therefore, a statistical evaluation which initially considered all of the available soil metals data was performed.

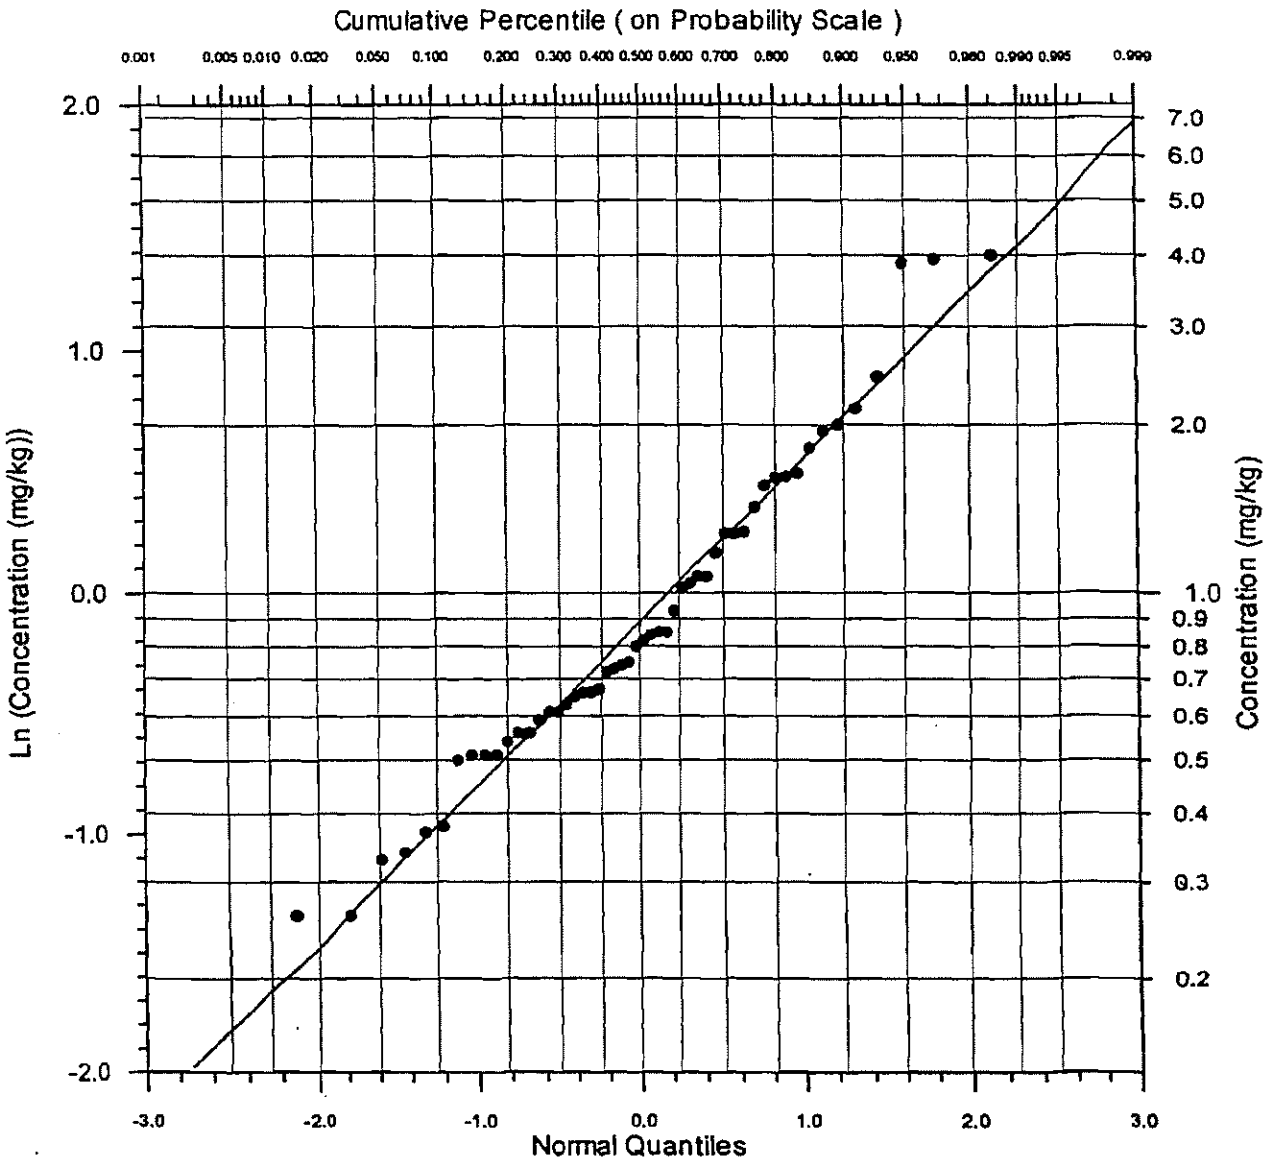
The soils data was first evaluated for identification of statistical outliers. The Grubbs Outlier test referenced in USEPA Statistical Analysis of Ground Water Monitoring Data at RCRA Facilities, dated April 1989 and ASTM E178-75 was used to determine the outliers. Normally, outlier data points are left in the data set and are statistically evaluated with the other data points. To be conservative in the evaluation of the metals in soil at the HAAF former FTA site, the outliers were removed from the data set prior to the statistical analysis. If a data point was an outlier for one metal, it was removed from all of the

metals data sets. Six samples which displayed statistical outliers for any metal were removed from the data sets for all metals. The outliers removed from the data set are listed below.

BH-10 (0-1 ft)	Barium concentration outlier
BH-11 (0-1 ft)	Arsenic and Lead concentration outliers
BH-13	Arsenic, Lead, and Mercury concentration outliers
BH-13 (0-1 ft)	Lead concentration outlier
FTASB-11 (SB-11) (0.5-1)	Barium concentration outlier
HMW-13 (8-10 ft)	Chromium concentration outlier

Sample locations BH-10, BH-11, BH-13, and SB-11 are located within the area where fuels were used in fire training exercises which is considered to be a source area.

A statistical evaluation was then performed on the remaining data after the outliers had been removed. Statistical methods were selected based on the distribution of the data and the number of non-detects. The data were evaluated for normality using the Filliben, Shapiro-Francia, and Shapiro-Wilk tests. Log-normal data sets (arsenic, barium, chromium, lead, and selenium) were logarithmically transformed. Upper background concentrations (UBCs) were then selected on the transformed data using the mean plus 1.645 standard deviations. A non-parametric analysis was then performed on the remaining data sets that did not normalize by log transform (cadmium, mercury, and silver) and were assigned a UBC equal to the maximum observed value. In the case of mercury, the maximum observed value (0.40 mg/kg in sample BH-12) exceeded the UBC for arsenic, lead, selenium, and silver. Therefore, the next highest maximum observed value (0.39 mg/kg in sample BH-13) was selected as the mercury UBC. The statistical evaluation yielded UBCs for each of the eight metals analyzed and are listed below. The statistical plots and statistical calculations used to select UBCs for each of the eight metals are included in Appendix H.



Metal	UBC (mg/kg)	Statistical Method	HSRA Table 2, Appendix III Values
Arsenic	2.6	Log-normal data Mean + 1.645 std. Dev	20
Barium	28	Log-normal data Mean + 1.645 std. Dev	1000
Cadmium	2.6	Non-Parametric, Max observed value	2
Chromium	7.7	Log-normal data Mean + 1.645 std. Dev	100
Lead	53	Log-normal data Mean + 1.645 std. Dev	75
Mercury	0.39	Non-Parametric, Max observed value	0.5
Selenium	1.9	Log-normal data Mean + 1.645 std. Dev	2
Silver	2.6	Non-Parametric, Max observed value	2

As indicated above, the UBC for arsenic, barium, chromium, lead, mercury, and selenium are below the HSRA Table 2, Appendix III values (which are based on GAEPD's estimate of statewide background). The UBCs were then used to evaluate where metals concentrations exceeded background and if the extent of metals could be delineated using the existing data. The results of the evaluation indicated that most of the exceedences of the background concentration (i.e., UBCs) were within the excavated area and areas immediately adjacent to the excavated area. The evaluation also indicated that the extent of the metals in soils was not completely delineated to the north and west of the excavated area. Additional delineation for chromium was conducted to the north of HMW-13 and to the west of HMW-11, for barium to the west of SB-13 (Figure 4.11).

Groundwater

Background groundwater samples from off-site locations were not collected during the 1999/2000 CSR assessment activities. However, review of previous groundwater analytical data collected during 1995 indicated that VOCs, PAHs, and metals (except barium) were not detected in groundwater samples

STATISTICAL DATA AND STATISTICAL PLOTS

LEGEND:

- Arsenic (mg/kg)

LN(Data) Passed the Shapiro-Francia Normality Test indicating the Data are Lognormal.
Probability Plot is Detects-Only. 7.9% ND. NDs/2 were included in UBC calculation.

Upper Background Concentration: **2.6 mg/kg**
Based on LN(Data) mean + 1.645 Standard Deviations
LN (Data) Mean: -0.2018 SD: 0.7012

Total 63 samples, of which 57 data points were used for UBC and 52 for Probability Plot.
Two data points, BH-11(13.90) and BH-13(11.98), are statistical outliers
By ASTM Designation E178-75, 1975.
5% significance level.
Four data points, BH-10 (5.99), BH-13 (7.75), FTASB-11 (0.86),and HMW-13 (0.6),
are rejected due to being outliers in other metals data sets.

LEGEND:

- Cadmium (mg/kg)

Due to high percentage of non-detects the data can not be validly normalized.
Probability Plot is Detects-Only. 79% NDs.

Upper Background Concentration: **2.6 mg/kg**
Based on non-parametric analysis, UBC is set equal to the maximum observed value.
5% Significance Level and 98% expected coverage.

Total of 63 samples, of which 57 data points were used for UBC and 12 for Probability Plot.
No Data Points are determined to be statistical outliers.
By ASTM Designation E178-75, 1975.
5% significance level.
Six data points, BH-10 (<1.98), BH-11 (1.99), BH-13 (0.02), BH-13 (3.87), FTASB-11 (2.2), and HMW-13 (<2.3), are rejected due to being outliers in other metals data sets.

LEGEND:

- Chromium (mg/kg)

LN(Data) Passed the Coefficient of Skewness Test of Normality Indicating the Data are Lognormal. Probability Plot is Detects-Only. 7.0% ND. NDs/2 were included in UBC calculation.

Upper Background Concentration: **7.7 mg/kg**
Based on LN(Data) mean + 1.645 Standard Deviations
LN (Data) Mean: 1.2527 SD: 0.4792

Total 63 samples, of which 57 data points were used for UBC and 53 for Probality Plot.
One data point, HMW-13 (31.7),is a statistical outlier.
By ASTM Designation E178-75, 1975.
5% significance level.
Five data points, BH-10 (12.80), BH-11 (4.16), BH-13 (2.84), BH-13 (9.10) and FTASB-11 (4.8), are rejected due to being outliers in other metals data sets.

LEGEND:

- Lead (mg/kg)

LN (Data) Passed The Coefficient of Skewness Test of Normality Indicating the data are lognormal. Probability Plot is Detects-Only. 25% ND. Aitchison's Adjustment used for UBC calculation.

Upper Background Concentration: **53 mg/kg**
Based on LN (Data) Adjusted Mean + 1.645 Adjusted Standard Deviations.
LN (Data) Adjusted Mean: 1.7158 SD: 1.3668

Total of 62 samples, of which 56 data points were used for UBC and 42 for Probability Plot.
Three Data Points, BH-11 (1163.00), BH-13 (1179.00) and BH-13 (1185.00), are statistical outliers.
By ASTM Designation E178-75, 1975.
5% significance level.
Three data points, BH-10 (645.00), FTASB-11 (15.0), and HWM-13 (3.2),
are rejected due to being outliers in other metals data sets.

LEGEND:

- Mercury (mg/kg)

The Data Failed all Tests of Normality.
Probability Plot is Detects-Only. 44% NDs.

Upper Background Concentration: **0.39 mg/kg**
The maximum observed value, 0.40mg/kg, was not used for the UBC,as it was from a sample location that exceeded the UBC for another parameter. Based on non-parametric analysis, the UBC was set equal to the next highest value detected.
5% Significance Level and 98% Expected Coverage.

Total of 63 samples, of which 57 data points were used for UBC and 32 for Probability Plot.
One Data Point, BH-13 (0.79), is a statistical outlier.
By ASTM Designation E178-75, 1975.
5% Significance Level.
Five data points, BH-10 (0.40), BH-11 (0.38), BH-13 (0.38), FTASB-11 (0.034), and HWM-13 (0.03), are rejected due to being outliers in other metals data sets.

LEGEND:

- Selenium (mg/kg)

LN(Data) Passed The Filliben Test of NormalityIndicating the Data are Lognormal.
Probability Plot is Detects-Only. 44% NDs. Aitchison's Adjustment used for UBC calculation.

Upper Background Concentration: **1.9 mg/kg**
LN(Data) Adjusted mean + 1.645 Adjusted Standard Deviations.
LN(Data) Adjusted Mean: -0.561 SD: 0.735.

Total of 63 samples, of which 57 data points were used for UBC and 32 for Probability Plot.
No Data Points are statistical outliers.
By ASTM Designation E178-75, 1975.
5% Significance Level.
Six data points, BH-10 (<0.20), BH-11 (<0.20), BH-13 (0.22), BH-13(0.33), FTASB-11 (0.28), and HWM-13 (0.23), are rejected due to being outliers in other metals data sets.

LEGEND:

- Silver (mg/kg)

Due to high percentage of non-detects the data can not be validly normalized.
Probability Plot is Detects-Only. 79% NDs.

Upper Background Concentration: **2.6 mg/kg**
Based on non-parametric analysis, UBC is set equal to the maximum observed value.
5% Significance Level and 98% expected coverage.

Total of 63 samples, of which 57 data points were used for UBC and 12 for Probability Plot.
One Data Point, BH-13 (<7.98), is determined to be a statistical outlier.
By ASTM Designation E178-75, 1975.
5% significance level.
Five data points, BH-10 (<3.99), BH-11 (<3.99), BH-13 (<3.99), FTASB-11 (2.2), and HMW-13 (<2.3), are rejected due to being outliers in other metals data sets.

Re: Response to 3/19/01 Meeting Letter
Hunter Army Airfield
HSI #10105

Dear Col. Stanley:

The Georgia Environmental Protection Division (EPD) has received your compliance status report (CSR) response letter dated March 5, 2001 and your April 16, 2001 correspondence following up on our March 19, 2001 meeting regarding the above referenced site. EPD was asked to address issues raised during our meeting pertaining to calculated background concentrations, the methodology used to calculate the background concentrations, and future sampling locations:

1. Background Concentrations - The proposed background concentrations presented on page 5 of CSR response are acceptable to EPD. It should be noted that although Table 2 of Appendix III should not be used for determining site-specific background concentrations, it is useful for comparative purposes in that most background concentrations will be below those levels.

2. Statistical Calculations – The statistical methods described can be used for determining background concentrations; however, they do not necessarily apply to all sites due to variations in site-specific data. The method used to determine multiple outliers in a dataset should be stated in the revised CSR and included in an appendix along with the other statistical methods used in the CSR.

3. Proposed Sampling Locations – The sample locations shown in Figure 1 of the CSR response surrounding SB-30 appear sufficient to delineate the site with the following exceptions. Two more sample locations (in addition to SB-45) are needed to delineate the southern boundary near SB-35. One location is needed to the west of SB-45 and south of SB-36. The other location to be added is to the east of SB-45 across Lightning Road. The purpose of proposed sampling locations SB-47 and SB-48 is unclear and needs to be explained before EPD can comment on them.

For specific answers to questions concerning risk assessment calculations and ecological evaluations, you may contact Michelle Burgess or Ahmet Bulbakaya at (404) 656-7802. Please contact David Brownlee of the Hazardous Site Response Program at (404) 657-8600 if you have questions regarding this letter.

Sincerely,

Jane Hendricks
Unit Coordinator
Hazardous Sites Response Program

Re: Response to 3/19/01 Meeting Letter
Hunter Army Airfield
HSI #10105

Dear Col. Stanley:

The Georgia Environmental Protection Division (EPD) has received your compliance status report (CSR) response letter dated March 5, 2001 and your April 16, 2001 correspondence following up on our March 19, 2001 meeting regarding the above referenced site. EPD was asked to address issues raised during our meeting pertaining to calculated background concentrations, the methodology used to calculate the background concentrations, and future sampling locations:

1. Background Concentrations - The proposed background concentrations presented on page 5 of CSR response are acceptable to EPD. It should be noted that although Table 2 of Appendix III should not be used for determining site-specific background concentrations, it is useful for comparative purposes in that most background concentrations will be below those levels.

2. Statistical Calculations – The statistical methods described can be used for determining background concentrations; however, they do not necessarily apply to all sites due to variations in site-specific data. The method used to determine multiple outliers in a dataset should be stated in the revised CSR and included in an appendix along with the other statistical methods used in the CSR.

3. Proposed Sampling Locations – The sample locations shown in Figure 1 of the CSR response surrounding SB-30 appear sufficient to delineate the site with the following exceptions. Two more sample locations (in addition to SB-45) are needed to delineate the southern boundary near SB-35. One location is needed to the west of SB-45 and south of SB-36. The other location to be added is to the east of SB-45 across Lightning Road. The purpose of proposed sampling locations SB-47 and SB-48 is unclear and needs to be explained before EPD can comment on them.

For specific answers to questions concerning risk assessment calculations and ecological evaluations, you may contact Michelle Burgess or Ahmet Bulbakaya at (404) 656-7802. Please contact David Brownlee of the Hazardous Site Response Program at (404) 657-8600 if you have questions regarding this letter.

Sincerely,

Jane Hendricks
Unit Coordinator
Hazardous Sites Response Program

RE: Revised Final Compliance Status Report (CSR) for the former Fire Training Area (FTA) dated May 24, 2002; HSI # 10395; Hunter Army Airfield; EPA ID No. GA4 210 022 733.
Addendum to the Compliance Status Report (CSR) for the former Fire Training Area (FTA), dated April 2005; HSI # 10395; Hunter Army Airfield; EPA ID No. GA4 210 022 733.

Dear Mr. Biering:

The Hazardous Waste Management Branch of the Georgia Environmental Protection Division (GA EPD) is in receipt of the above-referenced documents submitted with correspondence (Biering to Hendricks) dated June 6, 2005. Based upon our review, GA EPD has generated the following comment(s):

1. *Acronym* – Chapter 1.0 of the Addendum to the CSR indicates that the northern part of the former FTA has been designated as "DAACG chlorinated solvent area". Please explain the acronym DAACG.

2. *Section 391-3-19-.06(3)(b)(2) – Soil Delineation* – Soil contamination must be delineated to background concentrations for all VOCs detected above background within the DAACG area north of the former fire training area.

3. *Section 391-3-19-.06(3)(b)(2)(ii) – Analytical Parameters Selected and the Rationale for Selection* – The rationale for analyzing VOCs only must be expanded. Unless you can explain why no other regulated substances potentially exist at the site, additional samples should be collected and analyzed for metals, SVOCs, pesticides, and herbicides. We expect that approximately 20 additional soil samples and 10 groundwater samples collected from the former fire training area and the DAACG chlorinated solvents area would be sufficient to evaluate the potential presence of additional regulated substances.

4. *Section 391-3-19-.06(4)(a) and (b) – Compliance Certification* – The certification of compliance with the applicable risk reduction standards should be signed by the applicable person described in Items 1 through 4 of *Section 391-3-19.03(7)(c)*. The signature space was left blank.

5. *Section 391-3-19-.06(3)(b)(3) – Groundwater Delineation* – Groundwater must be delineated to background concentrations horizontally and vertically for all contaminants. Further sampling is required to complete delineation for the following constituents:

a. 1,2-DCE, benzene, ethylbenzene, vinyl chloride, and xylenes need to be horizontally delineated northeast of COE-MW-02; and east and south of HMW-14R.

b. 1,2-DCE, and vinyl chloride need to be horizontally and vertically delineated northwest of COE-MW-06; and west and southwest of COE-MW-07.

6. *Sections 391-3-19-.06(3)(b)(2) and (3)(x)* – Please show data for all regulated substances in soil and groundwater on the maps. Further delineation may be required based on the revised figures.

7. *Sections 391-3-19-.06(3)(b)(2) and (3)(x)* – Please include cross-sections for vertical delineation of soil and groundwater contamination.

8. *Sections 391-3-19-.06(3)(b)(3)(x)* – Please indicate on the groundwater maps whether or not wells with no data boxes were sampled, even if they had no detections. Show the results as <DL (actual detection limit value), rather that BDL.

9. *Section 391-3-19-.06(3)(b)(3)(viii)* – Maps – Please include isoconcentration lines on maps to show the horizontal extent of groundwater contamination.

10. *Toxicity Factors* – EPD has noted some discrepancies between the toxicity values on Table 10 of the Addendum and those used by EPD. Please review the following list of toxicity factors for the corrected values.

	Revised CSR Value	EPD Value
Arsenic	SFi = No Value	SFi = 15 $(mg/kg\text{-}day)^{-1}$ (IRIS)
Barium	RfDi = No Value	RfDi = 1.40E-04 (HEAST)

10. *Type 2 RRS for Soil- Lead* - As required by Section 391-3-19-.07(7)(c)(4) of the Hazardous Sites Response Rules, for lead, soil concentrations at the site must not exceed those concentrations that would cause a resident 6 year old child to have a probability of no greater than 5% of a blood lead level greater than 10 ug/dL as determined by the IEUBK model using site-specific exposure assumptions, including the ingestion of site groundwater as drinking water and the probability of subsurface soils being brought to the land surface. Please evaluate site lead RRS using the IEUBK model and submit all input parameters along with documented references.

11. *Type 2 and 4 RRS for Soil-Leaching Criteria* – Many of the Type 2 and 4 RRS for soil listed on Table 6.1 A and B of the revised final CSR are based on leaching criteria. Calculations for the leaching values were not included in the Addendum or the revised final CSR. Please provide the calculations for the leaching criteria along with documented references.

12. *Type 2 RRS for Groundwater* – The Type 2 RRS for groundwater listed on Table 10 of the Addendum for Arsenic and Barium are incorrect. Below are the correct RRS values and should be corrected in the Addendum.

REGULATED SUBSTANCE	REPORT VALUE	EPD VALUE (BASIS)
Arsenic	5.68E-04 mg/kg	1.11E-05 mg/kg (Carcinogenic Value- Adult)
Barium	1.10 mg/kg	2.9E-04 mg/kg (Non-Carcinogenic Value- Child)

13. *Type 4 RRS for Groundwater* – The Type 4 RRS for groundwater listed on Table 11 of the Addendum for Arsenic and Barium are incorrect. Below are the correct RRS values and should be corrected in the Addendum.

REGULATED SUBSTANCE	**REPORT VALUE**	**EPD VALUE (BASIS)**
Arsenic	1.91E-03 mg/kg	1.89E-05 mg/kg (Carcinogenic Value)
Barium	7.15 mg/kg	1.43E-03 mg/kg (Non-Carcinogenic Value)

14. Please submit one stand-alone document for the revised CSR, rather than a "Revised Final CSR" and an "Addendum CSR" separately. Include all updated text, figures, tables, appendices, and all historical data.

The revision for the former Fire Training Area CSR report, appropriately addressing the comment(s) above, should be submitted to GA EPD within ninety (90) days from receipt of this correspondence in the form of a totally revised document. Note that two (2) hard copies and two (2) electronic copies in pdf format following the attached guidance for electronic submittal are requested by GA EPD.

Should you have any questions concerning this correspondence, please contact Benoit Causse of my staff at 404-463-7513.

Sincerely,

Amy Potter
Unit Coordinator
Hazardous Waste Management Branch

Document Submittal Format

All documents more than 25 pages in length shall be submitted as one paper copy and two compact disc (CD) copies with the documents in Portable Document Format (PDF). A signed certification page must be included in the CD copies. The certification page states that the electronic copy is complete, identical to the paper copy, and virus free.

All documents currently in electronic format should be converted into the PDF format. All documents not available electronically and pages that contain signatures, initials, or other information not in the electronic copy should be scanned into a PDF format including the signed certification page. Scanning should be at 200 dpi with any documents requiring color being scanned in color.

The document should be broken down into multiple PDF files along the following guidelines with the file name referenced in the table of content.

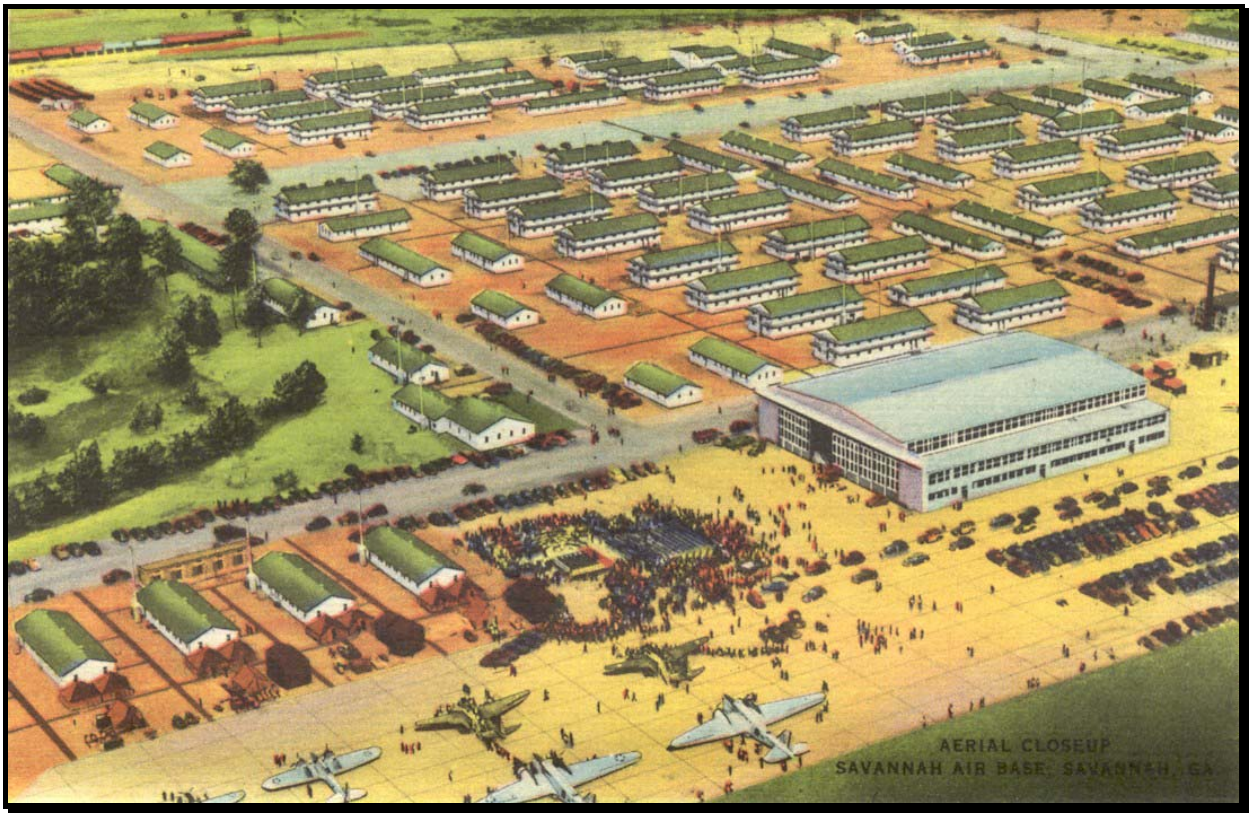

Table of Contents
Signature / Certification pages
Main body of document
Each Attachment (Appendices, Tables, Figures, Reports, etc.)

The CDs shall be enclosed in a jewel case. The CD shall be labeled with the following information written on the CD in indelible ink or affixed to the CD with an adhesive CD label.

Beginnings

The 1920s marked the true beginning of civilian aviation in the United States. By 1930 nearly 1700 civilian airports had been established in the nation. As part of this national trend, in 1927 the city of Savannah bought 900 acres of woods, pasture, and swamp three miles south of the city limits for the first Savannah Airport—later known as Hunter Field.

Airfield Lighting at the Savannah Airport in the Early 1930s

"Robbie Richard and myself used to ride with Mr. Tillman… on the running board of his Ford and put out lanterns… so that the airplanes can land at night… So when we come from school, just every afternoon… Mr. Tillman would have the lanterns filled with kerosene [in] the Model A… We'd get on the running board and we'd put the lanterns down… He'd go another say, fifty feet, and put another lantern down…"

— Joseph Butler Harris

Inside the WPA hangar (Building 1206), 1937

Savannah Airport

In three years, using mostly chain-gang labor, Chatham County ditched the area, graded the field with 400,000 cubic yards of sand, and planted it with Bermuda grass. The landing area was 4500 feet long and 3500 feet wide with no runways. Aircraft could take off and land in any direction. The original airfield lay roughly on what is now Hunter Army Airfield's parking apron.

On 20 September 1929 a six-seater Bellanca CH-300 Pacemaker named "The City of Savannah" became the first aircraft to land at the Savannah Airport, inaugurating the Eastern Air Express New York to Miami air service. One month later the stock market crashed, plunging the US into the Great Depression. By November of that ill-fated year, Eastern Air Express folded. This left Savannah without regular air service until 1931, when Eastern Airlines began offering intrastate travel from Savannah to Augusta and Atlanta.

In spite of the Depression the city undertook a number of improvements to the airfield throughout the decade, including the 1932 construction of Wilson Boulevard, named after Judge Emmett Wilson, chairman of the city's airport commission. In 1936 the city and one of President Roosevelt's public works programs, the Works Progress Administration (W.P.A.), cooperated in making significant improvements to the airport. The W.P.A. spent $130,000 and the city $36,000 to rebuild the drainage system, construct a new metal hangar, and replace the grass airfield with three new asphalt runways.

« H. G. "Sandy" Strachan, first airport manager

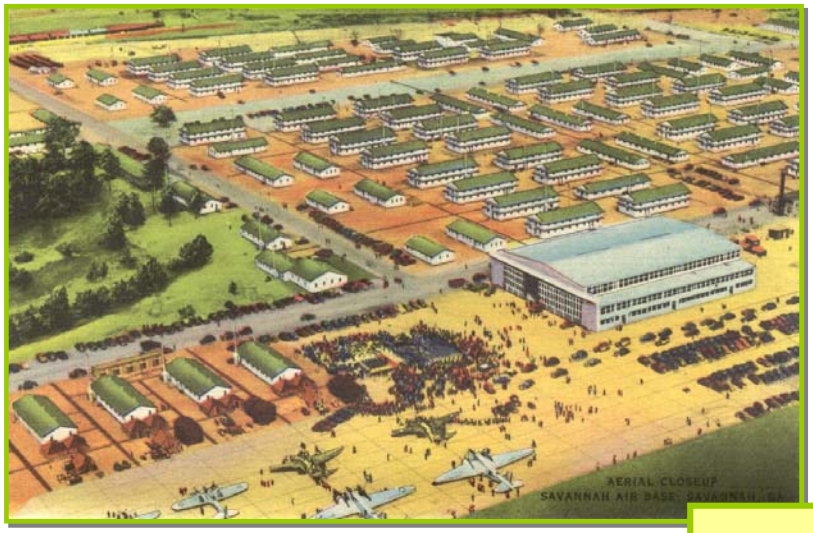
The current Building 1206 is the W.P.A. hangar, little changed from the 1930s. The first Savannah-based flying service, Strachan Skyways, moved into this hangar after it was built. Henry G. "Sandy" Strachan owned the company and was also the airport manager. Strachan was the most prominent local aviator of the 1930s. According to the Savannah Morning News Strachan was "recognized as one of the leading fliers of Georgia… [and] credited as much as anyone else with bringing the magical world of flight to Savannah's attention." Air activity grew apace with the airfield. By decade's end, the airfield hosted regular flights from both Delta and Eastern Airlines.

World War II

When Hitler invaded Poland in September 1939 the US Army had 175,000 men, ranking seventeenth in the world—weaker than both the Dutch and Romanian armies. Meanwhile the Japanese, locked in combat with the Chinese since 1937, were looking to expand their empire in Asia. The Air Corps, part of the Army at the time, had only 2200 obsolete aircraft stationed at twenty-four airfields around the country. Europe and China were engulfed in war, and although the US was not yet involved, in the corridors of Washington preparations began for a military build-up.

Frank O'Driscoll Hunter

Usually public facilities are named after deceased persons. However, Hunter Army Airfield's namesake, Frank O'Driscoll Hunter (1894-1982), Lieutenant Colonel, US Army Air Corps, was very much alive when the city of Savannah christened the installation "Hunter Field" in 1940. Hunter, Georgia's only World War I flying ace, native Savannahian, and a lifelong bachelor, would be promoted to Major General and briefly lead Eighth Air Force Fighter Command in the coming war.



Still, the war seemed far away from Savannah in that late summer. The Air Corps commissioned Sandy Strachan a lieutenant in September, but business continued as usual at the airport. In 1939-1940 the city built a permanent municipal airport building to house growing administrative activities of the airport (the building's terrazzo floor still stands intact on the installation flightline). On 19 May 1940 the city officially dedicated the airport as "Hunter Field."

Hunter Field Goes To War

In 1940 the US began to re-arm in preparation for war. The government increased funding for new equipment and bases and instituted a peace-time draft. A primary beneficiary of this new largesse was the Air Corps, which by 1941 had grown to over 25,000 personnel and 4000 aircraft. The Air Corps needed new airbases to accommodate its growth, and in August 1940 selected Hunter Field as a light bomber training base.

Within two months the Air Corps transferred 3000 personnel of the 3rd and 27th Bomb Groups, and a hundred A-18 trainers, A-20 light bombers, and B-18 medium bombers to the new base, sharing the airfield with the civilian airport. Within nine months the military had constructed an entire cantonment north of the runways, featuring over 220 facilities including barracks, warehouses, a hospital, hangars, and operations buildings. The threat of war had transformed the sleepy southern airfield into a bustling military installation.

Hunter Field in 1940

In January 1941 Savannah received the tragic news that Sandy Strachan had died in a training accident at Barksdale Field, Louisiana. In his honor the Air Corps named the road running adjacent to the runways and parking aprons Strachan Road (in the 1990s the installation changed this street's name to Lightning Road).

Birth of the Mighty Eighth Air Force

On 28 January 1942 the USAAF formed the Eighth Air Force at Hunter Field. For three months in early 1942 Hunter Field's personnel and facilities prepared the embryonic command for overseas service until its transfer to England, where the Eighth Air Force gained fame conducting daylight strategic bombing missions over western Europe.

The 3rd and 27th Bomb Groups trained at Hunter Field throughout 1940-41, participating in large-scale Army maneuvers in the Carolinas. On 7 December 1941 the Japanese bombed Pearl Harbor. All passes from Hunter Field were immediately canceled and airmen required to wear uniforms at all times. The US now faced war with Japan and Germany.

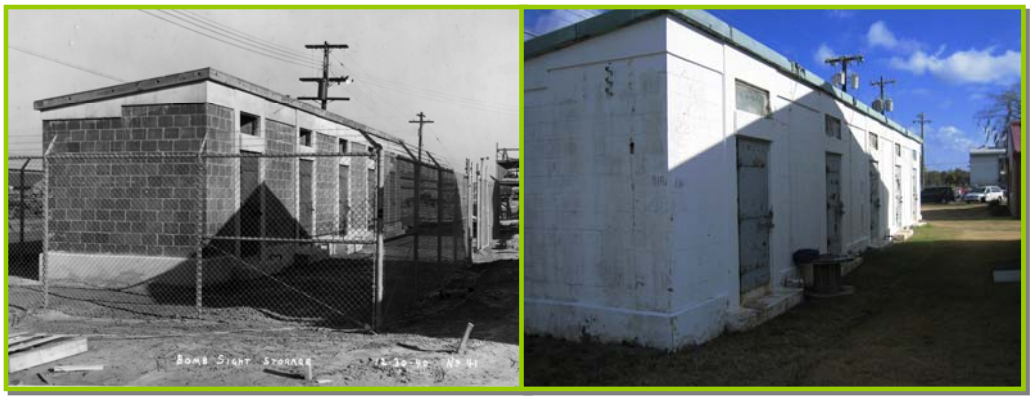
From 1941 to 1943 the base grew to a population of 10,000, expanded its boundaries from 900 to nearly 3000 acres, built six additional cantonments and tent camps at the installation, expanded runway capacity, built aircraft parking aprons, and trained ground support squadrons, bomber groups, and fighter groups. Units trained at Hunter Field later saw active combat in all major theaters of war, including the China-Burma India Theater, the Pacific, and in Europe.

In March 1943 the USAAF designated Hunter Field as the Third Air Force Staging Wing Base, changing its mission to staging air crews and aircraft for transfer to combat operations in Europe. Over the next two years, Hunter Field processed 9000 aircraft and 70,000 crewmen.

The Ill-Fated 27th Bomb Group

In November 1941 the Air Corps transferred the 27th Bomb Group from Hunter Field to the Philippines. The 27th arrived just before the Pearl Harbor attack on 7 December 1941. The Japanese invaded the Philippines days later. In a letter dated 18 February 1942 Lieutenant Colonel John Sewell described the 27th's ordeal to his family: "We never did get any airplanes and… as infantry we have functioned… We are living in the jungle; no tents… We eat twice a day… mostly canned salmon and rice. Morale is high… I have lost several men and one officer, mostly killed by bombs… But we have killed hundreds of [Japanese] too…How or when this letter will reach you I have no idea. I am putting it in the hand of God." The Japanese killed or captured the entire unit when the Philippines fell in April 1942. The photo depicts U.S. prisoners of war on Bataan being led into a brutal captivity.

The military built approximately 450 buildings at Hunter Field from 1940 to 1945. Over the past sixty years the installation has demolished most of its World War II buildings. Remaining on-post World War II structures include a water tower (Facility 721), an abandoned ammunition storage area (Buildings 1305-1308), a heat plant (Building 812), two bomb sight storage facilities (Buildings 803 and 816), the sewage treatment plant, the small arms range (used in World War II to test fire and sight in aircraft-mounted machineguns and cannon), three hangars (Buildings 811, 813, and 1290), and various administration buildings and warehouses.



After Germany's surrender in May 1945 Hunter Field processed aircraft and crew returning from the Mediterranean and slated for duty in the Pacific. This operation was cut short on 6 August 1945, when the B-29 *Enola Gay*, piloted by Colonel Paul Tibbetts, dropped a terrible new weapon—an atom bomb—on the Japanese city of Hiroshima, killing 100,000 Japanese. A second bomb dropped on Nagasaki prompted the Japanese government to surrender unconditionally. The mushroom clouds over Hiroshima and Nagasaki marked the final act of World War II and ushered in an era of global uncertainty. Would the destructive power of the bomb force an end to war? Or would the bomb lead to an end to humanity?

Hunter Army Airfield—Then (1940-1950) and Now (2006)

Facility 721 Water Tower

Building 816 Bomb Sight Storage Facility

Building 811 Hangar

A Municipal Airport Again

After 1945 Hunter Field reverted to the Savannah Municipal Airport. The airport only used a small fraction of Hunter Field's cantonment, the balance leased by the Federal Public Housing Administration to various public and private enterprises. Businessmen converted buildings to industrial plants, commercial businesses, and even apartments. The University of Georgia, overwhelmed with returning veterans, even opened a satellite campus on the old airbase.

Colonel Paul Tibbetts

Tibbetts (born 1915) trained at Hunter Field in 1940-41 as a lieutenant in the 3rd Bomb Group and remembers that "The… months [training at Hunter Field] were the most important of my career from the standpoint of learning to become a precision pilot." He distinguished himself in World War II as a squadron commander in Europe. In the Pacific Tibbetts commanded the 509th Composite Group, which dropped the Hiroshima and Nagasaki A-bombs. Tibbetts returned to Hunter as commander of the 308th Bomb Wing from 1956 to 1958. He married his second wife in the Hunter Chapel, Building 145, in 1956. At right is Tibbetts just after completion of the Hiroshima mission.

The Cold War and Strategic Air Command

As the 1940s ended the Soviet Union, formerly a World War II ally, showed itself under the dictator Josef Stalin to be an implacable foe of western capitalism and democracy. The Soviets took control of Eastern European nations, attempted a blockade of Berlin in 1948, and exploded their own atomic weapon in 1949. The US grew increasingly concerned with Communist aggression and expansion. In 1947, President Truman signed the National Security Act (NSA), reorganizing the US defense and intelligence establishments and making the Air Force a completely independent branch of service. Because of its role in atomic bomb deployment, the Air Force became the most important branch of the service. The Air Force's Strategic Air Command (SAC) was responsible for atomic bomb delivery, making it the most important of the Air Force commands.

And what of SAC's principal weapons? In 1948 there were less than sixty atomic bombs in the US nuclear arsenal, stored in four "Q Areas" controlled by the civilian Atomic Energy Commission, all adjacent to Air Force bases in the southern parts of the country: one in New Mexico, one in Tennessee, and two in Texas. By 1950 SAC consisted of fourteen bomb wings, flying mostly B-29 and B-50 propeller medium bombers, or huge B-36 piston-pull heavy bombers. Like the Q Areas, SAC based its bombers primarily in the southeast and southwest parts of the country.

General Curtis LeMay

The controversial General Curtis LeMay (1906-1990) commanded SAC from 1948 to 1957. LeMay made frequent surprise visits to his bases, including Hunter AFB. Under LeMay SAC continually improved its training, technology, doctrine, and morale, although the general was notorious for making disturbing public comments favoring pre-emptive nuclear war. LeMay retired as the Air Force Chief of Staff in 1965 and in 1968 ran unsuccessfully for vice president on George Wallace's ticket.

As part of SAC's southern strategy, in 1949 SAC stationed the 2nd Bomb Wing and its B-50 bombers at Chatham Field, a World War II airbase built a few miles west of Savannah. However, Chatham Field had inadequate barracks and operations facilities, and proved unsatisfactory for SAC. In order to keep SAC in the Savannah area, the city offered to exchange Hunter Field for Chatham Field.

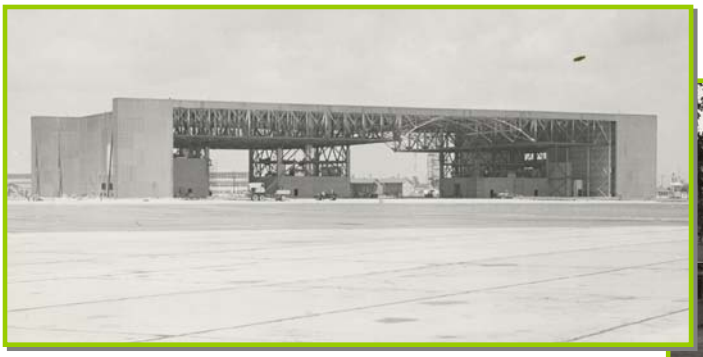
SAC accepted and in September 1950 the switch occurred. Hunter Field became Hunter Air Force Base (Hunter AFB), while Chatham Field became the Savannah Municipal Airport, now known as the Savannah/Hilton Head International Airport.

When SAC arrived at Hunter AFB in 1950, they found a neglected World War II-era airport. Buildings creaked with rotten siding and broken windows, while asphalt roads showed ruts and holes, and grass grew through the pavement of aircraft parking aprons. A land conflict in Asia soon accelerated the pace of base construction and development.

In June 1950 Communist North Korea invaded South Korea, starting the Korean War (1950-1953). Concerned that this attack was orchestrated by Moscow as the first round of World War III, the Truman administration began an immense American military build-up, with SAC a major beneficiary. During the Korean War the US nuclear arsenal increased from 300 atomic bombs to over 800, while SAC grew from 59,000 to 153,000 personnel, developed and issued new jet aircraft, and built up new bases, including Hunter AFB.

SAC Bombers at Hunter AFB: 1950-1953

SAC stationed B-29 and B-50 bombers at Hunter AFB from 1950 to 1953. The B-29 entered service during World War II and had a maximum speed of 357 mph and a range of 3,250 miles. The B-29 spawned many variants, including the B-50(pictured at right), which entered service in 1948. The B-50 was similar to the B-29, but had greater speed (385 mph), range (4,650 miles), and mid-air refueling capability.



By January 1951 SAC had slated a second bomb wing for Hunter AFB, and in 1950-51 spent over $5.6 million on the base, mostly in repairing World War II buildings, roads, and runways, and expanding the base to its current boundaries west to the Little Ogeechee (Forest) River and east to White Bluff Road. In the summer of 1951 Congress spent nearly $6 billion on the largest military construction program since World War II. Hunter AFB received $24.5 million, promptly spending $2.5 million on building what is now the installation's current runway.

Early SAC Operations at Hunter AFB

In the midst of this new construction the 2nd Bomb Wing conducted ground training, aircraft maintenance, Unit-Simulated Combat Missions (USCMs) which included practice bomb runs over American cities, and practiced loading and deployment of nuclear weapons. For weapons exercises SAC constructed a new ammunition storage area (still the post's ammunition storage point) and also "Hardstand 13," an unassuming facility (once located within the Building 1336 motorpool area but now demolished) which served as a classroom for nuclear weapons operations, and as a central control point for weapons loading exercises.

« Hardstand 13, December 1950

Pinwheel barracks, circa 1954 »

«Building 850 under construction, 1954

In April 1952 the 308th Bomb Wing, armed with B-29s, arrived at Hunter AFB. The 2nd and 308th Bomb Wings together formed the 38th Air Division. On paper each wing had 45 bombers in three combat squadrons and over 2500 men, including combat crews, maintenance personnel, and security teams. In reality, the more recently-formed 308th did not possess its full complement of bombers and was not yet rated combat ready.

"The New Look"

In 1952 Dwight D. Eisenhower was elected President. After Eisenhower's election, a series of military and political events, including the development of thermonuclear weapons thousands of times more powerful then atomic bombs, spurred the arms race between the US and the Soviet Union. It was thus under Eisenhower that the concept of deterrence through the threat of massive nuclear retaliation became central to US strategic planning, and was formalized in a reform of the military establishment called "The New Look"—named after a style of women's fashion advertised in Vogue magazine. Under the New Look, the Eisenhower administration stressed the deterrent potential of

US Special Weapon Deployment: 1948-1956

From the late 1940s through the 1950s the government stored its nuclear arsenal in secure "Q Areas," which grew in number from four in 1948 to twenty in 1960, matching the increase in the US nuclear and thermonuclear arsenal. Some SAC airfields were located next to Q Areas, but for the other installations not adjacent to Q Areas (like Hunter AFB) the Air Force, prior to 1952, deployed the nuclear weapons in two ways: bombers would fly to the Q Area, pick up bombs, and then conduct the exercise; or transport aircraft would fly the bombs from the Q Areas to the bases, and the bombs would be temporarily stored on the base.

nuclear weapons by making SAC the centerpiece of the military establishment, and from 1953 to 1961 SAC received nearly 50% of the entire US military budget.

With this massive increase in funding it is no surprise that many buildings at Hunter Field today date from this time period. From 1953 to 1956 the installation, in conjunction with the Savannah District Corps of Engineers, constructed on-post family housing, three massive pinwheel barracks, new double cantilever hangars, new administration and shop buildings, new air traffic control buildings, and new community and recreation facilities.

The B-47 Stratofortress »

The advent of the New Look coincided with a long-planned SAC-wide aircraft upgrade. In 1953 SAC began issuing the new B-47 jet bomber to its units, with Hunter AFB receiving its first jets in January 1954. Throughout the previous year, in addition to undertaking regular duties, SAC personnel at Hunter AFB had been training to fly and maintain this new aircraft, vastly different from their World War II-vintage propeller-driven bombers. With its swept-wing design and bubble cockpit, it looked and maneuvered more like a fighter than a bomber.

The B-47 flew at a top speed of 600 miles an hour, 200 mph more than its predecessors. The B-47 only had a range of 4000 miles, but its in-flight refueling capability gave this bomber a global reach. B-47's speed and maneuverability revolutionized bomber tactics and doctrine. Instead of flying in mass formations, the B-47s would individually fly into enemy airspace at various points, relying on surprise and speed as its main defense. This required more intensive flight training then was given to World War II bomber crews, and Hunter AFB, like other SAC bases, emphasized a high degree of training and readiness. Combat crews continually practiced navigation problems, bomb runs, outdoor survival, and other skills necessary to fight and (possibly) survive nuclear war.

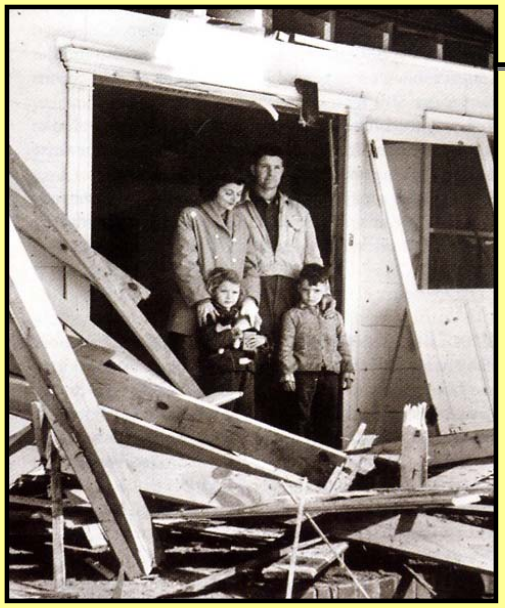
SAC Aircraft Maintenance at Hunter AFB

Crew chiefs would inspect their aircraft and inform Wing Maintenance Control of any maintenance problems. Maintenance Control, in turn, tracked the status of all sixty aircraft under its responsibility through a large plexiglass board, from which they scheduled the shops to work on aircraft. Maintenance Control issued the wing maintenance shop work orders, than each shop assigned their particular mechanics to the aircraft, giving them specific times for the work to be completed. Because B-47 bombers had limited space for maintenance work, the maintenance had to be very carefully coordinated. Each mechanic had a specific scheduled time to work on each aircraft, and if a mechanic ran out of time and did not inform Maintenance Control by radio, he would have to leave and let the next mechanic work.

In support of the combat crews, SAC maintenance personnel worked on aircraft along the massive concrete aircraft parking apron, capable of parking over 130 bombers and refueling tankers. The 2nd Bomb Wing operated from the north edge of the apron, while the 308th operated on the east edge. The space between the two double cantilever hangars, Buildings 850 and 860, marked the operational boundary between the two wings. New buildings were arranged and old buildings adapted to suit a maintenance system centrally controlled by single bomb wings. Basic maintenance and inspections of aircraft by combat squadrons and organizational/periodic maintenance squadrons occurred in nosedocks such as Buildings 843, 844, and 845 or on the flightline.

More specialized maintenance occurred in the large hangars under field maintenance squadrons in Buildings 850 and 860. Smaller aircraft components were often removed for maintenance in the armament & electronics squadron shops, which mostly operated out of old World War II buildings and hangars, such as Buildings 811, 813, 1206 and 1290. Wing maintenance control directed all of these maintenance activities.

From Wing Rotation To Reflex

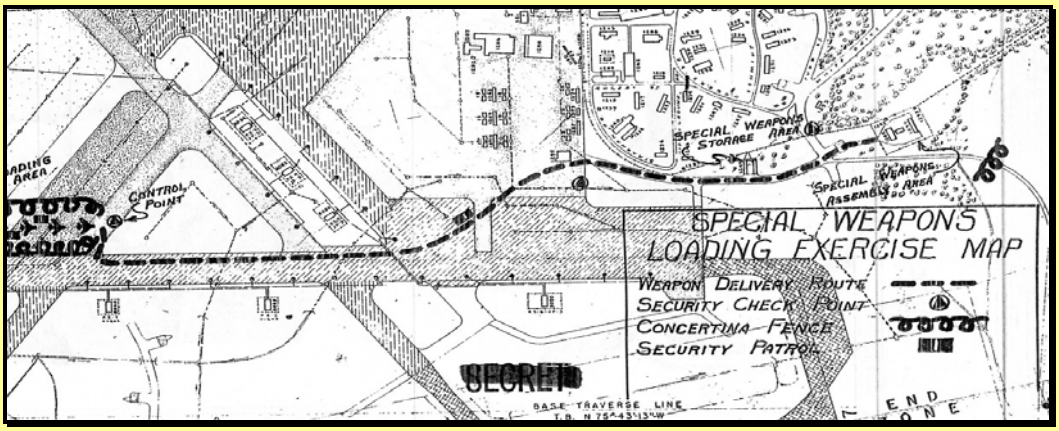


In 1954 SAC headquarters rated the entire 38th Air Division combat-ready and nuclear-capable. The 38th took part in wing rotation, a SAC program bringing bombers within easy range of the Soviet Union through ninety-day tours at SAC bases in the United Kingdom and North Africa.

A Second Bomb Wing Combat Crew, 1957

Hunter AFB's flightline was the staging area for the wings' deployment. The 2nd Bomb Wing undertook two wing rotations to the United Kingdom in 1951 and 1952. Both the 2nd and 308th Bomb Wings conducted multiple wing rotations to North Africa, particularly to Sidi Slimane, Morocco, after 1952. However, the presence of large U.S. bomber forces often caused political problems for the host countries. Wing rotation deployments ceased by the late 1950s.

The 1950s was a decade of continual evolution of nuclear weapons and delivery technology. By 1953 both the Soviet Union and the United States had developed thermonuclear, or hydrogen bombs, hundreds of times more destructive than atomic bombs. More ominously still, the development of missiles meant the warning time for an attack would soon be measured not in hours, but within minutes. This dawning realization led to SAC developing both a rapid response for its bomber force (the Alert program), and on-site nuclear and thermonuclear weapon storage on all SAC bomber installations. The latter program was called the Bombs on Base (BOB) program—fifteen facilities built in the current ammunition area were constructed as part of BOB in 1957.



H-Bomb Accidents and Hunter AFB

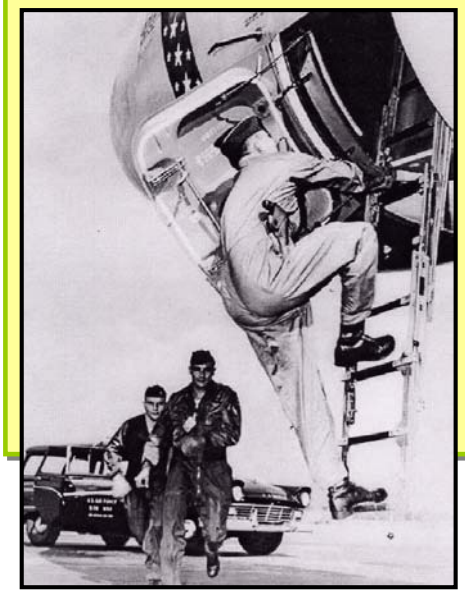
Hunter AFB was involved in two accidents involving hydrogen bombs, occurring within a month of each other. In February 1958 a bomber from Homestead AFB collided with a fighter plane, forcing the bomber to jettison the bomb off the coast of Tybee Island and land at Hunter AFB. In March 1958 a B-47 of the 308th Bomb Wing inadvertently dropped a hydrogen bomb near Florence, South Carolina, injuring six people and destroying a farmhouse owned by the Gregg family (shown at left with their house after the incident). Because of standard SAC safety precautions neither bomb was armed for a thermonuclear detonation.

By 1956 SAC had developed a one-third ground alert concept, which envisioned a third of SAC aircraft on alert *and armed*, ready to take off within fifteen minutes' warning for retaliatory nuclear strikes. In 1956 SAC headquarters designated Hunter AFB as the first test site for this concept. Under Operation TRY OUT (November 1956-April 1957) Hunter AFB locked the installation down, placed a third of its aircraft in full alert configuration, and continued normal training and maintenance schedules. The next six months were a grueling ordeal for the officers and men at Hunter AFB. One airman of the 2nd Field Maintenance Squadron recalled, "[W]e come on the base, we didn't go off the flightline for… months. I slept on mattresses brought in from the barracks on the hangar deck [of Building 850]. The messhall brought bag lunches, that's what we ate, and we lived and worked right out of the hangar."

Hunter AFB proved the one-third alert concept feasible and SAC quickly moved to implement the program after TRY OUT. In the late 1950s and early 1960s, when the US faced the threat of missile attack with only a bomber force, one third ground alert remained critical to US nuclear deterrence, and SAC bombers used variations of this alert concept through the end of the Cold War. In July 1957 SAC also began Reflex operations, which stationed bombers on ground alert in overseas bases primarily in North Africa and England. Reflex soon replaced wing rotation. By 1958 Hunter AFB began both home station alert and Reflex operations.

Special Weapons Operations at Hunter AFB

"[W]e always towed the Bomb behind a truck and…the trailer was covered with canvas. When we got to the B-47, the crew chief on the B-47 would open up the bomb bay, back the bomb in, in between the engine and the bomb bay, then we would hang the curtains from the bomb bay to the trailer and we'd push the Bomb in… Now when you loaded your Bomb… then we would set in what was called the Capsule. In those days, the Capsule was the Uranium-235 or whatever they put in the atomic weapon, and it set separately in the bomb bay… [I]t's against the law to fly over the continental United States with a loaded atomic bomb, so [when the aircraft got beyond the three mile limit] the bombardier…would [crawl] back into the bomb bay, take the Capsule out, go around behind it (there was a little walkway where you'd go around behind the Bomb), [attach] the Capsule, then the Bomb was loaded…"



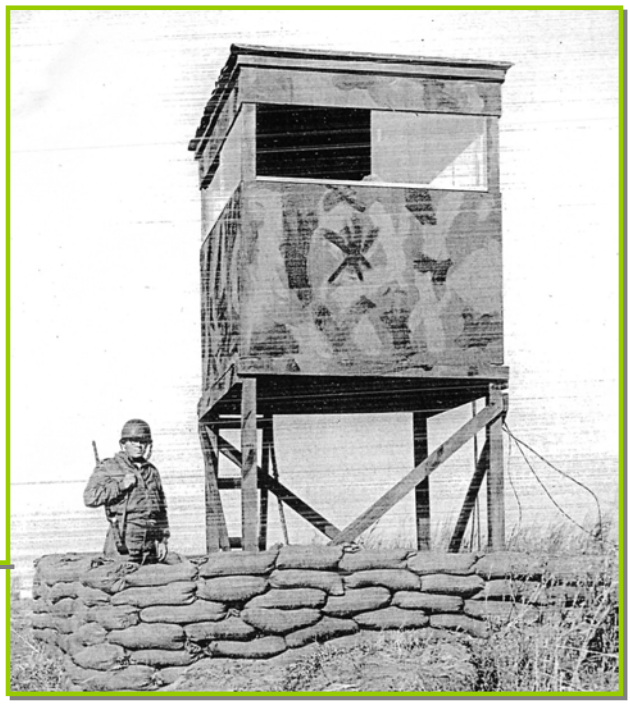
—Joe Kerr, 804th Supply Squadron, Hunter AFB, 1955-1957

In October 1957 the Soviet Union launched Sputnik I, the first man-made orbital satellite, leaping ahead of the US in what came to be known as the "Space Race." Sputnik proved Soviet intercontinental ballistic missile (ICBM) capability. With the United States' own rockets and missiles under development, SAC's bomber alert and Reflex program became more important then ever to the country's defense against Soviet missile attack.

Changing Strategies

In the mid-1950s SAC began basing bomb wings in the northern tier of the country, closer to the Soviet Union when flying over the Arctic Circle, and away from heavily populated areas. By 1955 the first B-52 heavy bombers—with greater range and payload capacity than the B-47—came online, while the US deployed ICBMs by 1959. The development of ICBMs and the B-52 precluded the need for B-47 bases in the southeast. Hunter AFB became obsolete.

The SAC Alert Area at Hunter AFB



The area known as "Saber Hall" was originally a SAC alert area, built in 1960 for home station alert operations. Building 8661, known as the "molehole," housed combat crews on alert, ready to run up the ramps to waiting aircraft, parked on the "Christmas Tree" apron, fully fueled and loaded with nuclear weapons. Aircraft parked at the Alert area stood ready to take off within fifteen minutes of the alert siren. The photograph at left depicts an alert crew running to their B-47 at an unknown alert area.

By 1960 SAC had transferred the 308th from Hunter AFB and announced the base's eminent transfer to Material Air Transport Service (MATS), another Air Force command. Because of changes in technology and American nuclear strategy, Hunter AFB's days as a SAC installation were definitely numbered.

The country elected John F. Kennedy President in 1960. The Soviets tested the young president repeatedly. Two years into Kennedy's presidency, in October 1962 (six months before SAC was scheduled to leave Hunter AFB), the Soviets began installing medium-range nuclear missiles in Cuba. The US imposed a naval blockade on missile shipments and demanded the missiles' removal. The world waited nervously and wondered what would happen if the Soviets tried to run the blockade—would a naval incident between the two superpowers start World War III?

Hunter AFB's 2nd Bomb Wing already had seventeen B-47s on Reflex alert overseas, and dispersed thirteen other bombers to Shaw and Charleston AFBs in South Carolina, all in full Emergency War Order configuration, loaded with nuclear weapons and Jet-Assisted Take Off rockets for lift-off. Beginning on 20 October 1962 the installation hosted the B-47s of the entire 306th Bomb Wing. On 22 October SAC placed its fleet at DEFCON 3, increasing readiness and alert levels above normal levels. By 24 October all aircraft at Hunter AFB, sixty B-47 bombers with full nuclear payloads, sat silent on the aircraft parking apron and the "Christmas Tree" apron at the alert area, waiting for the balloon to drop.

Other SAC bases in the U.S. and overseas were on full alert. Overhead, B-52s flew on airborne alert. Fortunately the Soviets stepped back from the abyss on 29 October 1962, pulling the missiles from Cuba while Kennedy secretly agreed to withdraw US missiles from Turkey. In this most dramatic Cold War incident of nuclear brinksmanship, the Soviets had blinked.

Temporary guard tower built during the Cuban Missile Crisis, Hunter AFB October 1962 »

Materiel Air Transport Service

Within six months of the end of the Cuban Missile Crisis, all SAC aircraft had left Hunter AFB. In April 1963 SAC transferred Hunter AFB to the 63rd Troop Carrier Wing of MATS (Materiel Air Transport Service), which stationed sixty C-124 cargo planes and 4300 men to the installation. By 1964 tenant units had also moved to the base, including the Coast Guard. The 63rd's missions were truly global, and flew in support of humanitarian efforts, the Gemini NASA missions, and military operations such as the US intervention in the Dominican Republic in 1965. Significantly, missions to Vietnam gradually increased as the decade wore on and the US became more deeply involved in that country's affairs.

In 1964, a year after MATS arrived, the Department of Defense announced Hunter AFB's closing. Built as a SAC base, Hunter AFB did not have the facilities needed to support transport missions.

Vietnam and the Army's Arrival

In the late 1950s and early 1960s the Army developed troop-carrying transport helicopters, helicopter gunships designed for close air support, and tactical doctrine for airmobile warfare. These efforts paid off in a tactical sense when the US became involved in the Vietnam War.

Saber Hall (the old SAC Alert building) in 1970, then in use as an AH-1 Cobra training facility

In 1965 US combat troops were sent to bolster a shaky authoritarian regime in South Vietnam against an insurgency sponsored by Communist North Vietnam. The helicopter became the crux of the Army's tactical efforts, essential in jungle terrain for air transport, fire support, medical evacuation, and supply.

The AH-1 Cobra

Pictured above is an AH-1 landing in the Oglethorpe Mall parking lot, 1972. The AH-1 entered service in 1967 and saw extensive use in Vietnam. HAAF was the only location in the United States during the Vietnam War where aviators could train on the Cobra. The Army has since phased out the AH-1 but it is still used by the Marine Corps.

The need for more helicopter pilots drove the expansion of the Army's aviation program, which saved Hunter AFB as a military base. In December 1966 the Department of Defense announced that the official new home of the Army's Advanced Flight Training Center (AFTC) would be Hunter Army Airfield (HAAF) and Fort Stewart. The airfield's massive parking apron, built by SAC for jet bombers, offered more than enough space for helicopter training operations.

Hunter Army Airfield is reactivated, 1974

HAAF became one of the Army's key helicopter training sites during the Vietnam War. Between 1967 and 1972, HAAF and Fort Stewart trained 11,000 rotary wing pilots and 4,328 fixed wing pilots, including 1400 South Vietnamese aviators. The US withdrew all combat troops from Vietnam in the early 1970s and in 1972 the Army closed HAAF. In 1975 North Vietnam conquered South Vietnam, closing an ignominious chapter in American history.

HUNTER ARMY AIRFIELD: 1974 TO 2001

The Army reopened HAAF in 1974 and designated it a sub-post of Fort Stewart and a base for the 24th Division's helicopter and support elements. In 1978 the 1st Battalion, 75th Ranger Regiment moved to HAAF as a tenant unit.

By the late 1970s HAAF had become the US Army's premier rapid deployment node on the eastern seaboard, thanks in no small part to facilities left behind by the Air Force, including the runway, parking apron, and the old SAC alert area, now called "Saber Hall." Special Forces troops or elements of the 24th Division could deploy as rapidly as possible to nearly anywhere in the world,

making it a potent offensive resource in the Cold War. The installation's effectiveness was demonstrated by its use as a rapid deployment center during the 1983 Grenada invasion, when the US squelched a Cuban-sponsored Marxist island state in the Caribbean.

In 1990 the Soviet Union collapsed, relegating Communism to the dustbin of history. For forty years the installation's purpose had been largely geared to the ongoing Cold War. What would the future hold for Hunter Field, and indeed, the US military?

In 1990-1991 the 24th Infantry Division participated in Operations Desert Shield and Desert Storm, taking part in the liberation of Kuwait and the destruction of much of Saddam Hussein's Iraqi Army. However, few missions in the 1990s had the clarity of Desert Storm, and the Army conducted multiple open-ended peace-keeping and humanitarian missions in countries as diverse as Haiti, Somalia, and the former Yugoslavia, with mixed results. In the middle of this uncertain decade, in 1996, the 24th Infantry Division was re-flagged the Third Infantry Division, "The Rock of the Marne."

Confronting Global Jihad: 2001 to the Present

After a close and controversial election, in 2001 President George W. Bush was sworn into office. On September 11 of that year, al-Qaeda terrorists flew three passenger aircraft into the Pentagon and World Trade Center towers, killing 3000 people. Once again America was at war, although not with a traditional enemy, but an extremist religious movement.

The current protracted guerrilla conflicts in Afghanistan and Iraq—fought as part of the larger War on Terror—have accelerated changes in organization and doctrine and also increased the construction tempo on Army bases. Within this context HAAF continues to be an important deployment and support base for the Army thanks to its existing airfield facilities, and location adjacent to Fort Stewart and the east coast ports of Savannah and Charleston. Its status shows no sign of changing soon, particularly since Army reorganization and withdrawal from Europe means more troops will be stationed on the installation.

Sixty years ago the Air Corps developed HAAF into a military airfield. During the Cold War the installation adapted to the military's changing needs, serving first as a bomber and air transport base for the Air Force, then as an Army helicopter training base, and finally as a rapid deployment node and home for an infantry division's aviation units, in addition to various Special Operations, Marine Corps, Coast Guard, and Air Force tenants. The War on Terror, too, will eventually pass into history but it will not be the final chapter in this installation's story.

Third Division troops returning from OIF III deployment in December 2005 walk through the massive doors of Building 850, a historic Strategic Air Command hangar.

SECTION 2. THE DEVELOPMENTAL HISTORY OF THE HUNTER ARMY AIRFIELD FLIGHTLINE AREA

The irregularly shaped Flightline Area stretches from Building 834 in the northwestern section of the parking apron to Building 1252 to the southeast (Fig. 2.1). This narrative explores the physical and functional evolution of the Flightline Area and its role in aircraft operations, particularly maintenance activities, from 1929 to the 1980s. The years of SAC occupation (1950-1963) will be particularly emphasized because of the installation's role in Cold War nuclear deterrence strategy during the period.

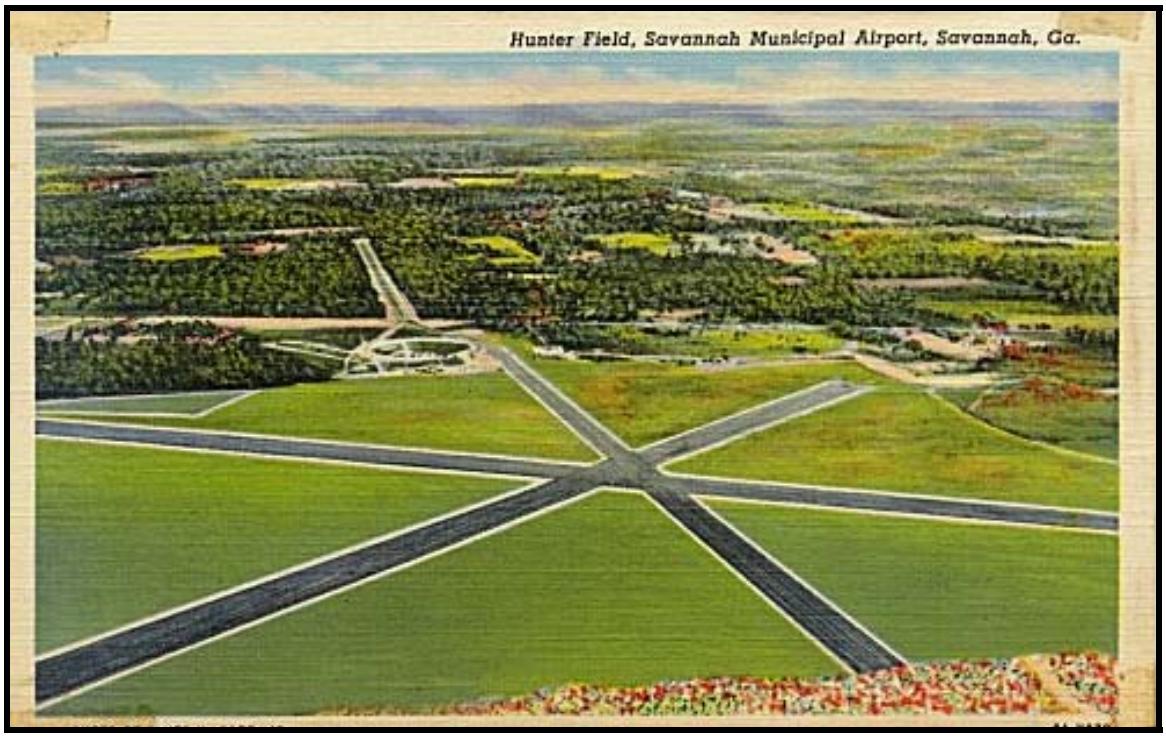

Figure 2.3 The Savannah Airport circa 1938, showing its three new asphalt runways. From a Coastal News Company postcard, photo by James H. Cobb, Jr.

Municipal Airport: 1929 to 1940

Hunter Army Airfield (HAAF) is the site of the first Savannah Municipal Airport, a graded grass airfield constructed in 1929 (Fig. 2.2). The airport lay three miles south of the city limits and there was little development in the area besides a few farms, dairies, and an African-American school at the current site of the Building 1336 motorpool (Maggioni 2004:18-19). Not until 1936, during the Great Depression, did significant

capital development occur at the airport. The Works Progress Administration (WPA), in conjunction with the city of Savannah, constructed three intersecting asphalt runways located in the middle of the current concrete parking apron, and a new hangar (Fig. 2.3 and 2.4). The hangar, now Building 1206, is the oldest building on post and the only building predating military occupation.

From 1938 to 1939 the city built a municipal airport building, replacing temporary wood structures at the airport (Fig. 2.5). This building, located four hundred feet north of Building 1206, measured forty four by eighty feet, and housed an octagonal waiting room and offices for Eastern Airlines, Delta, and the US Bureau of Air Commerce (Maggioni 2004:24-27; Newlin, J.S., Appraiser, "Project: Savannah Army Air Base-Savannah, Georgia. Municipally Owned Hangar and Administration Building," no date, Ft. Stewart Directorate of Public Works, Environmental Division, Cultural Resource Management Files). The remains of this building, specifically the terrazzo floor of the waiting room, are still extant on the HAAF flightline (Figs. 2.6 and 2.7).

By 1940 the municipal airport boasted three runways, a hangar from the early thirties sited just in front of the current Building 1132, the Municipal Airport building, the new WPA hangar (now building 1206), and three utility buildings at approximately the site of the current Building 1134. The hangars flanked the Airport Building, and all three structures were connected by a small asphalt parking apron at the east end of the east-west runway (Fig. 2.8).

World War II Training and Staging Field: 1940-1945

After Hitler invaded Poland in 1939, the US began to prepare its pitifully inadequate military for global warfare. In 1940 Congress approved the initial expansion of Air Corps installations by funding the lease of twenty-four civilian airfields for use as new Army Air Corps installations. Hunter Field was the first Air Corps installation begun under this program in October 1940, and the first of hundreds of new military airfields established in the continental US during World War II (Maggioni 2004:30).

Initially the city and the military planned to share the installation, with the Air Corps leasing the northern part of the airfield and the municipal airport using the eastern section. By November 1940 it became apparent that sharing the airfield between civilian and military uses would not be a viable option. The city developed Chatham Field in 1941-1942 on a six hundred-acre tract northwest of Savannah, but this facility was also taken over as a military airfield in 1942 (Maggioni 2004:37).*

* This airfield is the current site of the Savannah/Hilton Head International Airport and Travis Field, a Georgia Air National Guard installation.

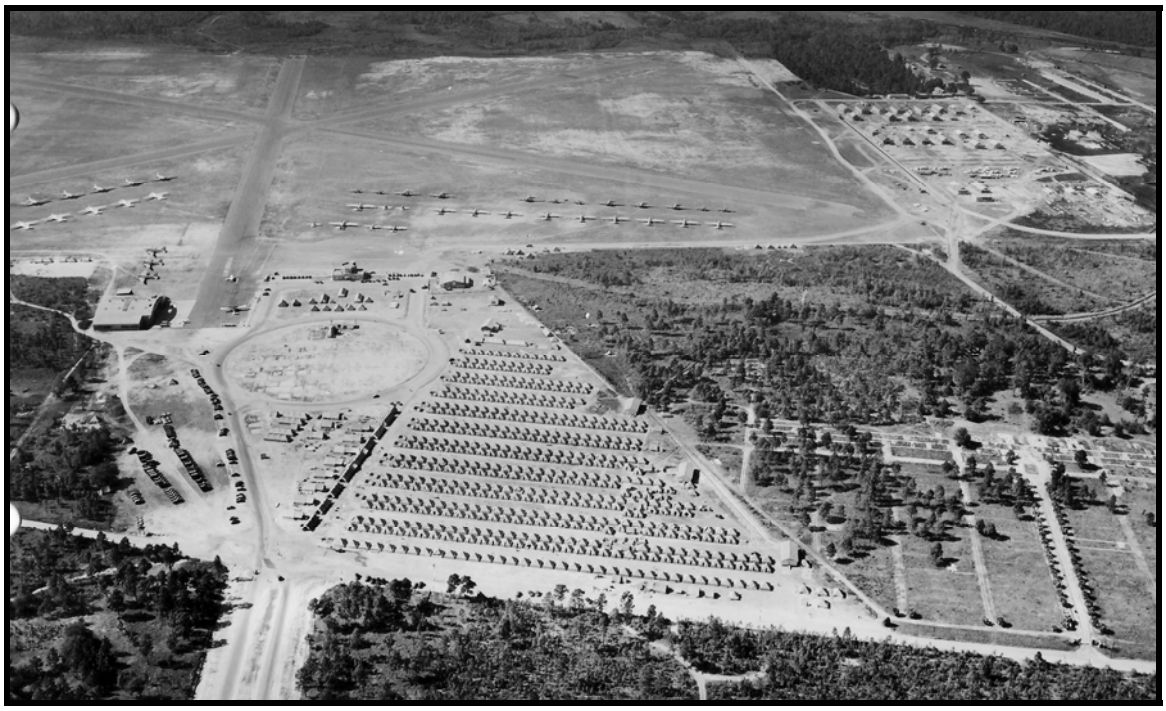

Figure 2.8 A 1940 view of Hunter Field at the start of military construction. Note the runways (currently the site of the parking apron), Building 1206 on the left, and the Municipal Airport Building above the traffic circle in the center. A Goode Construction Company photograph, courtesy U. S. Army.

From October 1940 to May 1941 the Goode Construction Company of North Carolina, under supervision of the Quartermaster Corps and the Corps of Engineers, built over fifty-five barracks and sixty-seven other buildings just north of the runways, including administration buildings, recreation facilities, crash stations, warehouses, guardhouses, hospital buildings, a Link trainer building, mess halls, officers quarters, and a theater (Savannah Morning News [SMN] 2 September 1940; SMN 13 October 1940) (Figs. 2.9, 2.10, and 2.11). As part of this development the military constructed its aircraft maintenance area just to the north of the runways, consisting of two hangars and a heat plant facility (Buildings 811, 812, and 813), two bomb sight storage facilities (Buildings 803 and 816), and thirteen 700 Series wood squadron operations buildings (no longer standing). A concrete parking apron extended a little over two hundred feet to the south of the buildings and connected to the existing runways. The squadron operations buildings were adjacent to the hangars to the west of Building 813 and the east of Building 811, next to the bomb sight storage facilities (Fig. 2.12).

Operations at Hunter Field from 1940 to 1941 focused on preparing the 3rd and 27th Light Bombardment Groups for combat. These bomb groups flew A-18 trainers, and A-20 and B-18 bombers (Maggioni 2004:30). The 3rd was based out of Building 813 and its associated operations buildings, while the 27th occupied Building 811 and the operations buildings to the east. The bomb groups' training at Hunter Field involved dangerous low-level formation flying missions, bombing practice, and support of large-scale Army maneuvers in the Carolinas. Paul Tibbets, a 26-year old Lieutenant in the 3rd

at Hunter, later became famous for piloting the Enola Gay, the B-29 that dropped the atomic bomb on Hiroshima (Maggioni 2004:34).

The bombing of Pearl Harbor in December 1941 and the subsequent US entry into World War II against Germany, Italy, and Japan added impetus to further military development of Hunter Field. From 1942 to 1943 the military added more than 2800 acres to the original airfield, tripling the installation's size to make room for additional troop areas and runways.

The asphalt runways and parking apron built in 1936-1940 were adequate for 1930s civilian aircraft, but the new, heavier military bombers required longer runways made with concrete instead of asphalt—material that could withstand greater mass and weight. The Savannah District Corps of Engineers poured the first concrete runways at Hunter Field in early 1942, extending the northeast-southwest and northwest-southeast runways, and built an additional two parallel runways and one perpendicular. The existing municipal airport's asphalt parking apron was replaced with a greatly enlarged concrete apron, which became the east apron. The Air Corps extended the north parking apron towards the runways with soil cement and bituminous material. By the end of 1942 Hunter Field had three new 5000-foot long concrete runways, two 5000-foot long bituminous runways, one 3400-foot long bituminous runway, a concrete and bituminous north parking apron, and a concrete east parking apron (Fig. 2.13).

The installation left most of the original 1940-41 hangars and operations buildings on the north apron untouched, but added infrastructure to the east apron. The military constructed a wooden fire/crash station adjacent to Building 1206 (referred to in World War II as Hangar #3), moved the other, older civilian hangar to the motorpool for automobile storage, and added a glass control tower to the top of the municipal airport building, which became the base operations facility (Hunter Field Historical Record January-September 1943:32, Microfilm Reel [MFR] B2279, Air Force Historical Research Agency [AFHRA]).

The installation also built over 450 additional buildings and four tent camps to the east, northeast, and south of the runways, mostly temporary wood or tarpaper facilities with a life expectancy between six months and ten years. With this infrastructure Hunter Field housed, at various times during the war, between three and ten thousand servicemen and women (Hunter Field 1945:14; Maggioni 2004:45, 57). The military's development of the installation during World War II, although mostly temporary in nature, set the stage for permanent military occupancy of the airfield after the war.

The frenetic pace of new construction matched the installation's post-Pearl Harbor training activities. Over the course of 1942 Hunter Field trained Bomber, Pursuit (fighter), Airdrome, Ordnance, Chemical, Signal Corps, Quartermaster, and Engineering units. Hunter Field also controlled nine sub-bases in south Georgia to support its training mission (Maggioni 2004:43-45).

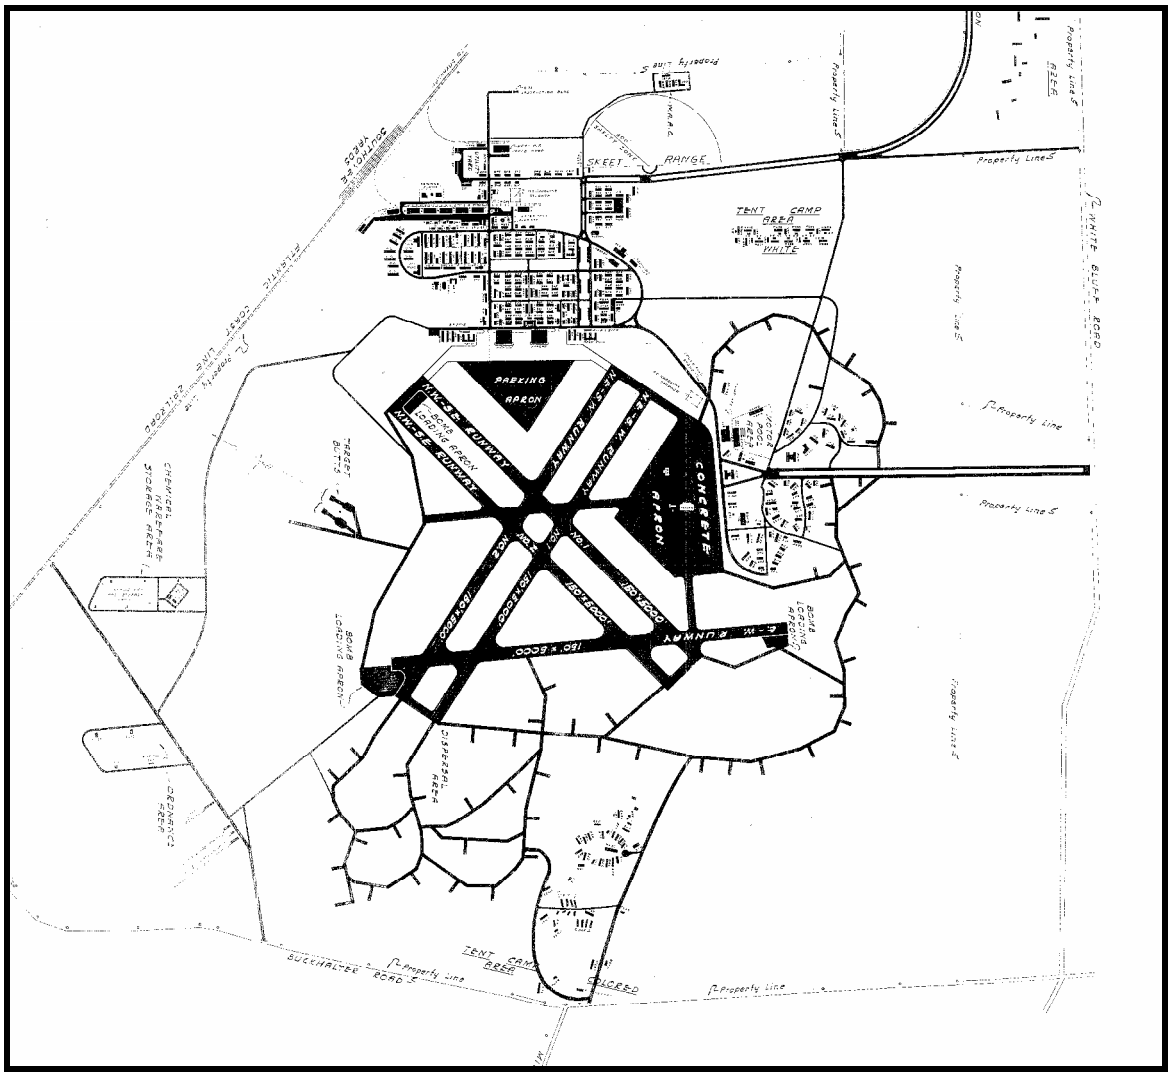

Figure 2.13 Hunter Field, 1942, with strengthened and lengthened runways and parking aprons. The installation had grown to the capability of housing ten thousand men in barracks and pyramidal tents. From the HAAF Engineering Files.

In March 1943 the United States Army Air Forces (USAAF) designated Hunter Field as the Third Air Force Staging Wing Base, changing its mission from training to processing aircraft and crews for combat duty in the European Theater of Operations (ETO). Hunter Field received aircraft (primarily bombers or transports) directly from factories, modified them for combat, assigned crews to specific aircraft, supported familiarization flights, and the flight to the combat zone across the Atlantic. In twenty-seven months' service, the installation processed nine thousand aircraft and 70,000 crewmen (Maggioni 2004:46).

There was little development on the flight line at this time, with the exception of the 1943 construction adjacent to the WPA hangar (Building 1206) of a metal open-ended pre-fabricated Butler hangar, Building 1290 (referred to in World War II as Hangar #4), largely completing construction on the flightline during the war. By this time the

Flightline Area began taking on some of its modern appearance. Many of the World War II flightline buildings, even some of the temporary wood structures, would last into the early years of the twenty-first century. All would be reused by the military during the Cold War.

Transitions: 1945-1950

After Germany's surrender in May 1945 Hunter Field became a processing point for aircraft and crew transferring from the ETO to the Pacific War, which ended in August 1945 with the dropping of atomic bombs on Hiroshima and Nagasaki. Subsequently the base served until December 1945 as a separation center for discharged personnel and as an accumulation point for aircraft being transferred to other bases (Maggioni 2004:48-49).

In early 1946 control of the airfield reverted back to the Savannah Municipal Airport, which now had an excess of infrastructure for their operations. Municipal Airport and private airline offices moved back to the Municipal Airport Building. Buildings 811, 813, and 1206 were used as civilian hangars. Building 1290 was used to store aircraft until October 1947, when a hurricane stripped the facility of its roofing, leaving it a skeletal metal shell (HAAF Re-Inspection Fire Protection and Security Report Section II Supplement, 21, 24, 25 November 1947, Accession 51-A-1, Records of the War Assets Administration Record Group 270 [RG 270], National Archives and Records Administration [NARA] Atlanta; Letter from Zone Fire Protection Engineer, Original Security and Fire Protection Report, HAAF, 10 December 1946, Accession 51-A-1, RG 270, NARA Atlanta) (Fig. 2.14). The city expanded one of the runways to 7000 feet to accommodate larger, more modern aircraft, but did little else to the rest of the massive installation. Cracks and weeds appeared in the parking apron and along the runways, and the hundreds of unused wood World War II buildings began to decay (Maggioni 2004:58, 62) (Fig. 2.15).

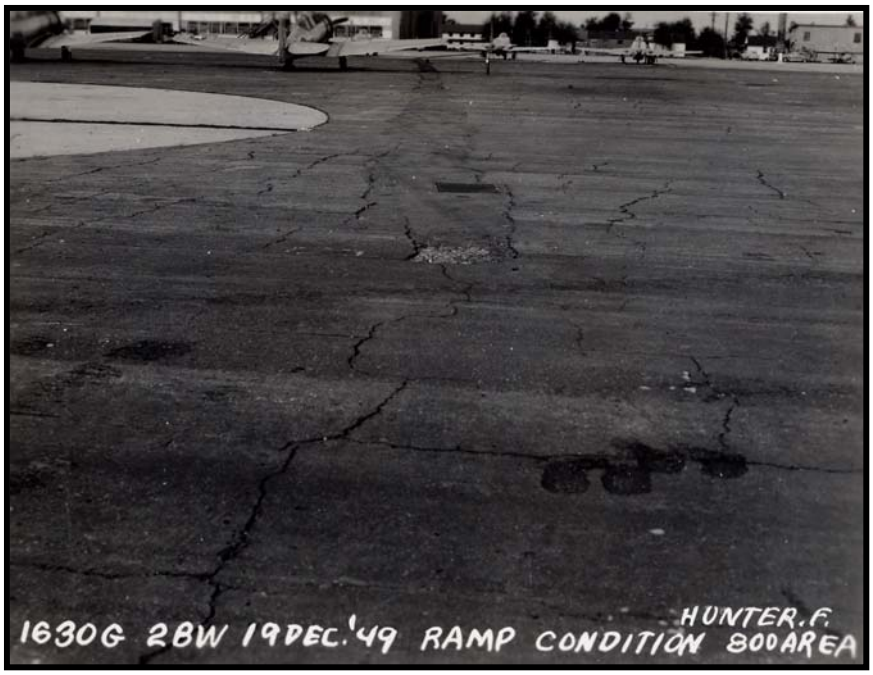

Fig. 2.15 Condition of the north parking apron in 1949. Note Building 813 in the left background and the heat plant, Building 812, on the right.

The 2nd Bomb Wing of the US Air Force Strategic Air Command moved from Davis-Monthan AFB in Arizona to nearby Chatham Field in 1948. Finding the infrastructure at Chatham Field unsatisfactory, SAC arranged with the city of Savannah to exchange airfields, with SAC taking Hunter Field and the Municipal Airport moving to Chatham Field (Maggioni 2004:62). In early 1950 Hunter AFB became part of SAC's Second Air Force, with headquarters at Barksdale AFB, Shreveport, Louisiana (McQueen, CPT Raleigh H. [McQueen], 2nd Air Base Group History, July 1951, MFR K0805, AFHRA).*

The first SAC aircraft stationed at Hunter AFB were not bombers, but transport aircraft of the 2nd Air Base Group, which occupied the base in early 1950, months prior to the arrival of the bomb wing (McQueen, 2nd Air Base Group History, June 1951:9, MFR K0805, AFHRA). SAC inherited a crumbling World War II-era air installation and its primary concern was to stabilize the operations infrastructure (largely ignored since the end of the war), upgrade on-post living and working conditions, and finally to modify and renovate the operations facilities to handle two jet bomber wings. It was a breathtakingly massive undertaking, and replicated in dozens of World War II-era air installations in the US as SAC expanded and upgraded its air fleet and base installations in the 1950s. Work began in January 1950, almost a year before the 2nd Bomb Wing's aircraft arrived, with the renovation of the remaining World War II buildings, and the planning and construction of nosedocks, washracks, a perimeter fence, and a special weapons loading/training facility, Hardstand 13 (Figs. 2.16, 2.17, and 2.18) (MacDonald, CPT Earle F., 2nd Air Base Group History, May 1950:21, MFR K0805, AFHRA).

* Other installations in the Second Air Force included MacDill AFB in Tampa, Florida, Turner AFB in Albany, Georgia, and Ramey AFB in Puerto Rico (McQueen History 2nd ABG July 1951, MFR K0805, AFHRA).

Fig. 2.16 Runway repair work at Hunter AFB in August 1950. From the John Baker Collection, Mighty Eighth Air Force Museum.

Fig. 2.17 Laying the foundation at Hardstand 13, November 1950. From the John Baker Collection, Mighty Eighth Air Force Museum.

While the Air Force renovation went on, civilian flight operations continued until 30 September 1950, when the switch occurred. That day the 2nd Bomb Wing and its aircraft were transferred to Hunter AFB, while Municipal Airport operations switched to Chatham Field (Byrd et. al. 1998:61). The 2nd Bomb Wing began air, ground, and simulation training and operations at the installation upon its arrival, which continued uninterrupted throughout the development of flightline infrastructure and the construction of the new runway. Because SAC had stationed only one wing at Hunter AFB, the impacts of development on operations and maintenance were minimal (Fig. 2.19).

Fig. 2.18 Construction of Building 1237 at Hardstand 13, November 1950. From the John Baker Collection, Mighty Eighth Air Force Museum.

Initial SAC Development: 1950-51

In accordance with direction from higher headquarters, the installation Engineering Section and the Savannah District Corps of Engineers planned Hunter AFB's rehabilitation and expansion to support two SAC jet bomber wings. Utilizing a local architecture and engineering firm, Thomas and Hutton, Hunter AFB conducted surveys and began development of a master plan (McQueen, 2nd Air Base Group History, March 1951:29-30, MFR K0805, AFHRA).

Bureaucratic conflict between the installation and a micromanaging SAC headquarters delayed planning in mid-1951(McQueen, 2nd Air Base Group History, April and June 1951, MFR K0805, AFHRA). In spite of this, the installation consulted with planning boards and got local approval to install a much longer east-west runway, necessary for the jet bombers projected to be issued within a few years (McQueen 2nd Air Base Group History, March 1951:29-30, MFR K0805, AFHRA). Installation of the new runway remained contingent on the acquisition of 2800 acres of land stretching to the southwest to the Little Ogeechee River. Working in close cooperation with the city, the installation bought or condemned the property in 1950-51 (Maggioni 2004:64; McQueen, 2nd Air Base Group History, March 1951:29-30, MFR K0805, AFHRA). Construction on the runway commenced on 28 May 1951 (McQueen History of Hunter Air Force Base, May 1951, MFR K0805, AFHRA). Aircraft continued to use the old World War II northeast-southwest runway during construction (McQueen, 2nd Air Base Group History, April 1951, MFR K0805, AFHRA).

Concurrent with its work on the new runway, the installation also designed and built structures related to flight operations, including the current Building 1295, a crash/fire station, erected by the Jerome Construction Company of Savannah on the flightline in 1951 (McQueen, 2nd Air Base Group History, June 1951:15, MFR K0805, AFHRA). Unfortunately a more important operations facility took longer to complete.

The installation recognized by July 1951 that its World War II air tower, although having excellent lines of sight to all points of the old runways, had limited observation of the new runway. The installation required a tower at a new site to oversee the runway in its entirety. In spite of this safety issue, the construction of the tower was not completed until 1954* (Clemens 1953; McQueen, 2nd Air Base Group History, July 1951:24, MFR K0805, AFHRA).

Early SAC Maintenance Operations: 1950-53

SAC maintenance crews worked under very primitive conditions during the first few years at Hunter AFB. The old World War II hangars, too small for B-50s, were used primarily as maintenance shops, which remained largely unmodified for specialized shop work. Maintenance on components that could not be physically removed from the aircraft primarily occurred either on the open flightline, under portable canvas-covered maintenance stands on the flightline, or in nosedocks.

Ephemeral in nature (Hunter AFB went through about four types from 1950 to 1955), with only a bare amount of shelter offering protection over the aircraft wings, most maintenance occurred at these docks. The 2nd Air Base Group constructed nosedocks on Hunter AFB in 1950, prior to the arrival of the 2nd Bomb Wing in anticipation of handling the wing's B-50 aircraft. The nosedocks remained the "workhorse" maintenance facilities of Hunter AFB's flightline. This held true for every SAC base in the early 1950s before the double cantilever hangar build-out began in 1953 (Weitze 1999:62). The 2nd Bomb Wing docks were erected along the north parking apron and also between Buildings 1206 to the south and the municipal airport building to the north (Figs. 2.20 and 2.21).

Early maintenance-support improvements on the flightline included construction of concrete B-29 and B-50 washracks and the erection of temporary metal administration, shop, storage, and support buildings along the flightline, all of which have since been demolished. By late 1951 the installation had assembled a "portable maintenance hangar" for engine repair of B-29s and B-50s, and the installation submitted for approval plans to enclose the ends on Building 1290, so the building could be adapted for shop purposes (Meador, 2LT Harry E., 2nd Air Base Group History:25, MFR K0805, AFHRA).

SAC maintenance operations at Hunter AFB and other bases were heavily influenced by experience gained in World War II. The rapid wartime expansion of the US Army Air Forces (USAAF) created a shortage of experienced mechanics, which

> "…prompted a high degree of specialization: teams and functional groupings of maintenance personnel were established in a dock system where hangar crews accomplished scheduled inspections in accordance with jobs that were sequenced. For each task, people were trained solely

* The tower was located to the southwest of the parking apron. The Army mitigated the facility in 1999 and demolished it in 2003 after building a new, taller air traffic control tower.

> against that task. Workflow through the dock was carefully scheduled, and postdock maintenance was developed to clean up carryover work… The result, organizationally, was a mandated, highly structured organization to manage these specialized assets." (George et. al. 2004)

The evolution of this specialized, dock-based system set the stage for the post-war SAC maintenance system. In August 1945 the US Army Strategic Air Forces (forerunner to Strategic Air Command) published Regulation 65-1, Combat Maintenance Procedures. This publication established a decentralized maintenance section with a centralized wing Maintenance Control, and provided for specialized maintenance organizations (George et. al. 2004). This first SAC system established the air base group as the primary provider of specialized maintenance, but by 1950 SAC began to shift responsibility for this maintenance back to the flying units (wings).

Hunter AFB reorganized its tactical and base units along these lines in February 1951. The tactical squadrons of the wing conducted their own general maintenance, but the wing, as opposed to the 2nd Air Base Group, now controlled specialized maintenance organizations. Under the 2nd Bomb Wing, these consisted of the 4210th Armament and Electronics Maintenance Squadron (AEMS), the 2nd Field Maintenance Squadron (FMS), and the 4210th Organizational Maintenance Squadron (OMS).

The 4210th Armament and Electronics Maintenance Squadron (AEMS) worked on so-called "black box" aircraft components, removable technical instruments that aided the crew in bombing, navigation, and communication tasks. The kinks were evidently still getting worked out of the system as of July 1951. According to the 2nd Bomb Wing history the "[a]rmament and electronics equipment maintenance is definitely on the upswing as a result of improved coordination between squadron engineering people and personnel of the A & E Organization…" (Kenney, MAJ Robert M. [Kenney], 2nd Bomb Wing History, July 1951:15, MFR M0244, AFHRA)

The 2nd FMS supplied the major specialized maintenance needs for the wing's flying squadrons. A sampling from their March 1951 history illustrates various specialized jobs conducted by the FMS, including a general overhaul of a B-50, a modification of B-50 bomb bay tank, the repair of a leak on a B-50 fuel cell, replacement of a rudder, tech orders on sixty propellers, the replacement of 55 B-50, six B-25, and three KB-29 propellers, and the repair of twenty aircraft wheels. The FMS conducted work in the open on the flightline or in nosedocks. Shop and administrative space for the 2nd FMS was initially scattered in various buildings on the flightline and in temporary World War II wood structures across Lightning Road.

The 4210th Organizational Maintenance Squadron (OMS) conducted aircraft inspections to spot developing problems or maintenance errors. In March 1951 the 4210th OMS completed nine major and eighteen intermediate inspections on KB-29 and B-50D aircraft, and a major inspection on a C-124 (Wilhite, LTC Robert T., and S/SGT Arthur N. Chamberlin, 2nd Bomb Wing History, March 1951:21-23, MFR M0244, AFHRA). The 4210th OMS conducted work in the nosedocks.

Fig. 2.19 The 2nd Bomb Wing Maintenance area, circa 1951. From the John Baker Collection, Mighty Eighth Air Force Museum.

Wing Maintenance Control ostensibly supervised the wing's maintenance activities. However, it is evident supervision was initially loose and there was little guidance on how to organize a control system. The installation began developing a system of coordinating the work of a multitude of aircraft technicians from various maintenance squadrons and shops on the same aircraft. By December 1951 Maintenance Control came up with a new board system "for the purpose of indicating the work of each assigned specialist as he progresses from job to job. The 2nd Field Maintenance Squadron and the 4210th Armament and Electronics Squadron are thereby minimally controlled as far as specialist assignment is concerned." (Kenney, 2nd Bomb Wing History, December 1951:7, MFR M0244, AFHRA)

The 308th Bomb Wing Arrives: 1952

In April 1952 SAC transferred the 308th Bomb Wing from Topeka, Kansas, to Hunter AFB. The installation assigned the 308th to the east edge of the flightline for its maintenance operations, while the 2nd now operated along the north edge. Together the three units—the 2nd Air Base Group, the 2nd Bomb Wing, and the 308th Bomb Wing—formed the 38th Air Division).* The additional bomb wing compressed space on the flightline, and the 2nd Bomb Wing was forced to consolidate many of its squadrons and sections into single buildings. This turned out to be a blessing as this increased efficiency and coordination within and among the various squadrons (Kenney and T/SGT W. J. Hively [Kenney and Hively], 2nd Bomb Wing History, April 1952:1, MFR M0244, AFHRA).

* For a brief time the installation also supported the transport aircraft of the 3rd Strategic Support Squadron (Kenney and Hively, April 1952:10, MFR M0244, AFHRA).

Fig. 2.20 Nosedocks erected north of Building 1206 (right), circa 1951. From the John Baker Collection, Mighty Eighth Air Force Museum.

Fig. 2.21 Wood Castle Docks of the 2nd Bomb Wing arranged along the north edge of the parking apron. From the John Baker Collection, Mighty Eighth Air Force Museum.

Although segregated between the bomb wings, Aircraft maintenance continued as before, either in the open on the flightline or in nosedocks. The old World War II hangars on the north (for the 2nd) and east (for the 308th) edges of the apron, new temporary buildings on the east apron, and some older World War II buildings across Strachan Drive, held the maintenance shops.

The 2nd continued to train for global bombardment missions. On the other hand, the 308th was a new unit, not rated combat-ready, and lacked its full complement of aircraft for much of 1952. For a time the 308th became a conduit unit for Air Force personnel transferring to the Far East Air Force (FEAF) to serve in the Korean conflict, causing constant personnel turnover that adversely affected the 308th's combat readiness operations at Hunter AFB.

Perhaps the installation's most important contribution to initial Cold War operations was support of wing rotation missions, which for the 2nd and 308th Bomb Wings involved ninety-day deployments to North Africa and the United Kingdom. These exercises brought the bombers within range of their principal target—the Soviet Union—and offered practice at large-scale operations. The flightline acted as a staging area for these deployments. Maintenance personnel working along the flightline accompanied the bombers overseas to continue maintenance work.

Maintenance personnel also supported wing rotation by building, storing, maintaining, loading, and unloading flyaway kits. Flyaway kits enhanced SAC mobility by acting as an airborne base supply, with spare parts (including spare engines) and containers with essential supplies. Each squadron was responsible for its own flyaway kit, which could provide bare-bones maintenance and operational essentials for at least thirty days (Futrell 1961). At Hunter AFB flyaway kits were stored in temporary storage buildings and sheds, as well as in the old World War II hangars. Because of their importance to wing mobility flyaway kit assembly and storage became a primary activity along the flightline at Hunter AFB and other SAC bases in the 1950s (Fig. 2.22).

Hunter AFB Flightline Maintenance and New SAC Regulations: 1952-1953

Concurrent with the development of its installations and aircraft inventory, SAC improved its aircraft maintenance system in the early 1950s. SAC considered aircraft maintenance as a form of industrial production, and began applying scientifically developed mass-production techniques to its maintenance operations. In 1952-53 Hunter AFB participated in SAC-wide efforts to further standardize and streamline maintenance operations and played a key role in developing a comprehensive SAC maintenance system when it service-tested SAC manual 66-12A (Production Control for Specialized Maintenance) and 66-12B (Maintenance Quality Control) from April to July 1952 (Kenney and Hively, 2nd Bomb Wing History, April 1952:20, MFR M0244, AFHRA). Hunter AFB completely implemented 66-12 after July, finding that "[n]o further changes in the system are expected as the tests have proven acceptable for the production control methods of a medium bomb wing." (Green, CPT Albert B., and A/2C Idus B. Newby [Green and Newby], 2nd Bomb Wing History, July 1952:22, MFR M0244, AFHRA)

SAC Regulation 66-12 was designed to ensure "a functional aircraft maintenance organization within the wing/base organization" guaranteeing full use of personnel and facilities for "maximum availability of aircraft." This mandated organizational change

throughout SAC, marked the first formal move to Air Force centralized maintenance, and strengthened the position of wing Maintenance Control as primary agency responsible for centralized direction and control of wing maintenance efforts (George et. al. 2004). Other regulations implemented in 1953 further centralized supervision and strengthened wing Maintenance Control. In January 1953 the base implemented SAC Regulation 66-13, which instituted a system of maintaining aircraft status, which proved "adequate" and "very flexible." (Newby, A1/C Idus B. [Newby], 2nd Bomb Wing History, January 1953:22, MFR M0244, AFHRA) In March 1953 Maintenance Control began following SAC Regulation 66-14, which outlined reporting procedures and duties for maintenance section chiefs, shop foremen, line, dock, and flight crew chiefs (Newby , 2nd Bomb Wing History, March 1953:22, MFR M0244, AFHRA).

In addition to standardizing production control techniques for wing maintenance units, 66-12 tested the application of aircraft maintenance quality control. Wing quality control units inspected work conducted by other shops to ensure maintenance and engineering errors (called "discrepancies") were caught and kept to a minimum. Under the 66-12 test in July, 2nd Bomb Wing Quality Control conducted 61 flight tests, 28 periodic inspections, six flight line spot checks on armament and electronics work, inspected eight maintenance sections, and fifteen engine changes (Green and Newby, 2nd Bomb Wing History, July 1952:23, MFR M0244, AFHRA).

SAC regulations mostly covered general maintenance organization and operations. Specific maintenance procedures were not covered under the SAC regulations, leaving some room for installations and wings to tailor maintenance operations to their particular circumstances, in the form of base regulations or wing policy. As an example, in May 1953 the 308th issued a complete revision of all Wing Maintenance Policies (WMP). WMP 66-22, dated 13 May 1953, established an efficient flight testing system whereas all sections concerned were notified, and the specific duties of each section during a flight test are fully described. In the words of the official history, "Since this policy has been in effect it has proven very effective and many problems previously encountered have been corrected." Other new WMPs established official procedure for various sections of maintenance squadrons (Newberry, A1/C Jack W. [Newberry], 308th Bomb Wing History, May 1953:23-24, MFR N0284, AFHRA).

SAC Regulation 66-12 formally established three maintenance production squadrons: field maintenance, periodic maintenance (replacing organizational maintenance), and electronic maintenance, while retaining general maintenance sections within the flight squadrons (George et. al. 2004). By August 1952 at Hunter AFB the wing maintenance squadrons solidified as:

- Wing Flight Squadron (one tanker and three bomber squadrons per wing)
- Wing Armament and Electronics Squadron: 158 authorized personnel
- Wing Field Maintenance Squadron: 228 authorized personnel
- Wing Periodic Maintenance Squadron: 95 personnel

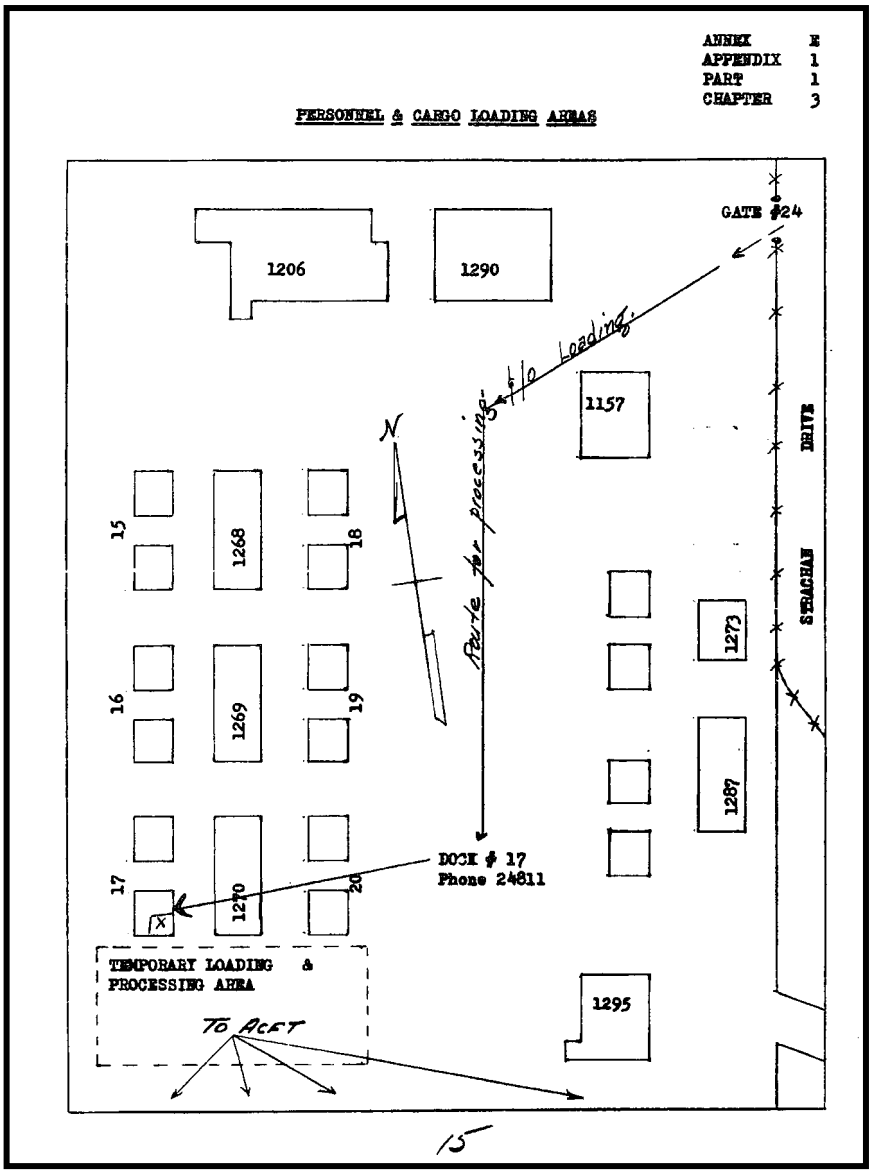

Fig. 2.22 Map showing flyaway kit loading plan for the 308th Bomb Wing, December 1955. Note the temporary nosedocks and shops to the south of Building 1206. Map from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA.

Flight Squadron Maintenance

Bomb Squadron Maintenance sections were authorized 58 men for fifteen aircraft. Squadron Maintenance sections during this time conducted routine maintenance, changed engines and master controls, and conducted all postflight inspections of aircraft. For more specialized maintenance, job orders were placed with the wing FMS or AEMS (Davis, A/1C James T. 308th PMS History December 1952 from Newberry December 1952; Ford, S/SGT Richard C. [Ford], 373rd Bomb Squadron History, April 1953, From Newberry, 308th Bomb Wing History 1-30 April 1953; Humphrey, A/2C Edward K. [Humphrey], 373rd Bomb Squadron History, December 1952, from Newberry, 308th Bomb Wing History, December 1952; and Whitefield, 1LT William F., 374th Bomb Squadron History, December 1952 from Newbery, December 1952, MFR N0284,

AFHRA). A report by the 373rd Bomb Squadron shows activities of a typical month in 1952 for flight squadron maintenance sections:

> "We are still missing several special tools used daily for trouble shooting and engine conditioning. The required number of crew chief stands are still not available… Besides routine maintenance, we had two engine changes and one master control change for the month. Three ships went to the periodic docks… There were an average of 43 mechanics and supervisors present for duty during the month." (Nunn, 2LT Dean L. [Nunn], 373d Bomb Squadron History, from Hubatch, A1/C Douglas F. [Hubatch], 308th Bomb Wing History, October 1952, MFR N0284, AFHRA)

Squadron maintenance sections physically consolidated operation and administration space during this period. For instance, the 373rd's supply section moving from Building 126, a World War II wood building north of the 2nd Bomb Wing operations area, to a maintenance dock, making supply operations to maintenance crews much more convenient (Nunn, 373d Bomb Wing History, from Hubatch, 308th Bomb Wing History, October 1952, MFR N0284, AFHRA).

The new regulations instituted in 1952-1953 decreased technical work for the flight squadrons. Earlier in the year, much of the specialized maintenance was being conducted by flight squadron ground crews, but later in the year, with implementation of the new regulations, specialist personnel were transferred from the flight squadrons to the FMS (Humphrey, 373rd Bomb Squadron History, December 1952, from Newberry, 308th Bomb Wing History, December 1952, MFR N0284, AFHRA).

However, new regulations also increased the inspection workload for the flight squadron maintenance sections with the implementation of an intense and highly thorough post-flight inspection program in April 1953. The new rules instituted a Post-Flight Chief and a separate post-flight team, stationed in its own nosedock—the 374th's Post-Flight team had Maintenance Stand #19 (Parker, 1LT Charles W., 374th Bomb Squadron History, April 1953, from Newbery, 308th Bomb Wing History, April 1953, MFR N0284, AFHRA.) During a typical month, the 373rd Bomb Squadron performed seven full post flight inspections under the new system and seven 25% inspections, with Quality Control checking each 25% inspection. Several Technical Orders for other shops were also completed (Ford, 373rd Bomb Squadron History, April 1953, from Newberry, 308th Bomb Wing History, April 1953, MFR N0284, AFHRA).

The Armaments and Electronics Maintenance Squadron

By late 1952 the 2nd AEMS operated primarily from Building 811 while the 308th AEMS was based out of Building 1206. With the implementation of 66-12 the AEMS was broken down into specialized administrative offices and nine separate shops:

- Shop Stock: Assigned tools and supplies to other shops.
- Flight Line/ Bomb Sight/Autopilot: Worked on bomb sights and the C-1 autopilot, used in B-29s. In October this shop completed 174 post-flight and pre-flight work orders, in addition to completing thirteen inspections.
- Bomb Release Shop
- Flight Line Turret Shop: Supported ten post and preflights, equal amount of preventitive maintenance each day
- Bomb Navigation Line Maintenance: Primarily worked on aircraft radar systems.
- Camera Repair: Installed, removed, and inspected aircraft cameras.
- Line Radio Section: Repaired and maintained radio equipment.
- Periodic Maintenance: This shop supported the 308th PMS during periodic inspections.
- Field Maintenance: Further divided into multiple specialized sections, such as radar, small arms, and electronic counter-measures (ECM). (Bennett 308th AES from Hubatch October 1952)

Under 66-12, in October 1952, the 308th AEMS underwent numerous changes for a more efficient operation. Operating a new shop stock system, they permanently assigned test equipment to their field, line, and periodic maintenance shops, and used a new status board system (Bennett, 1LT Val G. [Bennett], 308th AEMS History, from Hubatch, October 1952, MFR N0284, AFHRA). Continuing to implement 66-12, in January 1953, the 308th AEMS instituted a new manner of recording aircraft inspections, in such a way that noted discrepancies could be charged to specific mechanics. This allowed the AEMS maintenance supervision office to check work quality. The Periodic Maintenance section of the 308th AEMS, which assisted the 308th PMS in black box work, moved to the docks to afford the OIC and the NCOIC better control over AEMS periodic maintenance inspections. If the AEMS Periodic Maintenance section could not get its work done in time during an aircraft's scheduled dock time, the aircraft was sent back to the flight line for troubleshooting maintenance (Bennett, 308th AEMS History, October 1952, from Hubatch, October 1952, MFR N0284, AFHRA).

The Field Maintenance Squadron

The 2nd and 308th FMS were greatly affected by 66-12 and the implementation of Base Regulation 20-1, dated 7 November 1952, totally revising organizational and functional charts of all sections and shops. Both bomb wings' FMS were organized into twelve different sections and shops:

- Electric Shop
- Propeller Shop
- Ancillary Equipment Section
- Air Frame Section
- Hydraulic Shop
- Instrument Shop

- Power Plant Branch
- Machine Shop
- Sheet Metal Shop
- Parachute Shop
- Woodmill
- Paint and Dope Shop

Prior to completion of the double cantilever aircraft hangars in 1954-1955, the FMS shops were scattered over several buildings, including nosedocks and many World War II structures in the 1200 area.

The type and intensity of work for FMS shops during this time period can be gleaned from the 308th FMS history for November 1952. The Electrical shop had an average of eighteen Specialist Job Order Requests (SJOs) per day from Specialist Dispatch, with the biggest work loads being for electrical specialists for dock inspections, with the section working "overtime on many occasions in order to complete inspections set up by Maintenance Control." The Power Plant Branch maintained the engine build-up line, and prepared eighteen fly-away engines, completed three turbo changes, four engine changes, two cylinder changes, six master control changes, and built up four engines. The Sheet Metal Shop completed seventy SJOs in assisting the 308th PMS in its dock inspections. The Parachute Shop fabricated various cloth items such as dust covers, wind socks, flags, aviator bags, and toolkits, including spending over 1400 man hours on aircraft fabric repair and parachute and life raft maintenance (Burchfield, S/SGT, 308th FMS History, November 1952, from Hubatch, November 1952, MFR N0284, AFHRA).

The Periodical Maintenance Squadron

Under 66-12 the PMS primarily took over inspection duties from the OMS and implemented a more effective pre-planned inspection system (Norton, A/2C Robert E., 308th PMS History, January 1953, from Newberry, 308th Bomb Wing History, January 1953, MFR N0284, AFHRA). Within the space of six months, from October 1952 to March 1953, the 308th PMS infrastructure increased from one to three nosedocks, the PMS production, which was often tedious work (one and two hundred hour comprehensive inspections on B-29s) (Long, A/1C Paul R. [Long], 308th PMS History, October 1952, from Hubatch, October 1952; Crutchfield, M/Sgt. James R., 308th PMS History, March 1953, from Newberry 308th Bomb Wing History March 1953, MFR N0284, AFHRA). In an example of further physical consolidation of units on the flightline, the orderly room for the 308th PMS was also moved up to the flight line adjacent to the PMS docks and maintenance stands (probably in a temporary metal building) to be closer to the majority of its personnel, more convenient because of its proximity (Long, 308th PMS History, October 1952, from Hubatch, October 1952, MFR N0284, AFHRA).

Figure 2.23 Building 850 under construction, circa 1953. From the National Archives.

Construction at Hunter AFB and on the Flightline: 1952-53

Much effort was devoted at Hunter AFB in 1952 and 1953 to building housing. By late 1952 both the new pinwheel barracks for single airmen and the Wherry family housing units were under construction (Newby, 2nd Bomb Wing History, January 1953:29, MFR M0244, AFHRA). The first of the pinwheel barracks was scheduled for completion by July 1953, while the Wherry housing was also completed around that time (Tanner, 2LT Ernest G., and S/SGT Robert R. Hagan, 38th Air Division and 804th Air Base Group History, April 1953:21, AFHRA).

In 1952 SAC completed the primary east-west runway and began laying five taxiways, which were completed in 1953. Also in 1952-1953, the installation installed asphaltic concrete hardstand to connect the east parking apron to the north parking apron, and a parking/loading area to the southeast of the main apron. In 1953 the installation commenced the build-out of the north, west, and south parking aprons. This involved pouring fifteen-inch Portland concrete in the area encompassed by the old World War II runways, converting the old runways into a massive aircraft parking area. Hunter AFB also poured thirteen-inch concrete to support the projected double cantilever hangars. These projects lasted until 1956 (US Army Engineer Waterways Experiment Station 1960). The completion of the jet runway in 1952 and the subsequent construction of the parking apron from 1953 through 1956 provided Hunter AFB with the necessary hardstand to support flight operations for two jet bomber wings.

In mid-1953 the installation addressed its lack of permanent aircraft maintenance space, beginning construction on a double cantilever hangar (Building 850, see Volume I, Section 6). The hangar had originally been planned for FY 52. However, a squabble with SAC headquarters on the hangar's siting in 1951-52, and probably other factors, had delayed construction for about a year.

SAC headquarters wanted the facility sited on the northwest corner of the north parking apron, while Hunter AFB argued to place the hangar in a more central location for both planned bomb wings. The installation argued that the northeast location made more sense, as it was between maintenance areas of both bomb wings, which operated out of previously constructed facilities. Hunter AFB won out in the end and the hangar was built on the northeast corner of the apron (McQueen, 2nd Air Base Group History, April 1951:20-21, 27, MFR K0805, AFHRA). With construction starting in June 1953, completion was slated for May 1954 (Fig. 2.23) (Hively, 2nd Bomb Wing History, June 1953:26-27, MFR M0244, AFHRA).

At first the installation envisioned both wings sharing a single hangar, but by 1953 Hunter AFB planned for a second hangar sited to the south of Building 850 (Thomas and Hutton Hunter AFB Master Plan 1953). This hangar, Building 860, was constructed in 1954-55.

Hunter AFB was scheduled to receive its new B-47 jet bombers in January 1954. Although neither double cantilever hangar had been completed, by December 1953, Hunter AFB had mostly completed the minimal facilities to handle B-47 operations: a 10,500-foot runway, a Munitions Storage Area (MSA) with JATO* bottle bunkers, partial reinforcement and expansion of the aircraft parking apron, and most of the new fueling and fuel storage system. Hunter AFB did lack quality maintenance facilities for the B-47s and KC-97s. There were no enclosed hangars for general aircraft maintenance. Shop space was still primitively housed in largely unmodified World War II-era hangars, although the planning and construction of two double cantilever hangars for 1954-55 would take care of the installation's lack of completely enclosed hangar space. Until the hangars came on-line, the nosedocks remained the only sheltered maintenance space.

The B-47 Arrives at Hunter AFB: 1954

Beginning in January 1954 SAC gradually issued the B-47s to Hunter AFB. At the end of January all bomb squadrons had received four or five B-47s a piece, about one-third of their total complement. By February "[t]he shrill piercing whine of the B-47 jet engine and the deafening roar of the big bird on its take-off roll have become ordinary work-a-day sounds at Hunter Air Force Base." (Atkinson, S/SGT Carl A. [Atkinson], 308th Bomb Wing History, February 1954:14, MFR N0286, AFHRA) Hunter AFB's bomb wings spent much of early 1954 continuing aircrew instruction on flying the new

* JATO stands for Jet-Assisted Take Off. These were jet boosters used underneath the wings of jet bombers to assist take-off (Maggioni 2004:84).

jet aircraft. Later in the year both wings received their full complement of aircraft, forty-five B-47 bombers (divided into three bomb squadrons) and twenty-two KC-97 tankers.

Hunter AFB worked to streamline future B-47 and KC-97 operations by updating policies and standard operating procedures. These changes covered everything from individual aircrew duties to the pre-flight inspection procedure (Operations Memorandums, from Sonovich, S/SGT John [Sonovich], 308th Bomb Wing History, January 1954, MFR N0286, AFHRA). For instance, during conversion from B-29 to B-47, "the duties of the crew chiefs and assistants prior to and during the periodic inspection of their aircraft were not firm." The 308th issued a revised Wing Maintenance Policy to incorporate the new duties of the crew chief and his assistant when taking aircraft through periodic maintenance docks (Sonovich, 308th Bomb Wing History, January 1954:28, MFR N0286, AFHRA).

The introduction of B-47s necessitated some revision of Hunter AFB's current maintenance system. The revision was accomplished with assistance from Second Air Force headquarters beginning in February 1954, introducing a standard aircraft maintenance planning and scheduling procedure (Atkinson, 308th Bomb Wing History, February 1954:32, MFR N0286, AFHRA).

In addition to updating maintenance policy and procedure (yet again!) the maintenance crews, accustomed to working on B-29s and B-50s, had to be retrained as well. In fact, personnel for all specializations, from the lowliest mechanic to aircraft commander, required intensive retraining for the transition to B-47s. SAC sent Hunter AFB flight crews to McConnell AFB in Kansas for initial flight training on the B-47. The B-47s had more electronic components than the prop-driven bombers, so Hunter AFB sent its technicians to various schools at AFBs across the country for specialized maintenance training. For instance, as early as January 1953 the 308th AEMS sent personnel to Lowry Field, Colorado to be instructed on the B-47 bombing/navigation instruments, known as K-System (Bennett, 308th AEMS History, January 1953, from Newberry, January 1953, MFR N0284, AFHRA).

The B-47 Mobile Training Detachment provided on-site B-47 maintenance training for the flightline mechanics (Sonovich, 308th Bomb Wing History, January 1954:14-17, 26, MFR N0286, AFHRA). The wing also provided courses for training its armament and electronics shop mechanics on the new bombing, navigation, and auxiliary power systems on the new jets. Instructors from General Electric, United Aircraft, and the Boeing Corporation also visited the base to instruct mechanics on control systems, landing gear, airframe repair, electrical system, engine, and propeller maintenance for the B-47 and KC-97s (January Master Ground Training Schedule, from Sonovich, 308th Bomb Wing History, January 1954, MFR N0286, AFHRA).

Hunter AFB's Roles in the SAC Mission: 1954-1957

In the mid and late 1950s SAC was the centerpiece of early American Cold War strategy: the deterrence of Communist aggression through the promise of massive nuclear and thermonuclear retaliation, delivered by jet bombers. General Curtis LeMay, SAC's pugnacious commander from 1948 to 1957, instilled in his command a necessary aggressive edge, honed by a constant cycle of ground and in-flight training for the unthinkable.

The 2nd and 308th Bomb Wings were an integral part of SAC during this period and participated in exercises supporting overall American Cold War policy. This meant both wings had the capacity and expertise to precisely deliver nuclear and thermonuclear weapons to Soviet targets. SAC installations at this time did not have these "special weapons" permanently stored at its air bases. The government stored the weapons in special MSA's called "Q Areas" at four National Storage Sites (NSS) and, multiple Operational Storage Sites (OSS), all adjacent to Air Force air bases. Nuclear and Thermonuclear weapons operations at Hunter AFB are still classified. However SAC used at least two methods of nuclear and thermonuclear weapon deployment from its OSS and NSS in the early and mid 1950s, and the installation certainly participated in both types.

The first involved MATS (Material Air Transport Service) aircraft loading the weapons at the NSS or OSS and ferrying them to the air base for temporary storage for exercises and missions. A structure built west of Building 1252 (since demolished, see Figs. 2.24 and 2.25) may have been used for this purpose on the installation (Maggioni 2004:71).

Another early special weapon deployment method involved the wings flying to the NSS or OSS to pick up the weapons, prior to flying missions. An operation of this type called Top Hat/Fly Right occurred seven months after the 38th Air Division received its new B-47s. The operation successfully put into practice all phases of the Division's special weapons training, and called for 2nd and 308th Bomb Wing B-47s to fly to Campbell AFB, Tennessee (the site of the Clarksville NSS), load special weapons, and proceed to a refueling operation off the North Carolina coast. Top Hat/Fly Right was a significant event for Hunter AFB, marking the 38th Air Division as a fully combat-ready and nuclear-capable jet bomber unit (Maggioni 2004:86).

Although Hunter AFB did not have an adjacent Q Area, the installation did have Hardstand 13, a Special Weapons Training Area. Partially designed by SAC Headquarters at Offutt AFB, Nebraska, Hardstand 13 was built by the Jerome Construction Company of Savannah as one of the first new SAC buildings at Hunter AFB (Figs. 2.18 and 2.26). The Army demolished Hardstand 13 in the 1980s and it is currently the site of the Building 1336 motorpool.

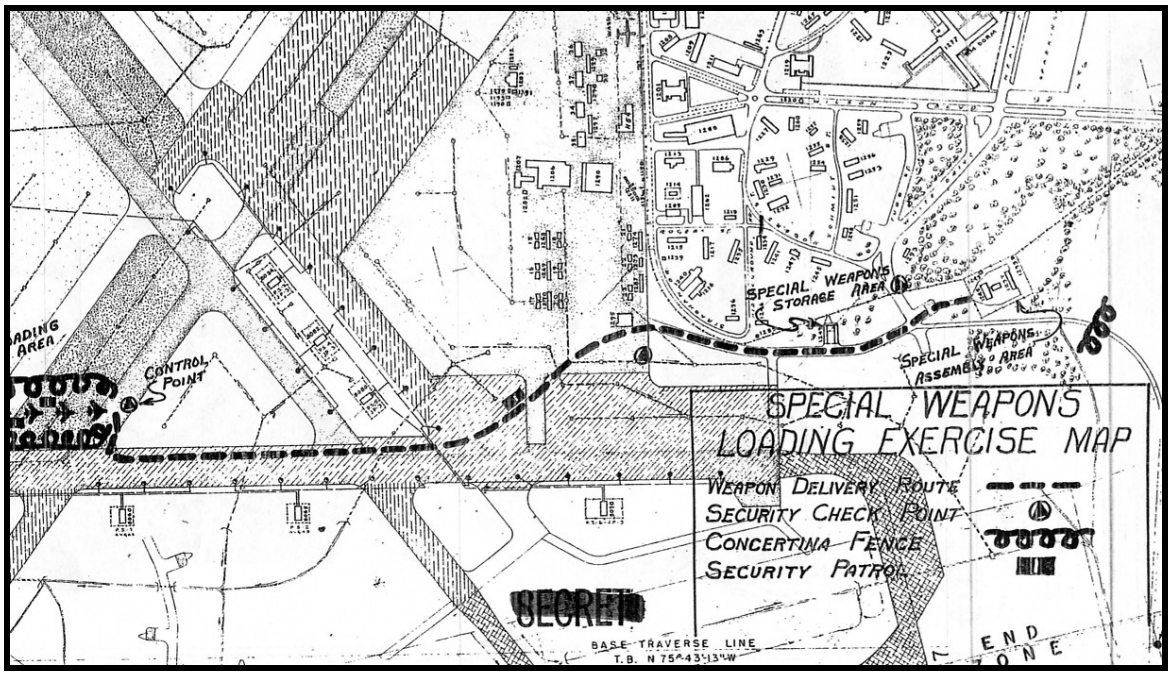

Fig. 2.24 An April 1954 map showing the special weapons storage building and Hardstand 13 (labeled "Special Weapons Assembly Area"). From Atkinson, 308th Bomb Wing History, April 1954, AFHRA.

Fig. 2.25 View from Building 1252 (visible at left) towards the former site of the temporary special weapons storage building, on the right of the photograph across Lightning Road. Photograph by David Diener, FMR, Volume II, Section 15.

Fig. 2.26 Hardstand 13's entrance gate, December 1950. From the John Baker Collection, Mighty Eighth Air Force Museum.

The 2nd Bomb Wing personnel trained on nuclear weapon mock-ups at Hardstand 13 from the December 1950 (for training on the much more powerful thermonuclear weapons, the installation sent its munitions personnel to Lowry AFB, Colorado) (Maggioni 2004:72). Training at Hardstand 13 assisted the 2nd Bomb Wing in attaining combat-ready nuclear capable status on their B-50s by 1951-52. 308th Bomb Wing personnel began training at Hardstand 13 by 1953.

Hardstand 13 also had a role in directing special weapons operations at Hunter AFB. Although Hardstand 13 was set about 1600 feet from the Flightline, it was connected by Strachan (Lightning) Road. Early practice special weapons operations involved towing dummy atomic weapons from Hardstand 13 and loading them on waiting aircraft parked on the on the parking apron or runways (Fig. 2.24).

In addition to technical training on special weapons, Hunter AFB aircrew had to sharply hone their flight skills in 1954-55 because of new aircraft and changing doctrine. The introduction of the B-47 revolutionized bomber tactics. Unlike B-29s and B-50s, jet bombers did not have to rely on group formation flying--instead, speed and maneuverability became its greatest defense. With the B-47, bomber tactics now involved individual aircraft invading enemy airspace timed to confuse air defenses, and to hit as many targets as soon as possible. This required much more skill than the average World War II bomber crew possessed. With the coming of the jet bomber, Hunter AFB and other installations carried out much more intense air crew training, including both simulator and practice missions (Fig. 2.27) (Maggioni 2004:85).

Both bomb wings continued overseas wing rotations, necessitated by the relatively short range of the B-47 and a shortage of tankers. Although B-47 units

stationed north of forty degrees latitude could make a bomb run to the Soviet Union, southern installations like Hunter AFB had to be supported by extensive air refueling support. It was easier to temporarily station units closer to the Soviet Union in North Africa, where bases were protected from a Soviet offensive by the Mediterranean and could also threaten the right flank of just such an attack. From 1953 to 1956 both bomb wings had been on rotation to Nouaesseur and Sidi Slimaine at least twice (Maggioni 2004:86).

Hunter AFB also took part in SAC alerts, which initially aimed at evacuating as many aircraft as possible in case of Soviet air attack. Upon direction of SAC headquarters, Hunter AFB and other SAC installations called occasional practice alerts. In the words of one SAC veteran of the 2nd FMS,

> "…[I]t was not uncommon for them to all of a sudden blow the whistle and place the base on alert as practice… [SAC Headquarters or Second Air Force would bring] an inspection with them, they evaluated everybody as to what their job was and to how well it was carried off… [W]e had mass alerts where we'd fly everything off the base... and could clean this base completely of aircraft in approximately six hours." (Wilson 2003)

Alerts gradually evolved into an offensive exercise because of the intercontinental ballistic missile (ICBM). Although neither the Soviets nor the West had ICBMs, SAC planners realized it was only a matter of time before the capability was developed. Once the enemy had functioning ICBMs, SAC aircraft would only have thirty minutes' warning prior to an ICBM strike (Maggioni 2004:90).

In 1955-1956 SAC developed the one-third ground alert concept, envisioning a third of SAC aircraft on full alert and war configuration, ready to take off within fifteen to thirty minutes. SAC chose Hunter AFB for Operation Try Out, which tested the concept. Under Try Out, from November 1956 to March 1957 the installation was placed on one-third alert (Maggioni 2004:93). The stress on both air crews and supporting maintenance personnel was enormous. Doug Wilson, an airman with the 2nd FMS, recalls, "…[W]e didn't go off the flightline for three months. I slept on mattresses brought in from the barracks on the hangar deck. The messhall brought bag lunches… and we lived and worked right out of the hangar [Building 850]…" (Wilson 2003) A munitions squadron veteran recalls, "…[T]hey moved us up… where the current fire station is up there [Building 1295], and we stayed… in tents… we would load the nuclear weapons, the small arms ammunition, and sometimes JATO bottles…" (Kerr 2002)

These preliminary ground alert operations at Hunter AFB highlighted facility, organizational, operational, materiel, and personnel problems inherent within the alert concept. Hunter AFB could only launch its first alert aircraft in fifteen minutes, not the hoped-for seven minutes. However this initial test proved the concept entirely feasible. By October 1957 SAC began implementing the ground alert concept on all of its installations in response to the launching of Sputnik, the first man-made satellite, which demonstrated the much-feared Soviet ICBM capability (Maggioni 2004:95-97).

Fig. 2.27 A postcard view showing B-47s on the Hunter AFB parking apron. Note the MPs with guard dogs. Courtesy US Army.

Under Try Out, Hunter AFB played a crucial role in testing the ground alert concept, which was the first SAC doctrinal response to the Soviet ICBM threat. Although the importance of bomber ground alert declined as SAC's ICBM fleet came online in the early and mid 1960s, its bomber fleet continued to use the same alert concepts originally tested at Hunter AFB up to the end of the Cold War.

The Flightline Maintenance System: 1954-1956

From 1954 to 1956, construction of maintenance facilities continued apace with training and practice missions. The installation had completed both double cantilever hangars (Buildings 850 and 860) and had heavily renovated World War II-era buildings to accommodate shop, administration, and maintenance space on the Flightline. Upon their completion the two double cantilever hangars marked the dividing line between the wings' respective maintenance operations, which "afford[ed] good control of maintenance operations," according to the 1960 Hunter AFB Master Plan (Thomas and Hutton 1960). In 1955-56 Hunter AFB replaced its old B-47 nosedocks with fully-enclosed metal nosedocks designed by the Industrial Machine and Tool Company. Buildings 834, 843, 844, and 845 are the last remnants of these nosedocks (see Volume I, Section 8). With the improvement in existing buildings, the construction of new facilities, the replacement of prop aircraft with jet bombers, and the implementation of standardized SAC maintenance procedures, the Hunter AFB flightline and its maintenance system had reached full maturity.

SAC required its bomb wings to fly a set number of sorties (individual aircraft flights) per month, requiring a certain projected number of maintenance and inspection hours. In December 1955, a typical month, 308th Bomb Wing maintenance personnel supported 180 B-47 sorties (Batjer, COL John F. [Batjer], Maintenance Plan and Schedule, 308th AEMS, from Howe, M/SGT Andrew B. [Howe], 308th Bomb Wing

History, December 1955, MFR N0290, AFHRA). Of these, the 373rd Bomb Squadron provided 62 sorties for a total of 351 hours of flight time. Because each aircraft had to undergo a preflight inspection prior to takeoff, the 373rd required 62 preflight inspections and 21 postflight inpections (Batjer, Maintenance Plan and Schedule, 373rd Bomb Squadron, from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA).

The wing's flight squadron maintenance sections worked on the open flightline and out of the nosedocks lining the north and east edges of the parking apron, performing pre-flight inspections and general maintenance. Preflight inspections were conducted by squadron maintenance and aircrews. In addition to pre-flights, Maintenance Control scheduled approximately one third of a squadron's aircraft to undergo post-flight inspections conducted by the PMS (Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA). Each month Maintenance Control would also assign three or four of a squadron's aircraft for comprehensive periodic inspections by the wing PMS.

The PMS looked for both developing maintenance problems and maintenance errors or "discrepancies" during their comprehensive inspections, which lasted twenty days for B-47s. For a periodic inspection the B-47s spent eight days in-dock, with the other twelve days taken up with forms checks, pre-dock meetings, washrack cleaning, and a test flight prior to its return to the tactical squadron (Wing Maintenance Policy #66-9, 4 January 1954, from Sonovich, 308th Bomb Wing History, January 1954, MFR N0286, AFHRA). Because periodic inspections lasted much longer than other aircraft inspections, bomb wings eventually assigned three specific nosedocks to their PMS to handle periodic inspections (Fig. 2.28).

For specialized maintenance needs the flight squadron or the PMS would call in job orders to wing Maintenance Control, which, for the 2nd Bomb Wing, operated out of Building 811 and for the 308th Bomb Wing, from Building 1290. Maintenance Control, using plexiglass aircraft status boards, carefully controlled and coordinated all work on aircraft, and would then assign jobs to either the wing FMS or AEMS (Maggioni 2004:89) (Fig. 2.29).

The FMS contained the specialized mechanical shops for the highly technical B-47s and KC-97s and specialized in major engineering, electrical, and mechanical work. In December 1955 the FMS had thirteen different shops: Jet Engine, Instrument, Fuel Systems, Wheel and Tire, Hydraulic, IFR, Aero Repair, Electric, Machine, Paint, Welding, Parachute, and Sheet Metal (Batjer, Maintenance Plan and Schedule, 308th FMS, from Howe 308th Bomb Wing December 1955, MFR N0290, AFHRA). The FMS had more personnel than any other squadron in the wing, in order to support its multiplicity of specialized shops.*

* Strengths of the units varied depending on availability of personnel. As an example of typical unit strengths, in April 1956 the 308th AEMS had 337 men and 13 officers, the 308th FMS had 417 men and 8 officers, and the 308th PMS had 106 men and three officers (Batjer, Wing Operations and Maintenance Plan, from Howe, 308th Bomb Wing History, April 1956, MFR N0290, AFHRA). The maintenance units were heavy on enlisted personnel, as opposed to the flight squadrons of which nearly half were officers.

Fig. 2.28 A May 2005 view of the former 2nd Bomb Wing nosedocks. The 2nd Bomb Wing's Flight squadrons and PMS conducted inspections and maintenance at these facilities. Photograph by David Diener, FMR, Volume II, Section 15.

The FMS for both wings operated from the new double cantilever hangars, with the 2nd FMS in Building 850 and the 308th FMS in Building 860 (Fig. 2.30). Work on aircraft would occur inside the hangars or on the flightline, unless a mechanical component needed such extensive work that it needed to be removed to a shop. Depending on facility requirements, some shops in the FMS were housed away from the double cantilever hangars. For instance, the 2nd FMS Engine Shop was located in Building 813 and the 308th FMS Engine Shop in Building 1206.

The AEMS primarily conducted work in their shop buildings on equipment removed from aircraft. However, AEMS also kept a line crew in the building to respond to service calls from hangars, nosedocks, or the flightline for in-place inspections and repairs, or to remove equipment for later servicing ("Planning Buildings for the US Air Force," Architectural Record, 1952). According to Jack Burr, a 308th AEMS airman, the worst jobs he had at Hunter AFB involved technical work on the open flightline, "When it was icy cold, and I had to get up and work on the flightline, and I had to get up on one of those aluminum aircraft… and replace an HF antenna [which] was a wire strung between the tail of the aircraft to just below the copilot's seat…" (Burr 2002)

By 1955-56 the AEMS had six shops: Bombardment/Navigation (primarily working on the B-47's K-System), A-5, Bomb Release, Camera, and Auto-Pilot shops (Batjer, Maintenance Plan and Schedule, 308th AEMS, from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA). As an example of a typical monthly workload, in December 1955, the 308th AEMS accomplished 180 pre-flight inspections, assisted the 308th PMS in 56 post-flight inspections, and conducted a periodic inspection. The main shop building for the 2nd AEMS was out of Building 811, while the 308th's at this time was Building 1290 (Figs. 2.31 and 2.32).

Figure 2.29 Building 811 (left) housed 2nd Bomb Wing Maintenance Control, which supervised all wing maintenance operations, including those in Building 850 (center) and the nosedocks (Building 845, right). A May 2005 Photo by David Diener, from the FMR, Volume II, Section 15.

For specialists, work on the flightline could involve a considerable amount of travel between nosedocks, aircraft parked on the apron, and their shops. A flightline "taxi service" had been initiated in mid-1953, using military trucks or civilian-type automobiles. Some airmen also used motor scooters to get them around on the flightline (Clear, S/SGT. 308th FMS, from Watson, T/SGT Curtis H., 308th Bomb Wing History, June 1953, MFR N0284, AFHRA; Wilson 2003). After work was completed on the aircraft, it was then inspected by wing Quality Control, which checked for maintenance discrepancies. Doug Wilson of the 2nd FMS recalls the way the system worked in 1955-1956:

> "When… there was a broken aircraft… [t]hey called… Maintenance Control… upstairs in [Building 813], that's [also] where the [Quality Control] people were at… You called them when you needed Quality Control to come out there and inspect an airplane. But you called the work order in to Maintenance Control.
>
> "The way that would develop is… if the problem came up, the crew chief would… get a hold of his maintenance truck, which they had a roaming flightline truck, they would call on the [truck's] radio to Maintenance Control and say, 'I've got a Number Two generator doesn't work.' Maintenance Control would call down, they would look at… a large plexiglass board that had all the aircraft and the status of each aircraft. And they scheduled you in to work on that airplane, based on what was wrong with it.

"So they would give us a work order. They'd call our Maintenance Control in the maintenance hangar. The hangar would write a work order, which was a small form, multiple copy. They would write up the discrepancy. They would call the shop. The shop would come by and pick up the work order and assign people and they would have 'x' time to fix the aircraft. If you couldn't fix it in that amount of time, you had to get over to the maintenance truck and say, 'Look, I need an hour extension,' or a two hour extension, because they would schedule somebody right in on top of you.

"Now the bombers didn't have enough room for more than a couple of people to work, depending on what you were working at. Especially in the cockpit areas. So if there was anything to do in the cockpit areas, it—you had to get that maintenance coordinated. That alone was a large job because it went off like clockwork. I mean, you know, if you were out there working and you didn't finish your job and you didn't call in, and another guy come in to work an area, you had to get out. Because that was his time schedule to work…." (Wilson 2003)

To assist maintenance personnel SAC pressed for standardization of maintenance solutions through a series of constantly evolving Technical Orders, or TO's. TO's gave maintenance personnel standard solutions to various technical problems encountered with B-47s and KC-97s. SAC urged maintenance personnel to study TO's: "We can sometimes attain the desired results by the 'this is the way we've been doing it' method, but when we ignore TO procedure and run into a snag in a so called routine maintenance job then we are in a sweat… So let's make TO familiarization a 'routine' part of our job." (308th Bomb Wing Maintenance Tips Volume I Issue 13:5, from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA)

Fig. 2.32 Building 1206 (right) housed the 308th AEMS upon the arrival of the 308th Bomb Wing in early 1952. The 308th AEMS later moved to Building 1290 (left) leaving Building 1206 as the engine shop for the 308th FMS. From a May 2005 photo by David Diener, FMR, Volume II, Section 15.

The bomb wings also worked to enhance their maintenance systems. For instance, the 308th published "308th Bomb Wing Maintenance Tips," a monthly newsletter filled with mechanical and operational pointers for those working on aircraft out in the flightline. A random sampling of typical maintenance problems encountered from the newsletter give a glimpse of a SAC flightline of the 1950s:

> "A mechanic pegs out for the aircraft before he gets his tools and then discovers that no tools are available in the tool crib…
>
> "A Mechanic forgets to peg in when he returns from the line, so dispatch must work overtime thinking that mechanics are still working on the aircraft…
>
> "A specialist reported to the airplane with a hot priority work order but the airplane was not open for maintenance…" (308th Bomb Wing Maintenance Tips Volume I Issue 13:1, from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA)

SAC policy also implemented a system of awards for good maintenance work. In December 1955, Colonel John F. Batjer, the commanding officer of the 308th, issued T/SGT Joseph R. Allen, a nosedock chief of the 308th PMS, a letter of commendation, and made him Base Maintenance Man of the Month. Batjer praised Allen for his "outstanding" record as a dock chief, and cited a specific incident where an aircraft was put into a rushed periodic inspection, and because of "the age of the aircraft [Allen] was confronted with an extensive number of discrepancies to clear, sheet metal work to be accomplished, and parts to procure and change." Allen successfully inspected and repaired the aircraft with a day to spare (308th Bomb Wing Maintenance Tips Volume I Issue 13:12, from Howe, 308th Bomb Wing History, December 1955, MFR N0290, AFHRA). Other incentives offered for excellent maintenance work included two- and three-day passes (Wilson 2003).

In September 1956, after nine years as a separate service, the US Air Force published its first definitive guidance on organizational maintenance, AFM 66-1. This did not require much alteration at Hunter AFB or other SAC bases because Air Force Headquarters patterned AFM 66-1 after SAC 66-12. However, AFM 66-1 did establish an overall chief of maintenance responsible for all wing maintenance activities (George et. al. 2004). AFM 66-1 also replaced the PMS with the Organizational Maintenance Squadron (OMS). The OMS assigned a crew to each aircraft, supervised by a crew chief. Each OMS crew constantly checked every aircraft system to ensure their functionality. The OMS crew reported discrepancies to Maintenance Control, who scheduled specialized maintenance (SAC Wing Organization, Strategic-Air-Command.com 2005). AFM 66-1 governed maintenance at Hunter AFB until the Army acquired the post in the late 1960s.

Fig. 2.33 A circa 1970 photo of the Alert Area molehole, later known as Saber Hall. Courtesy US Army.

New MSA, Alert Area, and Flightline Construction: 1957-1960

In the mid-1950s, perhaps as a response to the future Soviet ICBM threat, SAC began altering its special weapon deployment system by basing its bombs permanently at its air installations. Much is still classified about the Bombs on Base (BOB) program, but it is certain that the expansion of Hunter AFB's MSA in 1956-1957 was related to BOB. The expanded MSA had two storage bunkers (called an A Structure and a C Structure) with special fixtures to store and maintain the polonium/beryllium "triggers" for open-capsule nuclear and thermonuclear weapons (Maggioni 2004:91-92).

The MSA was built adjacent to the future site of the Hunter AFB Alert Area, which was constructed in 1958-60. This was part of a late 1950s SAC-wide construction program that supported the ground alert concept originally tested at Hunter AFB during Operation Try Out in 1956-1957. Hunter AFB's Alert Area was identical to most others built at SAC or SAC tenant installations, and consisted of "Christmas Tree" concrete parking pads connected by a taxiway to the installation's main runway, and an aircrew alert quarters adjacent to the pads, called a "molehole" (Fig. 2.33) (Maggioni 2004:99-100). Although originally a component of the SAC Operations District, the Army mitigated and modified the HAAF's alert area in 2003-2004.

In 1957-58 the installation worked on its last SAC-related wave of new construction on the flightline, building three new hangars in the 308th area (Buildings 1130, 1131, and 1132, for KC-97 maintenance), two administration/shop facilities for the 308th OMS (Buildings 1128 and 1129), and a base operations facility to the southeast of the 308th overlooking the east end of the runway (Building 1252) (Maggioni 2004:102-103). The installation also demolished the old Municipal Airport building around this time. This building had served SAC as both a base operations and a security control facility up to this time.

SAC at Hunter AFB: 1958-1963

SAC operations at Hunter AFB during this period revolved primarily around home station alert and Reflex operations. Reflex was an off-shoot of one-third ground alert, except conducted at overseas SAC installations. Reflex completely replaced overseas wing rotation (Maggioni 2004:95-96).

In 1959 SAC transferred the 308th Bomb Wing from Hunter AFB. In January of that year SAC transferred Hunter AFB from the Second Air Force to the Eighth Air Force. Shortly thereafter the installation announced SAC would be leaving the installation for good. SAC was phasing out the B-47 and shifting its installations to the north—closer to the Soviet Union via the North Pole, and away from major population centers. New SAC strategy obviated the need for SAC to remain at Hunter AFB (Maggioni 2004:102).

SAC continued operations out of the installation. SAC initially converted the 2nd into an experimental "super-wing" of seventy B-47s, but by early 1961 this concept had proven too cumbersome to effectively deploy and control. SAC reduced the 2nd and other super-wings back to 45 B-47s (Annex C, 2nd Bomb Wing Inactivation Plan, 2 January 1963, from Clark, A/1C William A. [Clark], 2nd Bomb Wing History, December 1962-January 1963, MFR M0260, AFHRA).

Two crises in the early 1960s nearly led to nuclear war. In the summer of 1961 the Soviets built the Berlin Wall. Tensions rose steeply and Hunter AFB and other installations were briefly put on alert.

The world came closer to the brink in October 1962 during the Cuban Missile Crisis. At the start of the crisis the 2nd Bomb Wing had seventeen B-47s and six KC-97s on overseas Reflex duty. Hunter AFB dispersed thirteen B-47s on ground station alert to bases in South Carolina, and kept its remaining aircraft on full alert on the north parking apron. Hunter AFB also hosted the 306th Bomb Wing from MacDill AFB, Florida, which SAC placed on alert at the west apron and the alert area. Hunter AFB was one of many Air Force installations in the southeast instrumental to SAC's efforts during the Crisis (Maggioni 2004:105-106).

MATS at Hunter AFB: 1963-1967

The last SAC B-47s and KC-97s left Hunter AFB in March 1963. In April 1963 the 63rd Troop Carrier Wing of MATS moved to the installation (Clark, 2nd Bomb Wing History, December 1962-January 1963:Annex C, MFR M0260, AFHRA). The 63rd had eighty C-124 cargo planes and utilized the old SAC flightline facilities without major alterations. Former SAC shop space was slightly altered and reutilized.

Operating under AFM 66-1, the 63rd, like SAC, continued to work the flightline as a centralized maintenance system under a single director of maintenance, although more facilities were adapted to cargo-loading operations, due to the change in the installation mission. Maintenance operations mostly occurred on the north edge of the flightline and the northeast corner, within the double cantilever hangars and Buildings 1130, 1131, and 1132. On the east edge of the flightline, Buildings 1128 and 1129 became Maintenance Control buildings, Building 1206 was converted to an air freight warehouse, and Building 1290 became a part of the 63rd Wing headquarters, along with Building 1201 and Building 865 (MAC Historical Services and Research Division, History of Military Airlift Command 1 January-30 June 1967, Supporting Documents, September 1968, AFHRA).

Unfortunately, the C-124s were too large to fit inside the nosedocks. Because they were mostly superfluous structures, from 1962 to 1965 the installation moved or demolished all of the 308th Bomb Wing nosedocks on the east parking apron and four of the 2nd Bomb Wing nosedocks. Two nosedocks migrated to the northwest edge of the parking apron and the new Coast Guard helicopter station. In 1964 two were sent to the old SAC alert area (now called Saber Hall) to shelter cargo and personnel waiting for deployment.

Because AFM 66-1 was patterned after the centralized SAC maintenance system, the 63rd had a Maintenance Control unit overseeing all maintenance activities, Quality Control checking on maintenance work, the 63rd FMS, and the 63rd OMS. MATS also had the 63rd Communications and Electronics Maintenance Squadron (CEMS) for black box work. CEMS was the equivalent of a SAC AEMS, and conducted "black box" technical work for the unarmed transport aircraft (Clark, 63rd Troop Carrier Wing History 1 July – 31 December 1964:ii, MFR M0799, AFHRA).

As under SAC, Maintenance Control managed the wing's entire maintenance, and implemented both installation and higher authority maintenance policies (Clark, William A. History 63rd Troop Carrier Wing, Heavy 1 July – 31 December 1964:48). Over a period of six months, from July to December 1964 Quality Control conducted 81 periodic inspections, 74 post-flight inspections, 22 aircraft acceptance inspections, 47 engine installation inspections, 77 engine build-up inspections, and 56 post-heavy maintenance aircraft inspections (Clark, 63rd Troop Carrier Wing History, 1 July – 31 December 1964:53, MFR M0799, AFHRA). Overall the installation had an excellent maintenance program when the 63rd was here, often attaining 81% operational readiness, ten percent

more than the MATS standard (Management Analysis Office, Management Analysis Digest, Hunter AFB December 1964, MFR M0799, AFHRA).

Hunter AFB had no billeting and large-scale storage buildings adjacent to its flightline, and served as a poor MATS base. Within a year of the 63rd's arrival the government announced Hunter AFB's closure scheduled for 1967 (Maggioni 2004:108-109). Fortunately the US Army was interested in the base, mostly because of its massive parking apron, conducive to large-scale helicopter operations.

Hunter Army Airfield: 1967 to 1990

The US Army already had an installation only nine air miles to the west, Fort Stewart. As of July 1966 Fort Stewart became a training installation for fixed wing aircraft pilots. In late 1966 the US Army announced plans to create the Advanced Flight Training Center at Fort Stewart and HAAF. HAAF would act as an extension for the Army's primary helicopter training facility at Fort Rucker, Alabama, at least until the Vietnam War was over. Fort Stewart and HAAF provided Army helicopter pilots sixteen weeks of advanced flight training and tactics. In addition to this, HAAF became the only installation in the US that trained pilots on the new AH-1 Huey Cobra attack helicopter (Maggioni 2004:113-114).

The US Army reused the old SAC buildings. It required very little effort to adapt the facilities for helicopter operations and maintenance. The large spaces inside nosedocks and hangars, built for single, large aircraft, were adaptable for maintenance on multiple smaller helicopters.

The north edge of the airfield, including the remaining nosedocks, became a maintenance and operations center for AH-1 Cobras, while Buildings 850 and 860 became maintenance buildings for UH-1s. Building 1206, the WPA hangar, became a flight simulator facility, while Building 1290 was converted from shop space to an education center.

HAAF closed briefly in 1972 but reopened two years later as a subinstallation of Fort Stewart, supporting operations of the reactivated 24th Infantry Division. In 1974-1975 the Army stationed the 145th Aviation Battalion (Combat) and a number of ground combat and supply units at HAAF (Fig. 2.34). The 145th was a helicopter unit and used the old SAC hangars for maintenance operations. In 1978 the 1/75 Ranger battalion moved to the installation. In 1981 the installation began extensively reusing the old SAC alert area as a rapid deployment node (Marsh 1984:19-20).

Beginning in the mid-1970s HAAF provided support to other Department of Defense tenant units and operations. Thanks to its 11,375-foot long runway (the longest held by the Army east of the Mississippi) which could handle any aircraft in the Air Force inventory, and an old SAC alert area (now called "Saber Hall") which acted as a marshalling yard for rapid deployment forces, the installation became the premier rapid

deployment point for the US Army, and figured prominently in moving elements of the 24th Infantry Division stationed at nearby Fort Stewart, the 82nd Airborne Division of Fort Campbell, and the 101st Airborne Division of Fort Bragg to and from points all over the globe. The installation also directly supported Ranger and special operations deployment during the invasion of Grenada in 1983 (Marsh 1984:3). As a prime air deployment point, the installation often provided facilities for MATS personnel and aircraft, with deployment exercises often bringing over thirty C-141s and giant C-5 transports to the installation, parked in the Alert Area and the west ramp of the parking apron (Marsh 1984:27, 38).

By the mid-1980s the military had sixteen installation and tenant units stationed at HAAF. Units utilizing flightline installations include the 224th Military Intelligence Battalion, the 24th Combat Aviation Battalion (the helicopter aviation element of the 24th Infantry Division), the 132nd Aviation Company (supported rapid deployment missions), the 609th Transportation Company (conducted aviation maintenance for units in Georgia and Florida), and the 260th Quartermaster Battalion (conducted fueling operations, among other off-flightline activities) (Marsh 1984:22-25).

The division helicopter elements were centered around Building 850, 860, 1130, 1131, and 1132. The 24th CAB was based around the two double cantilever hangars and Building 1132, while D Troop/9th Cavalry performed was based out of Buildings 1130 and 1131 (Marsh 1984:39).

The aviation units used Buildings 850, 860, and the old SAC nosedocks for maintenance hangars, working on both helicopters and small fixed wing Army aircraft (Marsh 1984:38). In 1984 the installation had 149 helicopters and 21 fixed-wing aircraft permanently assigned to the installation (Marsh 1984:37). Hangar space was critically short on the HAAF flightline and by the mid-1980s the installation was already studying the development of more hangar space along the west edge of the apron (Marsh 1984:38). By the end of the Cold War, however, in 1990, the flightline largely retained its SAC-era appearance.

Conclusion

During the 1950s and early 1960s SAC utilized the maintenance and operations buildings within the Flightline Area to directly support nuclear deterrence, the key US strategy of the early Cold War. SAC adapted some existing World War II facilities and constructed additional necessary maintenance and shop space. The new buildings along the flightline were planned out to fit the SAC maintenance plan and local conditions existing within the World War II airfield. SAC thus molded the flightline to fit its standardized maintenance system, itself a work in progress throughout the early and mid 1950s.

Specifically, the buildings were arranged and adapted to suit a maintenance system divided by the north and east sides of the parking apron, with each side centrally

controlled by a single bomb wing. Nosedocks lining the outer band of buildings were used by separate flying squadrons or the organizational/periodic maintenance squadrons. The double cantilever hangars provided shop and aircraft maintenance space for the Field Maintenance Squadrons. The old World War II-era hangars provided shop space for the Field Maintenance Squadrons and the Armament and Electronics Maintenance Squadron, and also provided administration space for the wings' maintenance control units to direct flightline maintenance activities.

When the Army arrived, maintenance necessarily became decentralized because the Army aviation elements had more numerous and varied units then the SAC wings. The buildings no longer functioned together as a single maintenance entity, but rather multiple facilities with little working relationship to each other. Buildings formerly serving as control points for the maintenance hangars were put to other uses, and hangars without administration buildings had to be modified to add necessary office space. This necessitated internal changes to many of the larger hangars, which now also needed to provide areas for administration and shop space needs. In exchange for a long runway and massive parking apron, the Army for the past forty years had to adapt Air Force facilities, specifically designed and arranged for 1950s SAC bomber units, to Army maintenance requirements.

SECTION 5. THE DEVELOPMENTAL HISTORY OF BUILDINGS 811 AND 813: 120-FOOT WORLD WAR II TEMPORARY HANGARS

The Goode Construction Company of North Carolina constructed Buildings 811 and 813 in late 1940 and early 1941 as part of the first military development of the airfield (Fig. 5.1). In addition to these hangars the development included squadron operations buildings to the west and east of the hangars, Building 812 (see Section 5), a heat plant facility serving both hangars, and the first military aircraft parking apron, a concrete pad stretching a little over two hundred feet to the south of the hangars (Fig. 5.2 and 5.3). Later during World War II the Air Corps extended the parking apron further south to the junction of the installation's two primary runways.

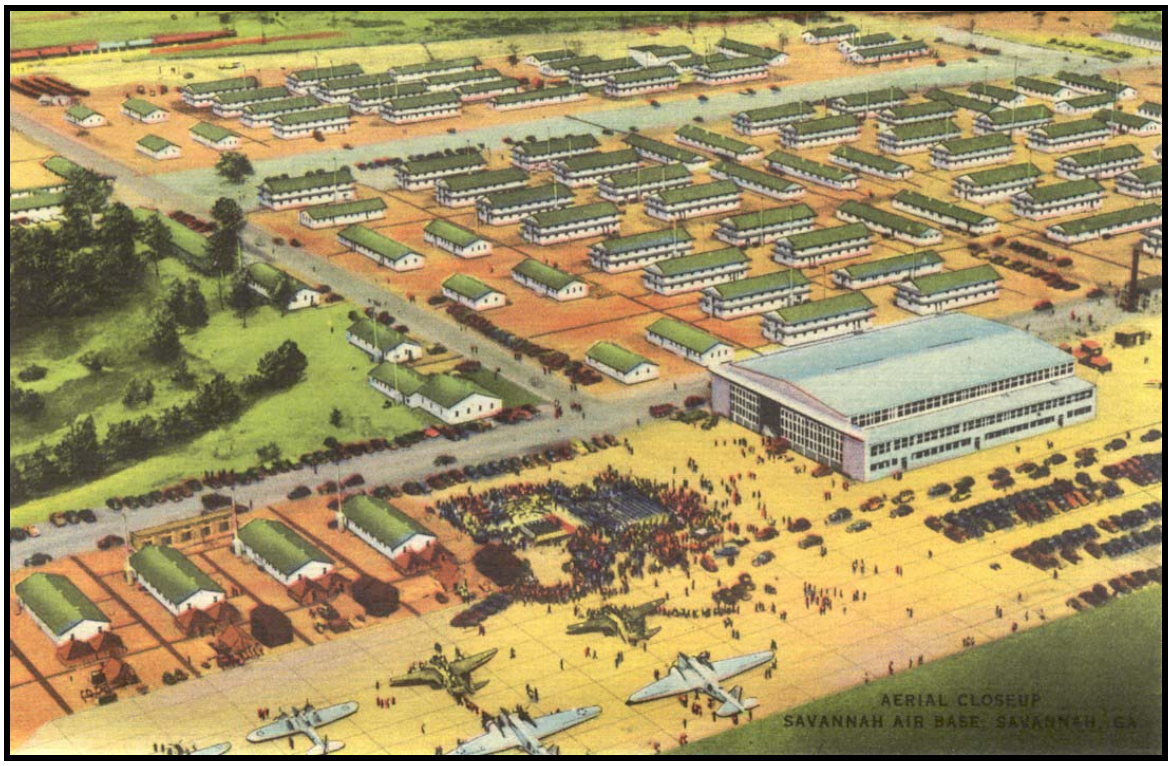

Fig. 5.2 A 1941 postcard showing barracks (top), squadron operations buildings (bottom left—the current Building 816 can be discerned immediately behind them), and the hangar, Building 813 (right). Courtesy Ms. Beth Grashof.

Buildings 811 and 813 were 120-foot steel truss flat gable hangars, perhaps the most common hangar type of the World War II-era air service (Pedrotty et. al. 1999:4-5). They were constructed with metal frames and sheathed in metal panels, with a shallow gabled gravel-surfaced roof and high hangar doors divided into ten sliding sections on their east and west facades. The hangars' design sought to maximize natural lighting, which shone through factory-style glass windows installed in the north and south façade walls and the east and west hangar doors. The hangar doors themselves consisted almost entirely of fixed steel sash windows opening into a central aircraft maintenance area, lit be clerestory windows set above the second floor. Administration space lined the first and second floors of the north and south interior walls.

The Air Corps initially used the hangars as the primary maintenance facilities for the 3rd and 27th Bomb Groups (Light), which began training at Hunter Field in 1940 (Maggioni 2004:30). When the Air Corps first occupied the buildings, Building 811 became the maintenance hangar for the 27th Bomb Group. The first floor rooms lining the north and south interior walls became maintenance administration and storage space for the 27th. The second floor offices held more 27th administration space and the Hunter Field base engineering and technical inspection offices. By 1943, however, the base engineering section had moved into a new facility, Building 1159.

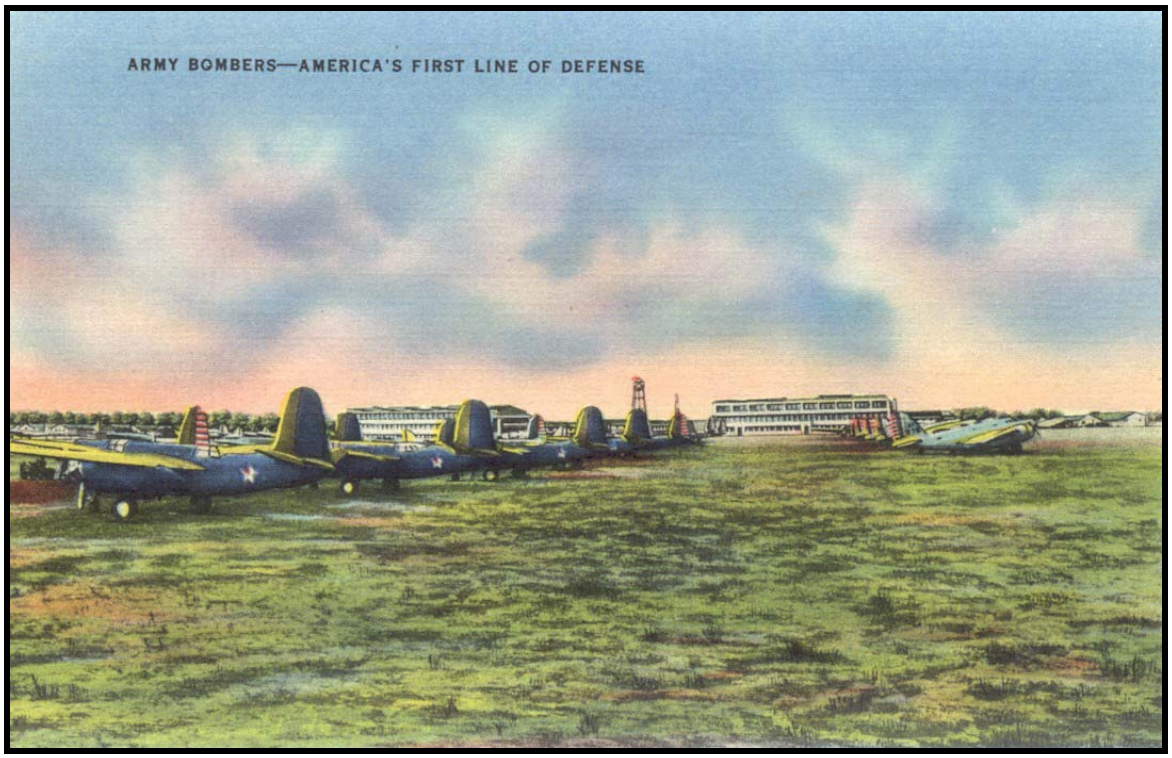

Fig. 5.3 A 1941 postcard showing bombers parked in a grass field between runways and the parking apron. Note Buildings 813 (left) and 811 (right) in the background. Courtesy Ms. Beth Grashof.

The floor plan for Building 813, the building that became the maintenance hangar for the 3rd Bomb Group, was nearly identical in most respects to Building 811, although the arrangement and subdivision of offices and latrines was altered to better fit the occupants of this hangar. On the ground floor were administration offices for the 3rd Bomb Group, storage space, and an aircraft maintenance shop. On the second floor of the north wall offices were technical supply rooms, a sewing (!) room, and radio and instrument sections. On the south interior second floor wall were 3rd Bomb Group administration areas.

The 3rd and 27th Bomb Groups conducted maintenance operations in these hangars from 1940 to 1941. In November 1941 the Air Corps transferred the 27th to the Philippines where the Japanese captured the entire unit in early 1942. From January 1942 until February 1943 Buildings 811 and 813 served the maintenance needs of various fighter and light bomber units training at Hunter Field.

In March 1943 the Air Corps, now renamed the United States Army Air Forces (USAAF), designated Hunter Field as a staging base. Buildings 811 and 813, along with Building 1290 (newly constructed in 1943) and Building 1206 (the Municipal Airport hangar) served maintenance personnel preparing factory-shipped bombers for combat in Europe (Maggioni 2004:46). Contemporary documents list Buildings 811, 813, 1206, and 1290 as, respectively, Hangars 1, 2, 3, and 4.

Fig. 5.4 Building 811 as a civilian hangar, in April 1950. Photo from the John Baker Collection, Mighty Eighth Air Force Museum.

Fig. 5.5 A 1950 view of Building 813,. Neither Building 811 nor 813 had been significantly altered since World War II. From the John Baker Collection, Mighty Eighth Air Force Museum.

When Hunter Field again became the Savannah Airport in 1946, the hangars reverted to civilian use. The Georgia Aero-Flying School and other aviation enterprises operated briefly out of Buildings 811 and 813 (Figs. 5.4 and 5.5). By 1947 Building 811 (described as "Hangar No. 1") was leased by Georgia Aeronautics, Inc., a flying school for small Piper Cub type aircraft (Fig. 5.6). The hangar floor held between twelve and eighteen Cubs at a time. Pleasure Craft Inc. and Seacoast Flying School shared Building 813. Both hangars were used for small civilian aircraft storage and repairs, including engine repair, fabrication, paint spraying, doping, and welding (HAAF Re-Inspection Fire Protection and Security Report Section II Supplement, 21, 24, 25 November 1947, Accession 51-A-1, Records of the War Assets Administration Record Group 270 [RG 270], National Archives and Records Administration [NARA] Atlanta; Letter from Zone Fire Protection Engineer, Original Security and Fire Protection Report, HAAF, 10 December 1946, Accession 51-A-1, RG 270, NARA Atlanta).

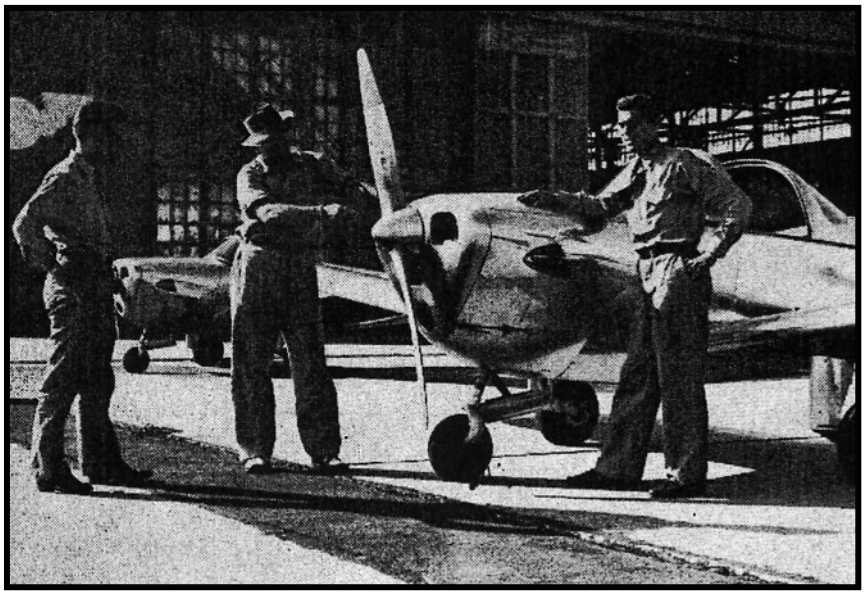

Fig. 5.6 Captain Robert S. Register, owner of the Georgia Aero-Flying School, talks with two of his flight instructors, both veteran World War II pilots, in front of Building 811. From The Georgia Veteran, October 1944, page 12.

SAC assumed control of Hunter Field in 1950 and began repairing the installation's World War II infrastructure, including Buildings 811 and 813. Because the B-50 bombers flown by the 2nd Bomb Wing were too large for the old 120-foot hangars, SAC reused Buildings 811 and 813 like the other World War II-era hangars, as shop space. A 1953 Master Plan shows Building 811 as the 2nd Bomb Wing Armaments and Electronics Maintenance Squadron (AEMS) shop and Building 813 was its Engine shop (Fig. 5.7) (Thomas and Hutton 1953).

In 1954-1955 the Air Force conducted major interior renovations to Buildings 811 and 813. The renovation of the 2nd Bomb Wing maintenance shop facilities coincided with the renovation of Building 1290, the 308th Bomb Wing AEMS shop.

The Air Force converted Building 811 to the primary AEMS shop of the 2nd Bomb Wing. The work by the 2nd AEMS would be conducted here on equipment taken out of planes, but a line crew was also kept in the building to respond to service calls from hangars and nosedocks for in-place inspections and repairs, or to remove equipment for later servicing ("Planning Buildings for the US Air Force," Architectural Record, 1952).

In renovating Building 811, the installation fastened shut the facility's sliding hangar door sections with welded anchors. The Air Force then subdivided the hangar area floor space into four unequal quadrants, connected by two hallways running east-west and north-south and intersecting roughly in the middle of the hangar. The floor plan for the original administration space along the north and south interior was also altered, although it is unclear if this occurred during the 1954 renovation or earlier.

Fig. 5.7 A view of Building 813 after SAC renovated the building, circa 1952. Note the portable maintenance stands in the foreground, used for work on aircraft on the flightline. Canvas was stretched over the metal frames in inclement weather for overhead cover. SAC had also erected Castle nosedocks just to the south of Buildings 811 and 813 on the north parking apron, not visible in this photograph. From the John Baker Collection, Mighty Eighth Air Force Museum

The walls of the shop space were built out of wood stud walls covered with gypsum board and concrete block. The ceiling in the former hangar area was lowered to ten feet, covered in gypsum, and supported by metal joists. Asphalt tile was laid in most of the building. New exterior doors matched the old World War II doors, while both new and old interiors were supplied with metal and wood flush panel doors, some with windows. An air conditioning unit was placed in the center of the building above the ceiling.

The new floor plan was designed for specific maintenance shops utilized by a SAC bomb wing of the mid-1950s. The northwest quadrant of the building consisted of the radar, electronic countermeasures, and radio shops. The northeast quadrant held the analysis unit, the material controls branch, and a supply area. The southeast quadrant held the gunnery system unit shop, and the southwest quadrant held the bombing and navigation systems shop. The south quadrants were just single large rooms, while the north quadrants were divided up into four or more separate rooms. The original administration space lining the north and south walls held classrooms, administration space, storage space, latrines, and a PX coffee shop.

The renovation was followed by a major organizational change in January 1955, when special weapons maintenance functions transferred from the 2nd AEMS to the 804th Air Base Group. The Special Weapons Division became part of the Maintenance Division, housed in nearby Building 813 (Newby, S/Sgt. Idus A., 2nd Bomb Wing History January 1955:4, Microfilm Reel [MFR] M0246, Air Force Historical Research Agency [AFHRA]).

Fig. 5.8 Maintenance Control, operating out of Building 811 (left), supervised maintenance operations in Building 850 (center) and the nosedocks (right). Photo by David Diener in May 2005, from the Flightline Mitigation Report (FMR), Volume II, Section 15.

In addition to maintenance shop functions, Building 811 housed 2nd Bomb Wing Maintenance Control, which served as the nerve center for all 2nd Bomb Wing maintenance operations on the installation. The SAC maintenance system was constantly evolving in the early 1950s, but by about 1954 had gelled into a highly efficient program. Mechanics inspected the aircraft and radioed subsequent work orders to Maintenance Control, which kept track of inpections and work orders from a large plexiglass board listing the status of all 2nd Bomb Wing aircraft. Maintenance work was then assigned to each shop, and the shops assigned personnel to work on the aircraft docked in either the 2nd Bomb Wing nose hangars just to the south of Maintenance Control, or Building 850, the 2nd Bomb Wing's maintenance hangar (See Volume I, Section 7). Building 811 also housed Quality Control, which oversaw the 2nd Periodic Inspection Squadron and checked the quality of aircraft maintenance work (Wilson 2003).

Building 811 therefore held prime importance for 2nd Bomb Wing maintenance activities. Centrally located on the 2nd Bomb Wing's flightline, Maintenance Control, operating from Building 811, coordinated maintenance work between the shops, the nosedocks to its immediate south, and Building 850, the maintenance hangar, to the east Fig. 5.8).

In 1959 SAC transferred the 308th Bomb Wing from Hunter AFB, freeing up space on the east edge of the parking apron. By 1960 Building 811 housed the 2nd Organizational Maintenance Squadron (OMS) main office in addition to shop and administration space for the 2nd AEMS. The OMS conducted regular and comprehensive inspections of aircraft and primarily worked in designated nosedocks. Buildings 1128 and 1129, originally 308th OMS shop space, also became 2nd OMS shop buildings after

the 308th left Hunter AFB (see Volume I, Section 11) (Alert Procedures Base Manual 55-3, from Ruddell, A1/C Kenneth W., 2nd Bomb Wing History July 1960, AFHRA).

Unlike Building 811, Building 813 retained its central maintenance space, and in October 1954 the Maintenance section of the 2nd AEMS moved from Building 811 to 813. The Engine maintenance shop, part of the 2nd Field Maintenance Squadron (FMS) operating out of the brand-new double cantilever hangar (Building 850) continued operations in Building 813 (Wilson 2003). The Air Force also installed exterior metal staircases on both buildings, a nod to their separate functions as shop space for multiple component maintenance tasks and also their significant administrative role in day-to-day maintenance operations (Newby, S/SGT Idus A., 2nd Bomb Wing History, October 1954:36, from MFR M0246, AFHRA).

By 1959 the Air Force had heavily altered the floor plan of Building 813's original administrative space, but kept the central hangar maintenance space open and the main hangar doors operational for work on B-47 jet engines, KC-97 prop engines, and other shop maintenance functions. The interior staircase on the south side of the building was eliminated in favor of two exterior staircases at both ends of the façade. The Air Force also added a small-scale, two-room storage area to this façade, and an exterior staircase in the middle of the north façade. The north side exterior staircase was added in 1954, while the other changes occurred between 1954 and 1959. A 1960 plan indicates the Engine Maintenance Manager office was located on the second floor, and that the Quality Control office had moved from Building 811 to the northeast corner of the second floor of Building 813.

Fig. 5.9 Building 827, a former World War II latrine converted by SAC into shop space. In the background is Building 811. Photo by Paul Maggioni 2004.

Fig. 5.10 The site of Building 827, demolished in early 2005. Photo by David Diener, Volume II, Section 15, FMR.

Fig. 5.11 Buildings 811 (right foreground) and 813 circa 1970, shortly after the Army acquired HAAF in 1967. Note the windows on the first two floors have been painted over by this time. Courtesy US Army.

Building 827, a former latrine made from terra cotta block, augmented the 2nd Bomb Wing shops in Buildings 811 and 813. Located between the two hangars, closer to Building 813, Building 827 was originally constructed in about 1943 by the USAAF as extra latrine facilities for maintenance personnel working in Buildings 811 and 813. At some point SAC converted this small structure into general purpose open shop space, likely a subsidiary service facility for either Building 811 or 813. MATS also used the facility for general purpose shop space. The Army demolished the structure in early 2005 (Figs. 5.9 and 5.10).

In 1963 SAC left the installation for good, replaced by the cargo aircraft of the 63rd Troop Carrier Wing (TCW) of the Material Air Transport Service (MATS). The change in mission, from strategic bombing to cargo and troop transport operations, also changed the nature of the components repaired in the shop space. Building 811 continued in the capacity as a "black box" shop, but armament and bombing component maintenance was no longer necessary. Because MATS aircraft were unarmed, the 63rd TCW utilized the 63rd Communications and Electronics Maintenance Squadron (CEMS) as opposed to a SAC wing's AEMS.

Building 811's floor plan since 1954-1955 had only been slightly altered, with some more walls put up to further subdivide shop space. The PX, shower room, and latrines remained in the same location when MATS moved in, but the uses of the shop spaces altered. The northwest quadrant changed from radar, radio, and ECM maintenance to radio and instrument shops, the southwest quadrant changed from bombing and navigation system shop to the radio and radar repair shop, the southeast quadrant changed from gunnery system unit maintenance to an electric shop, and the northeast quadrant changed from the analysis unit to the autopilot shop, dispatch and control room, a radio and radar shop extension, and the technical library. In addition to 63rd CEMS shops and offices, the facility also held administration space for the 63rd Organizational Maintenance Squadron (OMS).

Building 813 continued to serve MATS as an Engine Shop. The Air Force further subdivided the administration space in Building 813, making more private offices, with both studded and sheetrock partitions and concrete block walls, and closed off a door leading to the central hangar space.

In 1967 the Army acquired Hunter AFB and renamed it Hunter Army Airfield (HAAF). HAAF became part of the Advanced Flight Training Center (AFTC) that trained fixed wing and helicopter pilots for the Vietnam War. The Army used Building 811 for both shop and administration space, leaving the SAC renovations largely unchanged. Under the Army, Building 811 no longer had a central role in base maintenance operations. Instead, the smaller Army units directed their own maintenance from individual hangars or administration space across Strachan (now Lightning) Road. Initially the Army repaired the sliding hangar doors for the west façade of Building 811 and the east and west facades of Building 813. New weather stripping was applied between all glass panes on the doors. All existing metal panels at the ground level were replaced with new galvanized steel panels, interior and exterior (Fig. 5.11).

Fig. 5.12 Building 813 in May 2005. The hangar's original first floor windows have been painted over, while its second floor fenestration has been replaced by sheet metal and new windows. Photo by David Diener, FMR, Volume II, Section 15.

The Army repaired Building 813's roof in late 1968 with built-up roofing, and also added concrete skirting to the exterior of the hangar. HAAF was the only place in the US that trained pilots and pilot instructors on the AH-1 during the Vietnam War, and Building 813 became a maintenance hangar for the new AH-1 Huey Cobra attack helicopters (Maggioni 2004:116).

In 1974 the US Army reactivated the 24th Infantry Division at Fort Stewart. HAAF, now a subinstallation of Fort Stewart, became home to the division's airmobile (helicopter) units, in addition to other tenants such as the Coast Guard helicopter unit and the 1/75 Ranger Battalion. Since 1967 Building 813 continued to be utilized as a helicopter maintenance facility while Building 811 evolved into primarily an administration building.

By 1984 the 609th Transportation Company occupied both Buildings 811 and 813 (Marsh 1984:38). The 609th, with over 300 officers and men, provided direct support aviation maintenance and supply to active duty Army units in Georgia and Florida (Marsh 1984:23). The 1160th Transportation Company also occupied a third of Building 811 (Marsh 1984:39).

The Army undertook major exterior changes to Building 813 in 1983, installing two additional exterior stairways on each end of the north façade, and two second-floor doorways. The Army removed the original World War II factory-style sash windows on the second floor and replaced them with sheet metal panels. The Army installed sliding metal windows at regular intervals along the second floor, significantly altering their appearance (Fig. 5.12). The second floor administration space on the north façade was completely redesigned with individual office space for an aviation battalion conference room and aviation company administration space, including platoon commanders' offices, flight operations, planning, safety, and quality control. The windows formerly looking out into the central maintenance area were filled in with gypsum board.

Change came more slowly to Building 811. In 1989 the Army replaced Building 811's built-up roof with insulated metal roofing. In the late 1990s the Army heavily altered Building 811's exterior by removing the old World War II windows on the second floor and replacing them with metal paneling and smaller modern metal sash windows giving it a very similar appearance to Building 813's modifications (Photo 80, Volume II).

Buildings 811 and 813 have survived sixty years of adaptation to widely changing missions. Their survival is a testament to the hangars' quality of construction and the versatility of their design. The hangars' three-story high maintenance area, flanked by two stories of multipurpose space, allowed smooth transition between successive uses.

LABORATORY REPORT

TO: Mr. ROBERT BAUMGARDT
1587 FRANK COCHRAN DR
FORT STEWART, GA 31314

Sample ID:	AH34126
Facility Name:	usa-hunter army airfield - mai 302
Site ID:	0510107
Location ID:	302
Location Descr:	WELL #2 PLANT

Date Collected:	7/13/2011
Time Collected:	10:50
Sample Collector:	N. WILLIAMS
Chlorination:	Yes
Sample Type:	Routine
Received By:	JHM
Date Received:	7/14/2011
Time Received:	10:24 AM
Project:	VOC
Reporting Date:	7/28/2011
Received Temperature:	0.0 °C

ANALYTE	PARAMETER CODE	EPA NOTE	METHOD	RESULT	QUALIFIER	UNITS	RL	ANALYST	ANALYSIS DATE	MCL or QC Range
GC/MS Volatiles in DW QC Batch 127692										
Vinyl Chloride	39175		EPA 524.2	Not Detected		ug/L	0.50	RC1	7/14/2011	2

WATER RESOURCES MANAGEMENT BRANCH WELL DATA SHEET

Georgia Department of Natural Resources
Environmental Protection Division
(Form To Be Completed By Licensed Water Well Contractor)

Water System Name: Hunter Army Airfield - Main County: Chatham
System ID. No. 302522176 System Permit No. CG1790024 System Well No. 2
System Type: community: X non-community: ___ non-community non-transient: ___ non-public: ___

Owner: U.S. Army
Address: 1550 Frank Cochran Drive
City/State/Zip: Fort Stewart, GA 31314
Phone No: (912) 767-2010

Driller: _____
Address: _____
City/State/Zip: _____
Phone No: ( ) _____

Well Location Bldg 1205 at the corner of Neal Street and Strachan Road
Ground Elevation: _____ ft. MSL., Longitude: W _____, Latitude: N _____

WELL DESCRIPTION

Date Drilled: 1942
Total Depth: 600 ft.
Static Water Level (SWL): _____ ft.
Date SWL Measured: _____
DRILLING METHOD (Indicate)
Rotary: ___ Percussion: ___ Other: ___
HOLE DIAMETER
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
CASING RECORD
Type Material: cast iron
Wall Thickness: 12" SDR: _____
Weight/Foot: _____
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
(Use Additional Sheets If Necessary)

WELL SCREEN

Type Of Material: _____
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
Size: _____ in., From: _____ ft., To: _____ ft.
Thickness Of Gravel Packing: _____

GROUTING

Type Grout: _____
Applied By Pressure: Yes: ____ No: ____
From: _____ ft., To: _____ ft.
From: _____ ft., To: _____ ft.

PUMPING TEST DATA

Date Tested: _____
Test Pump Rated: _____ gpm, _____ hp
Total Continuous Hrs. Tested: _____
Water Level Stabilized: YES: ____ NO: ____
Hrs. Before Stabilization: _____
Sustained Well Yield: _____ gpm
Static Water Level : _____ ft.
Total Drawdown: _____ ft.
Specific Capacity: _____ gpm/ft.
Pumping Water Level: _____ ft.
No. Minutes Well To Recover: _____
Developed Well: Yes: _____ No: _____
Disinfected Well: Yes: _____ No: _____
(Attach Time And Drawdown Measurements)

PERMANENT PUMP DATA

(Completed By Contractor Or Owner)
Pump Type: electric Layne turbine
Diameter: _____ in., Outlet Size: _____ in.
Motor hp: 100 Motor rpm: _____
Total Dynamic Head: _____ ft.
Pump Set At: _____ ft.
Pump Disinfected: Yes: X No: ____
Deep Well Air Line Length: _____ ft.
Access Port Diameter: _____ in.
Casing Vent Installed: Yes: X No: ____
Sample Tap Installed: Yes: ____ No: ____
Meter Installed: Yes: X No: _____
Meter Size: _____ in. 1300 gpm

SEND FORM TO : Drinking Water Program, 205 Butler St., S.E., Rm. 1066, Atlanta, Ga. 30334

This well was drilled and constructed in accordance with the Georgia Department of Natural Resources' Rules for Safe Drinking Water, Chapter 391-3-5, and/or the Rules and Regulations for Groundwater Use, Chapter 391-3-2. I certify that the information on both sides of this form is correct and true to the best of my knowledge.

Horizontal coordinate information is referenced to North American Datum of 1983 (NAD 83).

Altitude, as used in this report, refers to distance above the vertical datum.

Specific conductance is given in microsiemens per centimeter at 25 degrees Celsius (µS/cm at 25 °C).

Concentrations of chemical constituents in water are given either in milligrams per liter (mg/L) or micrograms per liter (µg/L).

Hydrology, Water Quality, and Water-Supply Potential of Ponds at Hunter Army Airfield, Chatham County, Georgia, November 2008–July 2009

By John S. Clarke and Jaime A. Painter

Abstract

The hydrology, water quality, and water-supply potential of four ponds constructed to capture stormwater runoff at Hunter Army Airfield, Chatham County, Georgia, were evaluated as potential sources of supplemental irrigation supply. The ponds are, Oglethorpe Lake, Halstrum Pond, Wilson Gate Pond, and golf course pond. During the dry season, when irrigation demand is highest, ponds maintain water levels primarily from groundwater seepage. The availability of water from ponds during dry periods is controlled by the permeability of surficial deposits, precipitation and evaporation, and the volume of water stored in the pond. Net groundwater seepage (*Gnet*) was estimated using a water-budget approach that used onsite and nearby climatic and hydrologic data collected during November–December 2008 including precipitation, evaporation, pond stage, and discharge.

Gnet was estimated at three of the four sites—Oglethorpe Lake, Halstrum Pond, and Wilson Gate Pond—during November–December 2008. Pond storage volume in the three ponds ranged from 5.34 to 12.8 million gallons. During November–December 2008, cumulative *Gnet* ranged from –5.74 gallons per minute (gal/min), indicating a net loss in pond volume, to 19 gal/min, indicating a net gain in pond volume. During several periods of stage recovery, daily *Gnet* rates were higher than the 2-month cumulative amount, with the highest rates of 178 to 424 gal/min following major rainfall events during limited periods. These high rates may include some contribution from stormwater runoff; more typical recovery rates were from 23 to 223 gal/min.

A conservative estimate of the volume of water available for irrigation supply from three of the ponds was provided by computing the rate of depletion of pond volume for a variety of withdrawal rates based on long-term average July precipitation and evaporation and the lowest estimated *Gnet* rate at each pond. Withdrawal rates of 1,000, 500, and 250 gal/min were applied during an 8-hour daily pumping period. At a withdrawal rate of 1,000 gal/min, available pond volume would be depleted in 13–29 days, at a rate of 500 gal/min in 24–60 days, and at a rate of 250 gal/min, in 44 to 130 days. In each case, Halstrum Pond had the largest amount of available pond volume.

The water-supply potential at the golf course pond was assessed by measuring flow downstream from the pond during February–July 2009, and examining historic stormflow measurements collected during 1979–87. Streamflow during both of these periods exceeded average daily (2005–2007) golf course water use. Assuming an 8-hour daily irrigation period, the average discharge rate required to meet Golf Course water demand during peak demand months of March–May and July–October exceeds 200 gal/min, with the greatest rate of 531 gal/min during July. During February–July 2009, daily average streamflow downstream of the golf course pond exceeded 238 gal/min 90 percent of the time.

Based on samples collected for chemical analysis during April 2009, water from all four ponds at Hunter Army Airfield is fresh and suitable for irrigation supply, with chloride concentrations below 12 milligrams per liter. With the exception of iron in Wilson Gate Pond, constituent concentrations are below U.S. Environmental Protection Agency primary and secondary drinking water maximum contaminant levels. Water in Wilson Gate Pond contained an iron concentration of 419 mg/L, which exceeds the secondary maximum contaminant level of 300 micrograms per liter. Although not a health hazard, when the iron concentration exceeds 300 micrograms per liter, iron staining of sidewalks and plumbing fixtures may occur. Levels of dissolved oxygen were below the Georgia Environmental Protection Divison standard of 4 milligrams per liter for waters supporting warm-water fishes at deeper depths in Oglethorpe Lake, Wilson Gate Pond, and Halstrum Pond, and in the composite sample at the golf course pond.

Introduction

The Upper Floridan aquifer is the principal source of water in the coastal area of Georgia, but declining water levels and localized occurrences of salt-water contamination have resulted in restricted ("capped") withdrawals from the Upper Floridan aquifer in parts of the coastal area and have spurred interest in developing supplemental sources of water. To meet the growing water demand at Hunter Army Airfield (HAAF) in Chatham County, Georgia, four ponds—Oglethorpe Lake, Halstrum Pond, Wilson Gate Pond, and golf course pond—are being considered as possible sources of supplemental irrigation supply (fig. 1). To assess the water-supply potential and water quality of these ponds, the U.S. Geological Survey (USGS), in cooperation with the U.S. Department of the Army, conducted field investigations during November 2008–July 2009.

Purpose and Scope

This report describes results of investigations to evaluate the water-supply potential at pond sites at HAAF, Georgia. Included are

- Descriptions of local site setting and pond bathymetry;
- Estimates of the volume of water stored in Oglethorpe Lake, and Halstrum and Wilson Gate Ponds over a range of stages;
- Estimates of net groundwater seepage derived from water-budget analyses and pond-discharge tests for Oglethorpe Lake, and Halstrum, and Wilson Gate Ponds under dry climatic conditions;
- Estimated flow rates downstream from the discharge weir at golf course pond; and
- Determination of suitability of pond water quality for irrigation purposes.

Data collection included installation of stage recorders in Oglethorpe Lake, and Halstrum and Wilson Gate Ponds, and in the canal draining the golf course pond. Precipitation was monitored using new raingages installed at Ogtlethorpe Lake and Halstrum Pond, and existing raingages used for stormwater monitoring at Wilson Gate and golf course ponds. Evaporation estimates were obtained from an existing Georgia Automated Environmental Monitoring Network (GaEMN) site, the Bamboo Farm in Chatham County, about 8–9 miles to the west of the study area (Georgia Automated Environmental Monitoring Network, 2009). Stream-discharge measurements were made over a range of conditions to establish a stage-discharge rating at the golf course pond drainage canal. Water samples were collected and analyzed for major ions and nutrients from each of the four ponds during April 2009.

Previous Study

Clarke and Abu Rumman (2004) described results of investigations to evaluate the water-supply potential at seepage pond sites at Brunswick, in Glynn County, and in southern Bulloch County, Georgia. This study included descriptions of the hydrogeologic setting, estimates of a hydrologic budget and groundwater seepage rates, development and calibration of steady-state and transient groundwater flow models, and an assessment of water availability based on pond pumping tests and simulation results. Their study concluded that the availability of water from seepage ponds is controlled by the permeability of surficial deposits, the amount of precipitation recharging the groundwater system, and the volume of water stored in the pond. At both sites, most groundwater seepage entered the pond following major rainfall events that provided recharge to the surficial aquifer. The ponds at HAAF are located in a setting similar to the Glynn County site. At the Glynn County site, Clarke and Abu Rumman (2004) reported that net groundwater seepage, estimated using water-budget analysis and simulation, ranged from –11.5 to 15 gallons per minute (gal/min) during August 1999 to May 2000. Simulated values during pond pumping tests indicate that groundwater seepage increases with decreased pond stage. At the Glynn County pond, simulated net groundwater seepage increased from 7.8 to 103 gal/min in response to a 2-foot (ft) decrease in pond stage caused by pumping.

Description of Study Area

HAAF is located in western Chatham County, Georgia (fig. 1), in the Coastal Lowlands physiographic division (LaForge and others, 1925), near the Atlantic Ocean, in an area characterized by low relief and high-permeability sandy soils. Sandy soils compose the surficial aquifer, which is recharged by precipitation and discharges water to ponds, wetlands, and surface streams in the area. During dry periods, excavated ponds, such as those at HAAF, derive water primarily from groundwater seeping into the pond, in a manner similar to a dug or bored well completed in a surficial aquifer.

Four ponds constructed to capture stormwater runoff at HAAF were evaluated as potential sources of supplemental irrigation supply—Oglethorpe Lake, Halstrum Pond, Wilson Gate Pond, and golf course pond (fig. 1). Oglethorpe Lake, and Halstrum and Wilson Gate Ponds range in area from 4.6 to 9.5 acres, and in maximum depth from about 6 to 16 ft. Area and depth of the golf course pond were not delineated because streamflow records were used as a basis for evaluation and a detailed water budget analysis was not required. More detailed descriptions of individual ponds are provided in later sections of the report.

The study area has a mild climate with warm, humid summers and mild winters. Long-term climatic patterns in the area are provided by records from the National Weather Service Station at Savannah International Airport (097847).

Figure 1. Location of selected ponds in the Hunter Army Airfield area, Chatham County, Georgia.

During 1971–2000, precipitation at station 097847 averaged about 49 inches per year (in/yr). Maximum monthly rainfall (exceeding 4 inches per month) generally occurs during June–September, with monthly rainfall totals averaging less than 4 inches during the rest of the year (fig. 2). Mean monthly pan evaporation at station 097847 during 1965–2003 ranged from 2.43 to 8.49 inches per month, with the greatest evaporation during April–August. Monthly total precipitation and the cumulative departure from long-term average or "normal" precipitation for January 2005–May 2009 at station 097847 is shown in figure 3. Precipitation data indicate that pond water-budget evaluations at HAAF were conducted during a period of largely above-normal precipitation in November–December 2008, after a period of below-normal precipitation during January–September 2008.

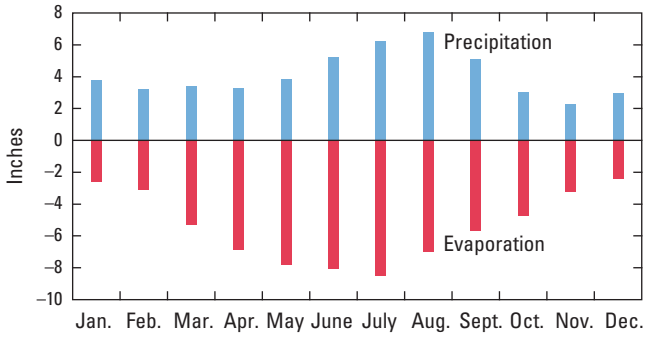

Figure 2. Mean monthly precipitation (1971–2000) and mean monthly pan evaporation (1965–2003) at National Weather Service Station 097847, Savannah International Airport, Georgia.

Acknowledgments

The authors appreciate the assistance of the U.S. Department of the Army and its contractors for providing onsite support and data. Special thanks to Eric Stulpin, Stanley Thomas, Tressa Williams, and Nathaniel Williams, II, of the U.S. Army Environmental Protection and Compliance Branch. Rachael Hallman, U.S. Army Fish and Wildlife Branch, provided support in measuring pond bathymetry and releasing water from ponds.

Michael Hamrick, Gary Holloway, Mark Truhlar, and Welby L. Stayton of the U.S. Geological Survey, provided valuable assistance in site setup and monitoring hydrologic conditions. John K. Joiner and Anthony J. Gotvald, of the U.S. Geological Survey, computed the stage-discharge rating at the golf course pond.

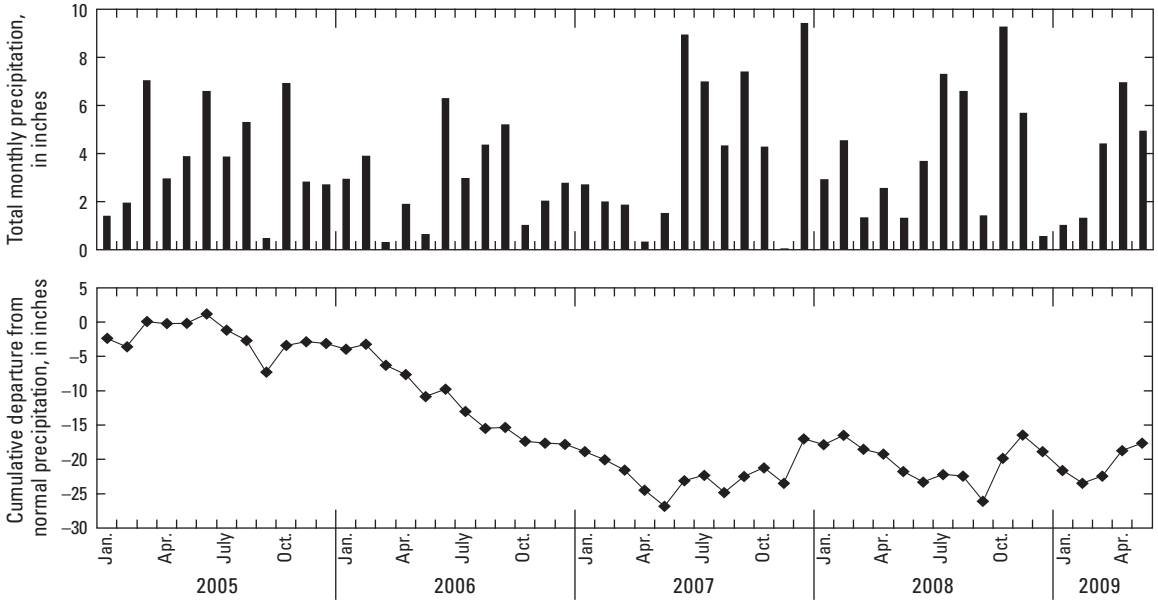

Figure 3. Total monthly precipitation and cumulative departure from normal (1971–2000) precipitation at National Weather Service Station 097847, Savannah International Airport, Georgia, 2005–2009.

Approach

This study investigated water availability and water quality at four pond sites at HAAF, which included:

- Determination of the volume of water stored in Oglethorpe Lake, Halstrum Pond, and Wilson Gate Pond under a range of stage conditions;
- Measurement of streamflow discharging from the golf course pond and development of a stage-discharge relation to determine flow rates over a range of climatic conditions;
- Estimating net groundwater seepage by developing hydrologic budgets for Oglethorpe Lake and Halstrum and Wilson Gate Ponds; and
- Sampling and analysis for pond water quality.

Determination of Pond Volume and Area

Digital maps of pond bathymetry in Oglethorpe Lake, and Halstrum and Wilson Gate Ponds were developed based on bathymetric surveys conducted during December 2008 and April 2009 by the USGS. Bathymetric surveys were conducted using a fathometer linked to a global positioning system with horizontal accuracy of 11–13 ft and depth accuracy of at least 1 centimeter (0.39 inch). Point data were imported into ArcMap™ and converted into a point feature dataset. Upon spatial review of bathymetric depths, some discrepancies in the pond floor were apparent in certain areas. These discrepancies were possibly due to the fathometer signal being interrupted by a tree stump, resulting in significant variation in depths among adjacent data points (in some case 1 ft or more.) Because of the high frequency of fathometer soundings and the belief that a subset of the data would eliminate many of these depth discrepancies, a subset of fathometer soundings was derived using the ArcGIS™ Geostatistical Analyst tool, "Create Subsets." This subset routine uses a random sample of the dataset based on a user-designated percentage criteria. For this study, a 50-percent criterion was designated whereby one-half of the fathometer measurements were used for the bathymetric surface generation at the three ponds.

Bathymethric surfaces were generated by using the ArcGIS™ 3D Analyst raster interpolation, "Spline with Barriers" tool. This tool allowed the generated raster to be restricted to the pond perimeter. The cell size used for contouring was 1 meter by 1 meter (3.21 by 3.21 ft); contours were generated at a 1-ft interval. Once a surface was generated using the subset of field measurements, the surface was compared to the entire dataset and minor manual modifications were made.

To calculate and project pond volume and surface area for a range of pond stages, a triangulated irregular network (TIN) was generated using the bathymetric contours. The ArcGIS™ 3D Analyst, Functional Surface, "Surface Volume" tool takes the altitude TIN and examines each individual triangle to determine its contribution to the area and volume. The tool requires the input of the elevation TIN along with user decisions to calculate below or above a defined reference plane or altitutde. The results are written to a text file. These data, computed using the geographic information system (GIS) for selected stage values, served as a basis to determine continuous relations between pond stage and volume using a second- or third-order polynomial regression of pond stage and pond volume. Similarly, relations between pond stage and surface area were developed using a second-order polynomial regression of pond stage and pond area. Changes in pond volume and surface area were computed by comparing values at different pond stages.

Estimation of Net Groundwater Seepage

The water-supply potential of a pond is dependent on the volume of water stored in the pond, precipitation and evaporation, surface-water runoff, and the rate of groundwater seepage into the pond. Figure 4 is a schematic diagram showing a conceptualization of groundwater flow and components of the water budget in the vicinity of a typical pond at HAAF. Groundwater seepage represents water either entering or leaving a pond as the result of hydraulic gradients between the aquifer and the pond. Net groundwater seepage (*Gnet*) is the difference between groundwater inflow minus outflow—when positive, more groundwater enters than leaves the pond; when negative, more groundwater leaves than enters the pond (Clarke and Abu Rumman, 2004). Rates and directions of groundwater seepage vary depending on groundwater levels and pond stage and related changes in hydraulic gradient and cross-sectional area. Decreased pond stage or increased groundwater levels result in an increased hydraulic gradient toward the pond and increased rates of seepage to the pond. Increased pond stage results in a decreased or reversed hydraulic gradient, whereby seepage to the pond is either decreased or reversed.

A simplified hydrologic budget for three ponds was developed to estimate *Gnet* and provide an indication of the volume of water available for irrigation during dry periods. The water budget used measurements of precipitation, evaporation, pond discharge, and pond-volume changes to estimate *Gnet*. A pond hydrologic budget was developed based on daily data using equation 1 (modified from Clarke and Abu Rumman, 2004):

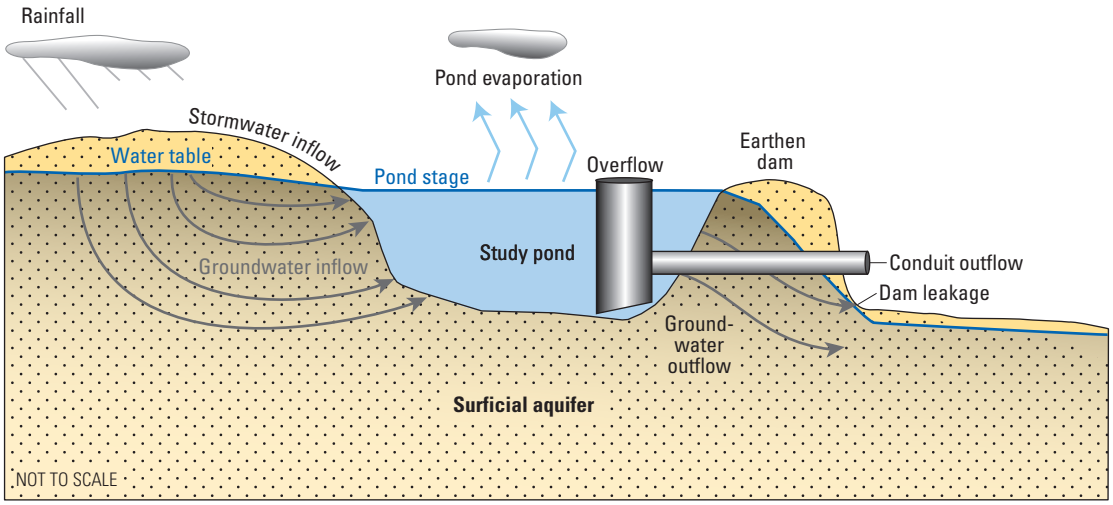

Figure 4. Conceptual model of pond-aquifer flow for coastal area seepage ponds.

$$Gnet = \Delta V + E - P - S + Q \pm \varepsilon, \quad (1)$$

where

- ΔV is the daily pond volume change, in million gallons,
- E is daily evaporation from the pond, in million gallons,
- P is daily precipitation falling over the pond, in million gallons,
- S is daily surface-water runoff, in million gallons (assumed 0, see below),
- Q is daily discharge and pond leakage, in million gallons, and
- ε is the error associated with the estimate.

Surface-water runoff was considered negligible due to permeable soils and low relief, and because the study was conducted during a mostly dry period. Volumetric estimates of precipitation and evaporation were computed by multiplying total daily precipitation or evaporation (in volume per unit surface area) by pond surface area.

Evaporation estimates were based on evapotranspiration computed at an existing GaEMN site, Bamboo Farm, in Chatham County, about 8–9 miles to the west of the study area (Georgia Automated Environmental Network, 2009). Sensors at this weather station measure air temperature, relative humidity, wind speed and direction, net and total solar radiation, barometric pressure, precipitation, and soil temperature at 2-, 4-, and 8-inch depths. GaEMN estimates potential evapotranspiration from these data using the Priestley-Taylor method (Stewart and Rouse, 1976).

To induce a change in pond stage and assess higher rates of *Gnet* when there is a larger hydraulic gradient between the surficial aquifer and the pond (Clarke and Abu Rumman, 2004), water was released (discharged) from Halstrum Pond and Oglethorpe Lake. To lower stage, water was discharged from the dam gate valve to a downstream location where infiltration did not affect test results.

Quantification of measurement errors of each water-budget component provides a measure of the reliability or accuracy of the hydrologic budget as a predictive tool (Lee and Swancar, 1997). Field measurements have an associated error depending on the method of measurement. Because *Gnet* is estimated from several different types of field measurements, the total error associated with its estimation is an accumulation of errors of the various measurements. The error (ε) for *Gnet* can be described using the following equation (Lee and Swancar, 1997) that accounts for percentage error of each parameter used in the computation:

$$\varepsilon_{Gnet} = \sqrt{[(\%\varepsilon P \times P)^2 + (\%\varepsilon E \times E)^2 + (\%\varepsilon V \times V)^2 + (\%QV \times Q)^2]}, \quad (2)$$

where

- ε_{Gnet} is the error in *Gnet* in million gallons,
- $\%\varepsilon P$ is the percentage error in precipitation,
- $\%\varepsilon E$ is the percentage error in evaporation,
- $\%\varepsilon V$ is the percentage error in pond volume,
- $\%QV$ is the percentage error in discharge, and
- P, E, V, and Q are as defined for equation 1.

Pond volume changes were assigned a 5-percent error, and precipitation was assigned a 15-percent error based on a study by Winter (1981). At Wilson Gate Pond, an additional 5-percent error was added to precipitation values (total error 20 percent) because part of the data was estimated based on a regression analysis. Pond discharge was assigned an error of 10 percent at each of the ponds, with the exception of Oglethorpe Lake, which was assigned an error of 25 percent because of leakage through the earthen dam. An additional source of error is any water contributed to the pond by stream runoff, which could lead to large *Gnet* values during rainfall periods.

Errors associated with evaporation estimates are difficult to quantify. Factors affecting the accuracy of the estimate include the distance of the GaEMN site from HAAF (8–9 miles), and the method used to estimate evapotranspiration by GaEMN. Mosner and Aulenbach (2003) conducted an assessment of methods used to estimate evapotranspiration at Lake Seminole in southwestern Georgia. Mosner and Aulenbach (2003) compared four methods used to estimate evaporation—including the Priestley-Taylor method used by the GaEMN to estimate evapotranspiration for this study—to the energy budget method, which is recognized as the one of the most accurate methods for determining lake evaporation (Winter, 1981). Their study concluded that estimates computed using the Priestley-Taylor method as computed by the GaEMN were generally lower than values computed using the energy-budget method, with an average error of –18.7 percent, and monthly errors ranging from –83.2 to +0.5 percent. Errors were largest during September–March, with a mean error of 46.5 percent. Because studies at HAAF were conducted during the winter months, an error of 50 percent was assumed for evaporation estimates. Fortunately, evaporation was low during the study period (fig. 2), so the influence of such a large error factor on estimation of *Gnet* was minimal.

Discharge Measurements

Pond discharge was measured using a circular orifice weir at Halstrum Pond, and by making stream-discharge measurements using a Price AA current meter at Oglethorpe Lake. A continuous stream stage recorder was installed in the drainage canal downstream from the discharge weir at the golf course pond to enable estimation of stream discharge. Stream-discharge measurements at this site were taken over a range of stage conditions to develop a best-fit line or “rating” based on visual examination of stage-discharge data using procedures described in Rantz and others (1982).

Determination of Pond Water Quality

Water samples were collected from each of the four pond sites in April 2009 to assess basic water quality. At Oglethorpe Lake, Halstrum Pond, and Wilson Gate Pond, field properties—dissolved oxygen, temperature, specific conductance, and pH—were measured at several depths at the deepest part of each pond to determine if there was stratification of the water column. Based on these profiles, samples were collected from the pond at several depths and mixed together using a churn splitter. At the golf course pond, a water sample was collected at a weir, which is the point of discharge from the pond. Water samples were analyzed for major ions and nutrients. These samples represent the non-storm water-quality condition of the ponds. Because the ponds also serve to capture runoff from HAAF during storm events, it is likely that the quality of water changes during such storms.

Hydrology and Water Quality

The hydrology of seepage ponds—including rates of net precipitation (*Pnet*) and *Gnet* and the volume of water stored in the pond—determines the amount of water available for water supply. In addition, suitability of pond water for irrigation purposes may be limited by the quality of water. The following sections describe the bathymetry, water budget, and water quality of seepage ponds located at HAAF.

Oglethorpe Lake

Oglethorpe Lake, also known as pond 29, was constructed in 1985 and covers a 9.5-acre area underlain by sandy soils (fig. 5). The pond is used to capture stormwater and also is used as a fishing pond. The pond, excavated to a maximum depth of about 9 ft, is contained by an earthen dam and captures runoff from Hickam Boulevard, Douglas Street, and Strachan Avenue. Stormwater enters the pond along the eastern shore from a ditch perpendicular to Douglas Street. After periods of prolonged, heavy rainfall, water discharges from the pond through an overflow culvert into a ditch along the western shore, downstream from the dam. Field studies at Oglethorpe Lake were conducted during November 7–December 31, 2008.

Bathymetry and Pond Volume

Bathymetric surveys conducted on December 3, 2008, and April 22, 2009, indicate that the altitude of the bottom of Oglethorpe Lake ranges from about 14 to 21 ft above the North American Vertical Datum of 1988 (NAVD 88; fig. 6). Numerous tree stumps are present along the bottom of the pond. The volume of water stored in Oglethorpe Lake and its surface area varies as pond stage changes. Pond stage was monitored from November 7 through December 31, 2008 (fig. 7). During this period, stage above NAVD 88 ranged from a high of 23.17 ft on November 15, 2008, to a low of 21.37 ft on December 31, 2008. Stage declined during this period largely as the result of leakage from the dam and discharge through an open gate valve.

Figure 5. Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia.

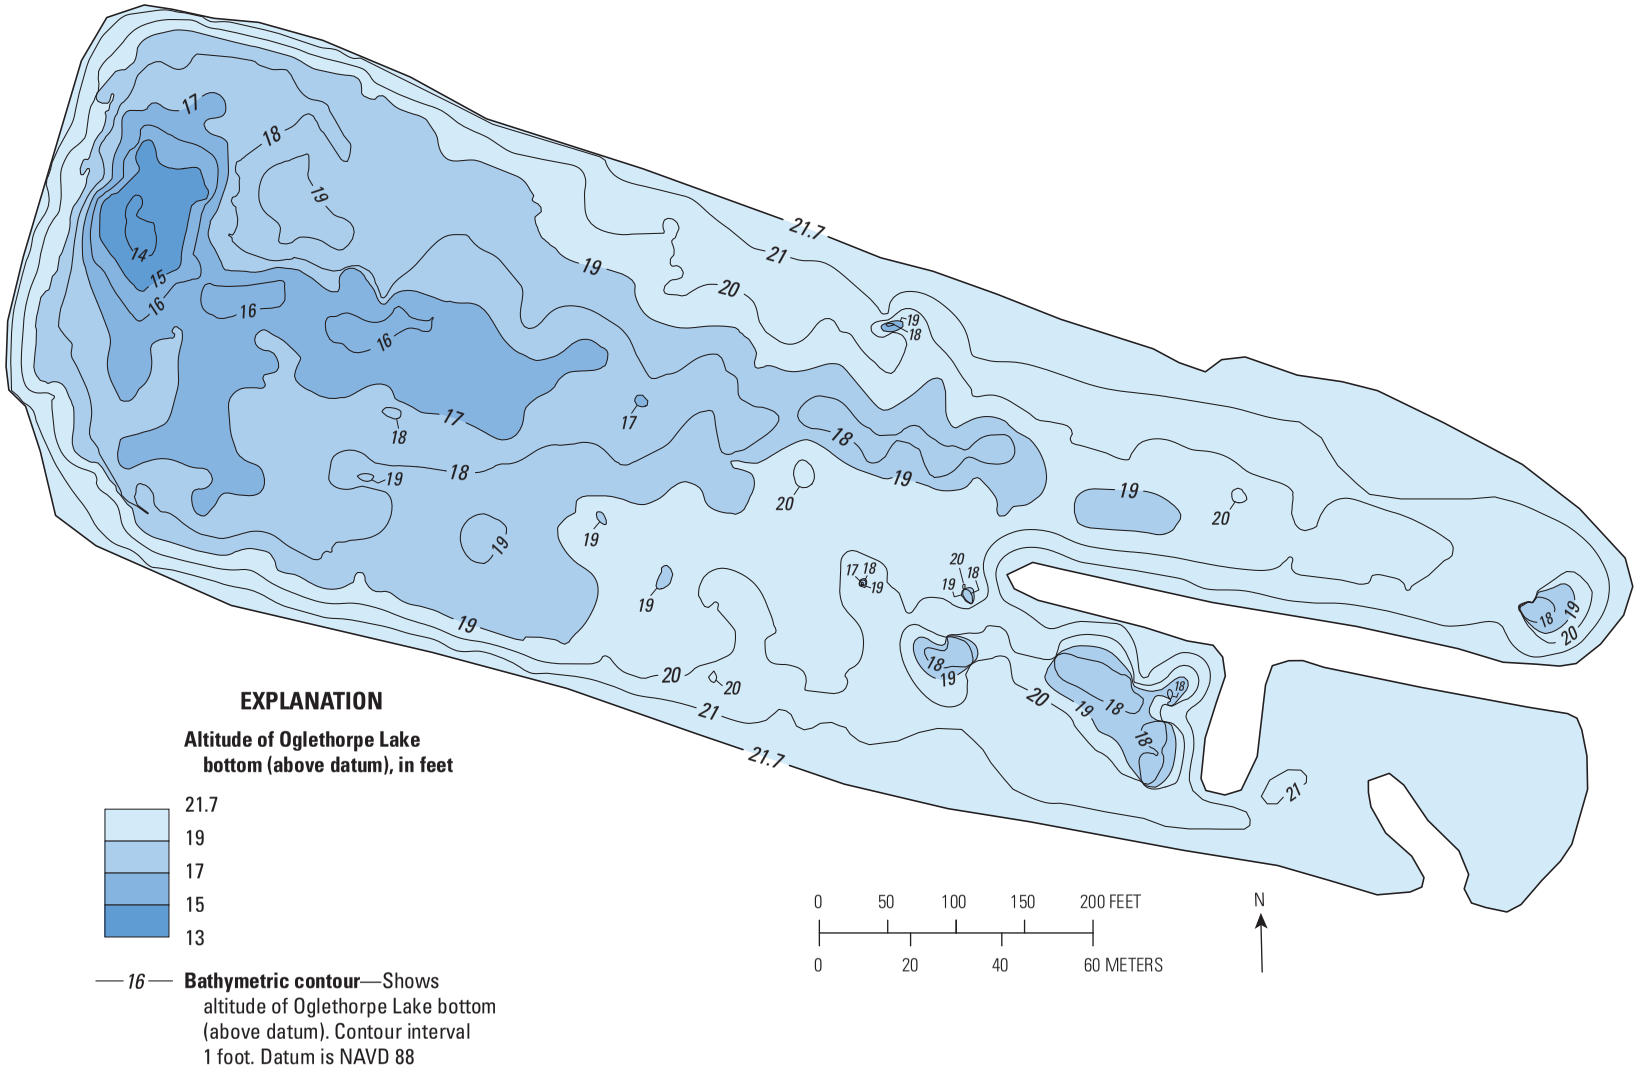

Figure 6. Bathymetry of Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia, December 2008 and April 2009.

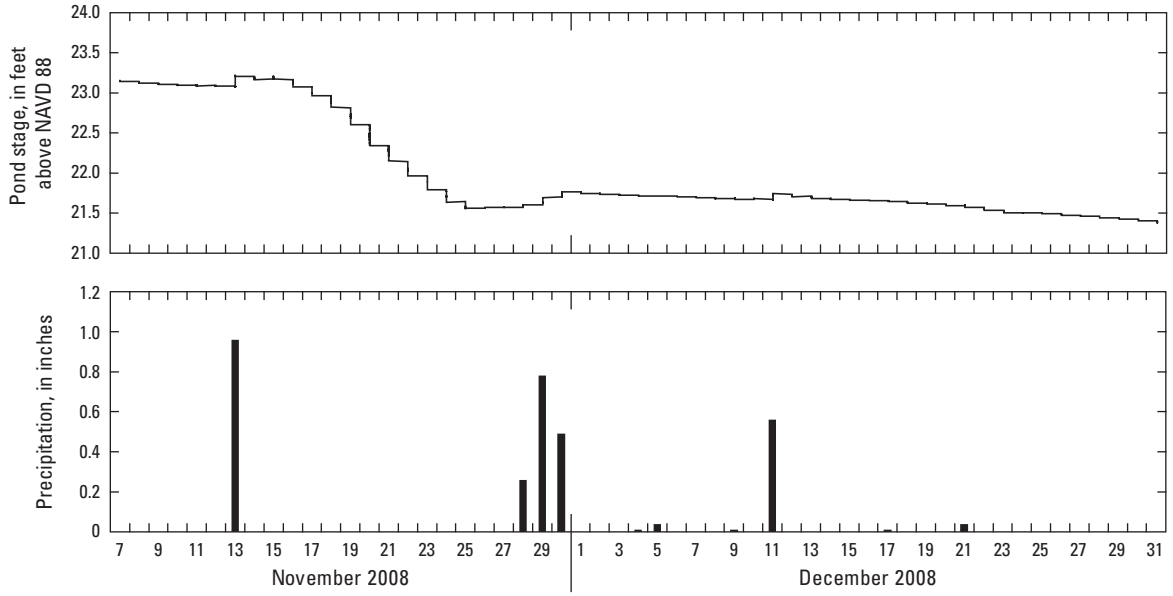

Figure 7. Stage and total daily precipitation at Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia, November–December 2008. Stage recorded at 15-minute intervals.

Pond volume and surface area were estimated using third- and second–order polynomial regression models, respectively, over a range of pond stages (fig. 8). At the highest recorded stage of 23.17 ft above NAVD 88 on November 15, the volume of water stored in the pond was about 7.28 million gallons (Mgal), covering a surface area of 415,379 square feet (ft^2) or 9.53 acres. At the lowest recorded stage of 21.37 ft above NAVD 88 on December 31, the volume of water in the pond was about 6.26 Mgal, covering a surface area of 372,588 ft^2 (8.55 acres)

Water Budget

A simplified water budget was developed for Oglethorpe Lake based on daily pond stage, precipitation, evaporation, and discharge data collected during November 7–December 31, 2008 (fig. 9). During this period, precipitation was limited to storms during November 13 and 28–30 and December 5, 11, and 21. Daily evaporation at the GaEMN Bamboo Farm site, ranged from 0.01 to 0.08 inch during November 7–December 31, 2008.

The water budget for the pond can be expressed in terms of gains and losses to pond volume (fig. 9). Pond discharge is reflected as a loss to pond volume and is indicated by a negative value. *Pnet* is the difference between precipitation and evaporation, which provides an indication of the net gain (+) or loss (–) of water to the pond when computed with *Gnet* and pond discharge. *Pnet* and *Gnet* can be either positive (reflecting gains to pond volume) or negative (reflecting a loss to pond volume). During the study period, values of *Pnet* were largely

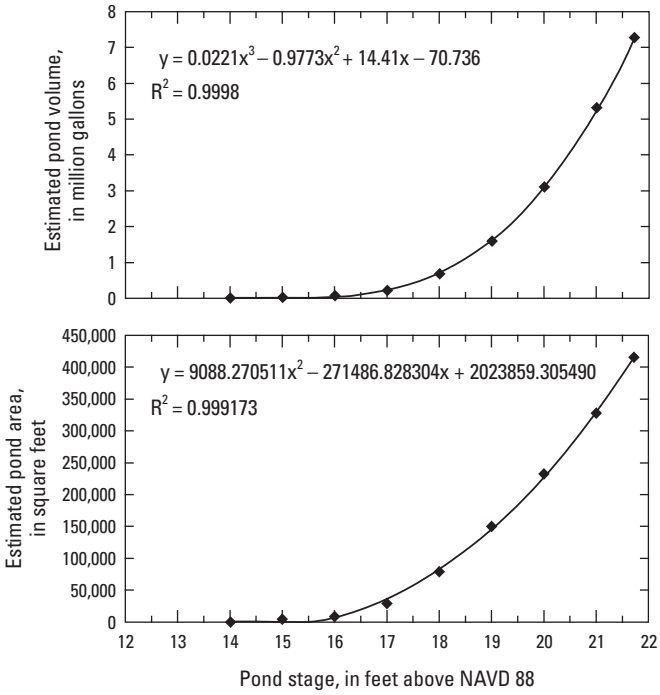

Figure 8. Relation of pond stage to computed volume and surface area, and regression fit of data, Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia.

negative, indicating more water was leaving the pond from evaporation than entering it from precipitation. Exceptions occur when *Pnet* values were positive during rainfall events.

To induce a change in pond stage and assess *Gnet*, water was discharged from the pond by opening a gate valve at a culvert along the earthen dam. The valve remained open during November 11–24, 2008, and produced an estimated discharge of 366 gal/min. In addition to this induced discharge, the pond loses water by leakage through the dam. During visits to the site in November 2008, personnnel observed the pond leaking through the earthen dam at a rate of about 280 gal/min to a drainage outlet about 30 ft below the top of the dam (fig. 10). Water was discharging from the lake through small submerged sinkholes located along the pondward side of the earthen dam (fig. 11). The sinkholes were formed as fill material was eroded away by moving water. When additional pond discharge was induced through the culvert, the leakage rate decreased to about 48 gal/min as pond stage was lowered beneath the position of some of the sinkholes. As pond stage rises to the position of the sinkholes, leakage from the pond is expected to increase. Total discharge from Oglethorpe Lake is the sum of culvert discharge and pond leakage (fig. 12). Leakage through the dam at Oglethorpe Lake resulted in less reliable estimates of pond discharge, with actual values likely higher than estimated. For this reason, an error of 25 percent was assigned to discharge values at Oglethorpe Lake.

During November–December 2008, estimated daily *Gnet* ranged from +0.61 to –0.57 Mgal (fig. 9*B*). The largest computed daily *Gnet* gain (indicated by a positive value) occurred following a rainstorm on November 13, and the largest daily loss (indicated by a negative value) occurred November 22, following an 8-day period of no rainfall. Some of the large *Gnet* gain on November 13 could be attributed to stormwater inflow to the pond.

Discharge from the pond is affected by changes in pond volume, *Gnet*, and *Pnet*. Figure 13 shows cumulative values for change in pond volume, pond discharge, *Pnet*, and *Gnet* during November 7–December 31, 2008. During this period, pond stage was lowered by 1.8 ft, resulting in a loss in pond volume of about 6.7 Mgal. Estimated cumulative discharge from the pond during the same period totaled about 7.4 Mgal. Because the rate of discharge is faster than the change in pond volume, the area between the two lines on figure 13 represents additional discharge provided by *Gnet* and *Pnet*. *Gnet* during this period totaled about 0.24 Mgal, or 36 percent of the additional discharge volume, and *Pnet* was about 0.43 Mgal, or 64 percent of the discharge volume. The 0.24 Mgal volume contributed by *Gnet* during the 55-day study period averages to a rate of only about 3 gal/min. Higher *Gnet* inflows occurred following rainfall events, with the maximum daily value of 0.61 Mgal on November 13, which is equivalent to a rate of 424 gal/min (fig. 9*B*). It is possible that some of the large *Gnet* gains following rainfall events can be attributed to stormwater inflow to the pond. The two longest periods of *Gnet* gains were on November 7–16 and 26–30 (fig. 9*B*):

- During November 7–16, dam leakage of about 3.84 Mgal resulted in a decline in pond stage of 0.07 ft and a loss in pond volume of 0.46 Mgal (figs. 9, 13). One storm event on November 13 resulted in a daily *Pnet* gain of about 0.17 Mgal. *Gnet* during November 7–16 contributed 3.21 Mgal at an average rate of 223 gal/min.

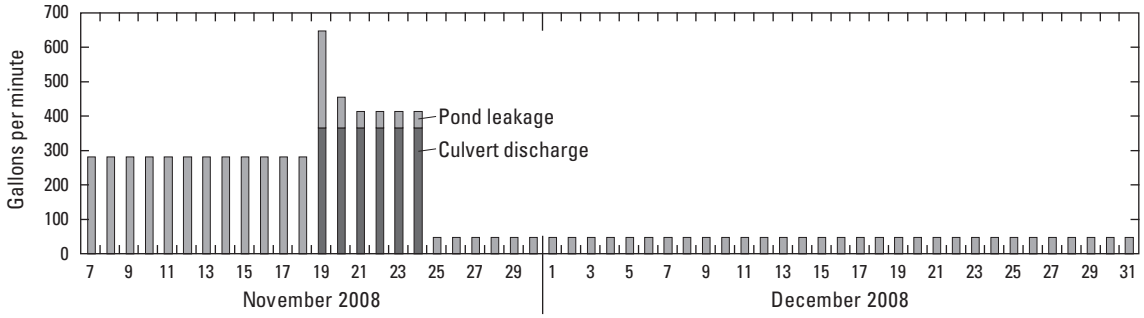

Figure 12. Daily average pond discharge at Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia, November 7–December 31, 2008.

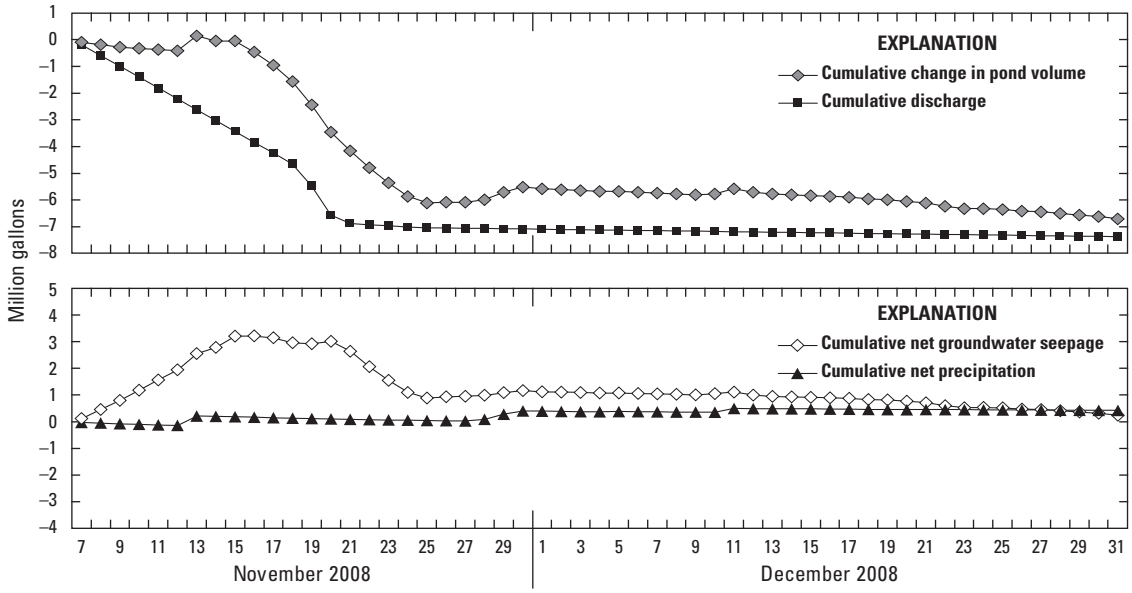

Figure 13. *(A)* Cumulative daily change in pond volume and discharge and *(B)* net precipitation and net groundwater seepage, Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia, November–December 2008.

- During November 26–30, pond stage rose by 0.19 ft, resulting in a gain in pond volume of about 0.6 Mgal (figs. 9, 13). This gain in volume occurred despite dam leakage volume loss of about 0.05 Mgal, and was largely the result of precipitation on November 28–30 that resulted in a *Pnet* gain of 0.36 Mgal during this period. *Gnet* contributed 0.28 Mgal over the 3-day period at an average rate of 39 gal/min.

Uncertainty in *Gnet* estmates are due to combined errors associated with precipitation, evaporation, volume, and discharge computed using equation 2. The largest error for daily *Gnet* estimates (0.28 Mgal) occurred November 20, when pond discharge was highest (fig. 9*B*). Because a 25-percent error was assigned to discharge at Oglethorpe Lake, the high discharge on these dates resulted in a larger overall error range. The variation in *Gnet* error was smaller during periods of decreased discharge from the pond.

Water Quality

To assess water quality at Oglethorpe Lake, field properties (specific conductance, dissolved oxygen, water temperature, and pH) were measured at four discrete depths in the deepest area of the pond near the dam on April 22, 2009 (fig. 14). The deepest part of the pond is about 9 ft deep; measurements were collected at 8, 6, 4, and 2 ft. Temperature, pH, and dissolved oxygen gradually decrease with depth. Conversely, specific conductance slightly increases with depth. Levels of pH ranged from 6.3 to 7.2 and were within the Georgia Environmental Protection Division (GaEPD) standard for waters supporting warm-water species of fish of 6.0–8.5 (Georgia Department of Natural Resources, 2005). Levels of dissolved oxygen met the GaEPD standard of 4 milligrams per liter (mg/L) for water supporting warm-water species of fishes (Georgia Department of Natural Resources, 2005), with the exception of the deepest water, measured at 8 ft, which had a dissolved oxygen concentration of only 3.3 mg/L.

A composite water sample was collected on April 22, 2009, from the four depth intervals, and analyzed for the dissolved constituents listed in table 1. Analytical results indicate that water from Oglethorpe Lake is low in dissolved solids and concentrations of most constituents. The water is fresh, with chloride concentration of 3.85 mg/L. Concentrations of analyzed constituents are all within U.S. Environmental Protection Agency primary and secondary maximum contaminant levels (MCLs) for drinking water (U.S. Environmental Protection Agency, 2009).

[2]Primary Standard

Halstrum Pond

Halstrum Pond, also known as pond 24, is a 4.6-acre pond constructed in 1968 (fig. 15). The pond has a maximum depth of about 17 ft and is contained by an earthen dam (fig. 16). The pond is used to capture stormwater and is also used as a fishing pond. The pond captures runoff from Perimeter Road to the south and from a drainage ditch located east of the pond. Field studies at Halstrum Pond were conducted during November 10–December 31, 2008.

Bathymetry and Pond Volume

A bathymetric survey conducted on December 4, 2008, indicates the altitude of the bottom of Halstrum Pond ranges from about 11 to 26 ft above NAVD 88 (fig. 17). The volume of water stored in Halstrum Pond and its surface area vary as pond stage changes. Pond stage was monitored from November 10 through December 31, 2008 (fig. 18). During this period, stage above NAVD 88 ranged from a high of 27 ft on November 13, 2008, to a low of 25.7 ft on November 20, 2008. Stage declined during this period largely as the result of discharge through an open gate valve during November 18–20 and rose in response to rainfall events on November 13, 15, 28–30, and December 11.

Pond volume and area were estimated using a GIS and second-order polynomial regression models to provide values for a range of pond stages (fig. 19). At the highest recorded stage of 27 ft above NAVD 88 on November 13, the volume of water stored in the pond was about 12.8 Mgal, covering a surface area of 200,408 ft^2, or 4.6 acres. At the lowest recorded stage of 25.7 ft above NAVD 88 on November 20, the volume of water in the pond was about 10.8 Mgal, covering a surface area of 187,348 ft^2, or 4.3 acres.

Water Budget

A simplified water budget was developed for Halstrum Pond based on daily pond stage, precipitation, evaporation, net precipitation, and discharge data collected during November 10–December 31, 2008 (fig. 20). During this period, precipitation was limited to storms during November 13, 15, and 28–30 and December 5, 9, 11–12, 21, and 23. Daily evapotranspiration at the GaEMN site, Bamboo Farm, ranged from 0.01 to 0.06 inch during November 10–December 31, 2008.

During the study period, values of *Pnet* were mostly negative, indicating that more water was leaving the pond from evaporation than entering it from precipitation (fig. 20*A*). Exceptions occurred when *Pnet* values were positive during rainfall events.

To produce a change in pond stage and assess *Gnet*, pond discharge was induced by opening a gate valve at a culvert along the earthen dam. The valve remained open during November 18–20 and produced an estimated discharge of 120–668 gal/min, for an average rate of 0.65 Mgal/d for the 3-day period.

During November–December 2008, estimated daily *Gnet* was mostly positive (reflecting gains in pond volume), ranging from –0.11 to +0.25 Mgal (fig. 20*B*). The largest daily *Gnet* gain (indicated by a positive value) occurred following a rainstorm on November 30, and the largest daily loss (indicated by a negative value) occurred on November 15. The November 15th *Gnet* loss followed rainfall events on November 13 and 15, indicating a possible time lag for rainfall to affect *Gnet*. During the 52-day study period, *Gnet*

contributed a total accumulated volume of 1.34 Mgal, which is equivalent to a rate of 19 gal/min. Higher *Gnet* inflows occurred following rainfall events, with the maximum daily value of 0.25 Mgal on November 30, equivalent to a rate of 175 gal/min. Some of the large *Gnet* gains following rainfall events could be attributed to stormwater inflow to the pond.

Uncertainty in *Gnet* estimates are due to combined errors associated with precipitation, evaporation, volume, and discharge computed using equation 2. The largest daily error for *Gnet* estimates (0.11 Mgal) occurred November 19, when pond discharge was highest. Because a 10-percent error was assigned to discharge at Halstrum Pond, the high discharge on these dates resulted in a larger overall error range. The variation in *Gnet* error was smaller during periods of decreased discharge from the pond.

Discharge from Halstrum pond is affected by changes in pond volume, *Gnet*, and *Pnet*. Figure 21 shows the cumulative values for change in pond volume, pond discharge, *Pnet*, and *Gnet* during November 10–December 31, 2008. During this period, pond stage decreased in response to pond discharge and *Pnet* and *Gnet* losses, and rose in response to gains in *Pnet* and *Gnet* (fig. 20).

A test was conducted during November 18–20 to determine the influence of changes in pond stage on *Gnet* (fig. 21). The test involved opening a gate valve to release water and lower pond stage, while monitoring discharge, pond stage, precipitation, and evaporation. The 3-day test released a total volume of 1.95 Mgal of water, and lowered pond stage by 1.12 ft, resulting in a loss in pond volume of about 1.72 Mgal. Because the volume of pond discharge is 0.24 Mgal higher than

Figure 20. Figure 21. *(A)* Cumulative daily change in pond volume and discharge and *(B)* net precipitation and net groundwater seepage, Halstrum Pond, Hunter Army Airfield, Chatham County, Georgia, November–December 2008.

the change in pond volume, the area between the two lines on figure 21*A* represents additional water provided by *Gnet* and *Pnet*. The total *Pnet* volume during this period was –0.04 Mgal, so that *Gnet* totaled about 0.28 Mgal for a net gain in pond volume of 0.24 Mgal. Over the 3-day period, the average rate of *Gnet* into the pond was 65 gal/min. The pond gate valve was shut off on November 20, and recovery was monitored for a 7-day period of no rainfall (fig. 20). During this period, pond stage rose by 0.1 ft, for an increase in volume of 0.15 Mgal. *Pnet* totalled –0.08 Mgal due to evaporative loss, and *Gnet* contributed 0.23 Mgal. Over the 7-day period, the average rate of *Gnet* into the pond was 0.03 Mgal/d, or 23 gal/min.

Water Quality

To assess water quality at Halstrum Pond, field properties (specific conductance, dissolved oxygen, water temperature, and pH) were measured at eight discrete depths at the deepest part of the pond near the dam on April 22, 2009 (fig. 22). The deepest part of the pond is about 17 ft deep; measurements were collected at 2-ft intervals from 2 to 16 ft. Values of pH and specific conductance vary little with depth, with pH values ranging from 5.3 to 5.6 units and specific conductance ranging from 55 to 89 microsiemens per centimeter (µs/cm). Levels of pH did not meet the GaEPD standard of 6.0–8.5 for waters supporting warm-water species of fish (Georgia Department of Natural Resources, 2005).

Water in the pond shows a decrease in temperature and dissolved oxygen with depth. Temperature was 22.1 degrees Celsius (°C) at a depth of 2 ft and was 14.8 °C at a depth of 16 ft. Dissolved oxygen decreases from a high of 6.2 mg/L at a depth of 2 ft to less than 1 mg/L at depths of 10 ft or greater. At depths of 8 ft and greater, levels of dissolved oxygen did not meet the 4 mg/L GaEPD standard for water supporting warm-water species of fishes (Georgia Department of Natural Resources, 2005).

A composite water sample was collected on April 21, 2009, from the 2- and 12-ft depth intervals and was analyzed for the dissolved constituents shown in table 1. Analytical results indicate water from Halstrum Pond is low in dissolved solids and concentrations of most constituents. The water is fresh, with chloride concentration of 6.52 mg/L. Constituent concentrations are all within U.S. Environmental Protection Agency primary and secondary drinking-water MCLs.

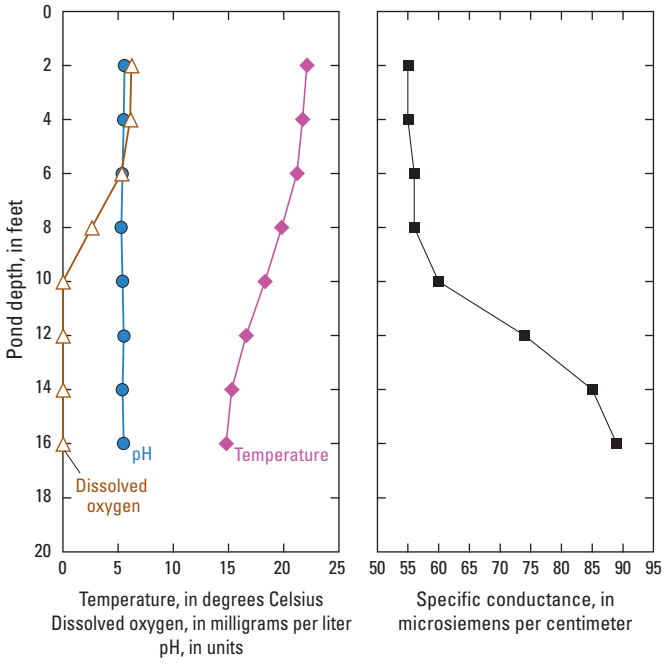

Figure 22. Water-quality profile at Halstrum Pond, Hunter Army Airfield, Chatham County, Georgia, April 21, 2009.

Wilson Gate Pond

Wilson Gate Pond, also known as pond 35, is a 4.7-acre pond (fig. 23) constructed in 1998 with a maximum depth of about 7 ft. The pond serves to capture stormwater runoff from a drainage ditch located along White Bluff Road near the eastern perimeter of the installation and is also used for fishing (fig. 24). Stormwater enters the pond through a four-pipe culvert, and has an overflow discharge pipe that passes beneath North Perimeter Road. A stormwater monitor records precipitation and stream-water-quality properties during storm events.

Bathymetry and Pond Volume

A bathymetric survey conducted on December 2, 2008, indicates that the altitude of the bottom of Wilson Gate Pond ranges from about 8 to 13 ft above NAVD 88 (fig. 25). The volume of water stored in Wilson Gate Pond and its surface area varies as pond stage changes. Pond stage was monitored from November 7 through December 31, 2008 (fig. 26). During this period, stage above NAVD 88 ranged from a high of 13.22 ft on November 30, 2008, to a low of 12.88 ft on November 27, 2008. Rising stage during this period was due to precipitation on November 13, November 28–30, and December 11, and stage declines were largely the result of evaporation and possible discharge from the pond through the culvert.

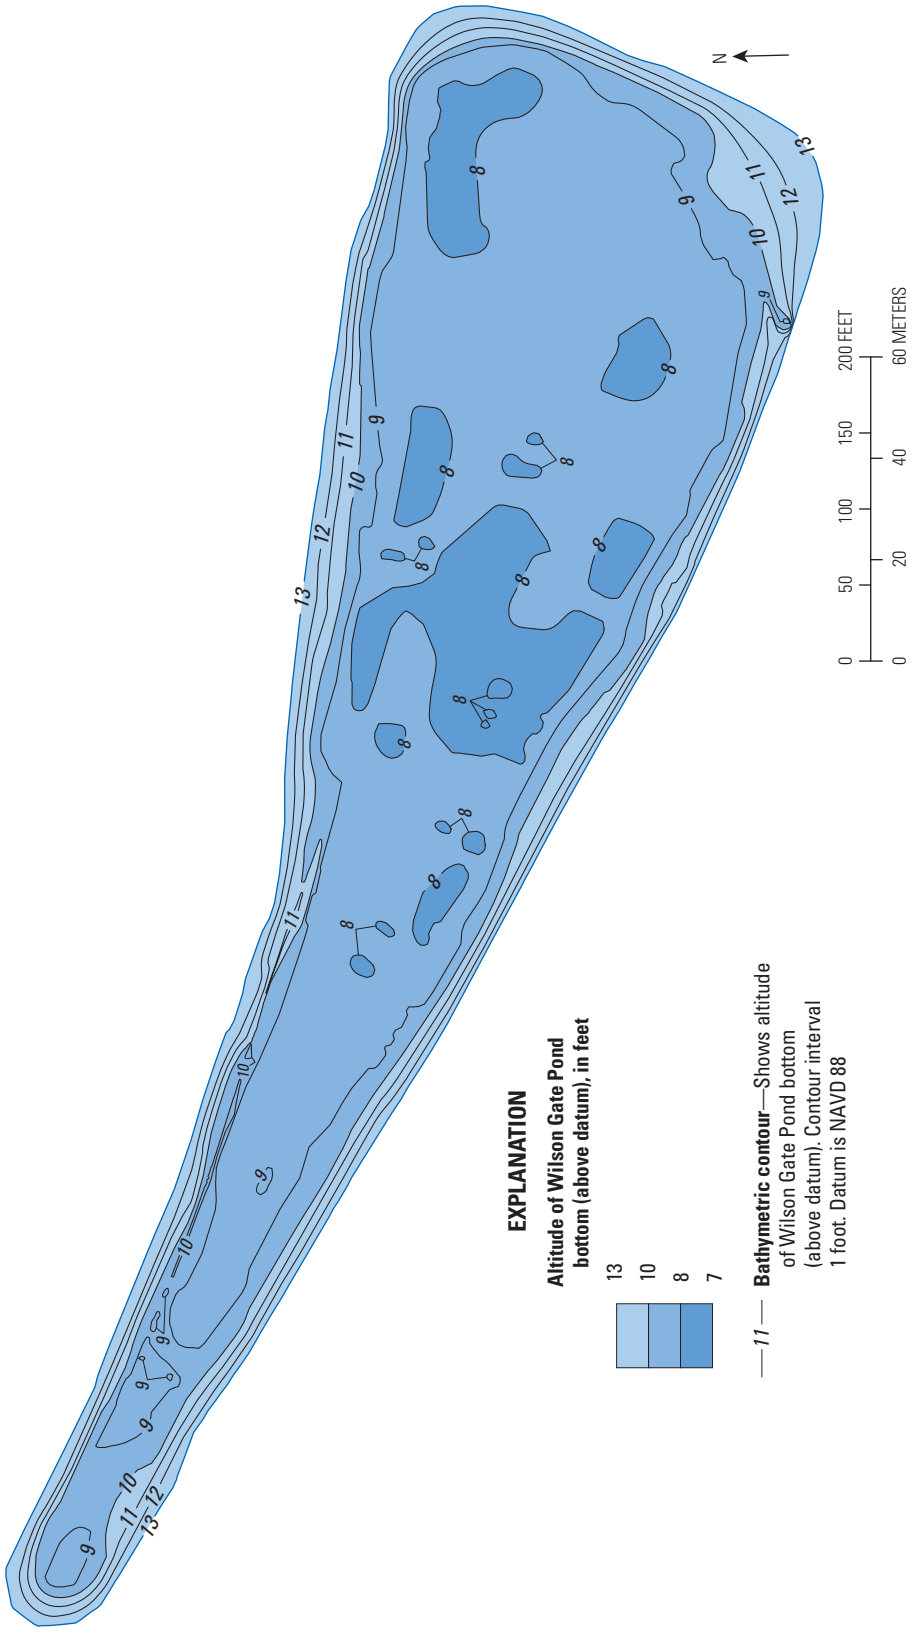

Figure 25. Bathymetry of Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia, December 2008.

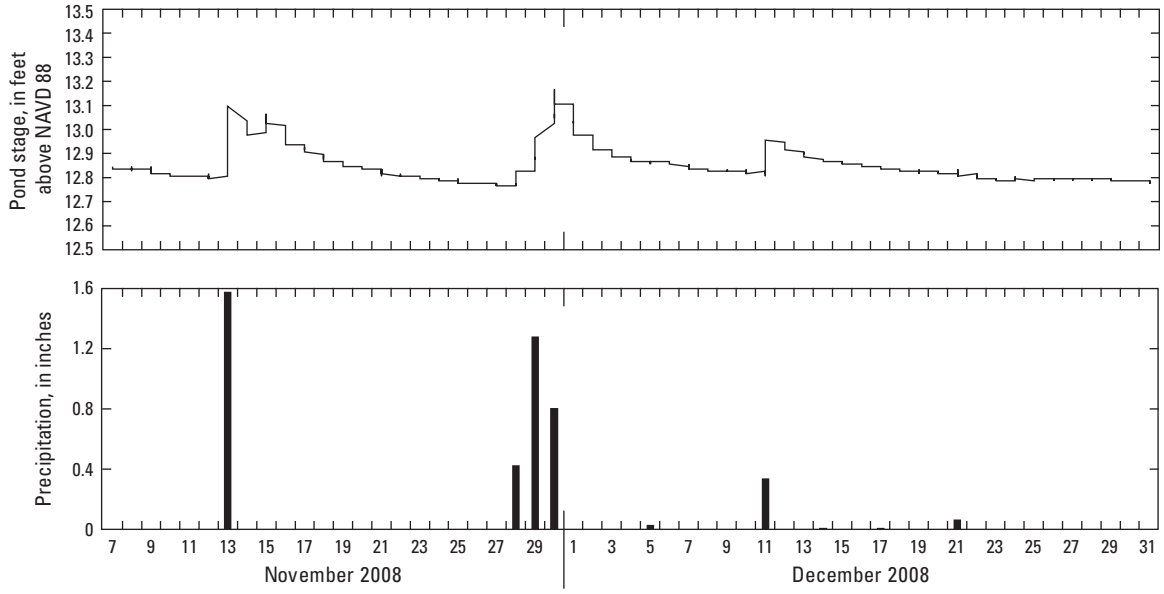

Figure 26. Stage and estimated daily total precipitation at Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia, November–December 2008. Precipitation estimates based on regression analysis with Oglethorpe Lake. Stage recorded at 1-hour intervals.

Pond volume and area were estimated using a GIS and polynomial regression models for a range of pond stages (fig. 27). At the highest recorded stage of 13.22 ft above NAVD 88, the volume of water stored in the pond was about 5.85 Mgal, covering a surface area of 202,266 ft^2, or 4.64 acres. At the lowest recorded stage of 12.88 ft above NAVD 88, the volume of water in the pond was about 5.32 Mgal, covering a surface area of 190,310 ft^2, or 4.32 acres.

Water Budget

A simplified water budget was developed for Wilson Gate Pond based on daily pond stage, precipitation, and evaporation data collected during November 7–December 31, 2008 (fig. 28). Precipitation data were obtained from the stormwater site at HAAF (Russell Moncrief, U.S. Army, written commun., April 15, 2009). Because of several days of missing record at this site, precipitaton was estimated based on daily precipitation data at Oglethorpe Lake, about 1.5 miles to the northwest. Because some of the precipitation data were estimated, an error factor of 20 percent was assigned for water-budget computations, rather than the 15-percent factor assigned at Halstrum Pond and Oglethorpe Lake.

Daily computed *Pnet* at Wilson Gate Pond ranged from a low of –0.8 inch on November 7, to a high of 1.54 inches on November 13 (fig. 28*A*). During the study period, precipitation was mostly limited to storms during November 13, November 28–30, and December 11, and daily evapotranspiration ranged from 0.005 to 0.08 inch. Daily values of *Pnet* were mostly negative, indicating more water was leaving the pond from evaporation than entering it from precipitation. Exceptions occur when *Pnet* values were positive during the aforementioned rainfall events. Despite these rainfall events, there was a small cumulative loss in pond volume during the study period (fig. 29).

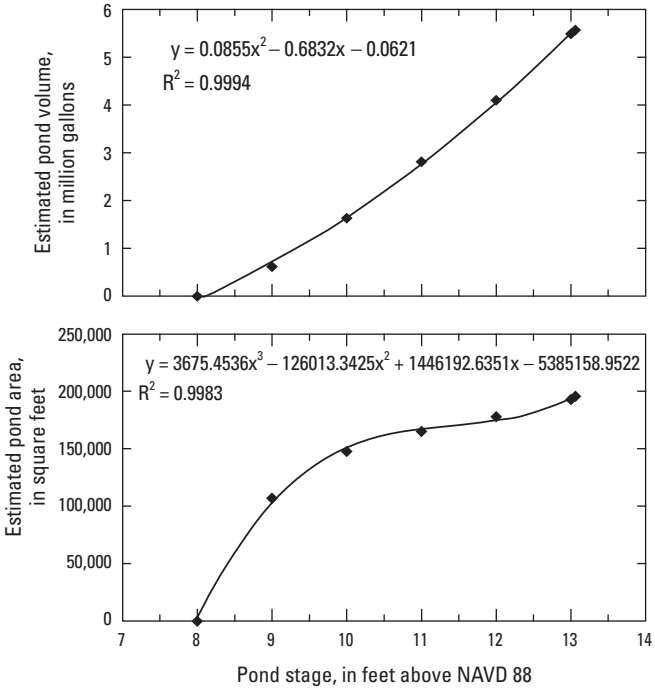

Figure 27. Relation of pond stage to computed volume and surface area, and regression fit of data, Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia.

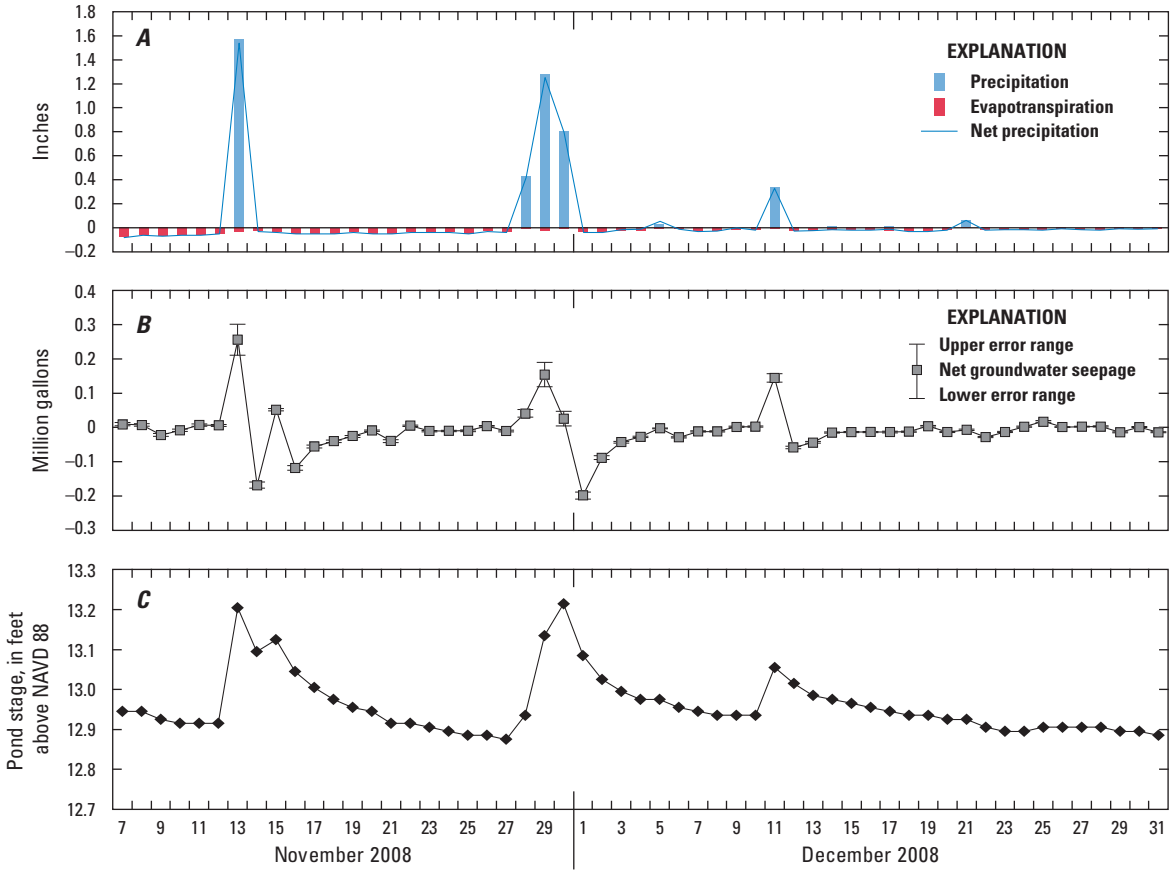

Figure 28. Hydrologic and climatic data at Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia, and vicinity, November–December 2008. *(A)* Daily estimated precipitation and net precipitation at Halstrum Pond, and estimated daily evapotranspiration at the Bamboo Farm, Georgia Environmental Monitoring Site; *(B)* net groundwater seepage; and *(C)* pond stage.

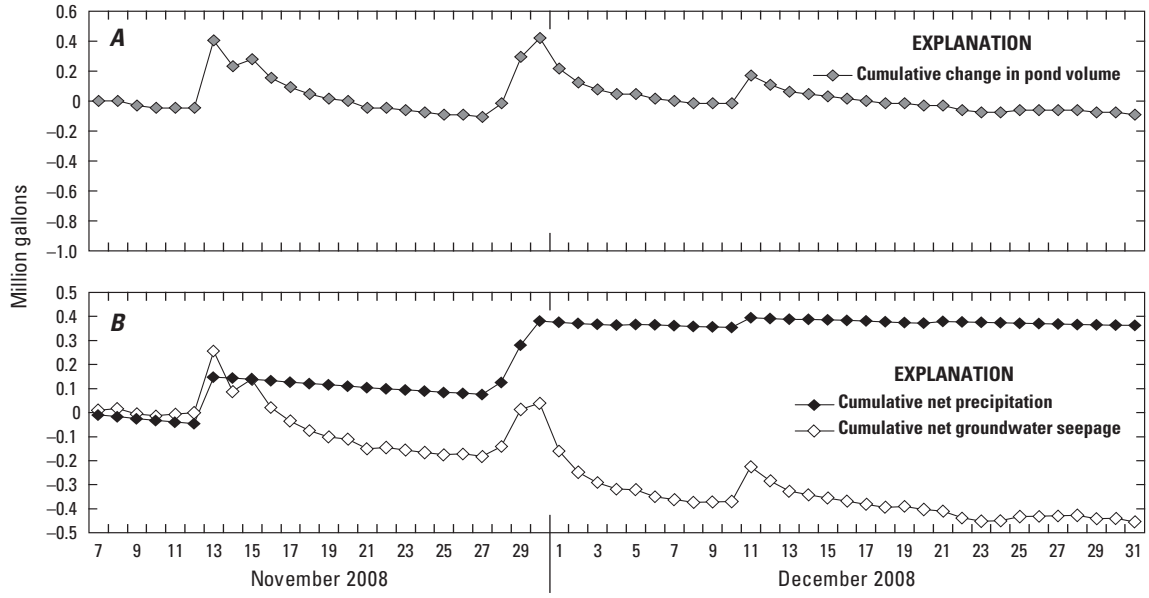

Figure 29. *(A)* Cumulative daily change in pond volume and *(B)* net precipitation and net groundwater seepage, Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia, November–December 2008.

During November–December 2008, estimated daily *Gnet* was mostly negative, reflecting loss of pond volume, and ranged from –0.20 to +0.26 Mgal (fig. 28*B*). The largest daily *Gnet* gain (indicated by a positive value) occurred following rainstorms on November 13, and the largest loss (indicated by a negative value) occurred on December 1. During the 55-day study period, the cumulative *Gnet* volume was –0.45 Mgal, or –5.74 gal/min, indicating a net loss to pond volume (fig. 29). *Gnet* inflows occurred following rainfall events, with the maximum daily value of 0.26 Mgal on November 13 equivalent to a rate of 182 gal/min. Some of the large *Gnet* gains following rainfall events could be attributed to storm-water inflow to the pond.

Uncertainty in *Gnet* estmates are due to combined errors associated with precipitation, evaporation, volume, and discharge computed using equation 2. The largest error for daily *Gnet* estimates (0.04 Mgal) occurred November 13, following a large rainstorm of an estimated 1.58 inches (fig. 28*B*). Because a 20-percent error was assigned to precipitation at Wilson Gate Pond, the high rainfall resulted in a larger overall error range. The variation in *Gnet* error was smaller during periods of little or no precipitation at the pond.

An indication of rates of groundwater replenishment (positive *Gnet*) to pond volume is provided by evaluating rates following three rainfall periods on November 12–13, 28–30, and December 10–11 (fig. 29).

- During November 12–13, a 1.58-inch rainfall resulted in an increase in pond stage of 0.29 ft and an increase in pond volume of about 0.45 Mgal. Total *Gnet* volume during this period was 0.26 Mgal, or 91 gal/min.
- During November 27–30, 2.51 inches of precipitation resulted in an increase in pond stage of 0.34 ft, and an increase in pond volume of about 0.53 Mgal. Over the 3-day period, *Gnet* contributed a cumulative volume of 0.22 Mgal (fig. 28*B*), at an average rate of 51 gal/min.
- During December 10–11, 0.34 in of preciptiation resulted in an increase in pond stage of 0.12 ft, and an increase in pond volume of about 0.18 Mgal. During the 2-day period, *Gnet* contributed a cumulative volume of 0.15 Mgal (fig. 28*B*), at an average rate of 51 gal/min.

Water Quality

To assess water quality at Wilson Gate Pond, field properties (specific conductance, dissolved oxygen, temperature, and pH) were measured at three discrete depths at the deepest part of the pond on April 21, 2009 (fig. 30). The deepest part of the pond is about 7 ft deep; measurements were collected at 2, 4, and 6 ft. Values of pH and specific conductance show little variation with depth, with pH values ranging from 5.3 to 5.4 units and specific conductance ranging from 84 to 86 µs/cm. Levels of pH did not meet the GaEPD standard of 6.0–8.5 for waters supporting warm-water species of fish (Georgia Department of Natural Resources, 2005).

Water temperature and dissolved oxygen slightly decrease with depth. Temperature was 24.4 °C at a depth of 2 ft and was 22.7 °C at a depth of 6 ft. Dissolved oxygen decreases from 5.3 mg/L at a depth of 2 ft to 4.3 mg/L at a depth of 6 ft, meeting the 4-mg/L GaEPD standard for water supporting warm-water species of fishes (Georgia Department of Natural Resources, 2005).

A composite water sample was collected on April 21, 2009, from the 2-, 4-, and 6-ft depth intervals (table 1). Analytical results indicate water from Wilson Gate Pond is low in dissolved solids and concentrations of most constituents. The water is fresh, with a chloride concentration of 12 mg/L. Constituent concentrations are within U.S. Environmental Protection Agency primary and secondary drinking-water MCLs, with the exception of iron (419 µg/L), which exceeds the secondary MCL of 300 µg/L. Although not a health hazard, when the iron concentration exceeds 300 µg/L, iron staining of sidewalks and plumbing fixtures may occur. The reason for the high iron concentration is unknown but may be related to input from sources located offsite of HAAF.

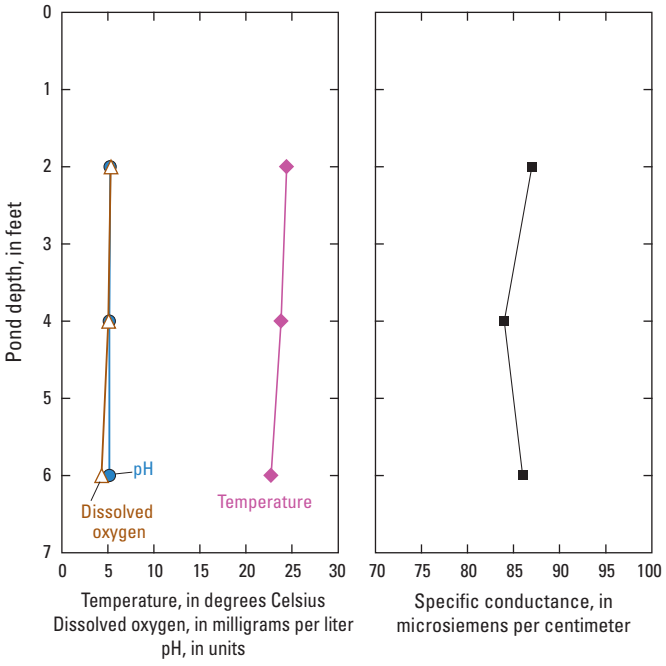

Figure 30. Water-quality profile at Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia, April 21, 2009.

Golf Course Pond

The golf course pond was constructed in 2000 and has a shallow unknown depth and area (fig. 31). The pond captures stormwater runoff from a drainage ditch along the eastern edge of the runway area (fig. 1) and is the only one of the four ponds not used for fishing. The pond discharges to a drainage ditch through a weir structure (fig. 32). Downstream from the weir, a continuous stormwater monitor operated by the U.S. Department of the Army at the location of USGS site 02203542 measures precipitation and water-quality properties during storm events.

Area and depth of the golf course pond were not delineated because streamflow records were used as a basis for evaluation and a detailed water budget analysis was not required. A report titled, "Golf Course Irrigation System Source Water Feasibility Evaluation" (U.S. Army Center for Heath Promotion and Preventative Medicine, 2008) indicated that the pond was designed to retain approximately 4.6 Mgal of surface water and stormwater. The report further stated that beaver dams obstructing the discharge weir had backed up water to levels 3 ft higher than designed, increasing the volume of water stored to about 7.4 Mgal. The same report indicated that the pond was discharging during drought conditions, suggesting it was fed by "groundwater seeps." Measurements taken downstream from the weir during November 2007 and January 2008 indicated water was discharging from the pond at rates of 1–1.25 Mgal/d, or 694–868 gal/min (U.S. Army Center for Heath Promotion and Preventative Medicine, 2008).

Streamflow

The USGS collected 36 periodic streamflow measurements, generally during storm events, at Harmon Canal (site number 02203542) located about 2,150 ft downstream from the golf course pond during March 1979–September 1987 (figs. 31, 33). During this period, streamflow ranged from 282.8 gal/min in March 1979, to 77,647.8 gal/min in September 1987, with a median value of 23,339.2 gal/min (table 2). The percentile of a data population provides an indication of the frequency that a specified value is exceeded. For example, the 10th percentile is the value that is higher than 10 percent of the data population, or, alternatively, is exceeded by 90 percent of the population. During 1979–87, streamflow exceeded 6,171.4 gal/min 90 percent of the time, as indicated by the 10th percentile. It is important to note that these measurements targeted higher stormflow values and that average monthly streamflow would be lower because non-storm base-flow periods are included.

To provide a more recent and seasonal indication of the amount of available water discharging from the golf course pond, a continuous streamflow monitoring site was established about 25 ft downstream from the weir in February 2009. The site monitors stream stage on a continuous basis, which provides data needed to estimate streamflow based on a relation or "rating" of stage and periodic discharge measurements. Streamflow data for February–July 2009 are shown in figure 34. A comparison of field streamflow measurements to values generated by the rating curve indicates an approximate error range of 30 percent from the measured value (Anthony J. Gotvald, U.S. Geological Survey, oral commun., August 6, 2009).

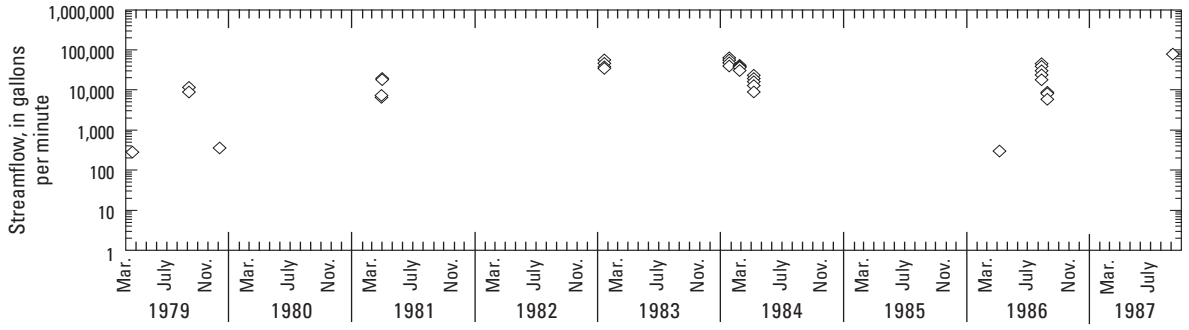

Figure 33. Periodic streamflow at site 02203542, Harmon Canal, Hunter Army Airfield, Chatham County, Georgia, 1979–87.

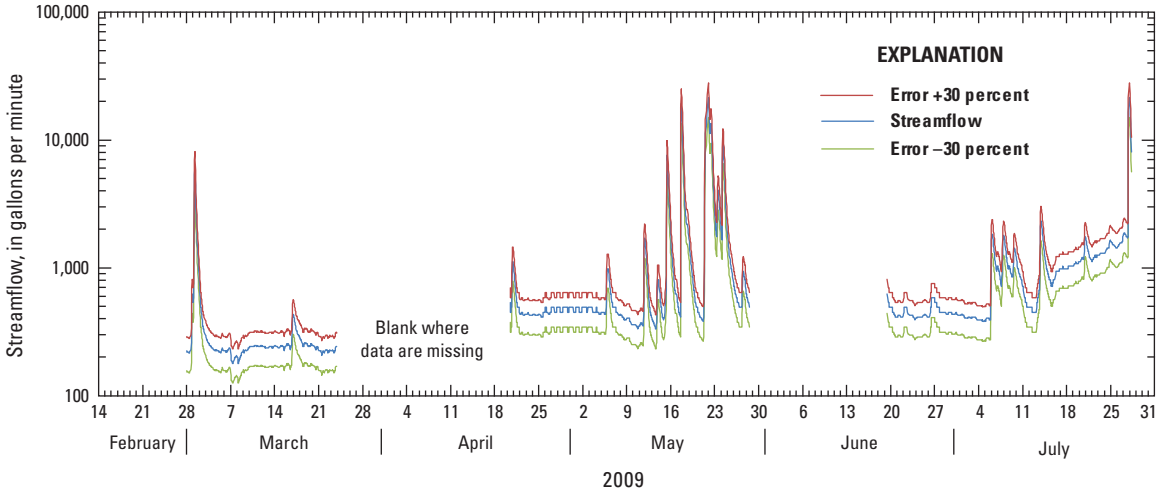

Figure 34. Hourly streamflow at golf course pond, Hunter Army Airfield, Chatham County, Georgia, February–July 2009.

During February–July 2009, streamflow at the golf course pond ranged from about 180 to 21,543.9 gal/min, with a median of 448.8 gal/min (fig. 34; table 2). Streamflow exceeded 237.9 gal/min 90 percent of the time, as indicated by the 10th percentile (table 2). Average daily discharge ranged from 347.3 gal/min in March, to 1,700.6 gal/min in May. A longer period of data collection could provide a better statistical characterization for this site based on a wider range of climatic conditions.

Water Quality

To assess water quality at golf course pond, a water sample was collected and field properties (specific conductance, dissolved oxygen, temperature, and pH) were measured at the mouth of the discharge weir on April 22, 2009. Water discharging through the weir had a temperature of 21.3 °C, a specific conductance of 105 µS/cm at 25 °C, and a pH of 6.0 (table 1). Dissolved oxygen was 3.8 mg/L, which is below the 4-mg/L GaEPD standard for water supporting warm-water species of fishes (Georgia Natural Resources, 2005).

Analytical results indicate that water from the golf course pond is low in dissolved solids and concentrations of most constituents. The water is fresh, with a chloride concentration of 7.09 mg/L. Constituent concentrations are within U.S. Environmental Protection Agency primary and secondary drinking-water MCLs.

Water-Supply Potential

To meet the growing water demand at HAAF, the four ponds are being considered as possible sources of supplemental irrigation supply for several locations at HAAF. The water-supply potential of the ponds is determined by available volume, rates of *Gnet* and *Pnet*, and water quality. In addition, because some of the ponds are stocked and used for fishing, changes in stage that affect fish habitats need to be considered.

An indication of the volume of water available for irrigation supply at Oglethorpe Lake and Halstrum and Wilson Gate Ponds during dry climatic conditions is provided by computing the rate of depletion of pond volume for various discharge, *Pnet*, and *Gnet* rates (table 3). Because the ponds will serve as irrigation sources mostly during dry periods, evaporation and precipitation estimates are based on the long-term average values for July from the Savannah International Airport site (fig. 2). Average total precipitation for July during 1971–2000 was 6.23 inches, and average monthly evaporation for July during 1965–2003 was 8.49 inches, resulting in a monthly *Pnet* of –2.26 inches. Rates of evaporative loss at each pond were adjusted to account for changes in pond surface area, with decreasing stage as pond volume is depleted. To provide conservative estimates of rates of depletion, the average estimated *Gnet* at each of the ponds for the study period was used for the evaluation; thus, greater quantities of water may be available from the ponds. This analysis assumes that there is no precipitation during the pumping period, that evaporation remains constant, and that rates of *Gnet* remain constant as pond stage is lowered. The latter assumption likely results in an underestimation of the amount of available water because a previous study by Clarke and Abu Rumman (2004) demonstrated that simulated *Gnet* rates increase in response to lowered pond stage.

Irrigation demands are often quantified in terms of application rates per acre, usually expressed in inches per acre. According to the Georgia Cooperative Extension Service (Landry, 2009), "In general, most turf grasses grown in Georgia use about 1 inch of water per week to maintain normal growth and color. But under some conditions such as shallow rooting and high nitrogen levels, water use may be 2 inches per week." A 1-inch application over 1 acre would require 57 gal/min over an 8-hour period; a 2-inch application would require 114 gal/min. The following sections describe depletion of pond volume for discharge rates of 250, 500, and 1,000 gal/min for an 8-hour per day (hr/d) pumping period. During an 8-hour period, pumping at a rate of 250 gal/min would enable application of 1 inch over 4.4 acres, 500 gal/min over 8.8 acres, and 1,000 gal/min over 17.6 acres.

Table 3. Summary of pond volume and net groundwater seepage and pond-volume depletion rates for Oglethorpe Lake and Halstrum and Wilson Gate Ponds, Hunter Army Airfield, Chatham County, Georgia.

[Depletion rates computed assuming an 8-hour per day irrigation period and long-term average climatic conditions during July and average net groundwater seepage during November–December 2008]

Site	Year constructed	Acres	Maximum volume (million gallons)	Average net groundwater seepage, November–December 2008 (gallons per minute)	Number of days for depletion of storage at pumping rate		
					250 gallons per minute	500 gallons per minute	1,000 gallons per minute
Oglethorpe Lake	1985	9.5	7.28	3	58	31	16
Halstrum Pond	1968	4.6	12.8	19	130	60	29
Wilson Gate Pond	1998	4.7	5.9	–5.74	44	24	13

Oglethorpe Lake

The quality of water from Oglethorpe Lake is fresh, with a chloride concentration of 3.85 mg/L. During the November–December 2008 study period, available volume in Oglethorpe Lake ranged from 6.26 to 7.28 Mgal, and *Gnet* averaged about 3 gal/min, with higher inflows following rainfall events. Assuming long-term average climatic conditions for July and an 8 hr/d pumping period, total depletion of pond volume in Oglethorpe Lake would occur after 16 days at a pumping rate of 1,000 gal/min, after 31 days at a pumping rate of 500 gal/min, and after 58 days at a pumping rate of 250 gal/min (fig. 35). A limitation on the quantity of water available in Oglethorpe Lake is leakage through the dam, with a maximum rate of 280 gal/min measured in November 2008.

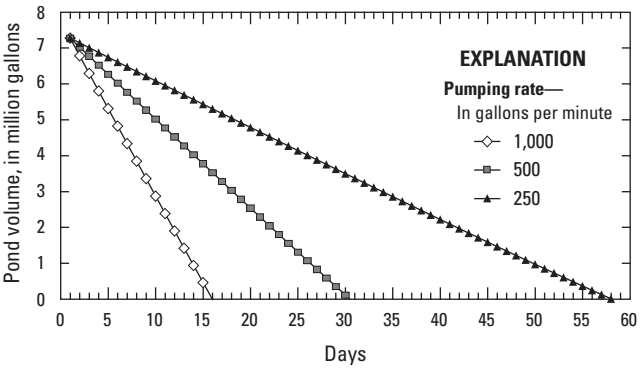

Figure 35. Hypothetical rate of depletion of pond volume at pumping rates of 1,000, 500, and 250 gallons per minute for 8 hours per day for long-term climatic conditions during July at Oglethorpe Lake, Hunter Army Airfield, Chatham County, Georgia.

Halstrum Pond

The quality of water from Halstrum Pond is fresh, with a chloride concentration of 6.52 mg/L. During the November–December 2008 study period, available volume in Halstrum Pond ranged from 10.8 to 12.8 Mgal, and *Gnet* averaged about 19 gal/min, with higher *Gnet* inflows following rainfall events. Assuming long-term average climatic conditions for July and an 8 hr/d pumping period, total depletion of pond volume in Halstrum Pond would occur after 29 days at a pumping rate of 1,000 gal/min, after 60 days at a pumping rate of 500 gal/min, and after 130 days at a pumping rate of 250 gal/min (fig. 36).

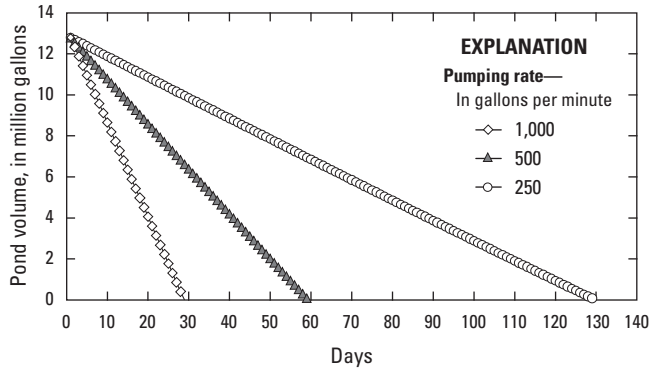

Figure 36. Hypothetical rate of depletion of pond volume at pumping rates of 1,000, 500, and 250 gallons per minute for 8 hours per day for long-term climatic conditions during July at Halstrum Pond, Hunter Army Airfield, Chatham County, Georgia.

Wilson Gate Pond

The quality of water from Wilson Gate Pond is fresh, with a chloride concentration of 12 mg/L. During the November–December 2008 study period, available volume in Wilson Gate Pond ranged from 5.32 to 5.85 Mgal, and *Gnet* averaged –5.74 gal/min; however, *Gnet* inflows occurred following rainfall events. Assuming long-term average climatic conditions for July and an 8 hr/d pumping period, total depletion of pond volume in Wilson Gate Pond would occur after 13 days at a pumping rate of 1,000 gal/min, after 24 days at a pumping rate of 500 gal/min, and after 44 days at a pumping rate of 250 gal/min (fig. 37).

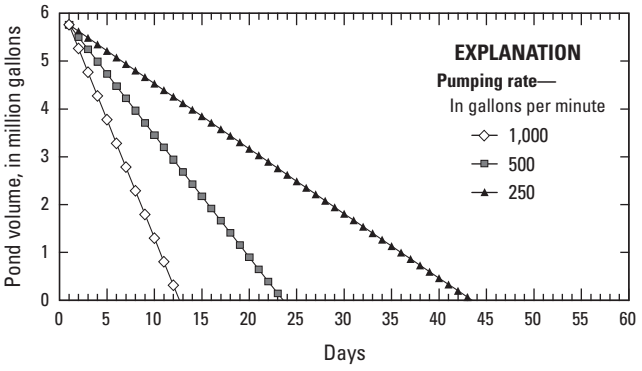

Figure 37. Hypothetical rate of depletion of pond volume at pumping rates of 1,000, 500, and 250 gallons per minute for 8 hours per day for long-term climatic conditions during July at Wilson Gate Pond, Hunter Army Airfield, Chatham County, Georgia.

Golf Course Pond

Currently (2009), irrigation water at the golf course pond is derived from the HAAF potable water system, which is supplied by wells completed in the Upper Floridan aquifer. Average reported water use at the golf course during 2005–2007, a period of below-normal precipitation, is listed in table 4. Maximum monthly usage generally occurs during March–May and July–October, with a maximum average of 7.91 Mgal (0.26 Mgal/d) used during the month of July. Assuming an 8-hour daily irrigation period, the average pumping rate required to meet the demand during March–May and July–October would range from 214 to 531 gal/min. Average daily golf course water-use data for 2005–07 and periodic streamflow measurements during 1979–87 and 2009 are shown in figure 38.

The quality of water from the golf course pond is fresh, with a chloride concentration of 7.09 mg/L. During February–July 2009, streamflow downstream from the golf course pond exceeded 237.9 gal/min 90 percent of the time (table 2). Daily average streamflow ranged from 347.3 gal/min in March to 1,700.6 gal/min during May, with higher values caused by storm events. The average daily streamflow during February–July 2009 exceeded average daily water use at the golf course during the same months in 2005–07 (fig. 38). In addition, periodic streamflow measurements during 1979–87 exceeded average 2005–07 golf course water use during January–April, August, September, and December, exceeding 6,171 gal/min 90 percent of the time.

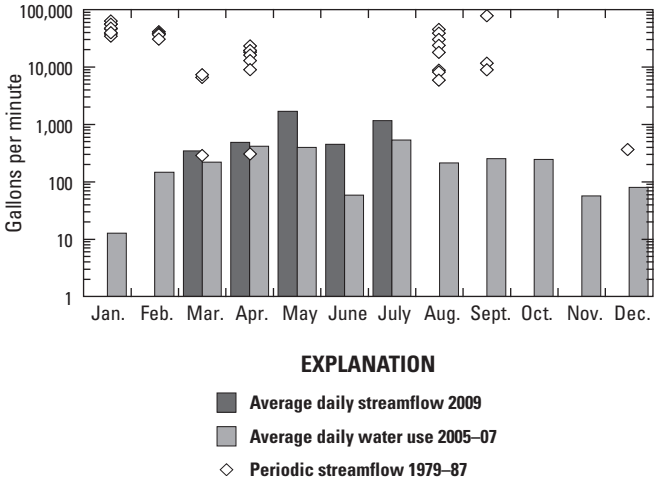

Figure 38. Average daily golf course water use, 2005–07, periodic streamflow measurements during 1979–87, and average daily streamflow during March–July 2009, golf course pond, Hunter Army Arifield, Chatham County, Georgia.

Table 4. Water use at golf course, Hunter Army Airfield, 2005–07 (modified from U.S. Army Center for Heath Promotion and Preventative Medicine, 2008).

Summary

Water from all four ponds at HAAF is fresh, with chloride concentrations below 12 milligrams per liter (mg/L). With the exception of iron in Wilson Gate Pond, constituent concentrations are below U.S. Environmental Protection Agency primary and secondary maximum contaminant levels (MCLs) for drinking water. Water in Wilson Gate Pond contains an iron concentration of 419 micrograms per liter (µg/L), which exceeds the secondary MCL of 300 µg/L. Although not a health hazard, when the iron concentration exceeds 300 µg/L, iron staining of sidewalks and plumbing fixtures may occur. Levels of dissolved oxygen were below the Georgia Environmental Protection Divison standard of 4 mg/L for water supporting warm-water fishes at deeper depths in Oglethorpe Lake, Wilson Gate Pond, and Halstrum Pond, and in the composite sample at the golf course pond.

Quantitites of freshwater from the four ponds are limited by pond volume and net groundwater seepage (*Gnet*) rates during periods of low precipitation. Pond volume for the observed range of stage was determined for Oglethorpe Lake, Halstrum Pond, and Wilson Gate Pond. Storage volume ranged from 5.32 to 12.8 million gallons (Mgal), with the greatest storage volume available in Halstrum Pond. During the November–December 2008 period, used to compute water budgets at the three ponds, average *Gnet* ranged from –5.74 gallons per minute (gal/min) at Wilson Gate Pond, indicating net loss in seepage, to 19 gal/min at Halstrum Pond, indicating a net gain in seepage. During several periods of stage recovery, daily *Gnet* rates were higher than the 2-month average, with the highest rates of 178–424 gal/min occurring during limited periods following major rainfall events. More typical *Gnet* rates were 23 gal/min in Halstrum Pond, 51–91 gal/min in Wilson Gate Pond, and 39–223 gal/min in Oglethorpe Lake. Some of the large *Gnet* gains following rainfall events could be attributed to stormwater inflow to the pond.

An indication of the volume of water available for irrigation supply at Oglethorpe Lake and Halstrum and Wilson Gate Ponds was provided by computing the rate of depletion of pond volume for a variety of withdrawal rates based on long-term average July precipitation and evaporation and the lowest estimated *Gnet* rate at each pond. Withdrawal rates of 1,000, 500, and 250 gal/min, were projected over an 8-hour daily pumping period. At a withdrawal rate of 1,000 gal/min, available pond volume would be depleted in 13 days at Wilson Gate Pond, 16 days at Oglethorpe Lake, and 29 days at Halstrum Pond. Pumping at a rate of 500 gal/min would deplete pond volume in Oglethorpe Lake in 31 days, in Halstrum Pond in 60 days, and in Wilson Gate Pond in 24 days. Pond volume would be depleted while withdrawing at a rate of 250 gal/min in 44 days at Wilson Gate Pond, 58 days at Oglethorpe Lake, and 130 days at Halstrum Pond. This analysis assumes that there is no precipitation during the pumping period, that evaporation remains constant, and that rates of *Gnet* remain constant as pond stage is lowered. The effect of stage changes resulting from withdrawal on fish populations in the ponds would need to be considered when developing a water-withdrawal plan for each pond.

Accuracy of *Gnet* estimates are limited by the accuracy of each water-budget component. Field measurements have an associated error depending on the method of measurement; total *Gnet* error is an accumulation of the errors of the various measurements. Note that different climatic conditions and pumping rates would influence the rate of pond-volume depletion, and that reducing pond stage beyond the range of observed test conditions during November–December 2008 also increases rates of net groundwater seepage into the ponds. Despite these limitations, the aforementioned analysis gives some indication of the sustainability of pumping the ponds during dry summer conditions.

The water-supply potential at the golf course pond was assessed by measuring flow downstream from the pond during February–July 2009, and examining historic stormflow measurements collected during 1979–87. These measurements indicate that streamflow during these periods exceeded average daily water use at the golf course pond during 2005–07, a period of below-normal precipitation when water demand would be expected to be higher. Assuming an 8-hour daily irrigation period, the average discharge rate required to meet golf course water demand during peak demand months of March–May and July–October exceeds 200 gal/min, with the greatest rate of 531 gal/min during July. During February–July 2009, daily average streamflow downstream from the golf course pond exceeded 238 gal/min 90 percent of the time. Daily average streamflow ranged from 347 gal/min in March to 1,700 gal/min during May, with higher values due to storm events. Periodic streamflow measurements during 1979–87 exceeded 6,171 gal/min 90 percent of the time; however, these measurements are skewed toward higher stormflow values, and average monthly streamflow would be lower because non-storm base-flow periods are included.

Vertical coordinate information is referenced to the National Geodetic Vertical Datum of 1929 (NGVD 29) or the North American Vertical Datum of 1988 (NAVD 88).

Horizontal coordinate information is referenced to North American Datum of 1983 (NAD 83).

Altitude, as used in this report, refers to distance above the vertical datum.

*Transmissivity: The standard unit for transmissivity is cubic foot per day per square foot times foot of aquifer thickness [$(ft^3/d)/ft^2$]ft. In this report, the mathematically reduced form, foot squared per day (ft^2/d), is used for convenience.

Specific conductance is given in microsiemens per centimeter at 25 degrees Celsius (µS/cm at 25 °C).

Concentrations of chemical constituents in water are given either in milligrams per liter (mg/L) or micrograms per liter (µg/L).

Hydrogeology and Water Quality of the Floridan Aquifer System and Effect of Lower Floridan Aquifer Pumping on the Upper Floridan Aquifer at Hunter Army Airfield, Chatham County, Georgia

By John S. Clarke, Lester J. Williams, and Gregory C. Cherry

Abstract

Test drilling and field investigations, conducted at Hunter Army Airfield (HAAF), Chatham County, Georgia, during 2009, were used to determine the geologic, hydraulic, and water-quality characteristics of the Floridan aquifer system and to evaluate the effect of Lower Floridan aquifer (LFA) pumping on the Upper Floridan aquifer (UFA). Field investigation activities included (1) constructing a 1,168-foot (ft) test boring and well completed in the LFA, (2) collecting drill cuttings and borehole geophysical logs, (3) collecting core samples for analysis of vertical hydraulic conductivity and porosity, (4) conducting flowmeter and packer tests in the open borehole within the UFA and LFA, (5) collecting depth-integrated water samples to assess basic ionic chemistry of various water-bearing zones, and (6) conducting aquifer tests in the new LFA well and in an existing UFA well to determine hydraulic properties and assess interaquifer leakage. Using data collected at the site and in nearby areas, model simulation was used to quantify the effects of interaquifer leakage on the UFA and to determine the amount of pumping reduction required in the UFA to offset drawdown resulting from the leakage.

Borehole-geophysical and flowmeter data indicate the LFA at HAAF consists of limestone and dolomitic limestone between depths of 703 and 1,080 ft, producing water from six major permeable zones: 723–731; 768–785; 818–837; 917–923; 1,027–1,052; and 1,060–1,080 ft. Data from a flowmeter survey, conducted at a pumping rate of 748 gallons per minute (gal/min), suggest that the two uppermost zones contributed 469 gal/min or 62.6 percent of the total flow during the test. The remaining four zones contributed from 1.7 to 18 percent of the total flow. Grab water samples indicate that with the exception of fluoride, constituent concentrations in the LFA increased with depth; water from the deepest interval (1,075 ft) contained chloride and sulfate concentrations of 480 and 240 milligrams per liter (mg/L), respectively. These relatively high concentrations were interpreted to have little effect on the overall quality of the well because flowmeter results indicated that water from 1,060 to 1,080 ft contributed less than 2 percent of the total flow to the completed well.

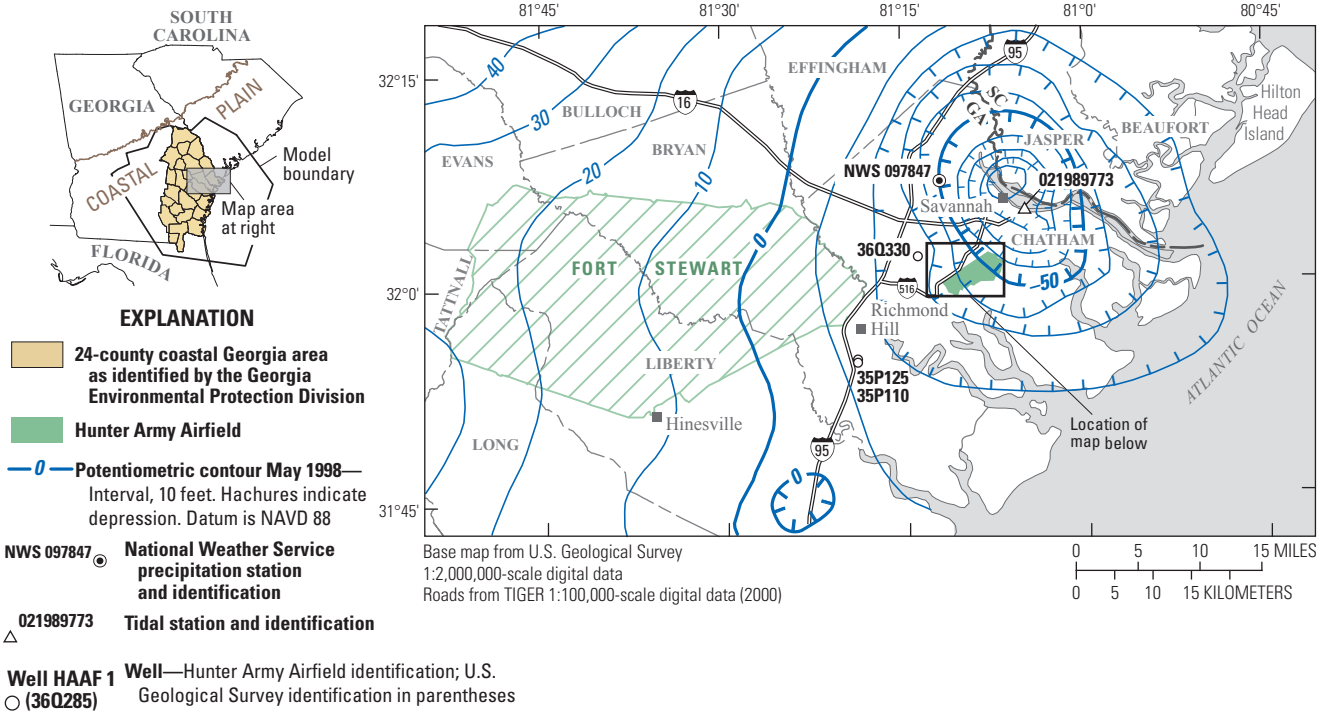
Results of a 72-hour aquifer test indicate that pumping a LFA well at a rate of 748 gal/min produced a drawdown response of 0.76 ft in a well completed in the UFA located 176 ft from the pumped well. A revised regional groundwater-flow model was used to simulate long-term (steady-state) leakage response of the UFA to pumping from the LFA and to estimate the equivalent amount of pumping from the UFA that would produce similar drawdown. Pumping the well at a rate of 748 gal/min (about 1 million gallons per day [Mgal/d]) resulted in a maximum simulated steady-state drawdown of 36.2 ft in the LFA and was greater than 1 ft over a 146 square-mile area. Simulated steady-state drawdown in the overlying UFA that resulted from interaquifer leakage was greater than 1 ft over a 141 square-mile area and was 2.03 ft at the pumped well. Flow to the pumped well was derived from increased lateral flow across the specified-head boundary (0.02 Mgal/d) and increased leakage from the UFA (0.52 Mgal/d), and by reductions in discharge to the Lower Floridan confining unit (0.53 Mgal/d) and to the lateral specified-head boundary (0.53 Mgal/d). Sixty-five percent of the leakage from the UFA occurred within 1 mile of the pumped well. This larger contribution results from a larger head gradient between the pumped well and the overlying aquifer in areas close to the pumped well.

The Georgia Environmental Protection Division interim permitting strategy for the LFA requires simulation of (1) aquifer leakage from the UFA to LFA resulting from

pumping the new LFA well, and (2) the equivalent rate of UFA pumping that induces the identical maximum drawdown in the UFA that would be expected as a result of pumping the LFA. Results of this analysis can be used as a basis to reduce nearby UFA permitted pumping in the same general area (within a 5-mile radius) by an amount equal to or greater than the determined leakage rate. Results of model simulations indicate that these two requirements result in widely varying pumping offsets for the UFA. Simulated interaquifer leakage was 361 gal/min (0.52 Mgal/d), whereas the equivalent UFA pumping rate to offset maximum drawdown was 189 gal/min (0.27 Mgal/d). The simulated pumping rate to match the maximum drawdown in the UFA underpredicts the amount of pumping offset because the cone of depression formed in response to pumping the UFA is steeper near the pumped well and covers a smaller area than the area simulated in response to interaquifer leakage. Thus, the simulated leakage rate may be a more effective means of evaluating required pumping offsets.

Three groundwater-pumping scenarios were run to evaluate the effect of various pumping changes on groundwater levels at HAAF. For two of the scenarios, the LFA was pumped 24 hours per day at a rate of 748 gal/min, while pumping from UFA wells was reduced by 187 gal/min for the first scenario and 361 gal/min for the second scenario. The third scenario involved pumping the LFA well 24 hours per day at a rate of 374 gal/min and reducing pumping of the UFA by 187 gal/min. These pumpage reduction scenarios decreased the magnitude and extent of drawdown in the UFA in comparison to the scenario in which the LFA was pumped without adjusting withdrawal from the UFA. None of the scenarios resulted in noticeable changes in the configuration of the simulated potentiometric surface and related groundwater-flow directions for the UFA.

Introduction



Hunter Army Airfield (HAAF) is located in the coastal area of Georgia near the city of Savannah (fig. 1). Water supply at the facility is derived from groundwater withdrawal from wells completed in the Upper Floridan aquifer (UFA). Concern over saltwater intrusion at Hilton Head Island, South Carolina, has resulted in increased restrictions by the Georgia Environmental Protection Division (GaEPD) on permitted groundwater withdrawals from the UFA. The current UFA groundwater permit at HAAF has been modified to reduce capacity from 1.03 to 0.98 million gallons per day (Mgal/d). To meet growing demands for water in the coastal Georgia area, GaEPD has encouraged use of alternative sources of water to the UFA, including wells completed in the Lower Floridan aquifer (LFA). HAAF seeks to offset reductions in permitted withdrawals from the UFA by making up the capacity using a well completed in the LFA.

Pumping from the LFA may increase the head gradient locally between the UFA and LFA, lower water levels in the UFA, and induce leakage (groundwater flow) from the UFA to the LFA. In January 2003, GaEPD released an interim strategy for permitting Lower Floridan withdrawals in the 24-county coastal area of Georgia (Nolton Johnston, Georgia Environmental Protection Division, written commun., January 28, 2003). The GaEPD permitting strategy states:

> "The applicant must demonstrate, using detailed aquifer testing and standard hydrogeological methods, that their LF [Lower Floridan] aquifer withdrawal does not induce downward leakage from the UF [Upper Floridan] aquifer and will have no net negative impact on water levels in the UF aquifer, or:
>
> "If the aquifer tests do show that there is an impact on water levels in the UF aquifer because of production from the LF aquifer, the applicant must calculate, using an approved hydrologic analysis, the UF contribution to the LF well. Then, using the information from the hydrogeological studies, the applicant must reduce nearby current UF withdrawals in an amount equal to any induced leakage from the UF into the LF. In other words, the applicant must offset the impact of the LF pumping by reducing nearby UF permitted pumping in the same general area (within a 5-mile (mi) radius) by an amount equal to or greater than the determined UF leakage. This will assure continued protection of the UF aquifer under the no net negative impact policy."

As part of the interim permitting strategy, GaEPD provided a hydrogeological study protocol that states (Nolton Johnston, Georgia Environmental Protection Division, written commun., January 28, 2003): "The applicant must conduct site-specific hydrogeological testing to obtain the data needed for development of a groundwater model capable of determining the contribution from the UFA that would result from the proposed withdrawal from the LFA. This information would be used to develop a new groundwater model, which would be run to simulate the equivalent Upper Floridan pumping that induces the identical maximum drawdown in the Upper Floridan that would be expected as a result of pumping the Lower Floridan."

To assess the water-supply potential of the LFA, the U.S. Geological Survey (USGS), in cooperation with the U.S. Department of the Army, conducted an investigation during 2009 to determine the hydrogeology and water quality of the Floridan aquifer system and the potential effect that pumping from the LFA would have on the UFA. The study included construction of a test well in the LFA, detailed site investigations, and groundwater-modeling studies.

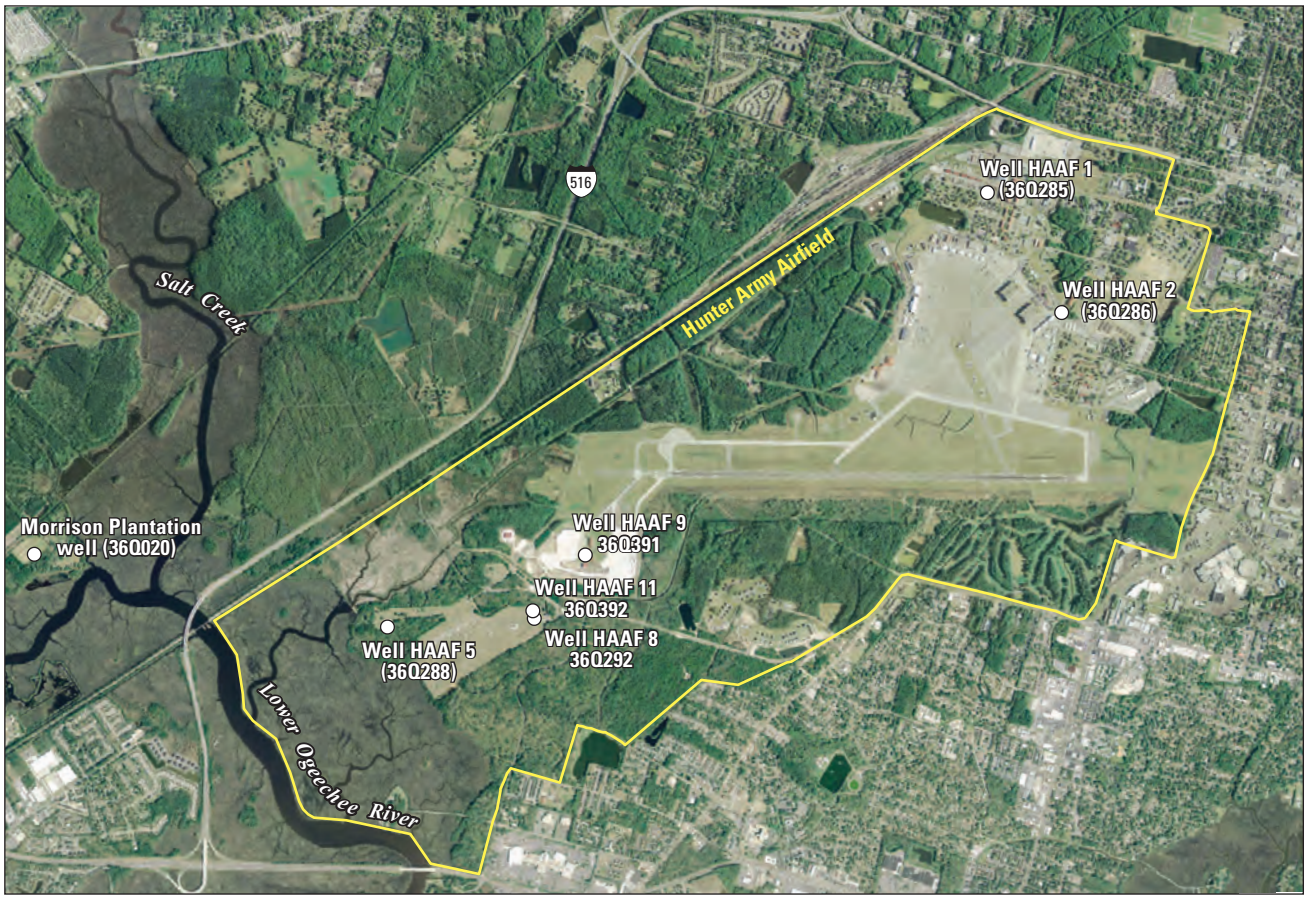


Figure 1. Location of groundwater-flow model area, selected wells, and tidal station at Hunter Army Air Field and vicinity, coastal Georgia (potentiometric contours modified from Peck and others, 1999).

Purpose and Scope

This report documents results of field investigations and groundwater-model simulations conducted at HAAF during 2009 to determine the hydrogeology and water quality of the Floridan aquifer system and to provide data needed to assess the effect of LFA pumping on the UFA, specifically to

- Evaluate leakage response in a nearby well completed in the UFA to pumping from the LFA, and
- Quantify the amount of pumpage reduction in the Upper Floridan well (or wells) required to offset leakage and the amount of drawdown induced by leakage.

Field investigations included:

- Constructing a 1,168-foot (ft) test boring and constructing a test well completed in the LFA;
- Collecting drill cuttings and borehole geophysical logs at the test well;
- Collecting core samples, in the test well, for analysis of vertical hydraulic conductivity and porosity;
- Conducting flowmeter and packer tests in the open borehole within the UFA and LFA in the test well;
- Collecting depth-integrated water samples to assess basic ionic chemistry of various water-bearing zones in the test well; and
- Conducting aquifer tests in the LFA test well and in the existing UFA wells to determine hydraulic properties and assess interaquifer leakage.

The effects of interaquifer leakage on the UFA were quantified through simulation using a modified groundwater-flow model of coastal Georgia (Payne and others, 2005). The groundwater model was used to quantify the amount of pumping reduction required in the UFA to offset drawdown from leakage resulting from pumping the LFA.

Site Description

The U.S. Department of the Army (U.S. Army) Fort Stewart and HAAF, Georgia, are home to the 3rd Infantry Division. HAAF is the focus of this investigation and is located in the Georgia Coastal Plain in central Chatham County, Georgia (fig. 1). The site is characterized by flat topography, with sandy topsoil typical of the Georgia coastal area.

The study area has a mild climate with warm, humid summers and mild winters. Long-term climatic patterns in the area are derived from records provided by the National Weather Service Station at Savannah International Airport (097847). During 1971–2000, precipitation at station 097847 averaged about 49 inches per year (in/yr). Maximum monthly rainfall (exceeding 4 inches per month) generally occurs during June–September, with monthly rainfall totals averaging less than 4 inches during the rest of the year. Mean monthly pan evaporation at station 097847 during 1965–2003 ranged from 2.43 to 8.49 inches per month, with the greatest evaporation during April–August.

Water Use

Water supply at HAAF is provided by four wells—HAAF 1, 2, 8, and 9—completed in the UFA, with a GaEPD permit limit of 1.03 Mgal/d in 2009. During 2002–2008, average monthly withdrawal exceeded 1 Mgal/d during the peak period from April through July and annual averages ranged from 0.78 Mgal/d in 2005 to 1.0 Mgal/d in 2007 (table 1). GaEPD has requested that the 2009 permitted withdrawal rate be reduced by 0.05 Mgal/d to a rate of 0.98 Mgal/d by July 2010 (Stanley Thomas, U.S. Department of the Army, oral commun., February 19, 2010).

Table 1. Average daily groundwater withdrawal at Hunter Army Airfield, 2002–2008 (data from Julia Fanning, U.S. Geological Survey, written commun., February 2010).

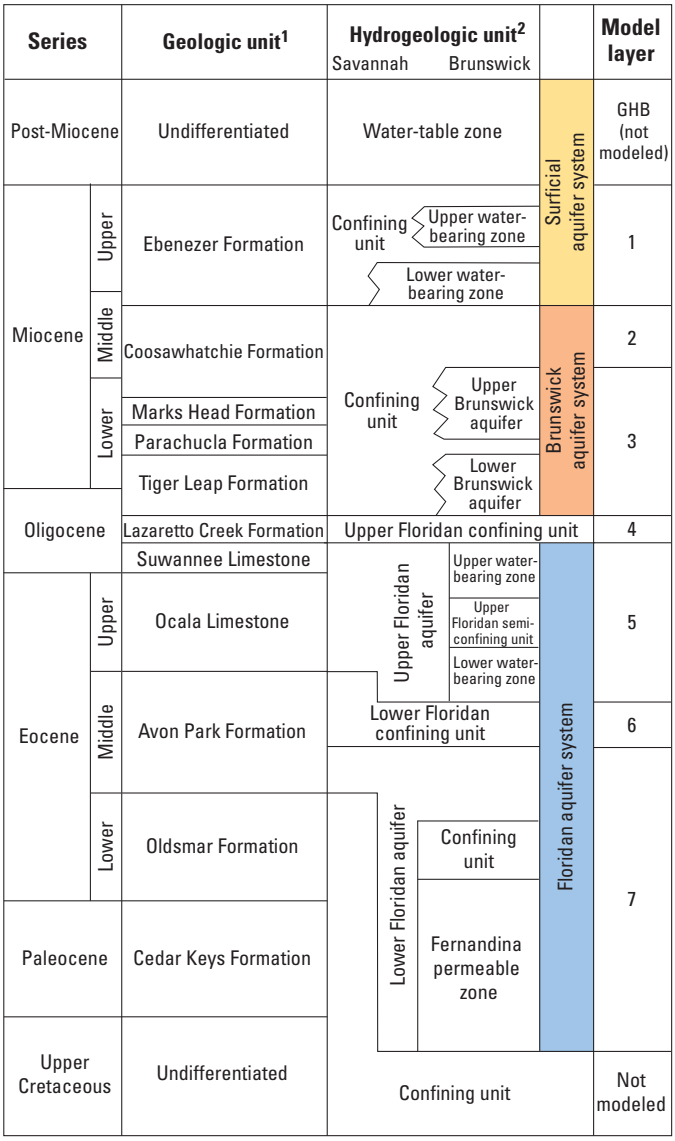
Hydrogeologic Setting

The 24-county coastal Georgia area is underlain by coastal plain strata consisting of consolidated to unconsolidated layers of sand and clay and semiconsolidated to very dense layers of limestone and dolomite (Clarke and others, 1990). These sediments constitute three major aquifer systems, in order of descending depth: the surficial aquifer system, Brunswick aquifer system, and Floridan aquifer system (fig. 2).

In the coastal area, the surficial aquifer system (fig. 2) consists of Miocene and younger age interlayered sand, clay, and thin limestone beds (Clarke, 2003). At HAAF, the surficial aquifer consists of fine sand at depths of less than 100 ft and largely is unconfined. Elsewhere in coastal Georgia, the aquifer system includes a water-table zone and two confined zones. The surficial aquifer system is separated from the underlying Brunswick aquifer system by a confining unit consisting of silty clay and dense, phosphatic Miocene limestone.



The Brunswick aquifer system (fig. 2) consists of two water-bearing zones—the upper Brunswick aquifer and the lower Brunswick aquifer (Clarke, 2003). The upper Brunswick aquifer consists of poorly sorted, fine to coarse, slightly phosphatic and dolomitic Miocene quartz sand and dense phosphatic limestone of the same age (Clarke and others, 1990). The lower Brunswick aquifer consists of poorly sorted, fine to coarse, phosphatic and dolomitic Oligocene and Miocene sand (Clarke and others, 1990). At HAAF, the Brunswick aquifer system consists of clayey fine sand and silt that has a much lower permeability than in the Brunswick, GA, area and can largely be considered a confining unit. Accordingly, in this study, sediments constituting the upper and lower Brunswick aquifers are considered a single unit, and the combined thickness and composite hydraulic properties are used for model simulations.

The principal source of water for all uses (excluding thermoelectric) in the coastal area is the Floridan aquifer system, which is composed of carbonate rocks of varying permeability. The Floridan aquifer system is confined by overlying clay layers and separated into several permeable water-bearing zones by layers of relatively denser limestone that act as semiconfining units allowing vertical leakage of groundwater. In the Savannah–Hilton Head Island area, McCollum and Counts (1964) identified five water-bearing zones in strata that would later be defined as part of the Floridan aquifer system.

The two shallowest of these water-bearing zones are part of the UFA, and the deeper three are part of the LFA (Krause and Randolph, 1989). In Beaufort County, SC, the term middle Floridan aquifer is used by the State of South Carolina (Ransom and White, 1999) for a water-bearing zone approximately 250–550 ft below land surface that is equivalent to zones 3 and 4 of McCollum and Counts (1964).

The UFA is overlain by a confining unit (fig. 2) consisting of layers of silty clay and dense phosphatic Oligocene dolomite that separate the aquifer from overlying permeable units of the Brunswick aquifer system. Reported vertical hydraulic conductivity of this confining unit, based on laboratory analysis of core, ranges from 2.3×10^{-4} to 3.0 feet per day (ft/d) (Clarke and others, 2004).

The UFA (fig. 2) is highly productive and consists of Eocene to Oligocene limestone and dolomite. Miller (1986) reported ranges in aquifer thickness in Chatham County from 400 to 600 ft. Reported transmissivity of the UFA in Chatham County ranges from 20,000 to 80,000 feet squared per day (ft^2/d) (Clarke and others, 2004). Zones of very high hydraulic conductivity exist within relatively thin intervals of the Floridan aquifer system, especially in the UFA (Clarke and others, 2004).

[2]Modified from Randolph and others, 1991; Clarke and Krause, 2000.

Figure 2. Generalized correlation of geologic and hydrogeologic units and model layers in the coastal plain of Georgia (modified from Payne and others, 2005). [GHB, general-head boundary]

The UFA is underlain by a confining unit of dense, recrystallized limestone and dolomitic limestone of middle to upper Eocene age that hydraulically separates, to varying degrees, the UFA from the LFA (fig. 2). Counts and Donsky (1963) reported the vertical hydraulic conductivity of this confining unit was 6.7×10^{-4} ft/d on the basis of laboratory analysis of a single core.

The LFA is composed of Upper Cretaceous to middle Eocene limestone and dolomitic limestone. At Savannah, the aquifer consists mostly of middle Eocene limestone, and a thickness of 100–300 ft was reported in Chatham County (Miller, 1986). Reported transmissivity of the LFA in Chatham and Bryan Counties, GA, ranged from 8,200 to 8,300 ft^2/d (Clarke and others, 2004).

The LFA is underlain by a confining unit consisting of Upper Cretaceous to lower Eocene marl, which Falls and others (2005) describe as a semi-indurated, fine-grained mixture of carbonate, clay, silt, and sand that generally is dominated by clay and silt. The base of the Floridan aquifer system and the underlying marl is recognized on natural-gamma logs by a sharp increase in counts per second from carbonate strata to the marl (Falls and others, 2005).

The permeability of the Floridan aquifer system is reduced in the vicinity of the Gulf Trough (fig. 3)—a zone of relatively thick accumulations of fine-grained clastic sediments and clay-bearing carbonates where the permeability of coastal plain deposits decrease. In this area, groundwater flow is partially impeded by the juxtaposition of rocks of higher permeability updip and downdip from the trough, with rocks of lower permeability within the trough (Krause and Randolph, 1989).

Groundwater Flow

Groundwater flow in the Floridan aquifer system mainly is controlled by rates and distribution of recharge to and discharge from the system, the extent and effects of confinement, and the ability of aquifers to transmit and store water (Krause and Randolph, 1989). A schematic diagram of the conceptualized predevelopment (no pumping) and modern-day (2000) flow systems in coastal Georgia is shown in figure 3. Water recharges the aquifers in the northern part of the coastal area where they are exposed at or near land surface and flows mostly southeastward toward the coast where it discharges into overlying units and surface-water bodies. Prior to development, the flow system was considered to have been at dynamic equilibrium, and potentiometric surfaces were considered nearly static from year to year.

The modern-day flow system reflects changes that have occurred as a result of groundwater development (withdrawal). Groundwater withdrawal has lowered water levels, induced additional recharge and reduced natural discharge, and degraded the quality of water in places along the coast.

An extensive cone of depression has developed in the potentiometric surface of the UFA in the Savannah area (fig. 1). HAAF lies within this regional cone of depression. Here, the principal direction of groundwater flow is toward the center of the cone of depression near Savannah.

Saltwater contamination is restricting the development of groundwater supply in coastal Georgia and adjacent parts of South Carolina and Florida (Krause and Clarke, 2001). Pumping from the UFA has resulted in substantial groundwater-level decline and subsequent saltwater intrusion from underlying strata containing highly saline water at Brunswick, GA, and encroachment of seawater at the northern end of Hilton Head Island, SC. Saltwater contamination at these locations has constrained further development of the UFA in the coastal area and has created competing demands for the limited supply of freshwater.

Well and Stream Site Identification

In this report, wells are identified by using a local site name, such as HAAF 11 and a USGS numbering system based on USGS topographic maps (such as 36Q392). In Georgia, each 7½-minute topographic quadrangle map has been given a number and letter designation beginning at the southwestern corner of the State. Numbers increase eastward through 39, and letters increase alphabetically northward through "Z" and then become double-letter designations "AA" through "PP." The letters "I" and "O" are not used. Wells inventoried in each quadrangle are numbered sequentially beginning with "1." For example, well HAAF 8 is the 292nd well inventoried in the Garden City quadrangle (map 36Q) and is designated 36Q292.

Surface-water stations are identified by a numbering system used for hydrologic-station records in USGS publications since October 1, 1950. The order of listing stations is in a downstream direction along the main channel. All stations on a tributary entering upstream from a main stream station are listed before that station. Each surface-water station is assigned a unique 8- to 14-digit number. Each station number, such as 02352500, begins with the 2-digit identifier "02," which designates the major river basin (for example, "02" is the South Atlantic Slope Basin), followed by the downstream-order number, "352500," which can range from 6 to 12 digits.

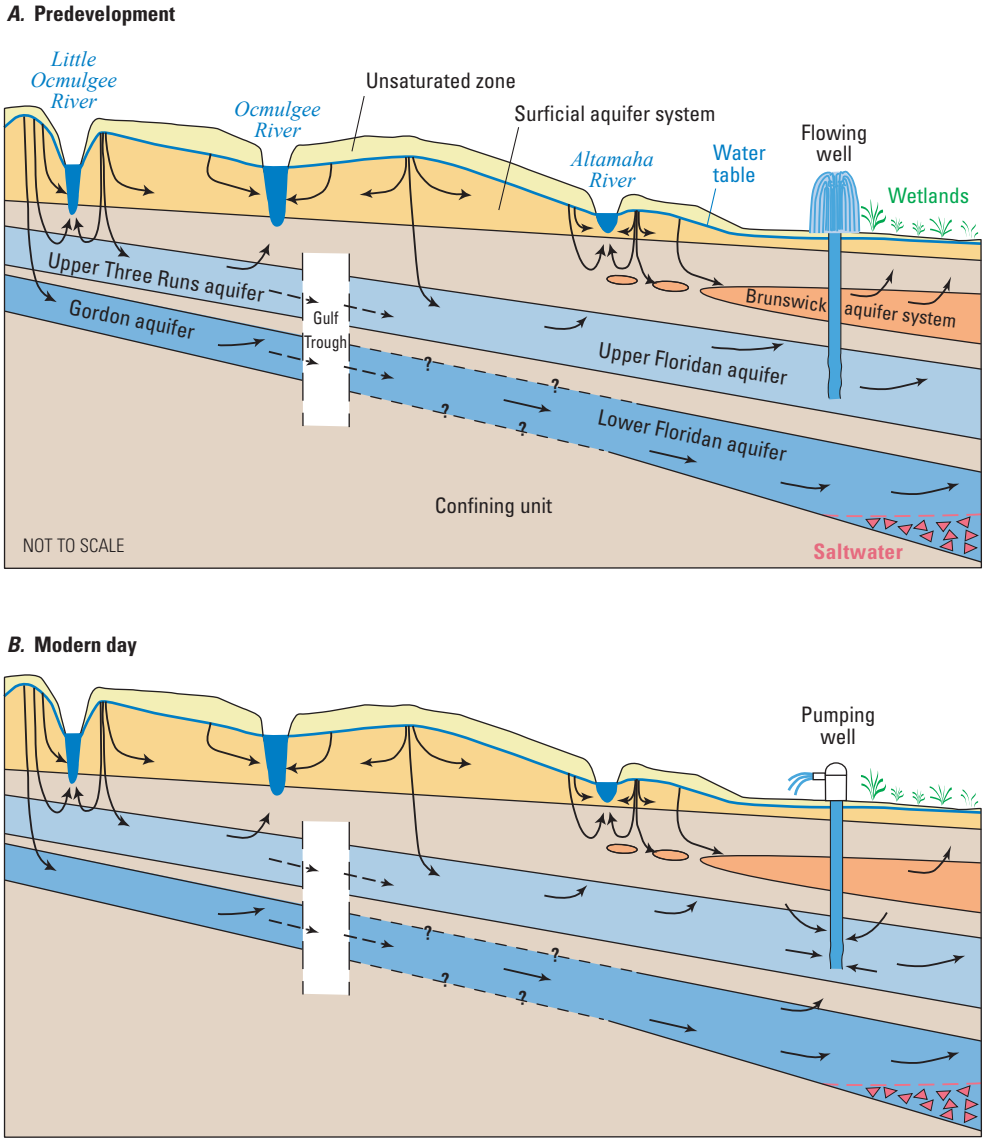

Figure 3. Schematic diagram showing conceptual model of *(A)* predevelopment and *(B)* modern-day (2000) flow system (modified from Priest, 2004; Payne and others, 2005).

Methods of Data Collection and Analysis

To assess the hydrogeology and water quality of the Floridan aquifer system at HAAF, site investigations were conducted during 2009, including construction of a 1,168-ft test boring and a new well (HAAF 11, 36Q392) completed in the LFA adjacent to existing HAAF Upper Floridan production well HAAF 8 (36Q292, fig. 1). Well construction and location information for all wells used during this study are listed in table 2.

Test Well Drilling

The LFA test well (HAAF 11, 36Q392) completed for this study was drilled at HAAF during May–June 2009. Drilling was conducted in several stages to accommodate collecting core, conducting geophysical logging, and completing various hydraulic tests (table 3). Prior to well completion, a pilot hole was drilled using (1) hydraulic mud-rotary methods and a bentonite-based drilling fluid through unconsolidated sediments to a depth of 333 ft, and (2) reverse-air rotary methods through consolidated limestone

Table 2. Well-construction and location information for selected wells at Hunter Army Airfield and vicinity.

Table 3. Chronology of drilling, logging, and testing in Lower Floridan Well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia, 2009.

Drilling stage	Testing/remarks
Stage 1: drilled a 32-inch hole with mud-rotary methods to 109 feet; set and grouted 24-inch casing to 86 feet	No logs collected in this interval.
Stage 2: drilled a 23-inch hole with mud-rotary methods to 350 feet; set and grouted 16-inch casing to 333 feet	Caliper and electric logs collected in mud-rotary hole prior to setting casing.
Stage 3: drilled an 8-inch pilot hole with reverse air-rotary methods to 1,168 feet; collected spot core at selected intervals during drilling	Caliper, electric, acoustic, and optical televiewer, and full-wave sonic logs collected in water-filled hole; ambient and pumping flowmeter traverses were run to determine the depth and yield of water-bearing zones and identify confining bed; packer tests completed in the confining bed.
Stage 4: reamed pilot hole from 8-inch to 16-inch to a depth of 705 feet and set and grouted 8-inch casing to 703 feet	Casing set to occlude Upper Floridan aquifer; no logs collected during this stage.
Stage 5: cleaned out bottom part of hole from 703 to 1,112 feet	Removed cuttings from bottom part of hole for final development and well completion; ambient and pumping flowmeter traverses were run to confirm depth and yield of water-bearing zones in the completed well.

of the UFA and LFA to a depth of 1,168 ft. Packer tests, ambient/pumping flowmeter traverses, and grab water samples were collected in the open borehole. These tests were critical in determining depths of the confining unit and water-bearing zones, and groundwater quality. Using this information, casing was installed to a depth of 703 ft, and the well was backfilled to a total depth of 1,112 ft, leaving an open-hole interval of 703–1,112 ft. Well-construction details are listed in table 2 and shown in figure 4.

During drilling, rock cuttings were collected every 10 ft from land surface to the bottom of the borehole, and changes in drill-bit penetration rates and the specific conductance of drilling fluids were monitored and recorded. Reflected-light microscopy was used to describe the mineralogy and texture of rock cuttings. Changes in drill-bit penetration rates were compared to lithologic changes observed in cuttings to assist in determining the depth intervals of contacts between rock units and voids, including solution cavities in the subsurface. A generalized description of rock cuttings is provided in table 4.

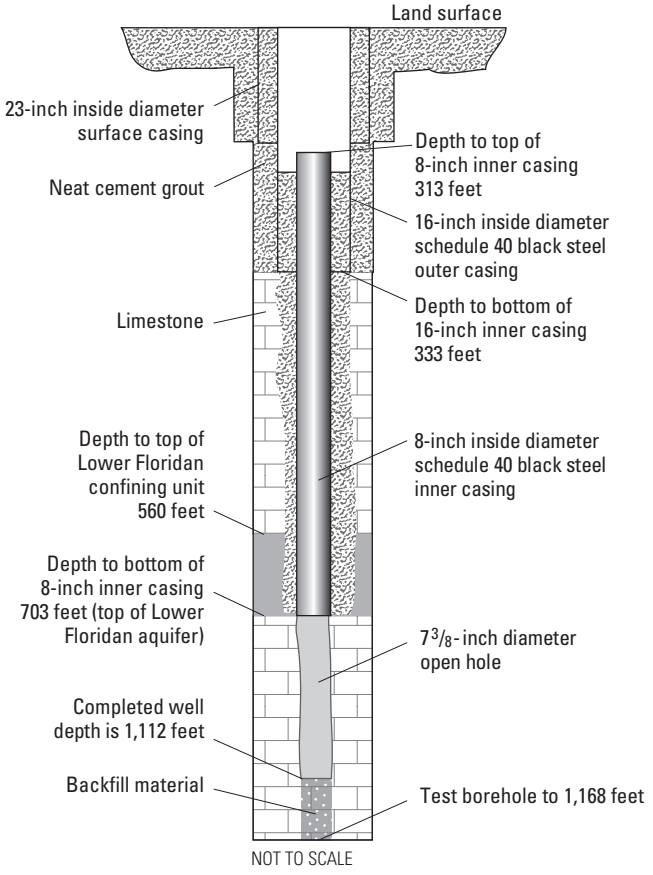

Figure 4. Well-construction diagram for well HAAF 11 (36Q392) completed in the Lower Floridan aquifer, Hunter Army Airfield, Chatham County, Georgia, 2009.

Table 4. Lithologic description of rock cuttings, well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia.

Hydrogeologic unit	Depth, in feet below land surface		Lithologic description
	Top	Bottom	
Surficial aquifer	0	60	Light gray silty fine to very fine sand
Upper Floridan confining unit	60	100	Greenish gray silty clay
	100	115	Dark-greenish gray to greenish gray clayey sand and silt, trace shell fragments
	115	195	Greenish gray, micaceous clay with minor siltstone
	195	205	Dark greenish gray silty clay, abundant (5-15 percent) phosphate, sharks teeth, bone fragments
	205	245	Dark-greenish gray phosphate bearing silty clay, some dolomite crystals
	245	247	Dark greenish gray clay, includes calcium carbonate nodules, phosphate, and quartz
	247	275	Fossiliferous limestone (calcarenite) with well-rounded quartz sand, black phosphate grains
	275	285	Light gray poorly-sorted well rounded calcareous clayey sand
Upper Floridan aquifer	285	315	Light gray sandy limestone with disseminated phosphate and quartz sand; phosphate abundant between 295–300 feet
	315	344	Light tan-very pale brown limestone with trace amounts phosphate
	344	354	Tan to buff limestone (calcarenite). Note that in this interval the drill rig lost circulation, discharge water was dark brown, and that the driller thought this was clay; however, no clay was found in this interval
	354	374	Speckled gray limestone (calcarenite) with black phosphate grains finely disseminated throughout, 0.5-foot thick shell bed (bivalves) at 362 feet
	374	434	White limestone (calcarenite) and bryozoan hash, trace brown chert
	434	454	White to light gray limestone (calcarenite), abundant bryozoans, trace glauconite
	454	524	Same as above, very porous and loosely packed, poorly indurated
	524	560	Light gray limestone (calcarenite) with fine glauconite, porous, abundant bryozoans, bivalves, and coral
Lower Floridan confining unit	560	595	White dolomitic limestone (calcarenite) and bryozoan hash; also light greenish-gray, glauconitic, chalky hash
	595	635	White limestone (fine-calcarenite), slightly chalky and less porous than above
	635	645	White to light gray dolomitic limestone (calcarenite), abundant bryozoans, trace glauconite
	645	660	White chalky limestone (calcarenite) with a trace of carbonate mud and glauconite
	660	675	White dolomitic limestone (fine to very fine calcarenite), abundant bivalves and oyster fragments at top of interval
	675	703	White limestone (fine to very fine chalky calcarenite) with traces of silt, sand, and glauconite

Table 4. Lithologic description of rock cuttings, well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia.—Continued

Hydrogeologic unit	Depth, in feet below land surface		Lithologic description
	Top	Bottom	
Lower Floridan aquifer	703	715	White shell hash of forams and bryozoans, fragments of chalky, glauconitic limestone
	715	725	Light gray limestone (calcarenite), poorly indurated and porous, with some fine chalky glauconitic fragments
	725	755	Light gray dolomitic limestone contains abundant bryozoans, porous, increase in grain size downward
	755	785	White limestone (calcarenite), abundant shell fragments, trace glauconite, trace black opaques (possibly phosphate or pyrite)
	785	792	Light gray dense limestone with molds and white poorly indurated porous bryozoan hash
	792	825	Light gray to greenish gray porous limestone (calcarenite), porous, glauconitic, abundant bryozoan and shell fragments
	825	865	Light gray to white, limestone (fine-grained calcarenite), slightly chalky and glauconitic, abundant shell, coral, and bryozoan fragments. Interval at 845–850 feet is dolomitic
	865	900	Light grey-greenish grey glauconitic limestone (fine calcarenite) with chalky material in pore space. Abundant fossil hash
	900	925	Light gray limestone (coarser-grained calcarenite, trace glauconite, fairly clean calcarenite with varying degrees of cementation
	925	965	Light gray, chalky limestone (calcarenite), some glauconite
	965	1,021	Light-greenish gray limestone (fine chalky calcarenite), trace glauconite. Interval at 985–995 dolomitic
	1,021	1,025	Mixture of light-greenish gray crystalline limestone and porous well- cemented medium-grained calcarenite
	1,025	1,052	Same as above but with glauconite disseminated throughout, abundant fossil hash 1,025–1,045 feet
	1,052	1,075	Same as above
	1,075	1,080	Light gray glauconitic limestone (fine chalky calcarenite) with trace phosphate
Confining unit	1,080	1,125	Light gray limestone (chalky, dense calcarenite) with abundant brown chert and beds of brown dolomitic limestone
	1,125	1,168	Mixture of white and brown limestone (fine calcarenite) and dolomitic limestone, dense and well cemented. Abundant brown chert at bottom

Borehole Geophysical Logs

Borehole geophysical logs were collected at various stages of drilling to characterize the physical properties of sediments penetrated. The first set of logs was collected in the 0–333 ft interval, where mud-rotary drilling was used to penetrate Miocene and younger clastic sediments. The second set of logs was collected in the 333–1,168 ft interval, following installation of 16-inch casing to a depth of 333 ft. Borehole geophysical logs include caliper; natural gamma; spontaneous potential; single-point, lateral, long- and short-normal resistivity; borehole fluid resistivity and temperature; full-waveform sonic; acoustic televiewer (not shown in this report); and optical televiewer. Selected borehole geophysical data from well HAAF 11 (36Q392) are shown in figure 5.

A variety of geophysical logs were used to indicate the locations of permeable zones in the hydrogeologic units.

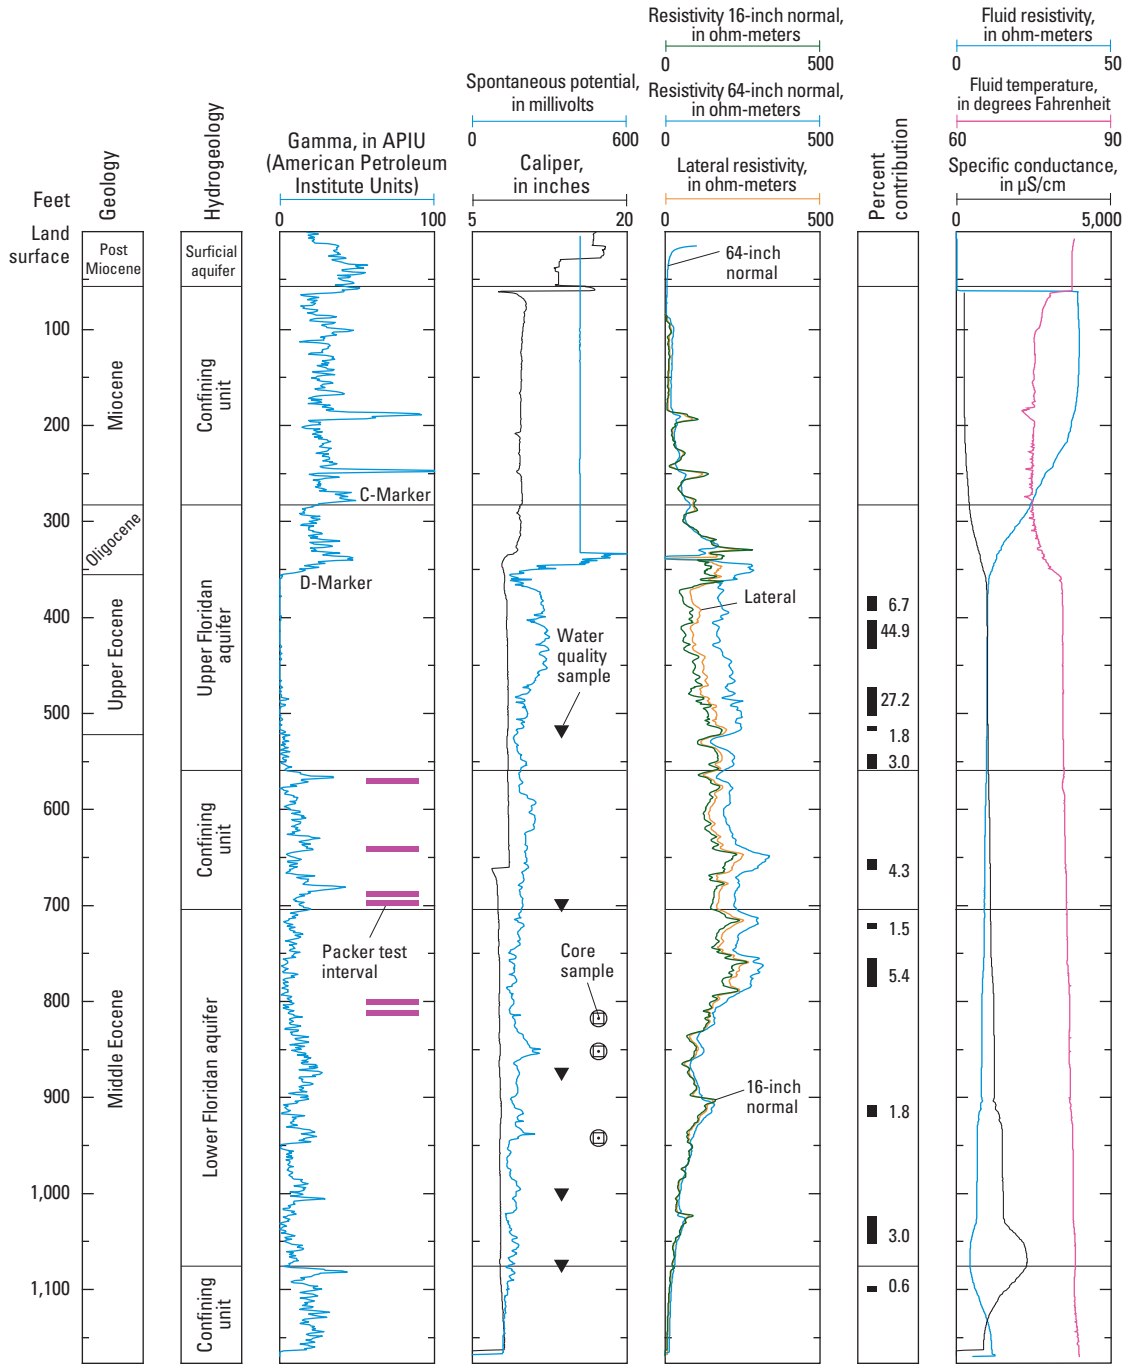

Figure 5. Selected borehole geophysical data from well HAAF 11 (36Q392). Percentage flow contribution determined from flowmeter survey in open borehole, 333–1,168 feet (see figure 6*A*), Hunter Army Airfield, Chatham County, Georgia (modified from Williams, 2010). [µS/cm, microsiemens per centimeter at 25 degrees Celsius]

Sharp increases on formation resistivity logs (single-point, lateral, and long- and short- normal resistivity) were observed and often corresponded to locations of water-bearing intervals that were later identified through flowmeter testing. Additional information on the locations of water-bearing intervals was provided by optical televiewer and full-waveform sonic (variable density) logs. The optical televiewer provides a photographic snapshot inside the borehole, enabling visual identification of solution openings and less permeable intervals in the rock units. The full-waveform sonic log provides an indication of the relative velocity of soundwaves traveling through bedrock. In general, when travel times are relatively rapid, bedrock is denser; when travel times are relatively slow, more voids are present. Zones of secondary permeability shown in figure 5 were derived by examining images from the optical televiewer and full-waveform sonic log.

Flowmeter Testing

Flowmeter testing provided valuable insight regarding the relative contribution of flow from water-bearing zones in the UFA and LFA and confinement between the two aquifers (fig. 6*A*, *B*). This information ensured accurate placement of well casing in the completed well. Tests were conducted in two stages—(1) June 17, 2009, upon completion of drilling to a total depth of 1,168 ft and prior to installation of the 8-inch casing to test flow in the 333–1,168 ft interval (UFA and LFA, fig. 6*A*), and (2) August 15, 2009, after installation of the 8-inch casing to test flow in the 703–1,112 ft interval (LFA only, fig. 6*B*). The first stage included assessment of borehole flow, pumping at a rate of 847 gallons per minute (gal/min), during the second stage borehole flow was measured at a rate of 748 gal/min. Testing was conducted by installing a test pump in the well and pumping while several traverses were made in the open borehole with an electromagnetic (EM) flowmeter to measure accumulated flow up the borehole (fig. 6*A*, *B*).

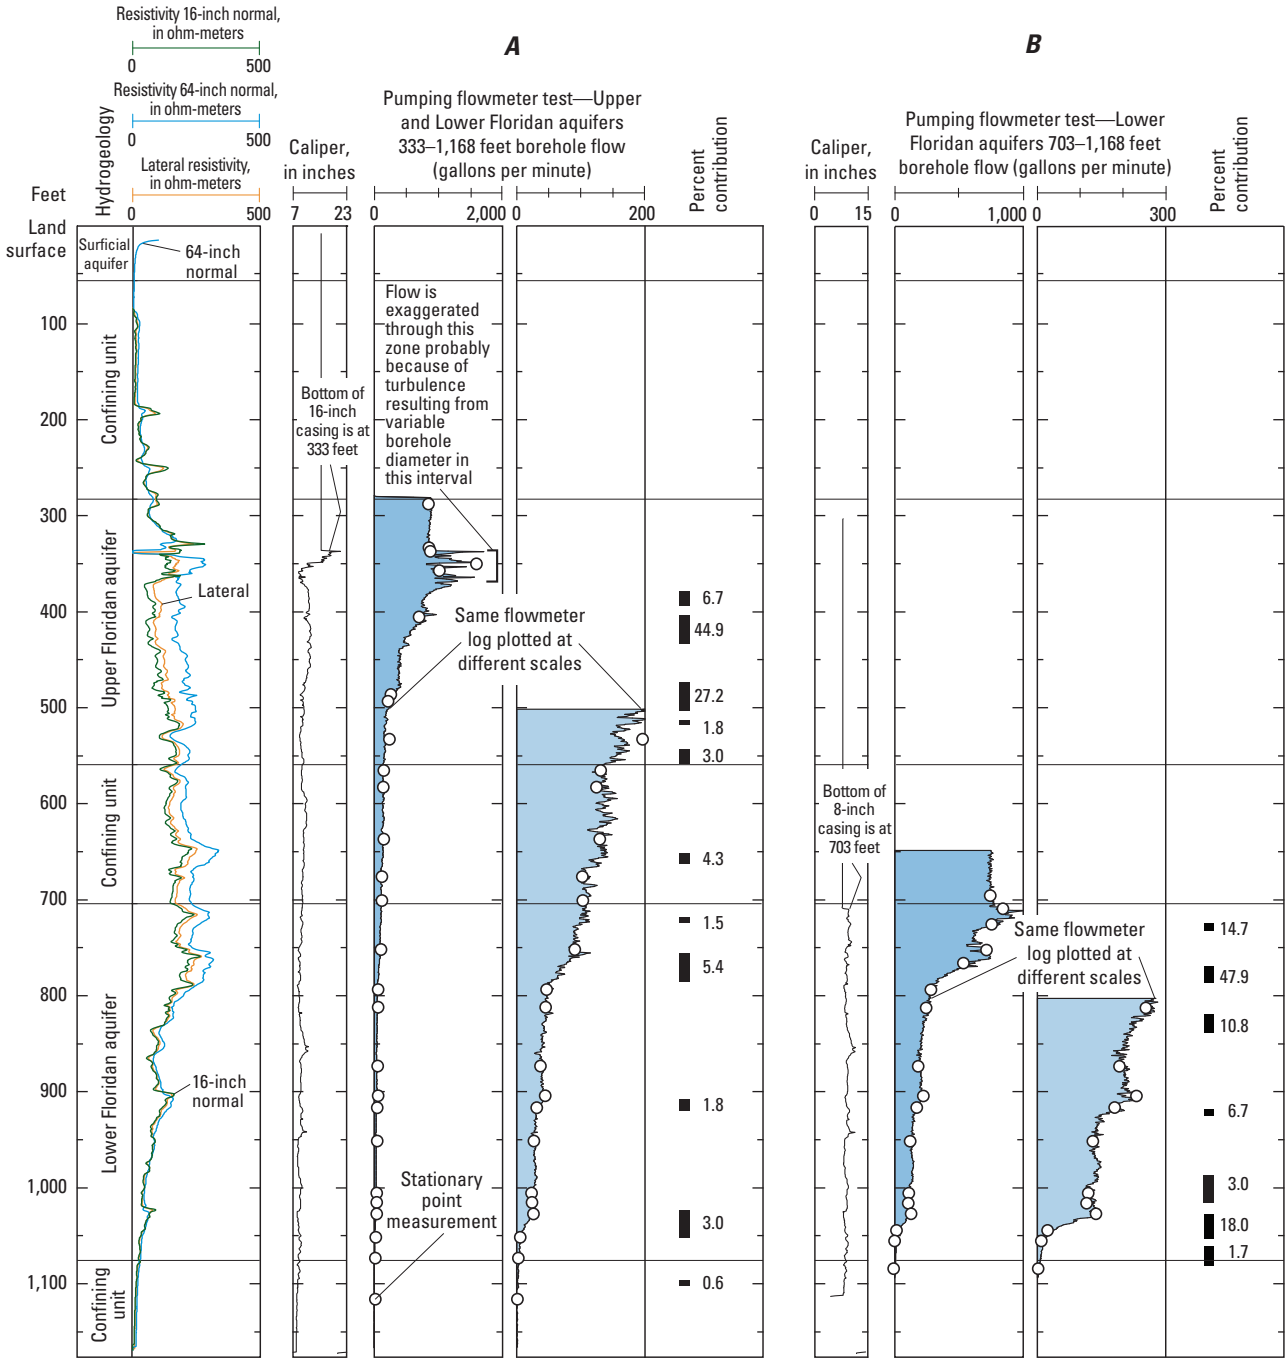

Figure 6. Borehole flowmeter data from well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia: *(A)* pumping flowmeter survey of the Upper and Lower Floridan aquifers completed on June 17, 2009, prior to installation of casing; and *(B)* pumping flowmeter survey of the Lower Floridan aquifer completed on August 15, 2009, after installation of casing (modified from Williams, 2010).

Water-Quality Sampling and Analysis

To assess vertical distribution of water quality, specific conductance of discharge water was monitored with a calibrated water-quality meter as reverse air drilling of the pilot hole progressed. After drilling the length of each 20-ft section of drill pipe, water samples were collected and specific conductance was measured (fig. 7). The pilot hole was terminated at a depth of 1,168 ft because a sharp rise in the specific conductance of drilling fluids to about 1,063 microsiemens per centimeter (µS/cm) at about 1,055 ft indicated that water quality had degraded from fresh to brackish.

During borehole flowmeter testing, a wireline water sampler was used to collect water samples at five separate intervals in the open borehole (table 5; fig. 8). These samples represent a composite of water entering the borehole beneath that depth. For example, the sample at 1,000 ft represents a composite of water entering the borehole between 1,000 ft and the total depth of the borehole, 1,168 ft. Water samples were removed from the wireline sampler as it emerged from the borehole using a peristaltic pump to transfer the water into sample bottles.

Upon completion of well construction, a water sample was collected and analyzed from the completed (703–1,112 ft) well near the end of the 72-hour aquifer test. Samples were analyzed for major ions, including chloride and sulfate, and for alkalinity as calcium carbonate, an indicator of hardness. Water samples for ion analysis were filtered using 0.45-micrometer capsule filters and analyzed at Test America Laboratories, Savannah, GA. Water-quality analyses are summarized in table 5 and figure 8. A trilinear diagram showing the relative composition of major ions in water from the various depth intervals is shown in figure 9. In general, constituent concentrations increase with depth of sampled interval.

Core Hydraulic Analysis and Packer-Slug Tests

To evaluate the hydraulic conductivity of the LFA, core samples were collected and analyzed for vertical hydraulic properties at a testing laboratory, and packer-slug tests were conducted in the borehole for horizontal hydraulic properties. Samples were collected at depths of 817.8–818.4; 851.8–852.2; and 941.9–942.6 ft and submitted to S&ME Inc., Savannah, GA, for hydraulic testing of vertical hydraulic conductivity (K_v) and porosity (table 6). These largely consolidated core samples were preserved onsite using procedures described in ASTM D5079 and analyzed using a flexible wall permeameter following procedures described in ASTM D5084.

Additional information on the hydraulic conductivity of hydrogeologic units was obtained by conducting packer-slug tests at selected intervals: 571–575, 641–645, 688–692, 698–702, 802–806, and 812–816 ft (table 7). A description of the techniques used to deploy and test the integrity of the packer system is provided in Holloway and Waddell (2008). Each of the test intervals was isolated using straddle packers, and a slug of water was injected into the interval and the rate of head decline was recorded. Data were analyzed for horizontal hydraulic conductivity (K_h) using the Bouwer and Rice (1976) method. The Bouwer and Rice (1976) method assumes that the aquifer has an infinite areal extent, is homogeneous with a uniform thickness, the test well is fully or partially penetrating, effects of storage are negligible, flow to the well is quasi-steady-state, and the slug is introduced into the well instantaneously.

Aquifer Tests

Aquifer tests were conducted in an existing UFA well (HAAF 9, 36Q391) and in the newly constructed LFA well (HAAF 11, 36Q392) to determine hydraulic properties of the aquifers and whether pumping the LFA well produced a drawdown response in the UFA. Details on these tests are provided in Williams (2010); a brief description is provided here and in subsequent sections; results are summarized in table 8.

Table 6. Vertical hydraulic conductivity and porosity of core samples collected from the Lower Floridan aquifer at well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia.

[Analyses by S&ME, Inc., Savannah, Georgia]

Interval (feet below land surface)	Vertical hydraulic conductivity (feet per day)	Porosity (percent)
817.8–818.4	0.20	36.6
851.8–852.2	0.13	44.1
941.9–942.6	0.34	51.8

Table 7. Horizontal hydraulic conductivity determined from packer-slug tests at well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia (modified from Williams, 2010).

Hydrogeologic unit	Interval, in feet below land surface	Horizontal hydraulic conductivity, in feet per day[1]	Estimated vertical hydraulic conductivity, in feet per day[2]
Lower Floridan confining unit	571–575	1.1	0.13
	641–645	3.1	0.36
	688–692	0.16	0.02
	698–702	0.20	0.02
Lower Floridan aquifer	802–806	1.7	0.19
	812–816	1.7	0.20

Pumping well	Observation well	Hydrologic unit	Testing period	Test duration (hours)	Average pumping rate in gallons per minute	Transmissivity, in feet squared per day	Storage	Remarks
HAAF 9 (36Q391)	HAAF 8 (36Q292)	Upper Floridan	February 17–18, 2009	24	430	39,700	2.54×10^{-04}	Computed using Hantush (1960) leaky aquifer solution. Drawdown was corrected for tidal and other fluctuations prior to analysis.
HAAF 11 (36Q392)	—	Lower Floridan	August 13–16, 2009	72	748	10,700 (drawdown), 12,100 (recovery)	—	Single well test conducted upon completion of Lower Floridan well open from 703 to 1,112 feet. Analysis used Theis (1935) solution. Drawdown was corrected for tidal and other fluctuations prior to analysis. Drawdown also monitored in Upper Floridan wells HAAF 5 and HAAF 8 to assess inter-aquifer leakage response.

To determine transmissivity of the UFA, a 24-hour aquifer test was conducted February 17–18, 2009. For this test, well HAAF 9 (36Q391) was pumped at an average rate of 430 gal/min, and drawdown response was observed in the pumped well and in well HAAF 8 (36Q292), located about 2,020 ft to the southwest (table 2; fig. 1). A similar 72-hour test was conducted August 13–16, 2009, in well HAAF 11 (36Q392) to determine the transmissivity of the LFA. For this test, well HAAF 11 (36Q392) was pumped at an average rate of 748 gal/min, and water levels were recorded in the pumped well and in two observation wells (wells HAAF 5 and HAAF 8), completed in the UFA, to assess interaquifer leakage response. For each test, data were collected and analyzed using the following procedures:

- Prior, during, and after each aquifer test, water levels were monitored to determine static water levels and assess ambient water-level fluctuations and trends.
- Upon completion of the pumping period, water-level recovery was monitored for a minimum period equal in length to the pumping period.
- Test data were corrected to remove tidal and barometric fluctuations and influence of regional pumping trends.

Aquifer test drawdown data were evaluated for local hydraulic properties using analytical solutions (Williams, 2010).

Groundwater-Flow Model

A groundwater-flow model previously developed by the USGS (Payne and others, 2005) was modified for finer spatial resolution and site-specific data to assess (1) the amount of induced interaquifer leakage and drawdown in the UFA resulting from pumping the LFA at a rate of 748 gal/min, and (2) the equivalent amount of pumpage from the UFA that would replicate simulated drawdown in the UFA (that resulted from pumping the LFA) at two alternate locations (A) adjacent to the newly constructed LFA well and (B) at a distance of 3,600 ft from the new well. The revised model also was used to simulate groundwater-pumping scenarios evaluating the effect of various pumping redistributions on groundwater conditions at HAAF. Modifications to the groundwater model are described in the appendix.

Hydrogeology and Water Quality of the Floridan Aquifer System

Miller (1986) provided a regional definition of the Floridan aquifer system on the basis of stratigraphic and borehole geophysical data that were widely spaced over the coastal area of Georgia and South Carolina. New hydrogeologic and water-quality data were used as a basis to refine the definition of the Floridan aquifer system at HAAF. Initial estimates of the depth and thickness of units constituting the Floridan aquifer system were obtained using Miller's (1986) structural contour maps. These maps indicated that the Floridan aquifer system at HAAF was approximately 760-ft thick, with the UFA between altitudes of –240 ft and –790 ft (NGVD 29) and the LFA between altitudes of –930 and –1,000 (NGVD 29). Given a land surface altitude of 20 ft (NGVD 29) at the HAAF drilling site, Miller's (1986) projected depths below land surface to the UFA were 260 to 810 ft, and to the LFA were 950 to 1020 ft. Subsequently, these depths were adjusted based on data collected from the newly constructed HAAF test well (HAAF 11, 36Q392).

In general, hydrogeologic units of the Floridan aquifer system can be distinguished by differences in flow contribution, lithology, geophysical signatures, and water quality. The following sections describe the depths, hydraulic properties, and water quality of hydrogeologic units that constitute the Floridan aquifer system at HAAF.

Upper Floridan Aquifer

The UFA at well HAAF 11 (36Q392) is present between depths of 285 and 560 ft and includes several high permeability zones in limestone (table 4; fig. 5). The top of the aquifer is composed of the Oligocene Suwannee Limestone and corresponds to a spike in the natural-gamma log called the "C-marker" (Wait, 1965; Gregg and Zimmerman, 1974; Clarke and others, 1990). The thickest part of the aquifer is composed of upper Eocene Ocala Limestone, which is characterized by a very low natural-gamma level, the top of which is called the "D-marker" (Wait, 1965; Gregg and Zimmerman, 1974; Clarke and others, 1990). The base of the aquifer (560 ft) is present in the uppermost part of middle Eocene limestone (Avon Park Formation) and was designated on the basis of flowmeter data that indicated a large reduction in borehole flow at that depth.

At well HAAF 11, the uppermost part of the UFA at 285–333 ft was isolated by well casing and not evaluated during flowmeter testing. Interpretation of borehole flowmeter data for June 17, 2009, indicates five main water-bearing intervals at the HAAF 11 (36Q392) well site: 380–395, 405–435, 475–505, 515–520, and 545–560 ft (fig. 6*A*). These intervals seem to coincide with the development of secondary permeability in the aquifer in the form of solution cavities and voids that have a higher permeability than the native-rock matrix. Formation-resistivity logs indicate that each of these water-bearing intervals coincides with an increase in resistivity (fig. 5). Solution openings in the uppermost part of the UFA are evident for the 352–356 ft interval as shown on the optical televiewer log (fig. 5). Flowmeter data indicated that when pumping at a rate of 847 gal/min, 83.5 percent of the total flow came from the UFA, and the remaining 16.5 percent of the total flow came from the underlying confining unit and the LFA.

Water-bearing intervals of 405–435 ft and 475–505 ft in the UFA produced the highest percentage of accumulated flow with an estimated 610 gal/min or 72 percent of the total pumpage. The remaining three zones in the UFA produced a combined flow of 97 gal/min or 11.5 percent of the total pumpage. The base of the UFA, which is the top of the Lower Floridan confining unit, was designated at a depth of 560 ft, where a contribution to borehole flow was not detected.

Water from the UFA can be distinguished from that of the LFA by lower specific conductance and concentrations of dissolved constituents, and by differences in the relative percentage of constituents (water type). Monitoring of reverse-air drilling fluids (formation water) indicates that water from the UFA, compared to deeper units, is relatively low in dissolved solids as indicated by lower specific conductance values, averaging 226 µS/cm (fig. 7). During flowmeter testing on June 22, 2009, a water-quality sample was collected using a wireline sampler in the open borehole from the UFA at a depth of 525 ft and analyzed for major ions (table 5; figs. 8, 9). Water from this interval represents a composite sample collected between 525 ft and the bottom of the borehole at 1,168 ft. Because of the relatively higher percentage flow contribution from the UFA, this sample is mostly representative of water from the UFA. Water from this sample is hard with an alkalinity value of 150 milligrams per liter (mg/L) and contains low concentrations of chloride (48 mg/L) and sulfate (29 mg/L). Each constituent analyzed was within U.S. Environmental Protection Agency (USEPA) primary maximum contaminant levels (MCL) and secondary maximum contaminant levels (SMCL; U.S. Environmental Protection Agency, 2009). Water from the UFA appears to be a slightly sodium-dominated mixed-anion type (fig. 9), whereas water from the LFA transitions to a sodium-chloride type in deeper parts of the aquifer.

To determine the transmissivity of the UFA, a 24-hour aquifer test was conducted February 17–18, 2009. For this test, well HAAF 9 (36Q291) was pumped at an average rate of 430 gal/min, drawdown response was observed in the pumped well and in well HAAF 8 (36Q292), which is located about 2,020 ft to the southwest (table 1; fig. 1).

A well completed in the UFA at Morrison Plantation (36Q020), approximately 2.41 miles (mi) west of well HAAF 9 (36Q291), was selected as a suitable background monitoring point for filtering unwanted water-level fluctuations from aquifer-test data. The background well shows similar regional

trends to wells HAAF 8 (36Q292) and HAAF 9 (36Q291) and is influenced by tidal fluctuations. The well is located far enough away from well HAAF 9 (36Q291) not to be affected by pumping during the 24-hour aquifer test (fig. 10). Wider-frequency fluctuations seen on the hydrographs were attributed to barometric pressure changes during the 24-hour test period.

The amplitude and phase of each time series dataset (background, tide, barometric pressure) were adjusted to create a composite synthetic water-level hydrograph that would span the period of the test (fig. 11) using the method presented in Halford (2006). Adjustments to these individual time series components were made to minimize differences between synthetic and measured water levels (residuals). Estimated pumping induced drawdown was derived from the residuals during pumping and recovery periods. Visual examination and the root mean square (RMS) error of computed residuals were used to evaluate the effectiveness of each stage of filtering. The closer a value is to 0, the more representative the estimated value.

A trial-and-error approach was used to evaluate the effect of each time series component on the development of a synthetic water level for the aquifer test. During the trial-and-error analysis, each component was added iteratively, and the effect of that series on the filtering process was evaluated. The final filtering included several components that collectively improved the match. Figure 11 shows the effect of various components on the generation of synthetic water levels in well HAAF 8 (36Q292).

Using background water level time series alone yielded an RMS of residuals of 0.043 and a relatively poor fit to the tidal loading effects (fig. 11*A*). Using a 6-hour moving average of the background time series the fit was improved (RMS 0.033), but the effects of tidal loading still were evident in the resulting dataset (fig. 11*B*). Combining the raw background time series with the 6-hour moving average improved the quality of the data series fit, with an RMS of residuals of 0.027 (fig. 11*C*).

Barometric pressure had a slight influence on estimated water levels. Adding the barometric pressure time series to the analysis improved the fit to an RMS of 0.026 (fig. 11*D*). Similar attempts were made using the tidal stage time series alone, but this did not produce satisfactory results. Combining the tidal stage and barometric pressure time series gave an RMS of 0.039 and produced a poorer fit than by applying barometric pressure alone (fig. 11*E*).

The best fit (RMS 0.014) was obtained by combining all of the time series, including the raw and 6-hour moving average time series from the Morrison Plantation background well (36Q020), tidal stage, barometric pressure, gravity tides, and earth tides (fig. 11*F*). These data were used as a basis for analysis of the drawdown in well HAAF 8 (36Q292) in response to pumping at well HAAF 9 (36Q391) on February 17–18, 2009.

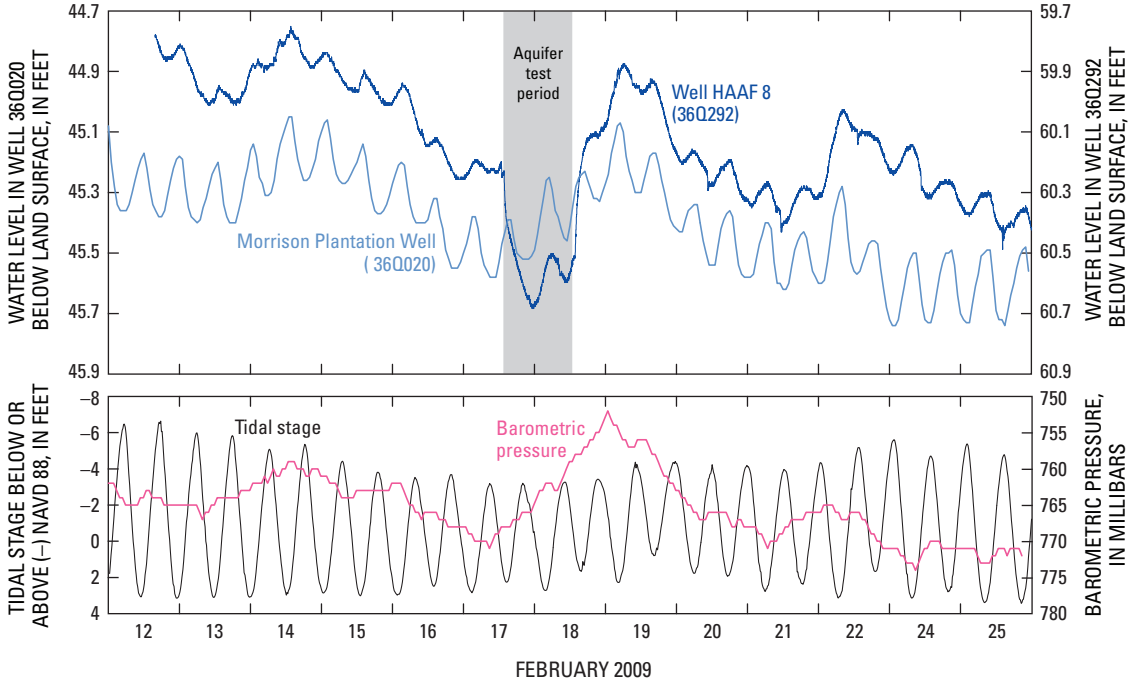

Figure 10. Comparison of water levels at well HAAF 8 (36Q292) to background water levels at Morrison Plantation observation well (36Q020) and to stage and barometric pressure at tidal gage 02198773, February 12–25, 2009 (modified from Williams, 2010).

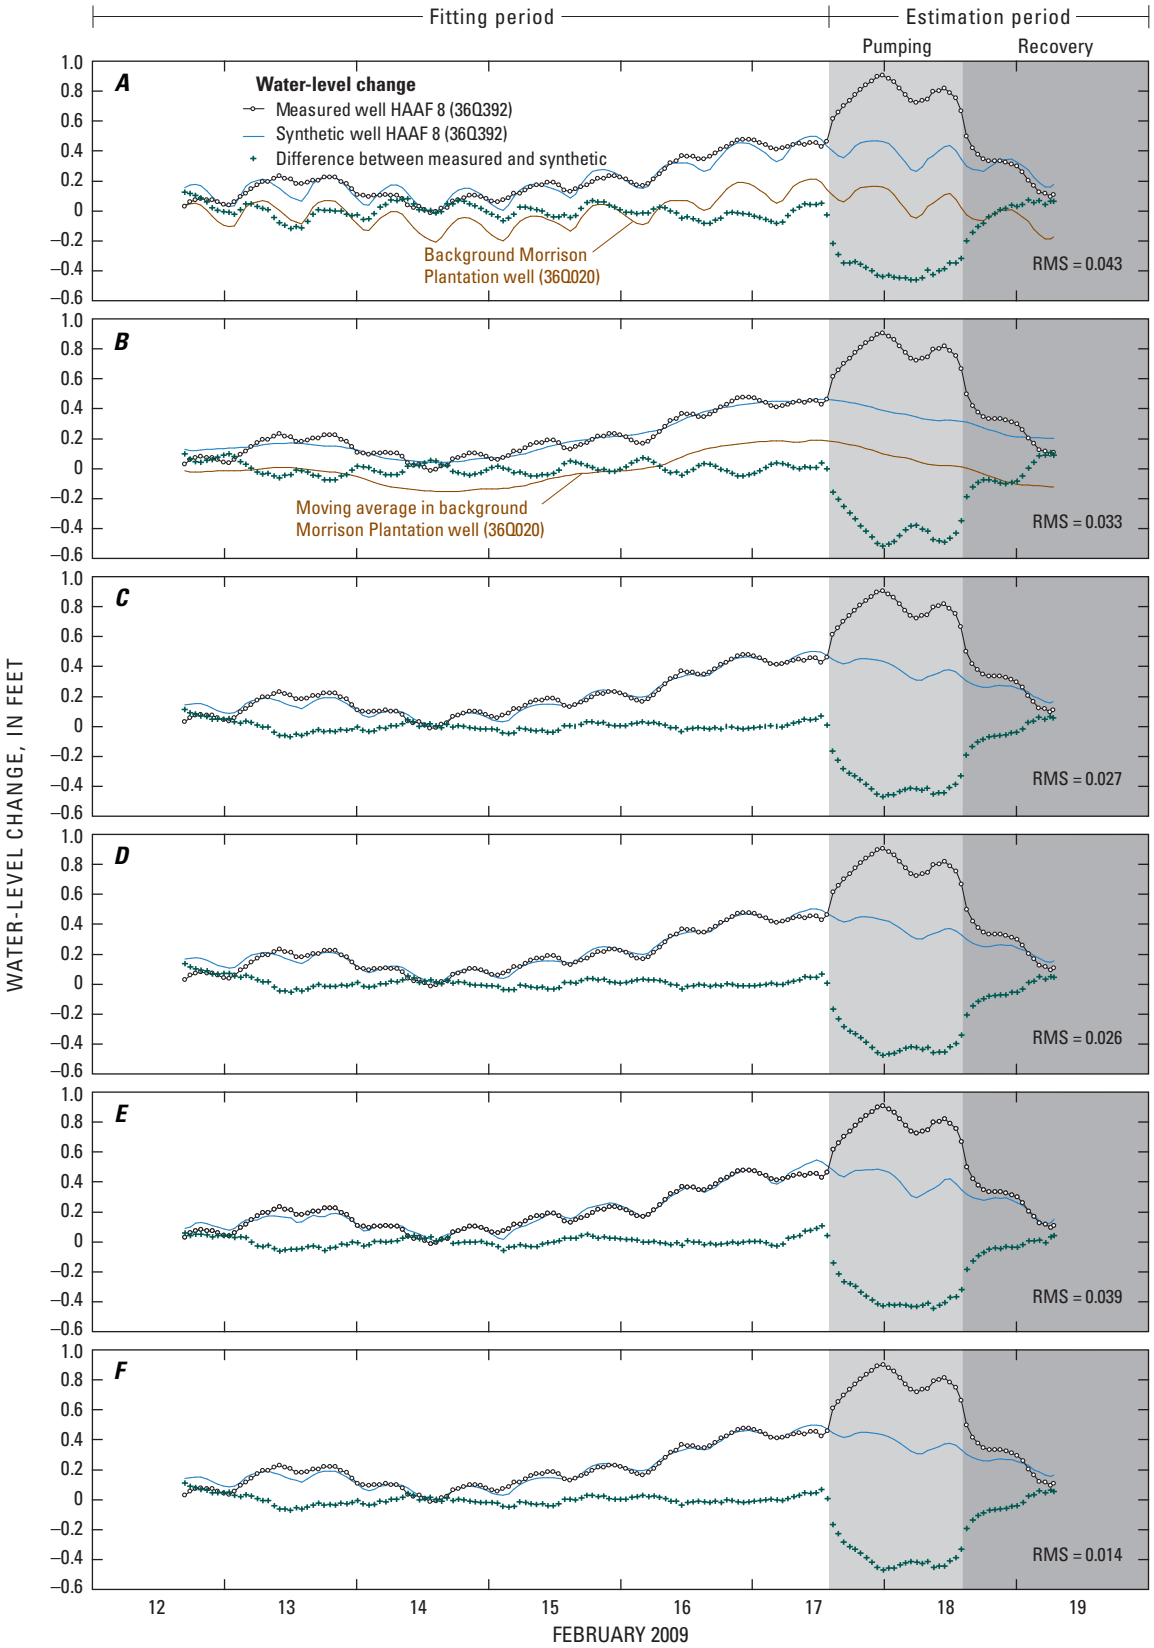

Figure 11. Effects of different time series components on development of a synthetic water level used to filter out extraneous trends from well HAAF 8 (36Q292), Hunter Army Airfield, Chatham County, Georgia: *(A)* raw water-level data from well 36Q020, *(B)* 6-hour moving average water level from well 36Q020, *(C)* raw and 6-hour moving average water-level data from well 36Q020, *(D)* raw and 6-hour moving-average water level well 36Q020 and barometric pressure, *(E)* raw barometric pressure and raw tidal stage data, and *(F)* raw and 6-hour moving average water-level data from well 36Q020, tidal stage, barometric pressure, gravity tides, and earth tides (modified from Williams, 2010). [RMS, root mean square of differences between measured and synthetic water levels]

Analysis of the drawdown data for well HAAF 8 (36Q292) suggested a leaky artesian aquifer response with storage of water in the semiconfining unit (fig. 12). Both the early and late data do not fit the Theis (1935) type curve for an ideal confined aquifer. The departure of the drawdown response from the Theis curve after about 50 minutes suggests appreciable amounts of water are being released from storage, likely from the underlying Lower Floridan confining unit and the LFA.

A transmissivity of about 40,000 ft^2/d and a storage coefficient of 2.5×10^{-4} (table 8) were computed for the UFA using the Hantush (1960) leaky aquifer solution (Williams, 2010). This solution assumes that (1) the aquifer is infinite in areal extent, homogeneous, and isotropic, (2) the pumping well is fully or partially penetrating and flow to the pumping well is horizontal, (3) the aquifer is leaky, and flow is unsteady, (4) the water is released from storage instantaneously, (5) the diameter of pumping well is very small, and the storage in the well can be neglected, (6) the confining unit is infinite in areal extent and has a uniform vertical hydraulic conductivity and thickness, (7) the confining unit has an adjacent constant-head source, and (8) flow in the confining unit is vertical. Although all of these conditions may not be absolutely satisfied for this site, the aquifer conditions approximate and satisfy the assumptions relevant for this solution approach.

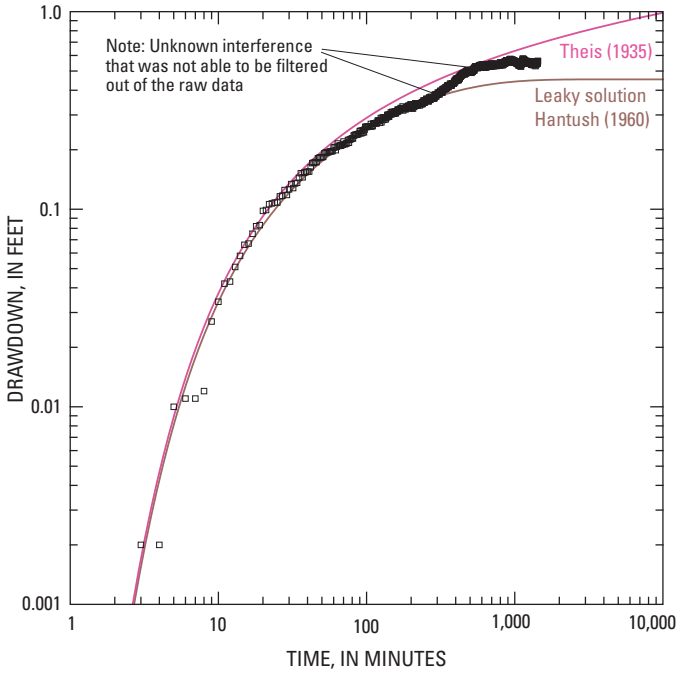

Figure 12. Logarithmic plot of drawdown and time for observation well HAAF 8 (36Q292) during Upper Floridan aquifer test conducted in well HAAF 9 (36Q391), Hunter Army Airfield, Chatham County, Georgia, February 17–18, 2009 (modified from Williams, 2010).

Lower Floridan Confining Unit

The thickness and hydraulic conductivity of the confining unit that separates the UFA and LFA controls the rate of interaquifer leakage. Thickness of the Lower Floridan confining unit was determined by evaluating rock cuttings, borehole geophysical logs, and results of flowmeter testing (figs. 5, 6; table 4).

The Lower Floridan confining unit at well HAAF 11 (36Q392) is interpreted to be present between depths of 560 and 703 ft (fig. 5) and is composed of low permeability chalky and glauconitic limestone in the uppermost part of the middle Eocene Avon Park Formation (figs. 2, 5). This unit is similar in lithology to overlying and underlying rock units (table 4), which precluded the identification of the depth interval of the confining unit during drilling. Following completion of the pilot boring, thickness and location of the confining unit were assessed by using borehole geophysical logs and the results of a flowmeter survey. The Lower Floridan confining unit is about 143 ft thick at HAAF and similarly about 155 ft at the Berwick Plantation well (36Q330), which is 3.7 mi west of the HAAF site (fig. 1). The Lower Floridan confining unit can be distinguished as a zone of relatively higher natural-gamma radiation when compared to the very low natural-gamma radiation in the overlying Ocala Limestone of the UFA (fig. 5). The high natural gamma radiation likely is due to a high percentage of glauconite in the Avon Park Formation.

Borehole flowmeter testing in well HAAF 11 (36Q392) (fig. 6*A*) in the 333–1,168 ft open interval indicated the Lower Floridan confining unit contributed little to overall flow in the borehole. In particular, continuous vertical sections of limestone at 556–665 and 675–719 contributed no detectable amounts of water during the 847 gal/min flowmeter survey. Within the confining unit, a single water-bearing zone at 665–675 ft yielded 36 gal/min or 4.3 percent of the total borehole flow during the flowmeter survey. This water-bearing zone corresponded to an increase in formation resistivity at that depth (fig. 5).

Prior to installation of 8-inch casing (table 7), the K_h of the Lower Floridan confining unit was determined by conducting packer-slug tests at four separate intervals within the confining unit: 571–575, 641–645, 688–692, and 698–702 ft (fig. 5). Although the lithology in the confining unit interval was fairly consistent, two variations affected K_h: (1) fine-grained calcarenite with trace amounts of fine carbonate mud (chalk) disseminated throughout mostly granular limestone and (2) very fine-grained chalky and sandy limestone. The slug tests for the 571–575 ft and 641–645 ft intervals are representative of the first lithology variation with K_h of 1.1 and 3.1 ft/d, respectively. In the second lithologic variation, the K_h was 0.16 ft/d at 688–692 ft and 0.20 ft/d at 698–702 ft.

An approximation of the K_v of the Lower Floridan confining unit was derived using K_h data obtained from packer-slug tests and K_v data obtained from core analysis (table 6). Sediments constituting the Lower Floridan confining unit and upper part of the LFA consist of middle Eocene

limestone that appears similar in lithologic composition. Because of this similarity, an approximation of the K_v of the Lower Floridan confining unit was determined using data from the uppermost part of the LFA. A K_h:K_v ratio of 8.5:1 was determined by comparing laboratory analyses for K_v (table 6) in the 817.8–818.4 ft interval (0.2 ft/d) to the packer test for K_h (table 7) in the nearby 812–816 ft interval (1.7 ft/d). Using this relation, the estimated K_v of the confining unit is estimated to range from 0.02 to 0.36 ft/day (table 7). These values are consistent with ranges for K_h reported by Freeze and Cherry (1979) for limestone and dolomite.

Water in the Lower Floridan confining unit has a low specific conductance compared to deeper units as indicated by the monitoring of drilling fluids while completing the pilot hole in well HAAF 11 (36Q392). Water from the 570–685 ft interval had an average specific conductance of 225 µS/cm (fig. 7).

Lower Floridan Aquifer

The LFA at well HAAF 11 (36Q392) is present between depths of 703 and 1,080 ft and consists of several high permeability zones in limestone of the middle Eocene Avon Park Formation (fig. 2; table 4). A second round of flowmeter testing conducted in the completed LFA well on August 15, 2009, provided information on water-bearing intervals in the LFA. Test results indicated that there are six main water-bearing intervals in the LFA: 723–731; 768–785; 818–837; 917–923; 1,027–1,052; and 1,060–1,080 ft (fig. 6*B*). These intervals seem to coincide with the development of secondary permeability in the aquifer in the form of solution cavities and voids that have a higher permeability than the native-rock matrix (fig. 5). Formation-resistivity logs indicate that each of these water-bearing intervals coincides with an increase in resistivity (fig. 5). Flowmeter-test data indicated that when pumping at a rate of 748 gal/min, the upper two water-bearing zones produced 62.6 percent of the total flow, with 110 gal/min from the 723- to 731-ft interval and 359 gal/min from the 768- to 785-ft interval. The remaining four zones contributed from 1.7 to 18 percent of the flow during the flowmeter test (fig. 6). Flow was not detected beneath a depth of 1,080 ft by the flowmeter. Based on the low contribution from the interval beneath 1,080 ft, the base of the LFA was assigned a depth of 1,080 ft at the HAAF 11 (36Q392) well site.

The quality of water in the LFA was evaluated during drilling by monitoring the specific conductance of reverse-air drilling fluids, collecting grab water samples during flowmeter testing, and collecting a composite water sample from the completed well HAAF 11. Monitoring of drilling fluids indicated that the specific conductance in the LFA between depths of 710 and 1,045 ft averaged 262 µS/cm. At a depth of 1,055 ft, the specific conductance increased abruptly to 1,063 µS/cm and averaged 751 µS/cm for the 1,055–1,165 interval. These higher specific-conductance values suggest an increase in dissolved-solids-concentration that could affect the suitability of the well for water supply. Drilling was halted at a depth of 1,168 ft to avoid further penetration into zones containing water with a high total dissolved-solids concentration.

Grab water samples were collected using a wireline sampler from five discrete depths on June 22, 2009, and were analyzed for major ions (table 5; figs. 8, 9). Water samples collected in the UFA and LFA indicate a transition with depth (fig. 9) from a slightly sodium-dominated mixed-anion type water in the UFA at a depth of 525 ft to a sodium-chloride type water in the LFA at the 1,075 ft depth.

Water from the LFA is hard to very hard with an alkalinity of 150–250 mg/L (fig. 8; table 5). Data indicate that with the exception of fluoride, constituent concentrations increase continuously with depth. Water from the deepest interval (1,075 ft) has a chloride concentration of 480 mg/L, which exceeds the USEPA SMCL of 250 mg/L (U.S. Environmental Protection Agency, 2009). The 240 mg/L sulfate concentration of water from the same interval is slightly below the USEPA SMCL of 250 mg/L (U.S. Environmental Protection Agency, 2009). Flowmeter testing indicates that water from the 1,075-ft zone contributes less than 2 percent of the total flow to the well (fig. 6*B*); thus, the relatively higher concentrations of chloride and sulfate in the deepest interval will not likely affect the quality of the water in the completed well.

A composite sample of water in the LFA was collected and analyzed from well HAAF 11 (36Q392) on August 16, 2009 (table 5), near the completion of a 72-hour aquifer test. Constituent concentrations of the composite sample (703–1,112-ft interval) of the completed well were generally below values for each of the grab samples in the LFA and all were below USEPA MCLs and SMCLs (U.S. Environmental Protection Agency, 2009).

To determine the transmissivity of the LFA, well HAAF 11 (36Q392) was pumped for a 72-hour period at an average rate of 748 gal/min, during August 13–16, 2009 (table 8). Water-level and discharge data were recorded in the pumped well, and water levels were recorded in two observation wells (wells HAAF 5 and HAAF 8) completed in the UFA to assess interaquifer leakage response.

Pumping from well HAAF 9 (36Q391), completed in the UFA about 2,000 ft to the north, was identified as a possible source of interference for the HAAF 11 (36Q392) aquifer test. Because of water-supply needs, pumping at well HAAF 9 (36Q391) could not be discontinued during the 72-hour test and background/recovery periods. For this reason, pumping at the well was maintained at a generally constant rate starting a few days before the start of the aquifer test (August 10, 2009) and was operated on that schedule throughout the duration of the test and recovery period (August 22, 2009). Small fluctuations in the water-system pressure caused slight variations in pumping at well HAAF 9 (36Q391). In addition to adjusting for pumping influences, aquifer test data were corrected for regional trends, barometric pressure, and tidal influences prior to aquifer-test analysis by using the same filtering procedures described earlier for the test conducted in the UFA (Williams, 2010).

Transmissivity of the LFA was estimated from drawdown and recovery data from the pumped well (well HAAF 11) because no other nearby LFA wells were available for drawdown observations (table 8). Transmissivity calculated using the Theis (1935) solution was 11,000 ft²/day (Williams, 2010). The Theis (1935) solution assumes the aquifer has an infinite areal extent; is homogeneous, isotropic, and has a uniform thickness; the pumping well is fully penetrating; flow to the well is horizontal; the aquifer is confined; flow is unsteady and water is released instantaneously from storage with decline of hydraulic head; and the effects of borehole storage are small enough to be neglected. The Theis (1935) solution also assumes the aquifer is confined; however, the aquifer test indicates a leaky artesian aquifer response with a flattening of the drawdown curve starting several hundred minutes into the test (fig. 13). Thus, the type curve for this analysis was only matched to early-time data between 7 and 90 minutes. The observed values plotting below the Theis (1935) curve between 1 and 7 minutes are probably the result of borehole storage that were not matched in this analysis.

The Theis (1935) solution for recovery data in a confined aquifer also was used to calculate transmissivity for the aquifer test (Williams, 2010). In the Theis recovery method, the residual drawdown is plotted against time over elapsed time since pumping began (t/t') on a semilogarithmic plot (fig. 13*B*). A straight-line fit through the observed residual drawdown gives a transmissivity of about 12,000 ft²/day (table 8), which is comparable to the value determined using the drawdown data.

Vertical hydraulic conductivity of the LFA was determined from core samples at depths of 817.8–818.4, 851.8–852.2, and 941.9–942.6 ft (table 6). These samples originally were to have been collected from the Lower Floridan confining unit; however, this interval was not readily identified during drilling, and sampled intervals were designated on the basis of projected depths of the Lower Floridan confining unit according to maps by Miller (1986). Field testing after samples were collected indicated that the samples actually were collected from intervals within the upper part of the LFA. This discrepancy resulted from differing local geology and the coarse resolution of Miller's (1986) maps. Vertical hydraulic conductivity of the LFA, determined by using a flexible wall permeameter following procedures described in ASTM D5084, ranged from 0.13 to 0.34 ft/d.

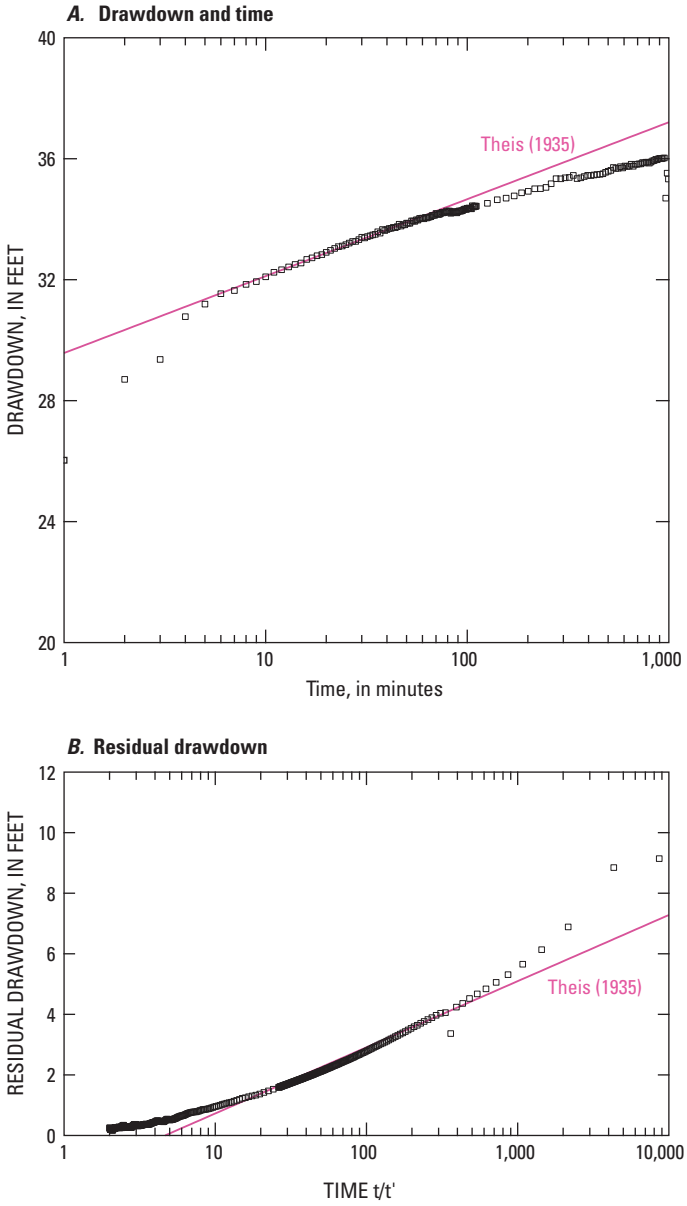

Figure 13. Semi-logarithmic plots of *(A)* drawdown and time and *(B)* residual drawdown and t/t' for aquifer test of Lower Floridan aquifer at well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia, August 13–16, 2009.

Effect of Lower Floridan Aquifer Pumping on the Upper Floridan Aquifer

Potential effects of pumping the LFA on water levels in the UFA were evaluated by monitoring drawdown response in nearby UFA wells and through model simulation. Observed water-level response in the UFA as a result of pumping the LFA was determined by using water-level data that were filtered for tidal, barometric, and pumping interferences and by following procedures described earlier. These measured drawdowns were used to provide a basis for evaluating the accuracy of model simulations. Model simulation was used to determine long-term (steady-state) leakage response of the UFA to pumping from the LFA, and to estimate the equivalent amount of UFA pumping that would produce similar drawdown.

Observed Water-Level Response

During the 72-hr LFA test in well HAAF 11 (36Q392), 36.3 ft of drawdown were observed in the pumped well, and small amounts of drawdown were observed in two UFA observation wells. The closest of these observation wells (HAAF 8, 36Q292) is located 176 ft from the pumping well and the farthest (HAAF 5, 36Q288) is located 3,600 ft from the pumping well (fig. 14). Well HAAF 9 (36Q391), located 1,995 ft from the pumping well, was not used in the drawdown analysis because this well was operational and was being pumped at a generally constant rate during the test. Small fluctuations in water-system pressure caused variations in pumping at well HAAF 9 (36Q391) that masked any observable drawdown resulting from LFA pumping at well HAAF 11.

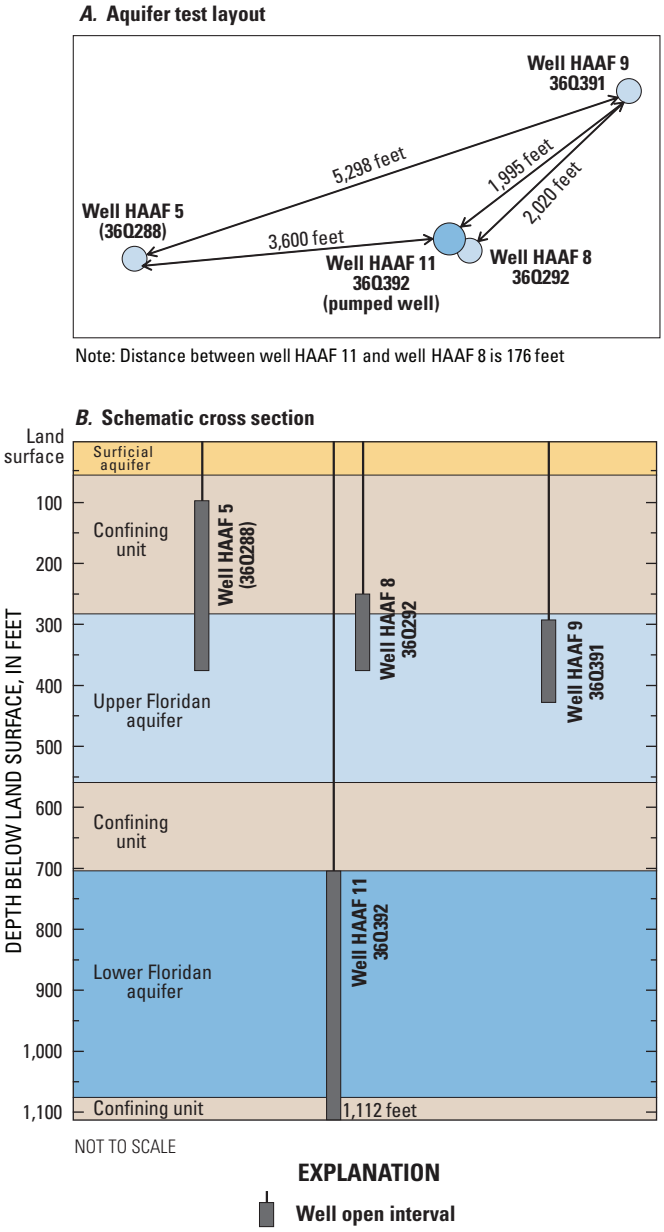

Figure 14. Location and construction characteristics of wells used for aquifer tests at Hunter Army Airfield, Chatham County, Georgia: *(A)* diagram showing aquifer test layout and *(B)* schematic section showing the open intervals of the wells in relation to major hydrogeologic units (modified from Williams, 2010).

Raw, unfiltered water-level data from the 72-hour LFA test and the response at the two UFA observation wells are depicted in figure 15. Visual examination of unfiltered data indicates that drawdown at well HAAF 8 (36Q292) is readily evident, whereas drawdown in well HAAF 5 (36Q288) is less evident but still distinguishable.

Water-level data from wells HAAF 5 (36Q288) and HAAF 8 (36Q292) were filtered to reduce the effects of tidal loading, barometric pressure, regional trends, and pumping at well HAAF 9 (36Q391), following the method presented in Halford (2006). To ensure that local interferences were adequately filtered in order to accurately depict small drawdown values resulting from LFA pumping, the fitting period for the filtering included a week before and several weeks after the test was completed (fig. 16). The amplitude and phase of each time series (background, tide, barometric pressure) were adjusted to create a composite synthetic water-level hydrograph for each observation well that spanned the period of the test, following procedures described earlier for the UFA 24-hour aquifer test.

During the filtering process, the effects of pumping well HAAF 9 (36Q391) on the drawdown response had to be taken into account. For well HAAF 8 (36Q292), the synthetic and measured water levels (fig. 16*A*) matched fairly well during the week prior to pumping at well HAAF 9 (36Q391). During this pre-test period, well HAAF 9 (36Q391) was taken offline in order to obtain natural background fluctuations. Pumping at well HAAF 9 (36Q391) was started 2 days prior to the startup of the LFA test and was maintained at an average rate of 400 gal/min until 5 days following the end of the test. At well HAAF 8 (36Q292), the drawdown and recovery response of pumping both at wells HAAF 9 (36Q391) and HAAF 11 (36Q392) are shown in figure 16*A*. After removing the effects of well HAAF 9 (36Q391) pumping, the total drawdown and recovery response attributed to pumping at well HAAF 11 (36Q392) are estimated to be 0.76 ft (fig. 16*A*). At well HAAF 5 (36Q288), which is located 3,600 ft away from the LFA well, the total pumping-induced drawdown attributed to well HAAF 11 (36Q392) is estimated to be 0.43 ft (fig. 16*B*).

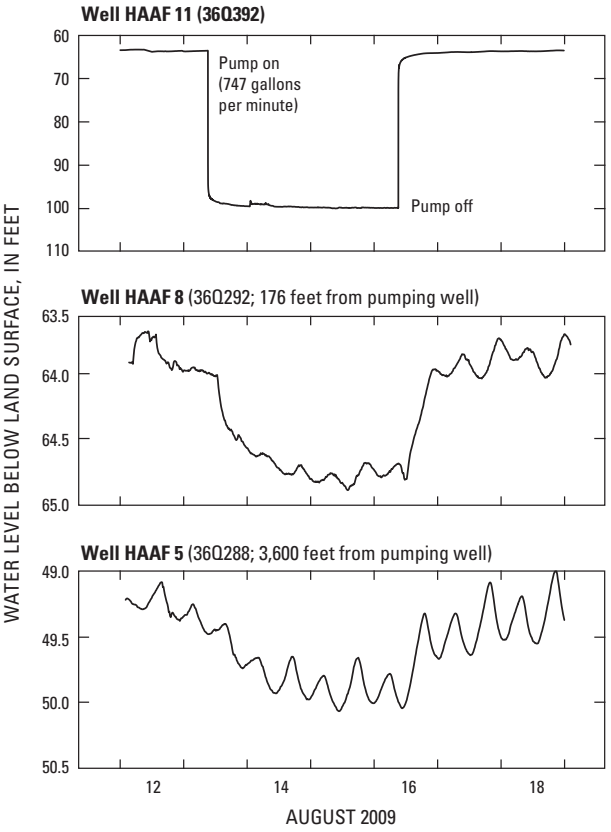

Figure 15. Water levels in the pumped Lower Floridan well (HAAF 11, 36Q392) and in Upper Floridan observation wells HAAF 8 (36Q292) and HAAF 5 (36Q288) before, during, and after the 72-hour aquifer test of the Lower Floridan aquifer, Hunter Army Airfield, Chatham County, Georgia, August 11–19, 2009 (modified from Williams, 2010).

Model Simulation

A revised regional groundwater-flow model was used to simulate the water-level response of the UFA in selected observation wells to pumping from the LFA at well HAAF 11. The revised model was also used to simulate the equivalent pumping rate in a hypothetical UFA well at the same location as HAAF 11 (36Q392) that would produce a comparable drawdown to that resulting from pumping well HAAF 11.

To simulate the steady-state effect on groundwater flow of pumping the new LFA well at HAAF, the existing USGS MODFLOW model of Payne and others (2005) was modified based on hydrogeological information obtained from field investigations (described earlier) and from existing wells in the area. The model grid was modified to a finer 10-ft by 10-ft cell size near well HAAF 11 (36Q392) to enable more accurate simulations at smaller scale. Revisions to the regional model of Payne and others (2005) are described in the appendix. The location of the regional model is shown on in figure 17.

The revised model used regional pumping and boundary conditions during 2000 as a "base case" for comparing drawdown and water-budget changes simulated in response to pumping well HAAF 11 (36Q392). Pumping well HAAF 11 (36Q392) at a rate of 748 gal/min resulted in a simulated maximum steady-state drawdown of 36.2 ft in the LFA, which is nearly identical to the 36.3 ft of drawdown observed in well HAAF 11 (36Q392) during the 72-hour aquifer test. Simulated steady-state drawdown in the LFA was greater than 1 ft over a 146-square-mile (mi^2) area (fig. 17).

Interaquifer Leakage and Drawdown Response

Pumping from the LFA at well HAAF 11 (36Q392) also resulted in a simulated drawdown response in the overlying UFA because of leakage through the Lower Floridan confining unit (fig. 18). Model simulations indicate that steady-state drawdown in the UFA was greater than 1 ft over a 141 mi^2 area and was 1.9 ft near well HAAF 5 (36Q288) and 2.03 ft near wells HAAF 11 (36Q392) and HAAF 8 (36Q292).

The GaEPD interim permit strategy for the LFA (Nolton Johnston, Georgia Environmental Protection Division, written commun., January 28, 2003) states that "the applicant must offset the impact of the LF [Lower Floridan] pumping by reducing nearby UF [Upper Floridan] permitted pumping in the same general area (within a 5 mi radius) by an amount equal to or greater than the determined UF leakage." To assess the amount of leakage resulting from pumping in the Lower Floridan aquifer, the steady-state water budget before and after the initiation of pumping at well HAAF 11 (36Q392) was compared (table 9; fig. 19).

Table 9. Simulated steady-state water budget for 2000 and after initiation of pumping 748 gallons per minute (1.08 million gallons per day) at well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia.

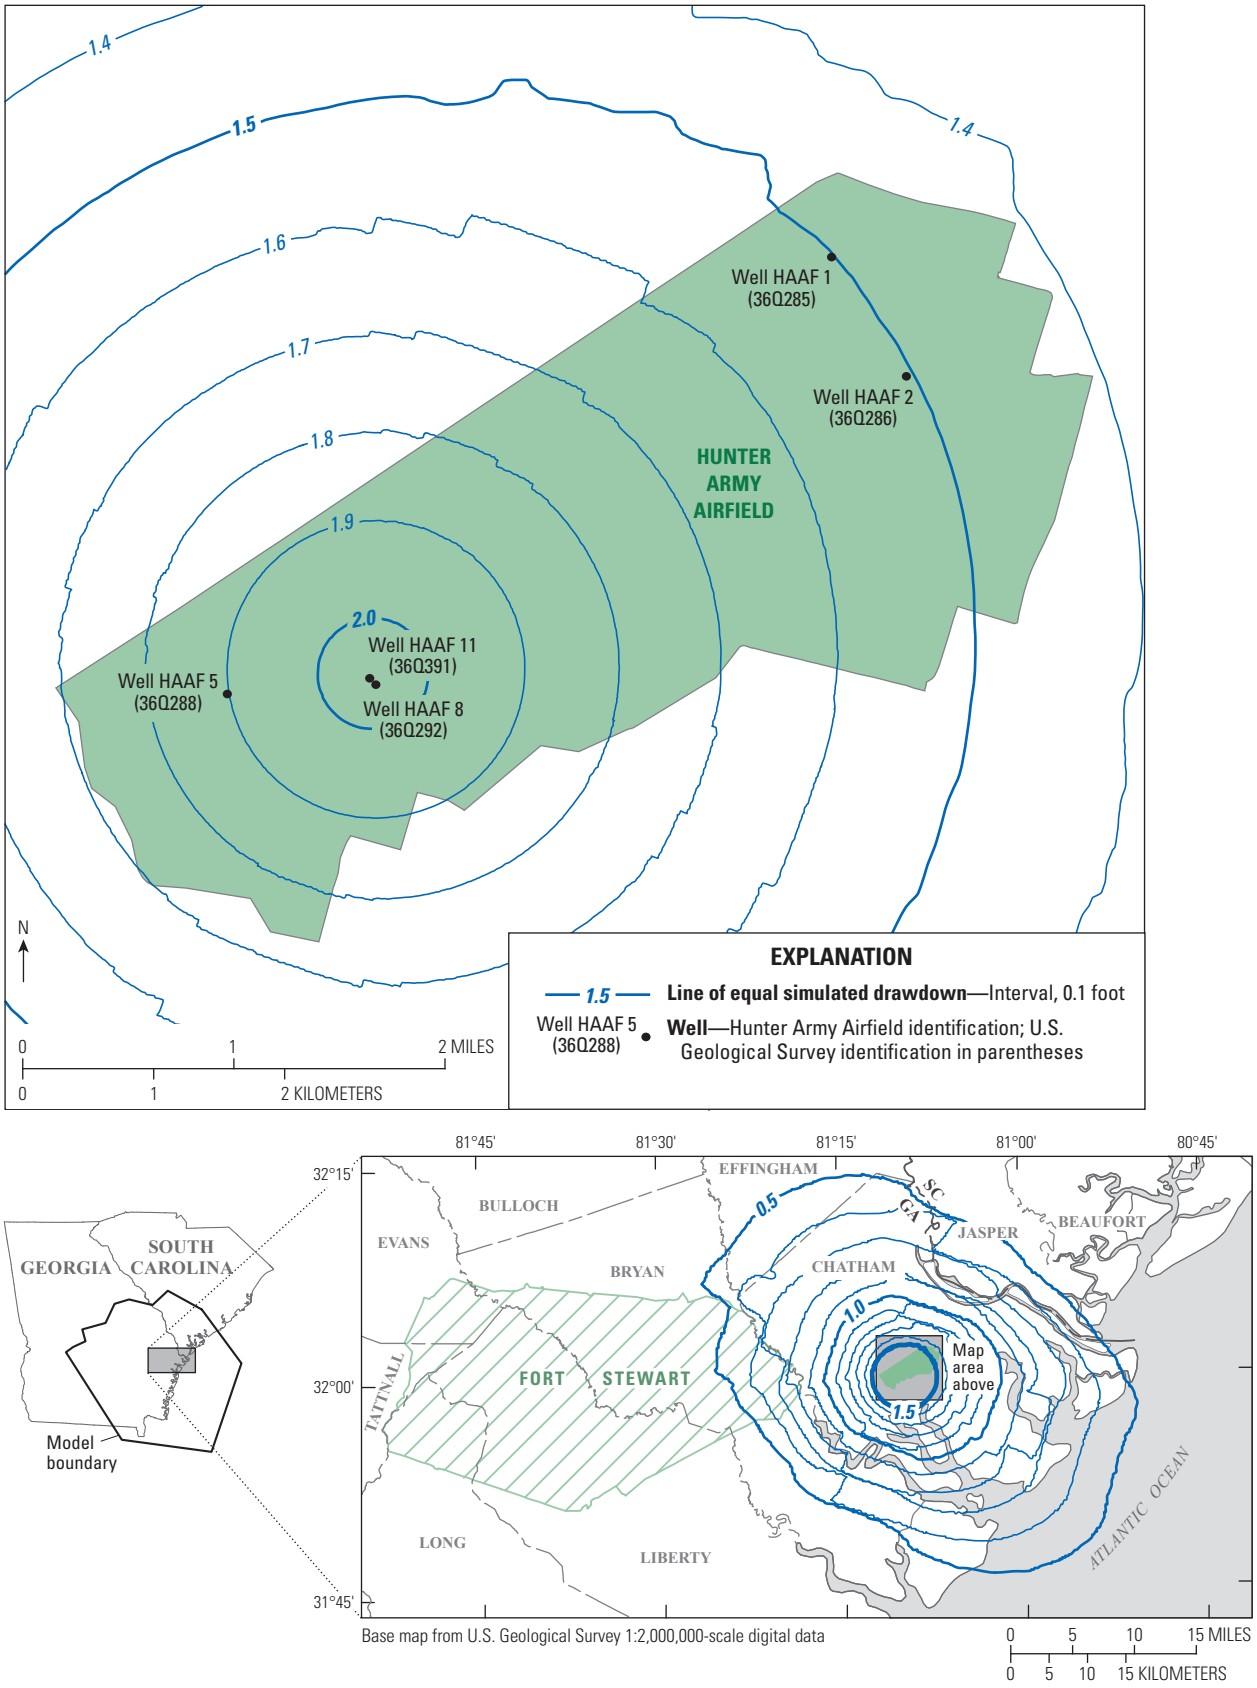

Figure 18. Simulated steady-state drawdown in the Upper Floridan aquifer resulting from pumping well HAAF 11 (36Q392) at 748 gallons per minute, Hunter Army Airfield and vicinity, coastal Georgia.

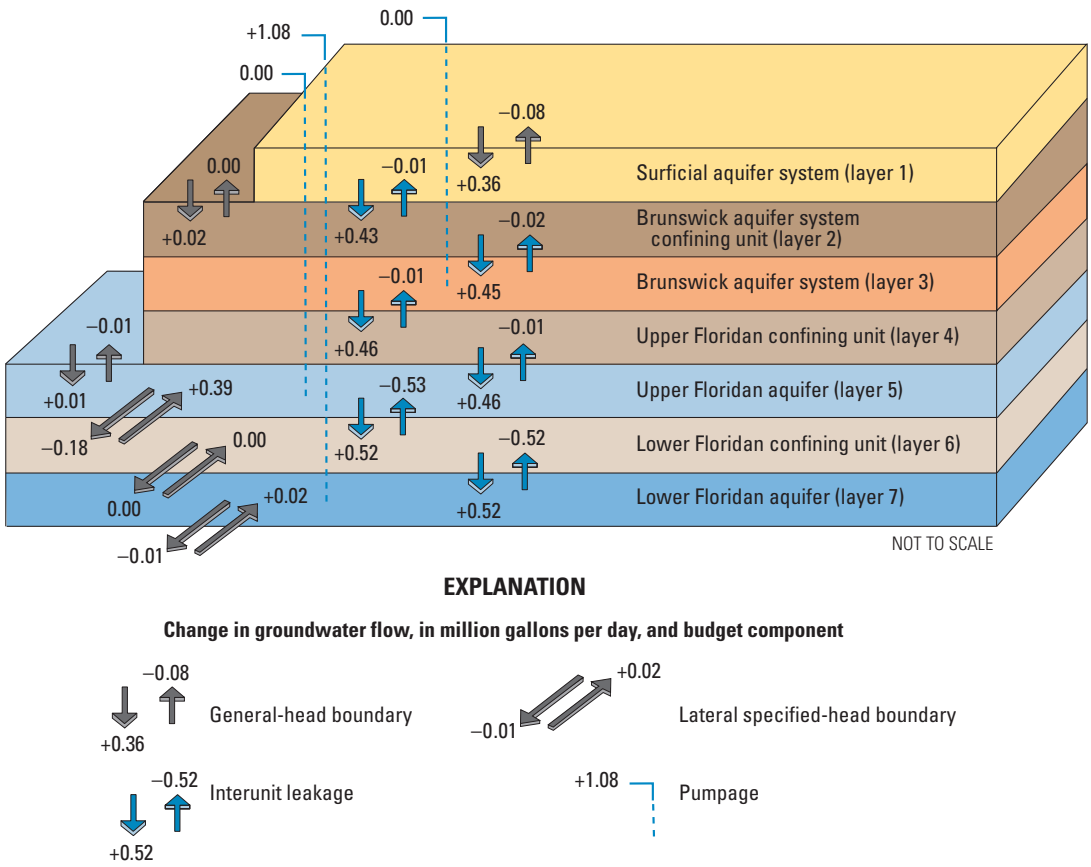

Figure 19. Change in simulated steady-state water budget resulting from initiation of pumping at well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia (modified from Payne and others, 2005).

Pumping 1 Mgal/d (748 gal/min) at well HAAF 11 (36Q392) resulted in small changes and redistribution of flow among model layers, including increased downward and decreased upward leakage in all layers, and increased inflow and decreased outflow from lateral boundaries in the UFA and LFA. In the surficial aquifer, pumping at well HAAF 11 (36Q392) resulted in increased inflow (recharge) from the general head boundary (0.36 Mgal/d). Flow to well HAAF 11 (36Q392) was derived from increased lateral flow from the specified-head boundary (0.02 Mgal/d), from increased leakage through the Lower Floridan confining unit (0.52 Mgal/d), and by reductions in discharge to the Lower Floridan confining unit (0.52 Mgal/d) and to lateral specified-head boundaries (0.01 Mgal/d).

The simulated steady-state water budget was further evaluated using the MODFLOW postprocessor ZONEBUDGET (Harbaugh, 1990). ZONEBUDGET enables summation of flow entering and leaving a designated subarea of the model domain. For this evaluation, three zones surrounding well HAAF 11 (36Q392) were designated: 0–0.5 mi, 0.5–1 mi, and greater than 1 mi. The percentage of leakage from the UFA that contributed flow to the LFA at well HAAF 11 (36Q392) is shown on figure 20. About 65 percent of the water that was contributed to well HAAF 11 (36Q392) came from within 1 mi of the pumped well, of which 36 percent came from within 0.5 mi of the pumped well. The larger contribution of water resulted from a larger head gradient between the pumped well and the overlying aquifer in areas close to the pumped well.

Upper Floridan Aquifer Drawdown Offset

As part of the interim permitting strategy, GaEPD provided a hydrogeological study protocol, that states that a groundwater model shall be used (Nolton Johnston, Georgia Environmental Protection Division, written commun., January 28, 2003) "… to simulate the equivalent Upper Floridan pumping that induces the identical maximum drawdown in the Upper Floridan that would be expected as a result of pumping the Lower Floridan."

To replicate simulated drawdown in the UFA in response to pumping in the LFA at well HAAF 11, a series of steady-state simulations were conducted using the revised model. Each simulation involved applying a different pumping rate to a hypothetical UFA well located at the site of well HAAF 11 (36Q392) and running the model under steady-state conditions. Profiles (fig. 21) and maps (fig. 22) show the simulated drawdown in the UFA (1) resulting from LFA pumping in well HAAF 11 (36Q392) at 748 gal/min and (2) resulting from pumping a hypothetical UFA well at the same location as well HAAF 11 (36Q392) at rates of 189 and 650 gal/min.

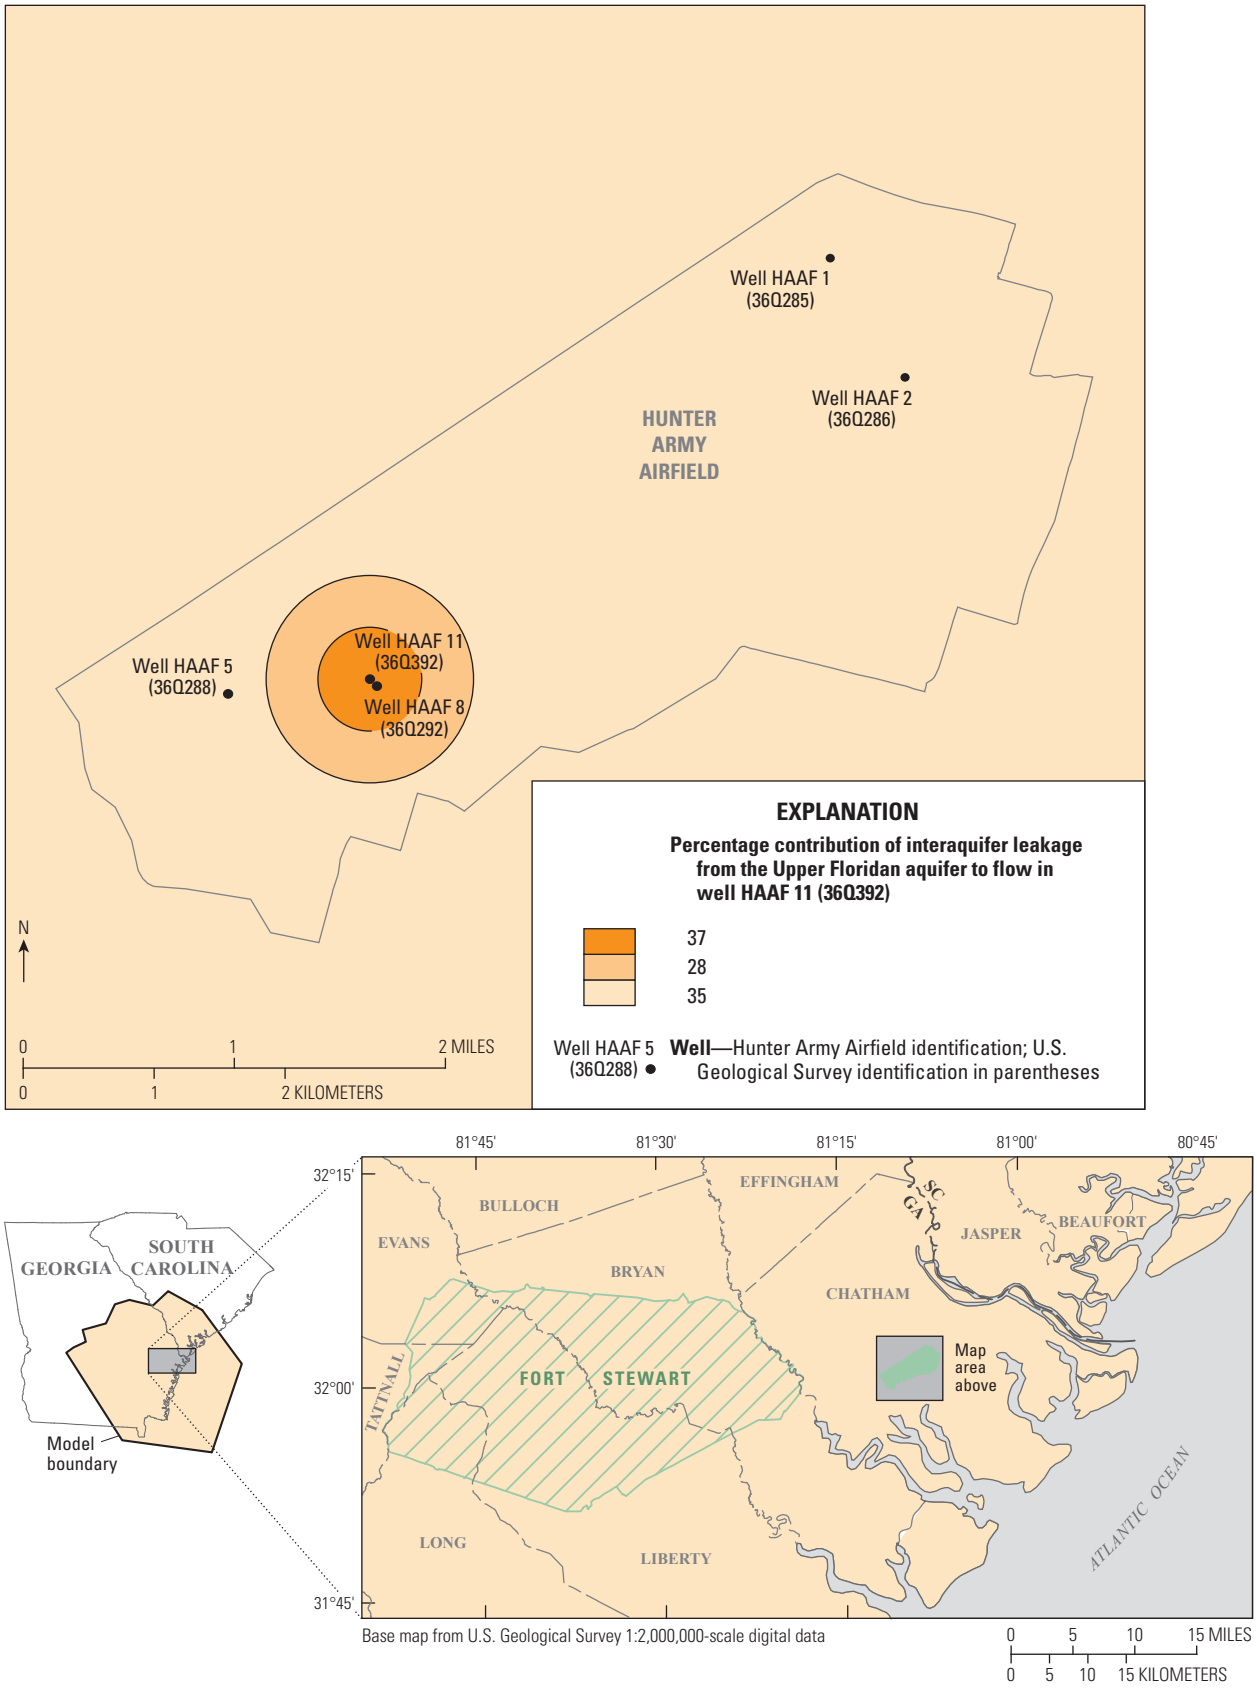

Figure 20. Percentage of interaquifer leakage from the Upper Floridan aquifer contributing flow to well HAAF 11 (36Q392) pumping at a rate of 748 gallons per minute (1.08 million gallons per day), Hunter Army Airfield and vicinity, coastal Georgia.

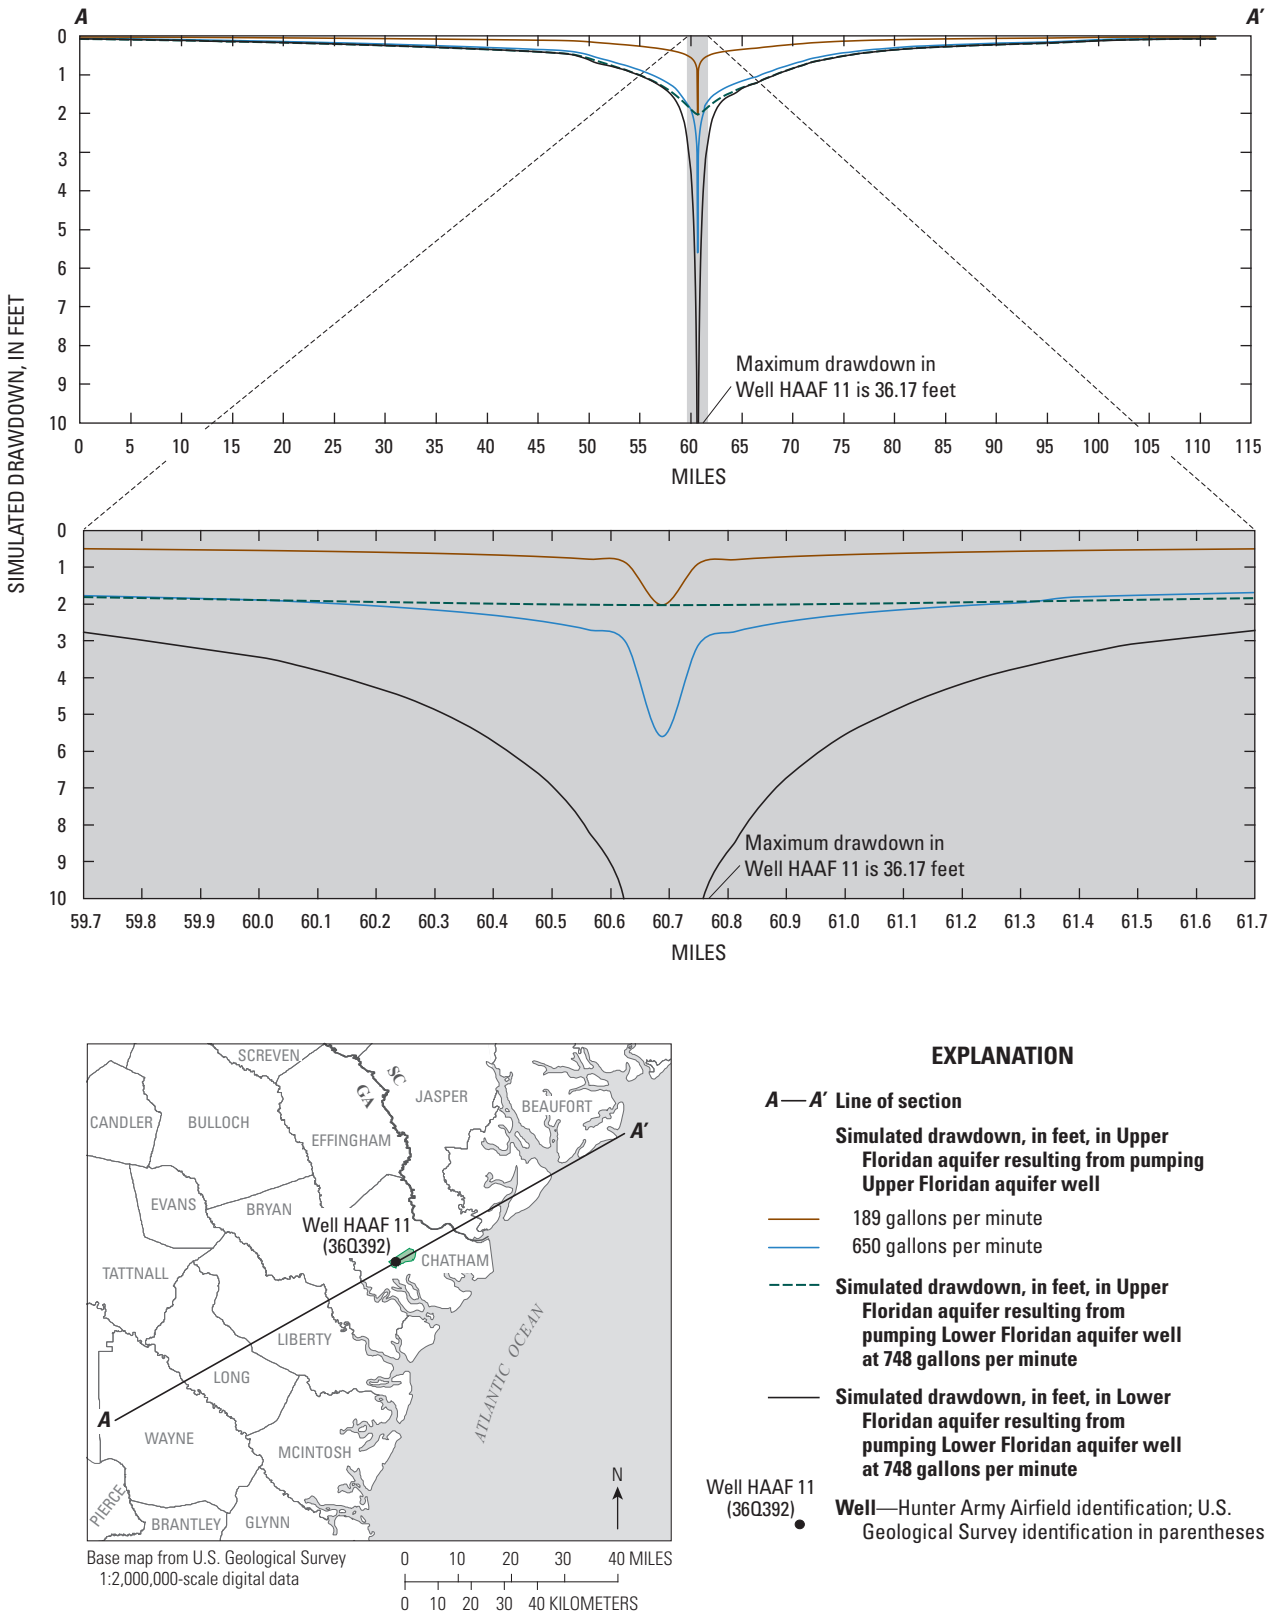

Figure 21. Profile showing simulated steady-state drawdown in the Upper and Lower Floridan aquifers resulting from pumping in the Lower Floridan aquifer at well HAAF 11 (36Q392) and from pumping the Upper Floridan aquifer at rates of 189 and 650 gallons per minute at a hypothetical Upper Floridan aquifer well at the site of well HAAF 11 (36Q392), Hunter Army Airfield and vicinity, coastal Georgia.

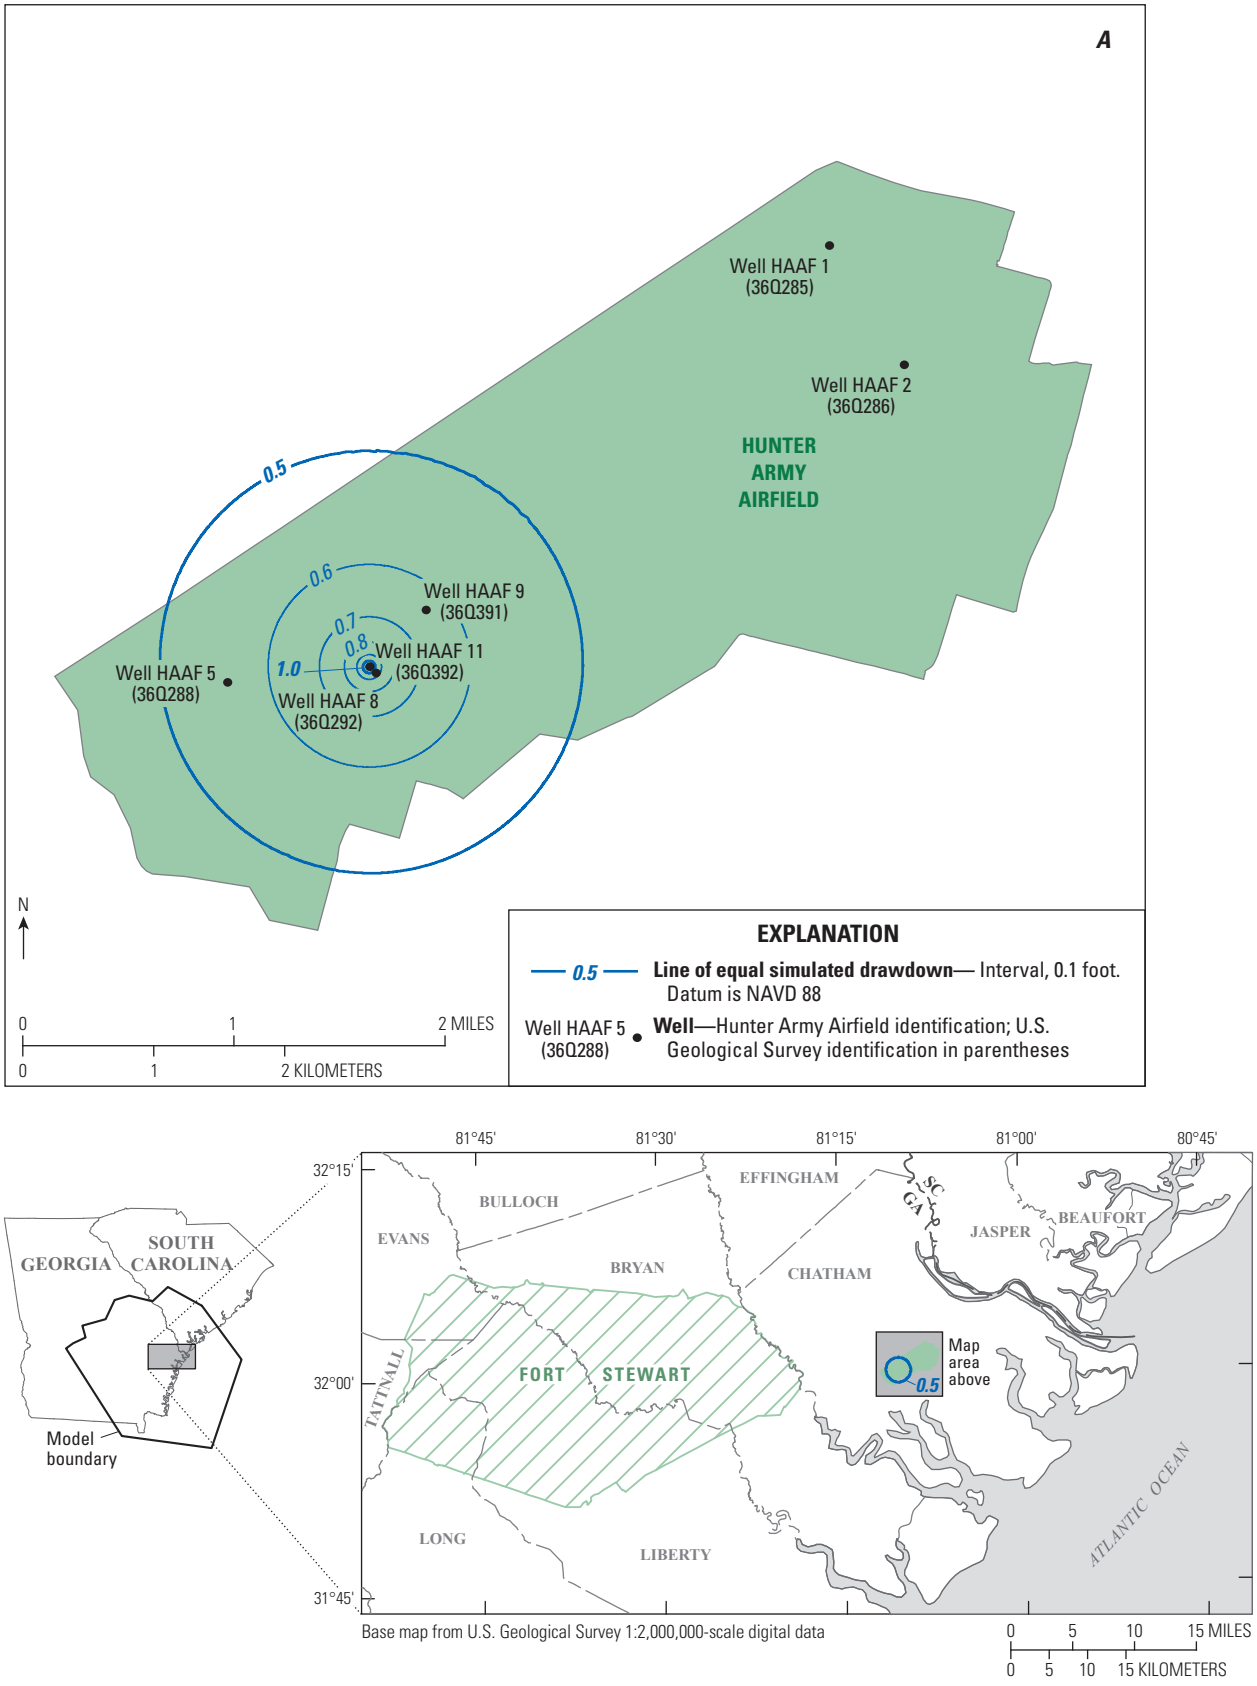

Figure 22. Simulated drawdown in the Upper Floridan aquifer resulting from pumping a hypothetical Upper Floridan aquifer well at the site of well HAAF 11 (36Q392) at rates of *(A)* 189 and *(B)* 650 gallons per minute, Hunter Army Airfield and vicinity, coastal Georgia.

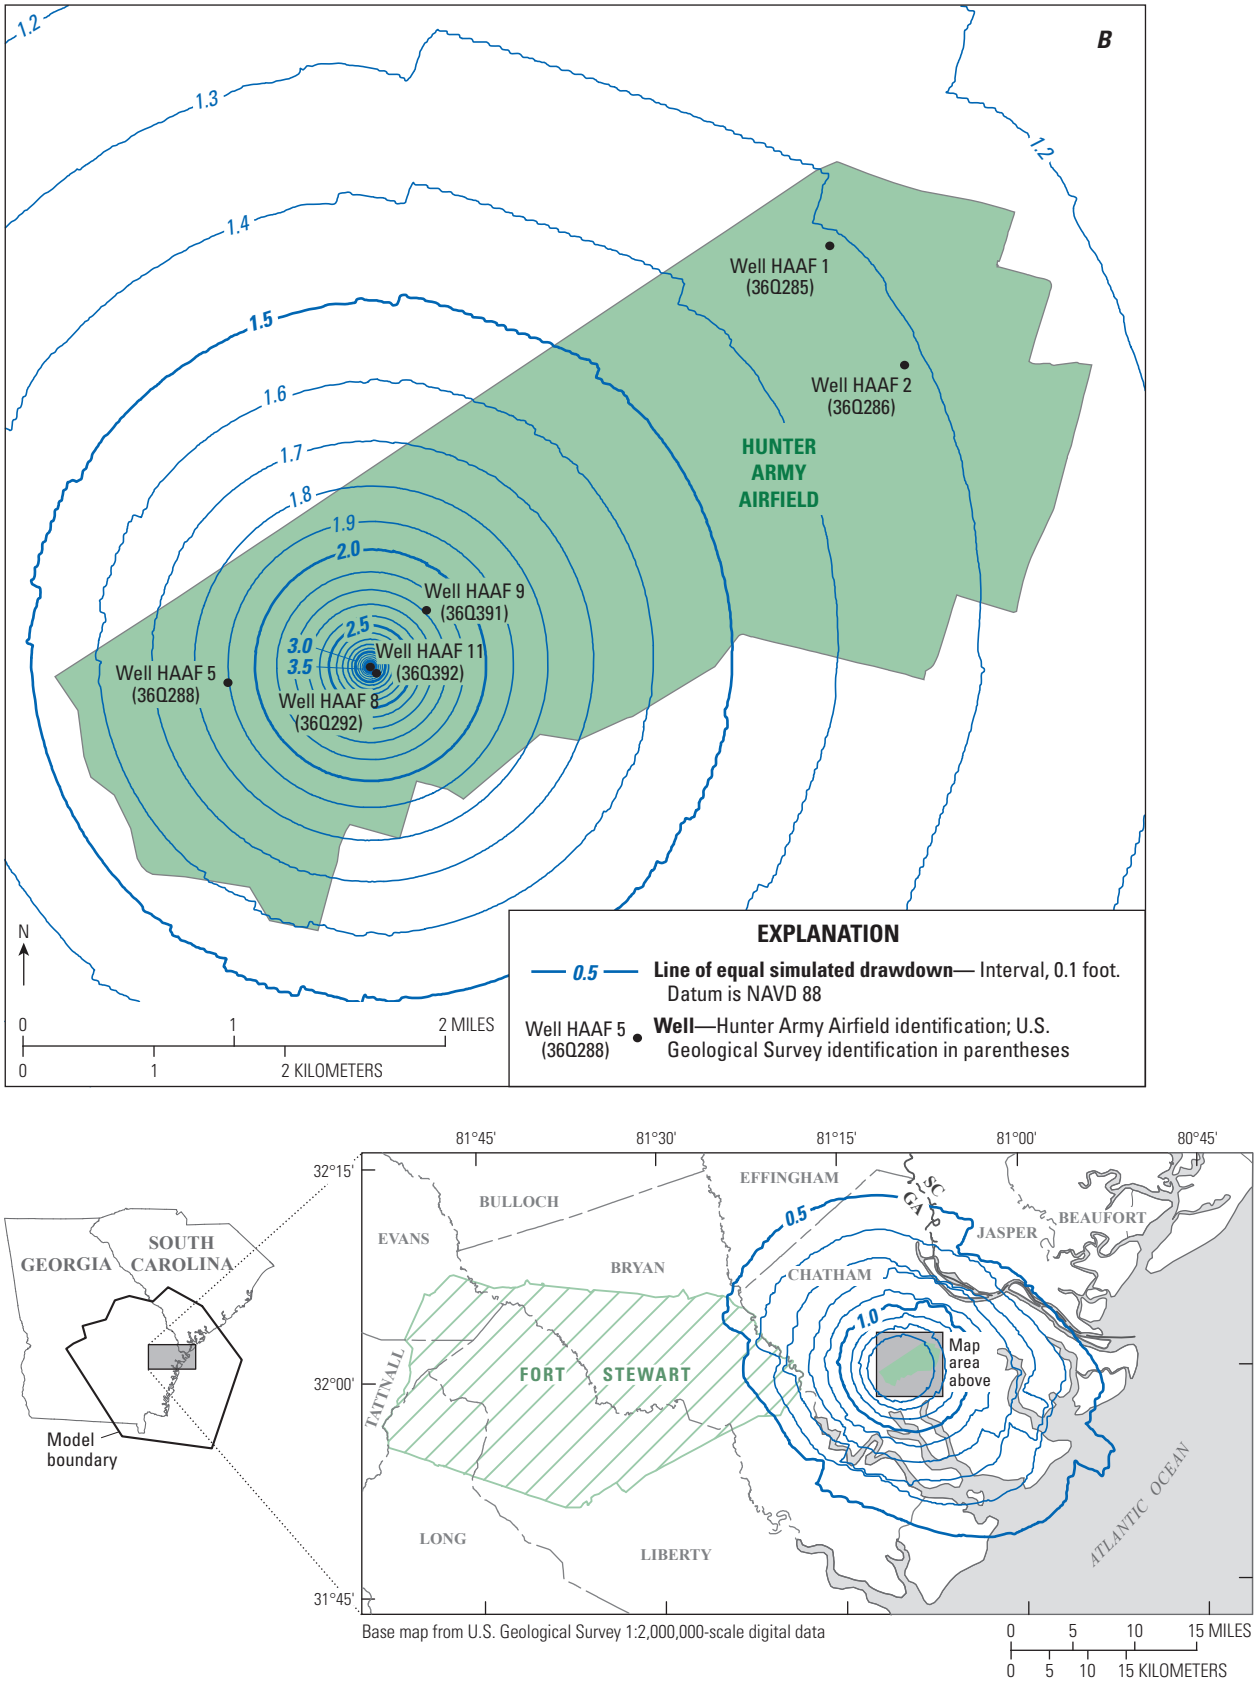

Figure 22. Simulated drawdown in the Upper Floridan aquifer resulting from pumping a hypothetical Upper Floridan aquifer well at the site of well HAAF 11 (36Q392) at rates of *(A)* 189 and *(B)* 650 gallons per minute, Hunter Army Airfield and vicinity, coastal Georgia.—Continued

Simulated water-level profiles indicate that drawdown resulting from pumping the hypothetical UFA well at a rate of 189 gal/min approximates the maximum drawdown resulting from pumping the LFA at well HAAF 11, but is less at distances greater than 0.1 mi from the pumped well (fig. 21). Conversely, drawdown resulting from pumping at a rate of 650 gal/min approximates that resulting from pumping in the LFA at distances greater than 0.1 mi from the pumped well, but is greater closer to the pumped well. The poor overall match to drawdown resulting from interaquifer leakage results from differences in how the model simulates stress. Leakage stress occurs over a wide area, not at a localized position as is the case with an individual pumping well. Thus, drawdown resulting from leakage shows a more gradual lateral gradient and covers a wider area than drawdown resulting from a well being pumped directly from the UFA.

The area in which simulated drawdown exceeded 1 ft further illustrates differences in how the model simulates stress in the form of interaquifer leakage from the simulation of pumping a single UFA well (fig. 22). Simulated drawdown in the UFA that resulted from pumping the LFA covered a 141-mi^2 area (fig. 18), whereas drawdown that resulted from pumping an UFA well at rates of 189 and 650 gal/min covered areas of 0.003 mi^2 and 88.7 mi^2, respectively (fig. 22). In general, the cone of depression formed in response to pumping in the UFA was much steeper near the pumped well, but diminished in magnitude away from the pumped well, whereas the cone of depression formed in response to pumping in the LFA was less steep, but covered a larger area. Neither pumping rate matched the 0.52 Mgal/d (361 gal/min) simulated leakage rate.

Effect of Pumping Offsets on Groundwater Levels at Hunter Army Airfield

To assess the effect of pumping redistribution on current groundwater conditions at HAAF, three model scenarios were run:

- Scenario A—Effect of pumping the LFA at well HAAF 11, 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 187 gal/min (0.27 Mgal/d) or 25 percent of the pumping rate at well HAAF 11 (36Q392). The reduction in withdrawals from the UFA is close to the 189 gal/min rate required to match the maximum drawdown simulated near well HAAF 11.
- Scenario B—Effect of pumping the LFA at well HAAF 11, 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 374 gal/min (0.54 Mgal/d) or 50 percent of the pumping rate at well HAAF 11 (36Q392). The reduction in withdrawals from the UFA is close to the simulated steady-state leakage rate of 361 gal/min.
- Scenario C—Effect of pumping the LFA at well HAAF 11 (36Q392) at a rate of 374 gal/min (0.54 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 187 gal/min (0.27 Mgal/d) or 50 percent of the pumping rate at well HAAF 11 (36Q392). Note that all withdrawals from the UFA at wells HAAF 8 (36Q292) and HAAF 9 (36Q391) were eliminated for this scenario.

For each scenario, permitted withdrawals for the UFA at HAAF during 2005 were apportioned on the basis of the reported well yield of the four main withdrawal wells—HAAF 1 (36Q285), HAAF 2 (36Q286), HAAF 9 (36Q391), and HAAF 8 (36Q292)—and reduced by a designated percentage (table 10). Withdrawal from well HAAF 11 (36Q392) was held constant at 1.08 Mgal/d (748 gal/min) for scenarios A and B, and was decreased by one-half for scenario C (374 gal/min or 0.54 Mgal/d). For scenarios A and B, pumping reductions in the UFA were uniformly distributed among wells HAAF 1 (36Q285), HAAF 2 (36Q286), HAAF 8 (36Q292), and HAAF 9 (36Q391) on the basis of the well's contribution to the overall yield (table 10). For scenario C, pumping was eliminated at wells HAAF 8 (36Q292) and HAAF 9 (36Q391), with the balance of pumping reductions at wells HAAF 1 (36Q285) and HAAF 2 (36Q286). Simulated drawdown at selected well sites for scenarios A, B, and C is listed in table 10. Maps showing water-level changes in the UFA resulting from scenarios A and B are provided in figures 23–24. A map showing drawdown for scenario C is not provided because drawdown was less than 0.5 ft throughout the area.

For each scenario, pumping reductions in the existing HAAF UFA wells resulted in decreased magnitude and extent of drawdown when compared to a scenario in which a well in the LFA was pumped without reducing withdrawals in the UFA (fig. 18). Pumping at well HAAF 11 (36Q392) in the LFA without reducing pumping in the UFA resulted in a simulated drawdown in the UFA of 2.03 ft near well HAAF 11, with drawdown exceeding 1 ft over a 141-mi^2 area. For scenario A, simulated drawdown was 1.59 ft near well HAAF 11 (36Q392), and the area in which drawdown exceeded 1 ft covered 40.5 mi^2 (fig. 23; table 10). Simulated drawdown in the UFA for scenario B was 1.15 ft at well HAAF 11 (36Q392), and the simulated 1-ft drawdown contour covered an area of 4.37 mi^2 (fig. 24; table 10). For scenario C, simulated drawdown in the UFA was less than 0.5 ft throughout the area and was 0.42 ft near well HAAF 11 (36Q392) (table 10). None of the scenarios resulted in noticeable changes in the configuration of the simulated potentiometric surface and related groundwater-flow directions for the UFA (fig. 25).

[1] Scenario A—Effect of pumping the Lower Floridan aquifer at well HAAF 11, 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing Upper Floridan aquifer HAAF supply wells by 187 gal/min (0.27 Mgal/d) or 25 percent of well HAAF 11 pumping rate. The reduction in Upper Floridan pumping is close to the 189 gal/min rate required to match the maximum drawdown simulated near well HAAF 11.

[2] Scenario B—Effect of pumping the Lower Floridan aquifer at well HAAF 11, 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing Upper Floridan aquifer HAAF supply wells by 374 gal/min (0.54 Mgal/d) or 50 percent of well HAAF 11 pumping rate. The reduction in Upper Floridan aquifer pumping is close to the simulated steady state leakage rate of 361 gal/min.

[3] Scenario C—Effect of pumping the Lower Floridan aquifer at well HAAF 11 at a rate of 374 gal/min (0.54 Mgal/d), and reducing pumping in existing Upper Floridan aquifer HAAF supply wells by 187 gal/min (0.27 Mgal/d) or 50 percent of well HAAF 11 pumping rate. Note all Upper Floridan aquifer pumping eliminated at wells HAAF 8 and HAAF 9 for this scenario.

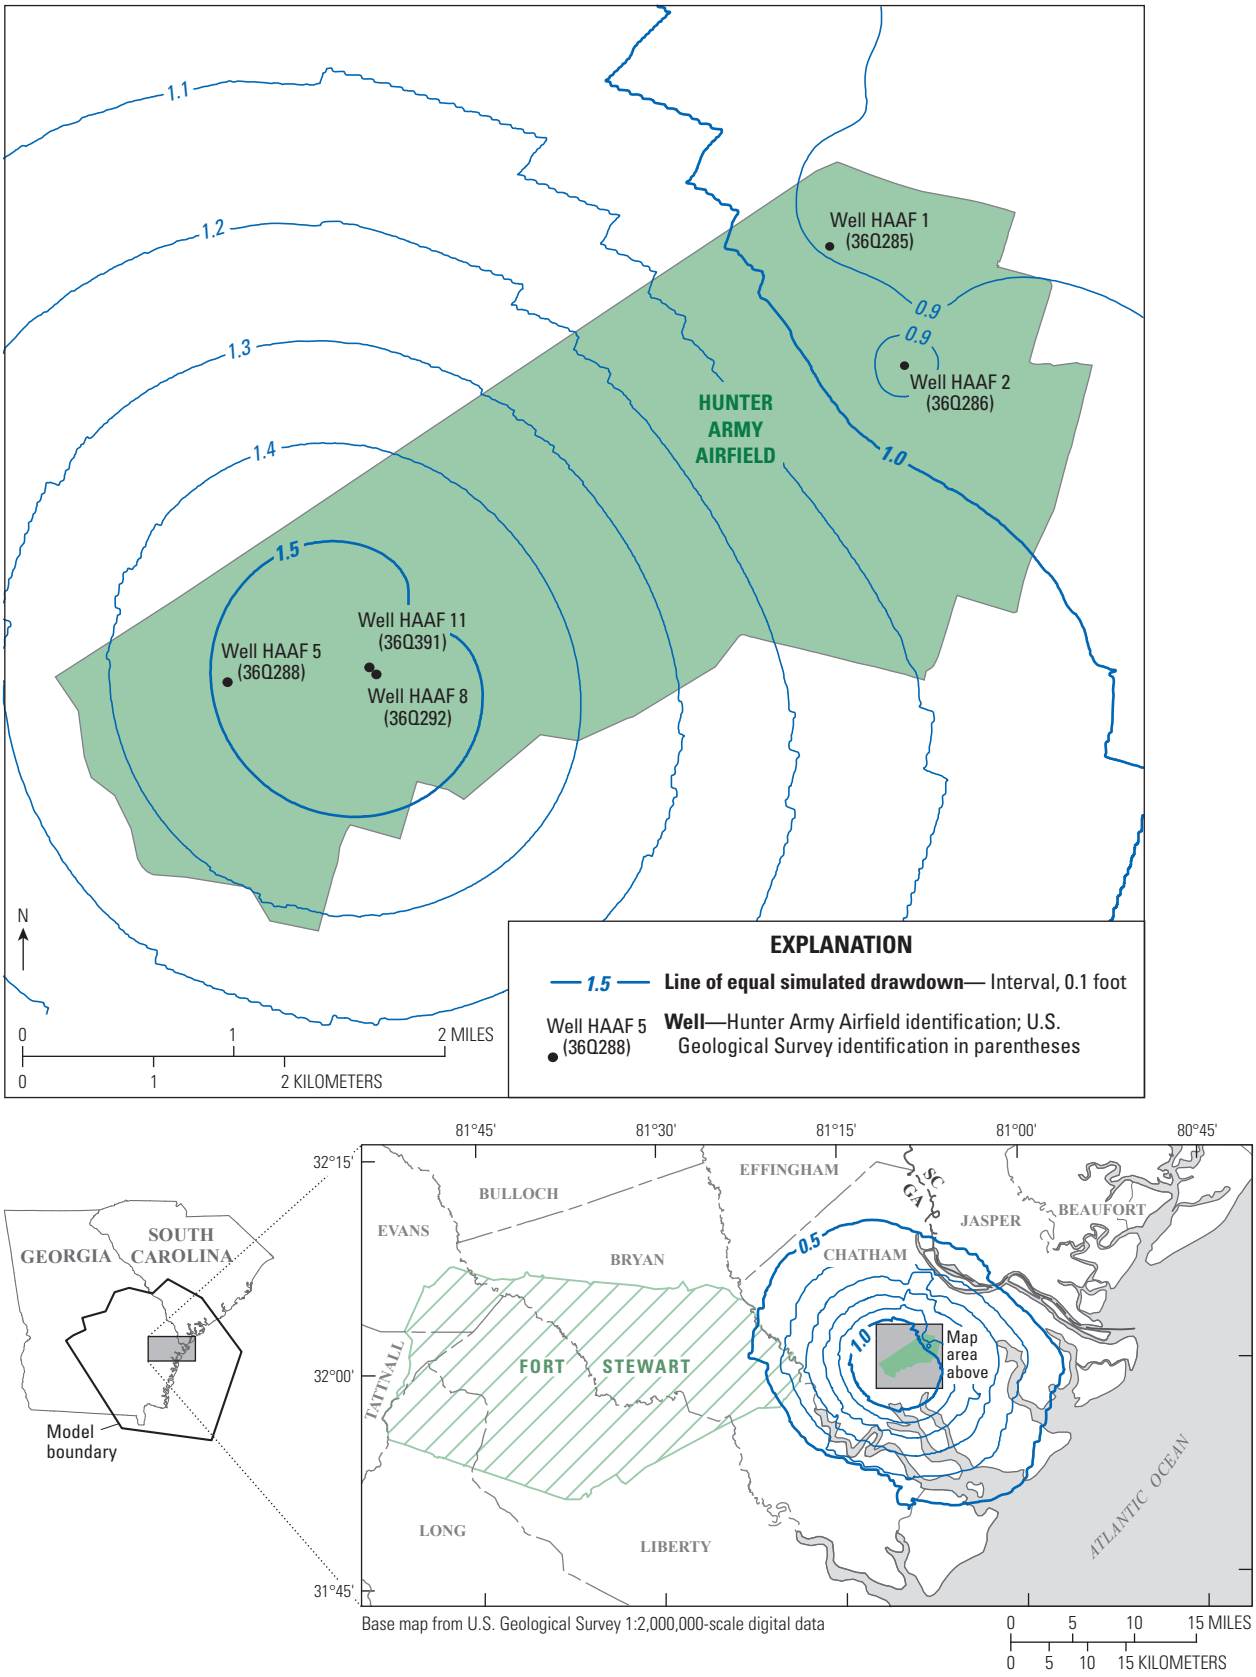

Figure 23. Drawdown in the Upper Floridan aquifer for scenario A—effect of pumping the Lower Floridan aquifer at well HAAF 11 (36Q392) at a rate of 748 gallons per minute, and reducing pumping in existing Upper Floridan aquifer HAAF supply wells by 187 gallons per minute or 25 percent of well HAAF 11 (36Q392) pumping rate—Hunter Army Airfield and vicinity, coastal Georgia.

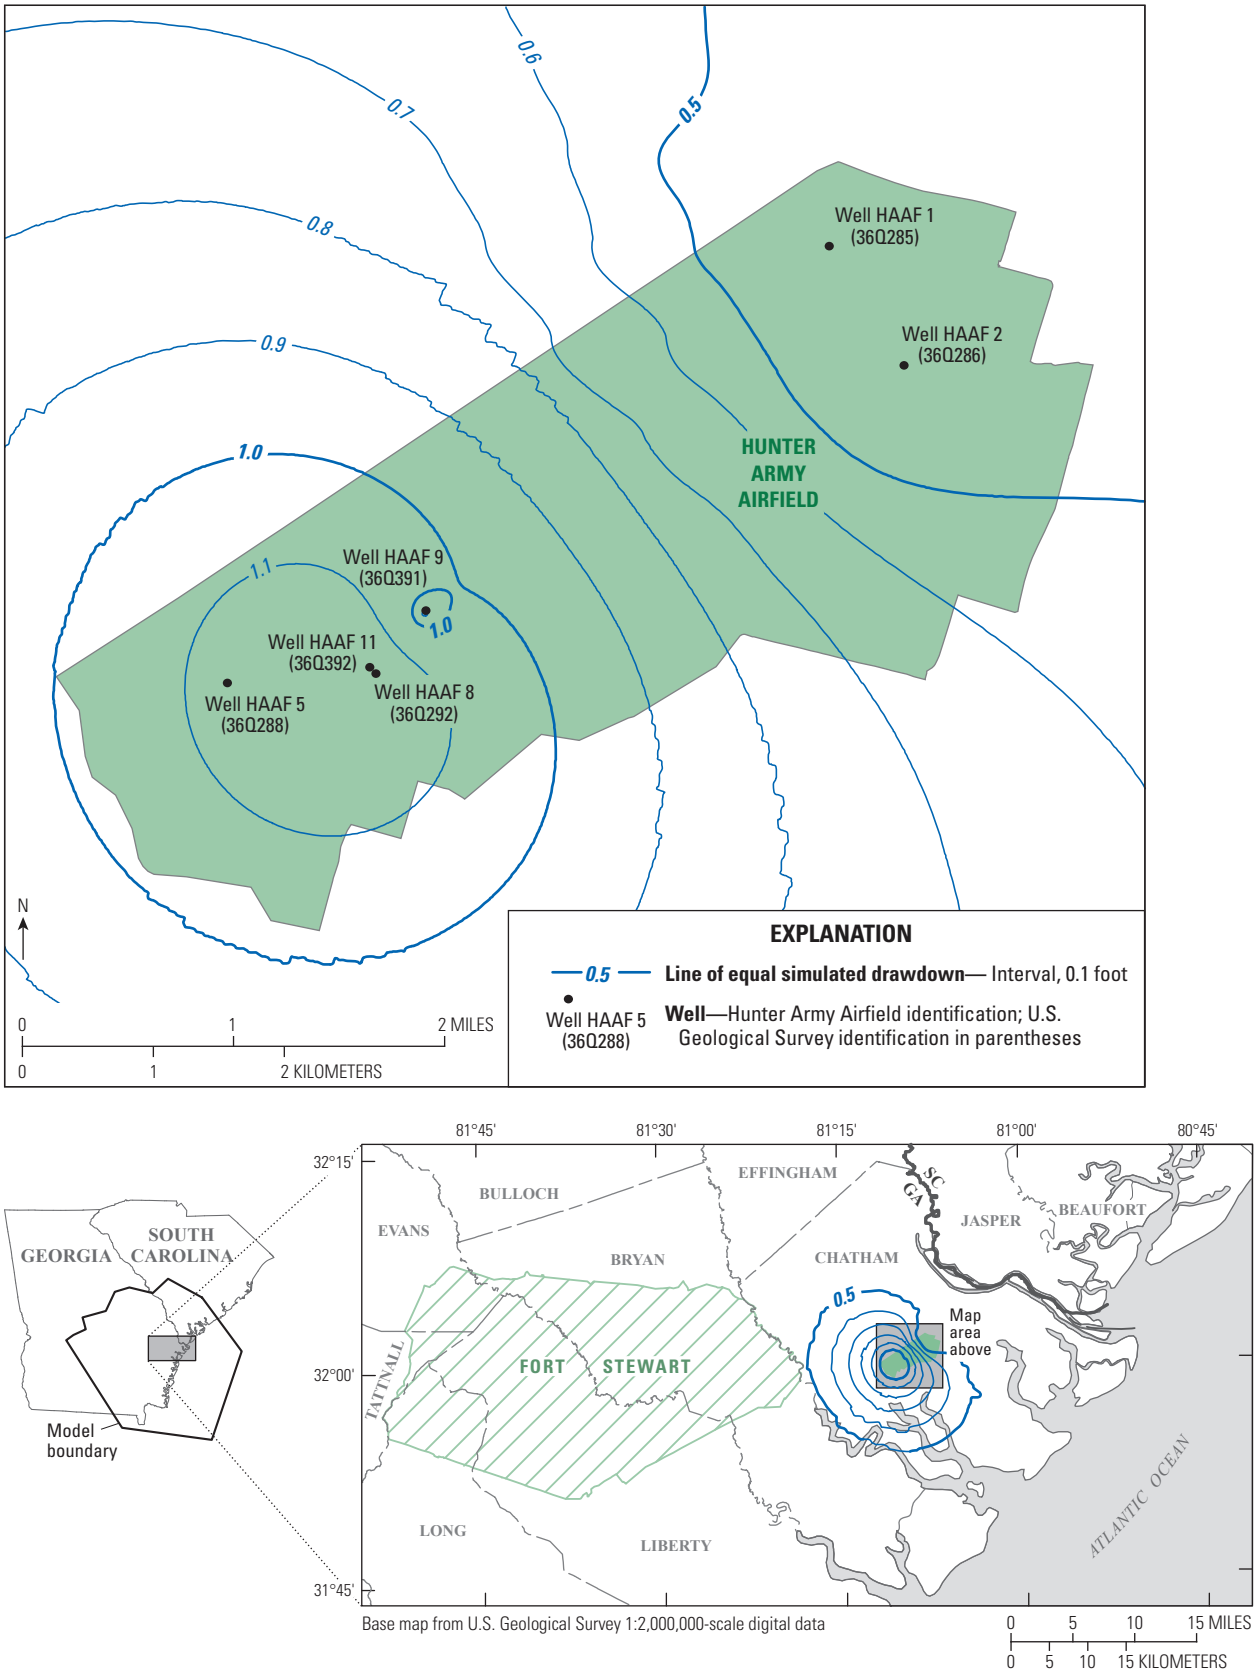

Figure 24. Drawdown in the Upper Floridan aquifer for scenario B—effect of pumping the Lower Floridan aquifer at well HAAF 11 (36Q392) at a rate of 748 gallons per minute, and reducing pumping in existing Upper Floridan aquifer supply wells by 374 gallons per minute or 50 percent of the well HAAF 11 (36Q392) pumping rate—Hunter Army Airfield and vicinity, coastal Georgia.

Effect of Pumping Offsets on Water Supply at Hunter Army Airfield

The GaEPD interim strategy for permitting withdrawals from the LFA (Nolton Johnston, Georgia Environmental Protection Division, written commun., January 28, 2003) requires an applicant to

- "offset the impact of the LF [Lower Floridan] pumping by reducing nearby UF [Upper Floridan] permitted pumping in the same general area (within a 5 mile radius) by an amount equal to or greater than the determined UF leakage" and
- "simulate the equivalent Upper Floridan pumping that induces the identical maximum drawdown in the Upper Floridan that would be expected as a result of pumping the Lower Floridan."

Results of model scenarios indicate that these two requirements result in widely varying simulated pumping offsets for the UFA. Simulated interaquifer leakage from the UFA through the Lower Floridan confining unit into the LFA was 361 gal/min (0.52 Mgal/d), whereas a pumping rate of 189 gal/min (0.27 Mgal/d) in a hypothetical UFA well was needed in order to match simulated maximum drawdown in the UFA that resulted from interaquifer leakage. The simulated pumping rate needed to match the maximum drawdown in the UFA underpredicts the amount of pumping offset because the cone of depression formed in response to pumping the UFA is steeper near the pumped well and covers a smaller area than the area simulated in response to interaquifer leakage. Thus, the simulated leakage rate may be a more effective means of evaluating required pumping offsets.

Changes in total permitted capacity at HAAF would vary based on the amount of reduction mandated by GaEPD. Described below are the required pumping reduction and net gain in production capacity at HAAF that would result if (1) the June 2010 revised UFA permit rate is assumed (0.98 Mgal/d), (2) pumping from the LFA is for a 24-hour period at a rate of 748 gal/min (1.08 Mgal/d), and (3) the simulated leakage response (361 gal/min or 0.51 Mgal/d) is used as the basis of the reduction:

- Because the simulated leakage rate is 0.51 Mgal/d, the June 2010 UFA permit at HAAF would need to be reduced by 0.26 Mgal/d to a revised permitted withdrawal rate of 0.72 Mgal/d,
- The new LFA permit would be based on a 24-hour per day pumping period at a withdrawal rate of 748 gal/min (1.08 Mgal/d),
- The resulting water production would be the combined permitted rate of the UFA and LFA or 0.72 Mgal/d + 1.08 Mgal/d = 1.8 Mgal/d.

Pumping offsets and net gain in water production capacity for a variety of pumping periods are listed in table 11. For a 12-hour daily pumping period, the net gain in capacity would range from 0.28 Mgal/d (to meet the leakage requirement) to 0.4 Mgal/d (to meet the maximum drawdown requirement). For a 24-hour pumping period, the net gain in capacity would range from 0.56 Mgal/d (to meet the leakage requirement) to 0.8 Mgal/d (to meet the maximum drawdown requirement).

Table 11. Projected reductions in Upper Floridan aquifer permitted capacity and net gain in total water capacity for various pumping periods, well HAAF 11 (36Q392), Hunter Army Airfield, Chatham County, Georgia.

Limitations of Analysis

The effect of pumping the LFA on water levels in the UFA was analyzed using model simulation. These analyses are limited by the accuracy of field data, including possible errors and uncertainty in water-level measurements, hydraulic properties, and pumping. Although water-level data were filtered (Halford, 2006) in an attempt to eliminate local interferences, such as tidal and pumping effects, it is possible that some of these interferences still affect recorded levels and, thus, computed hydraulic properties and measured drawdown response.

A revised regional-flow model was used to simulate long-term (steady-state) changes in groundwater flow. Additional insight into changes in water levels over time could be gained by using transient simulation. The revised model reasonably depicts changes in groundwater levels resulting from pumping the LFA at HAAF at a rate of 748 gal/min. Results are limited by the same model assumptions and design as described by Payne and others (2005). In addition to limitations of field data accuracy as described above, the revised model may have inaccuracies in the conceptual model of groundwater flow. For example, approximations made in representing the physical properties of the flow system and errors inherent in estimating the spatial distribution of these properties; approximations made in the formulation and application of model boundary and initial conditions; errors associated with numerical approximation and solution of the mathematical model of the flow system; and assumptions made in using the models to predict the future behavior of the flow system. The variably spaced mesh used in the revised model has an aspect ratio between row and column dimensions of as high as 1,646:1, which can lead to numerical errors (de Marsily, 1986, p. 351). Fortunately, such high aspect ratios occur only in areas distant from HAAF and will have little effect on simulated results in the area.

Simulated rates of interaquifer leakage and drawdown may be lower than actual because of the influence of specified-head and general-head boundaries. These boundaries supply an unlimited amount of water to the groundwater system, which may result in lower than actual simulated drawdown and related rates of interaquifer leakage. Simulation results could be improved by eliminating these types of boundaries and using active simulation of the surficial aquifer and by using lateral specified-flux boundaries.

Summary and Conclusions

To assess the hydrogeology and water quality of the Floridan aquifer system and the potential effect of Lower Floridan aquifer (LFA) pumping on the Upper Floridan aquifer (UFA), the U.S. Geological Survey, in cooperation with the Department of the Army, conducted an investigation at Hunter Army Airfield (HAAF) in Chatham County, Georgia, during 2009. The study included construction of a test well completed in the LFA, aquifer-performance testing, geophysical logging, water-quality sampling and analysis, and digital groundwater modeling.

Results of test drilling and field tests indicate the LFA at HAAF consists of limestone and dolomitic limestone between depths of 703 and 1,080 feet (ft). Six major permeable zones were identified through borehole-geophysical logging and flowmeter testing: 723–731; 768–785; 818–837; 917–923; 1,027–1,052; and 1,060–1,080 ft. The two uppermost zones contribute about 469 gallons per minute (gal/min) or 62.6 percent of the total flow of 748 gal/min. The remaining four zones each contributed from 1.7 to 18 percent of the total flow.

Grab water samples indicate water from the LFA is hard to very hard with a bicarbonate alkalinity of 150 to 250 milligrams per liter (mg/L). With the exception of fluoride, constituent concentrations increased with depth. Water from the deepest interval (1,075 ft) has a chloride concentration of 480 mg/L and a sulfate concentration of 240 mg/L, above and close to the U.S. Environmental Protection Agency (USEPA) secondary maximum contamination level for drinking water, respectively. Flowmeter testing indicates that water from the 1,075-ft zone contributes less than 2 percent of the total flow to the well, so the relatively higher concentrations of chloride and sulfate in the deepest interval will not adversely affect the water quality in the completed well. A composite water-quality sample from the completed LFA well indicated constituent concentrations of the composite sample were all below USEPA primary and secondary maximum contaminant levels (U.S. Environmental Protection Agency, 2009).

To assess the effect of LFA pumping on the UFA, a 72-hour aquifer test was conducted in which LFA well HAAF 11 (36Q392) was pumped at an average rate of 748 gal/min, and drawdown response was monitored in nearby UFA wells HAAF 5 (36Q288) and HAAF 8 (36Q292). At the end of 72 hours, total drawdown—after filtering data to remove the effects of regional pumping, tides, and barometric pressure—was 0.76 ft in well HAAF 8 (36Q292) and 0.43 ft in well HAAF 5 (36Q288).

A revised regional groundwater-flow model was used to simulate the long-term (steady-state) leakage response of the UFA to pumping from the LFA, and to estimate the equivalent amount of UFA pumping that would produce similar

drawdown. The model incorporated data obtained during field testing at the site of well HAAF 11 and applied a fine grid resolution near that well to enable more accurate simulation at small scale.

Pumping well HAAF 11 (36Q392) at a rate of 748 gal/min (about 1 million gallons per day [Mgal/d] resulted in a maximum steady-state drawdown of 36.2 ft in the LFA and was greater than 1 ft over a 146-square-mile (mi^2) area. Simulated steady-state drawdown in the overlying UFA that resulted from interaquifer leakage was greater than 1 ft over a 141-mi^2 area and was 2.03 ft at the site of well HAAF 11.

Pumping 1 Mgal/d at well HAAF 11 (36Q392) had a minor influence on the overall simulated water budget, with most of the change reflected by an increase in recharge from the overlying general head boundary. Although the overall budget changed little, there was a redistribution of flow in individual model layers. Flow to well HAAF 11 (36Q392) was derived by increased lateral flow from specified-head boundary (0.02 Mgal/d), increased leakage from the UFA through the Lower Floridan confining unit (0.52 Mgal/d), and reductions in discharge to the Lower Floridan confining unit (0.53 Mgal/d) and to lateral specified-head boundaries (0.53 Mgal/d). Sixty-five percent of the leakage from the UFA occurred within 1 mile of well HAAF 11. This larger contribution results from a larger head gradient between the pumped well and overlying aquifer in areas close to the pumped well.

As part of the interim permitting strategy for the LFA, the Georgia Environmental Protection Division (GaEPD) required simulation of (1) aquifer leakage from the UFA to LFA resulting from pumping the new LFA well, and (2) "the equivalent Upper Floridan pumping that induces the identical maximum drawdown in the Upper Floridan that would be expected as a result of pumping the Lower Floridan." Results of this analysis can be used as a basis to reduce nearby UFA permitted pumping in the same general area (within a 5-mi radius) by an amount equal to or greater than the determined leakage rate. Results of model simulations indicate that these two requirements result in widely varying pumping offsets for the UFA. Simulated interaquifer leakage was 361 gal/min (0.52 Mgal/d), whereas the equivalent UFA pumping rate to offset maximum drawdown was 189 gal/min (0.27 Mgal/d). The simulated pumping rate necessary to match the maximum drawdown in the UFA underpredicts the amount of pumping offset because the cone of depression formed in response to pumping the UFA is steeper near the pumped well and covers a smaller area than the area simulated in response to interaquifer leakage. Thus, the simulated leakage rate may be a more effective means of evaluating required pumping offsets.

Three groundwater pumping scenarios were run to evaluate the effect of various pumping changes on groundwater levels at HAAF:

- Scenario A—Effect of pumping the LFA at well HAAF 11, for 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 187 gal/min (0.27 Mgal/d) or 25 percent of the pumping rate at well HAAF 11 (36Q392). The reduction in withdrawals from the UFA is close to the 189 gal/min rate required to match the maximum drawdown simulated near well HAAF 11.

- Scenario B—Effect of pumping the LFA at well HAAF 11, for 24 hours per day at a rate of 748 gal/min (1.08 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 374 gal/min (0.54 Mgal/d) or 50 percent of the pumping rate at well HAAF 11 (36Q392). The reduction in withdrawals from the UFA is close to the simulated steady state leakage rate of 361 gal/min.

- Scenario C—Effect of pumping the LFA at well HAAF 11 (36Q392) at a rate of 374 gal/min (0.54 Mgal/d), and reducing pumping in existing UFA HAAF supply wells by 187 gal/min(0.27 Mgal/d) or 50 percent of the pumping rate at well HAAF 11 (36Q392). Note that all withdrawals from the UFA at wells HAAF 8 (36Q292) and HAAF 9 (36Q391) were eliminated for this scenario.

For each scenario, pumping reductions in existing HAAF UFA wells resulted in decreased magnitude and extent of drawdown when compared to a scenario in which the LFA was pumped without adjusting withdrawals from the UFA. Pumping from the LFA well HAAF 11 (36Q392) without adjusting pumping from the UFA resulted in drawdown exceeding 1 ft over a 141 mi^2, whereas drawdown exceeding 1 ft covered areas of 40.5 mi^2 for scenario A and 4.37 mi^2 for scenario B. Drawdown was less than 0.5 ft for scenario C. None of the scenarios resulted in noticeable changes in the configuration of the simulated potentiometric surface and related groundwater flow directions for the UFA.

GaEPD requires a reduction in permitted UFA withdrawals in order to offset simulated rates of leakage and maximum drawdown in the UFA. Once these reductions are accounted for, the net gain in water production capacity would be the difference between the maximum pumping rate in well HAAF 11 (36Q392) and the pumping offset. Changes in total permitted capacity at HAAF would vary on the basis of which amount of reduction is mandated by GaEPD. For a 12-hour daily pumping period, the net gain in capacity would range from 0.28 Mgal/d (to meet the leakage requirement) to 0.4 Mgal/d (to meet the maximum drawdown requirement). For a 24-hour pumping period, the net gain in capacity would range from 0.56 to 0.8 Mgal/d.

Regional Groundwater Model

The existing USGS regional groundwater-flow model (herein termed "regional model") of Payne and others (2005) was modified using hydrogeological information obtained from field investigations and from existing wells in the vicinity of Hunter Army Airfield (HAAF) to simulate pumping from the newly constructed Lower Floridan aquifer well (HAAF 11, 36Q392) and the effect on the Upper Floridan aquifer. The regional model is described in detail in Payne and others (2005); only a brief description is included here. The regional model was calibrated for predevelopment, 1980, and 2000 pumping and boundary conditions. Because pumpage during 2009 was within the range simulated by the earlier regional model, the revised model was deemed suitable for the evalution of groundwater flow at HAAF.

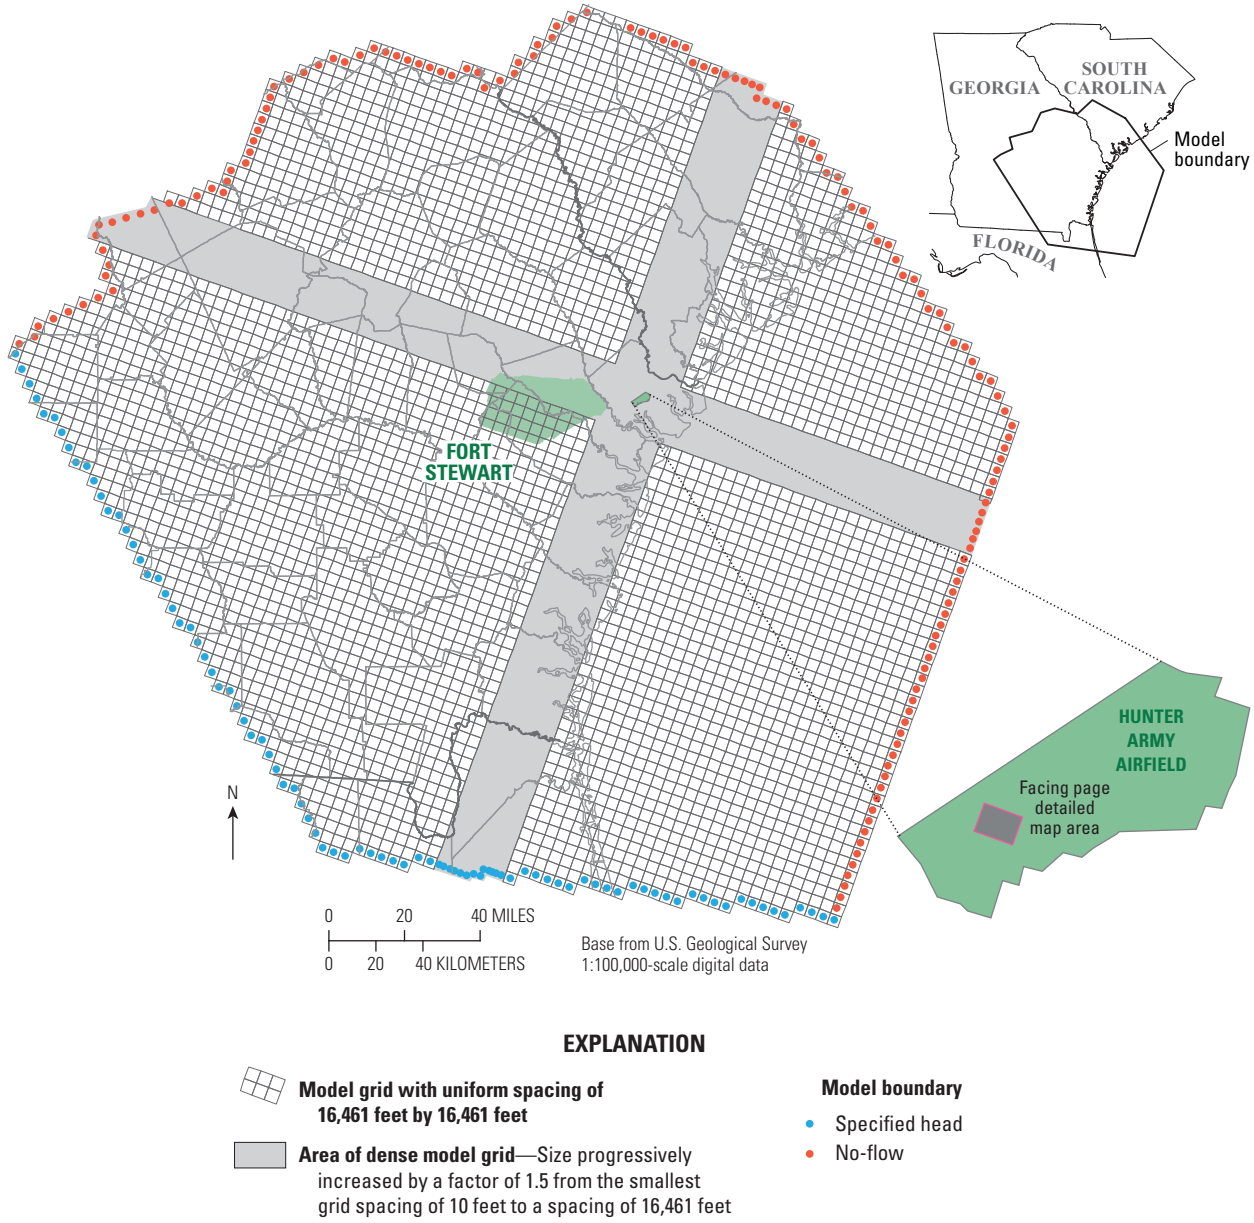

Figure A–1. Location of selected wells, regional groundwater model and boundary conditions, and revised model grid Hunter Army Airfield and vicinity, coastal Georgia.

Regional groundwater flow was simulated using MODFLOW-2000 (Harbaugh and others, 2000), a finite-difference, constant-density flow simulator that is widely used and is appropriate for modeling local- and regional-scale groundwater-flow systems. To account for natural hydrologic boundaries, the model area covers a 42,155 square-mile (mi^2) area extending inland in Georgia and into northeastern Florida and southwestern South Carolina, and the adjacent offshore area (fig. A–1).

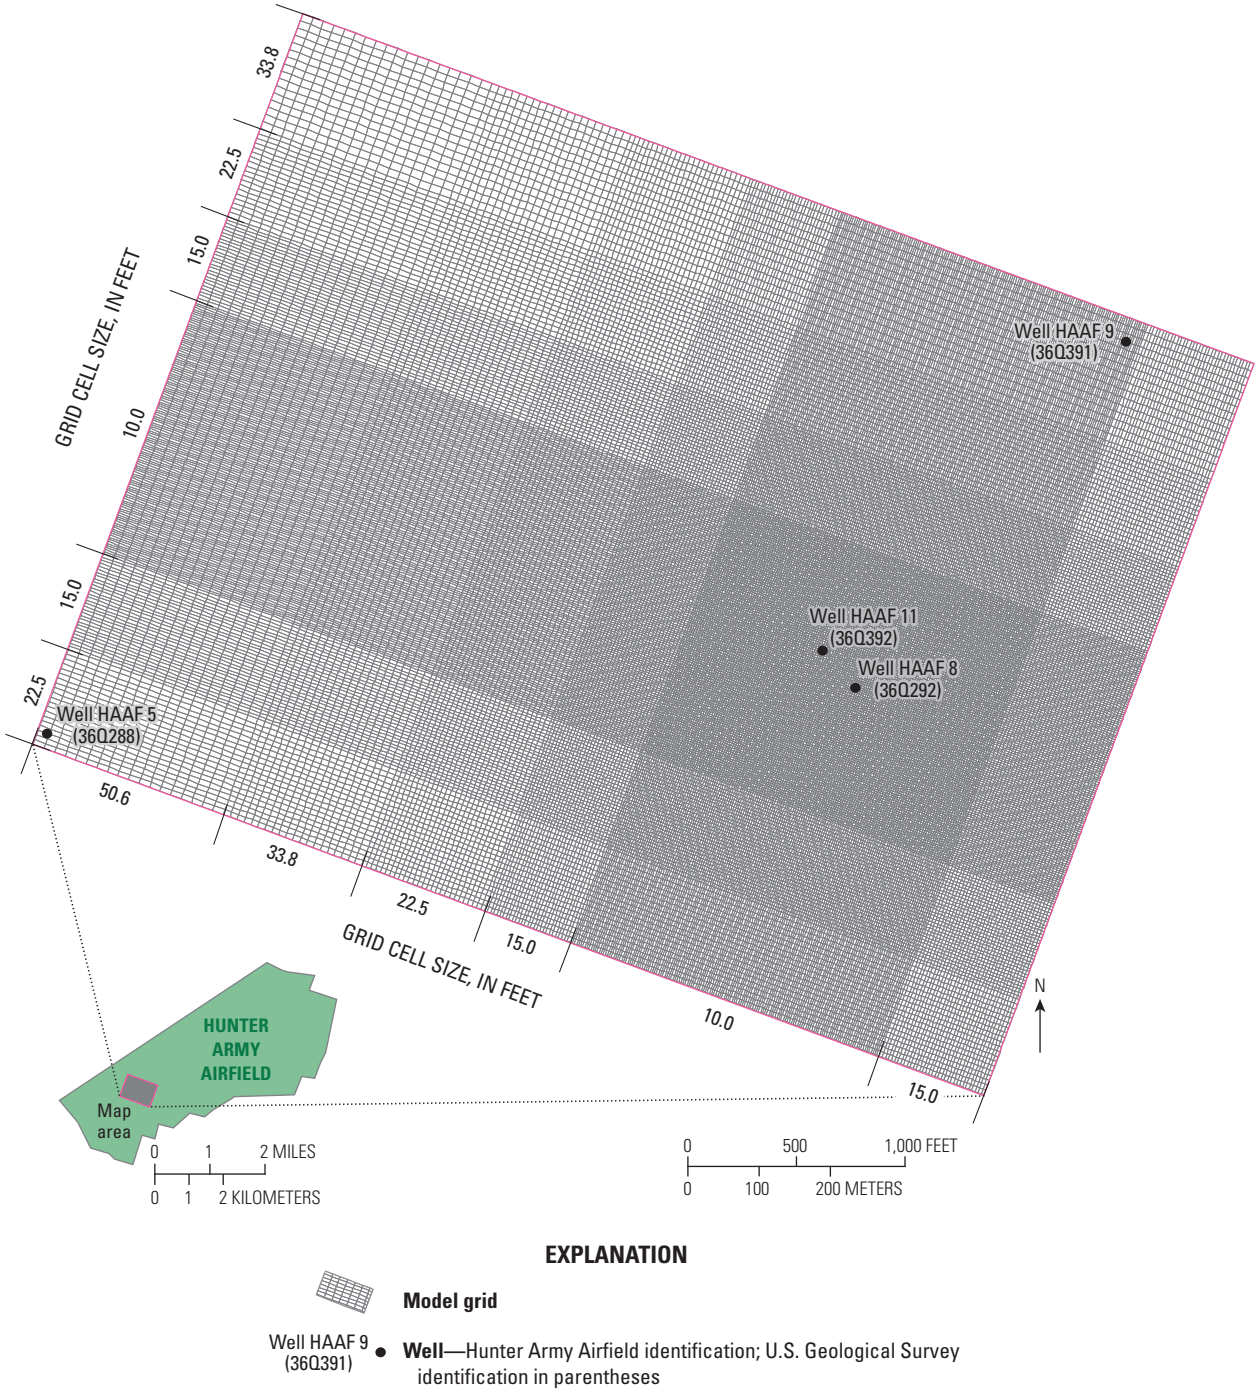

Figure A–1. Location of selected wells, regional groundwater model and boundary conditions, and revised model grid Hunter Army Airfield and vicinity, coastal Georgia.—Continued

The regional model (Payne and others, 2005) was calibrated for 1980 and 2000 pumping conditions assuming steady-state flow. The regional model consists of seven hydrogeologic units (fig. A–2), which include, in descending order:

- the confined upper and lower water-bearing zones of the surficial aquifer system, grouped together as layer 1;
- the Brunswick aquifer system confining unit (layer 2);
- the upper and lower Brunswick aquifers, grouped as the Brunswick aquifer system (layer 3);
- the Upper Floridan aquifer confining unit (layer 4);
- the Upper Floridan aquifer (layer 5);
- the Lower Floridan aquifer confining unit (layer 6); and
- the Lower Floridan aquifer (layer 7).

These units crop out to the northwest of the study area and generally dip and thicken to the southeast. The thickness, extent, and other hydraulic properties of these units as well as the model development process are described in detail in Payne and others (2005). A schematic diagram showing model layers and boundary conditions is shown in figure A–2.

The original regional model was horizontally discretized using a variably spaced grid, with cell sizes ranging from approximately 4,000 × 5,000 feet (ft) (0.7 mi^2) to 16,500 × 16,500 ft (9.8 mi^2). At HAAF, the mesh resolution is 5,000 × 5,200 ft, whereas at Fort Stewart the resolution is 14,900 × 16,100 ft. Each hydrogeologic unit is represented with one layer of grid cells in the vertical dimension.

With the exception of layers 5, 6, and 7 (Upper and Lower Floridan aquifers and intervening confining unit), lateral boundaries for all layers are designated as noflow. For layers 5, 6, and 7, the lateral boundaries on all sides of the

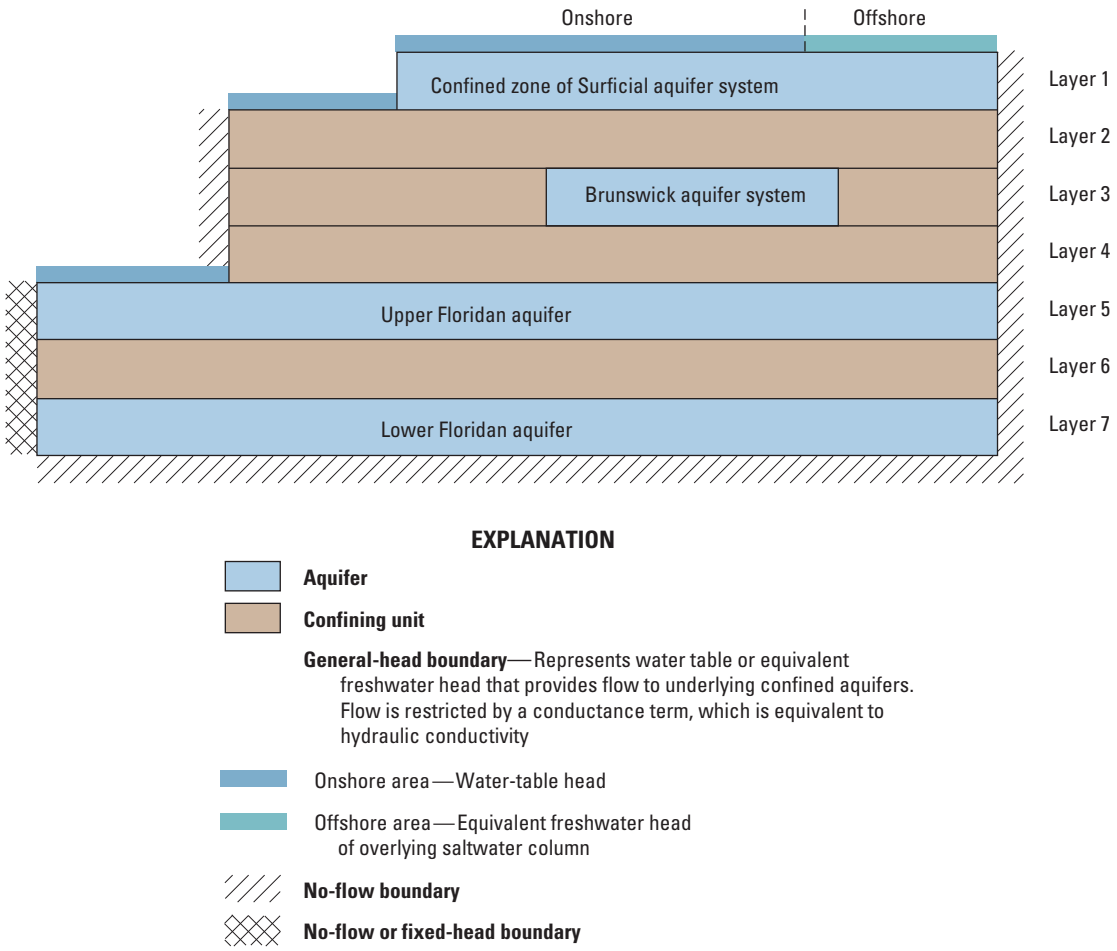

Figure A–2. Schematic diagram showing model layers and boundary conditions (from Payne and others, 2005).

model, except for the southern and southwestern sides, also are designated as noflow. The southern and southwestern lateral boundaries are set as specified head for the layers representing the Upper Floridan aquifer (layer 5), the Lower Floridan aquifer (layer 7), and the intervening confining unit (layer 6). For these three layers, the value assigned to specified-head cells is based on Upper Floridan aquifer head estimated from potentiometric-surface maps for 1998 (Peck and others, 1999).

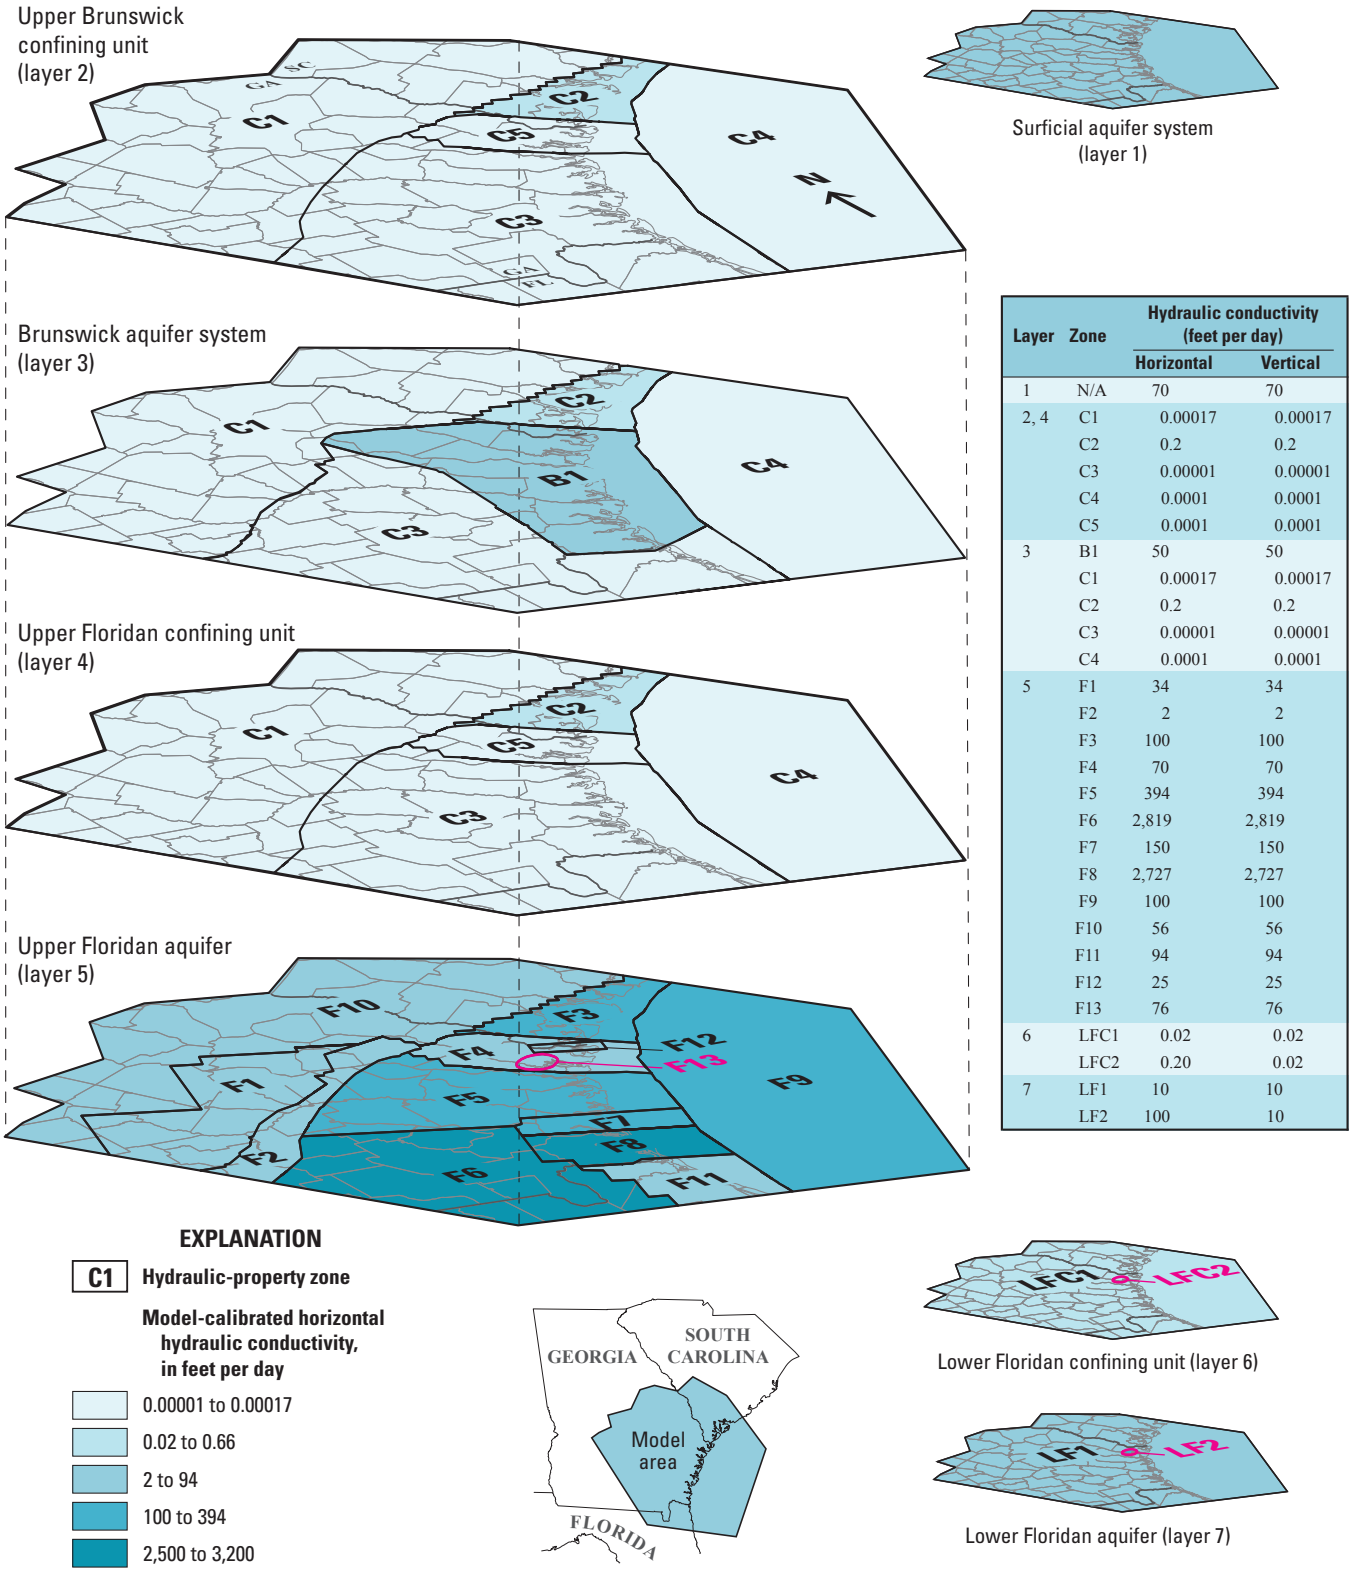
The bottom boundary of the regional model is noflow, corresponding to the lower confiing unit of the Floridan aquifer system, whereas the top boundary is set as a head-dependent flux (or general head) boundary condition with a controlling specified head and a conductance term that regulates the flux into the top layer of the model. The controlling head is the water-table altitude in the onshore area and the freshwater equivalent of the saltwater head in the offshore area. In the onshore area, the conductance is set to limit the amount of recharge entering the system in any given grid cell to less-than-maximum estimated recharge from baseflow estimates (Priest, 2004). For the purpose of simplification and because little is known about hydraulic properties in the offshore area, the conductance imposed in the offshore area is large, posing minimal resistance to flow in or out of the system.

Pumping distribution was assigned based on county-aggregate and site-specific data, which were used to estimate average annual pumpage for 1980 and 2000. Pumpage was assigned to model layers 3 (Brunswick aquifer system), 5 (Upper Floridan aquifer), and 7 (Lower Floridan aquifer) based on the open interval of wells located within a model cell. The sum of site-specific and nonsite-specific pumping rates for 1980 and 2000 were assigned to the model cell in which their respective assigned locations and aquifers were situated. Total pumpage simulated by the model during 1980 was 692 Mgal/d, by 2000 this had risen to 798 Mgal/d.

Revisions to Regional Model

A steady-state simulation was conducted using the model of Payne and others (2005) in which well HAAF 11 (36Q392) was pumped at a rate of 748 gallons per minute (gal/min) and drawdown response was recorded. Simulated Upper Floridan aquifer drawdown was 4.13 ft at well HAAF 8 (36Q292) and 3.08 ft at well HAAF 5 (36Q288); Lower Floridan aquifer drawdown was 222 ft at well HAAF 11 (36Q392). The amount of drawdown simulated in the Lower Floridan aquifer was more than six times greater than the 36.3 ft of drawdown observed in well HAAF 11 (36Q392) during a 72-hour aquifer test in which drawdown appeared to have mostly stabilized. This excessive drawdown indicated that modification of the model was needed.

The regional model was modified to enable more detailed simulation in the vicinity of the new Lower Floridan aquifer well (HAAF 11, 36Q392) and surrounding area. Grid-cell dimensions were modified to a variably spaced grid (fig. A–1) that was progressively increased by a factor of 1.5 from the smallest grid spacing of 10 ft near well HAAF 11 (36Q392) to a spacing of 16,461 ft, which was held constant to the lateral extent of the model. The revised model consists of 452 rows and 530 columns. Model layering and boundary conditions remained unchanged from the original regional model.



Refinement of Hydraulic Conductivity Distribution

Values of vertical and horizontal hydraulic conductivity (K_v, K_h) in the revised model corresponded to values used in the original regional model (Payne and others, 2005) in the area outside of HAAF. Field testing at HAAF provided new information on the hydraulic properties of the Upper Floridan aquifer (layer 5), Lower Floridan confining unit (layer 6), and Lower Floridan aquifer (layer 7), and enabled refinement of values in the original regional model. In addition, results of a 72-hour aquifer test conducted in the Lower Floridan aquifer provided information on drawdown in the Lower Floridan aquifer and in the overlying Upper Floridan aquifer, which guided a revised calibration of the model in the vicinity of HAAF within the larger regional model. Maps showing the distribution of hydraulic- property zones by model layer are shown in figure A–3.

To incorporate refined hydraulic-property information, new hydraulic-property zones were created in the Upper Floridan aquifer (zone F13), Lower Floridan aquifer (zone LF2) and intervening Lower Floridan confining layer (zone LFC2). These zones cover a 114.5 mi^2 common area that includes HAAF and the area of highest grid resolution, and extend from western Chatham County into eastern Bryan County (fig. A–3).

For the Upper Floridan aquifer (layer 5), zone F13 was subdivided from existing regional model zone F4, and assigned a K_v and K_h value of 76 feet per day (ft/d), which is slightly higher than the 70 ft/d value assigned in the original regional model. This modification was based on results of aquifer testing conducted in wells HAAF 9 (36Q291) and HAAF 8 (36Q292). Multiplying this K_h value by the simulated thickness of the aquifer (526 ft) gives an estimated transmissivity of 40,000 square feet per day (ft^2/d), matching results of field testing at HAAF.

In the original regional model (Payne and others, 2005), the Lower Floridan confining unit (layer 6) was assigned a constant K_h and K_v value of 0.02 ft/d; in the revised model, zone LFC2, covering an identical area as zone F13, was subdivided from this single zone and assigned a K_h value of 0.2 ft/d and a K_v value of 0.02 ft/d (fig. A–3). These values were based on adjustments made during model calibration and are at the lower end of the range of estimated values derived from packer-slug tests and core analysis at well HAAF 11 (36Q392).

Layer	Zone	Hydraulic conductivity (feet per day)

7	LF1	10	10
	LF2	100	10

Figure A–3. Schematic diagram showing simulated hydraulic property zones by model layer. Zone added for updated model shown in magenta (modified from Payne and others, 2005).

In model layer 7, which represents the Lower Floridan aquifer, zone LF2 was subdivided from a single zone that was previously assigned a uniform K_h and K_v value of 10 ft/d in the original regional model of Payne and others (2005). Zone LF2 covers an identical area as zones F13 and LFC2 and was assigned a K_h value of 100 ft/d and a K_v value of 10 ft/d on the basis of results of aquifer testing conducted in well HAAF 11 (36Q392). Multiplying the K_h value by the regional-model-assigned thickness for the Lower Floridan aquifer of 70 ft, gives a transmissivity of 7,000 ft^2/d, which is similar in magnitude to the 11,000 ft^2/d value computed from an aquifer test conducted in well HAAF 11 (36Q392). K_v of the Lower Floridan aquifer in zone LF2 was 10 ft/d based on an assumed 10:1 ratio of horizontal to vertical properties.

Simulation of Observed Drawdown in Pumped Well

Drawdown calculated by the MODFLOW model represents the average drawdown for the grid cell, which is less than that observed in an individual pumped well. Because the grid cell size used in the MODFLOW simulation at the pumped well (10 ft^2) is much larger than the well diameter (0.33 ft), the drawdown calculated by the MODFLOW model at the pumped well needs to be proportionately increased on the basis of well diameter to provide a more precise estimate of drawdown. Simulated drawdown was adjusted using the following equation (Peaceman, 1983):

$$S_p = Sb + [Q * \ln(r_e / r_w) / 2\pi (T_{xx} T_{yy})^{0.5}] \quad (1)$$

where:

S_p is the adjusted drawdown in the pumped well, in feet;
S_b is the MODFLOW simulated drawdown in the pumped well, in feet;
Q is the pump discharge, in cubic feet per day (144,000);
r_e is the equivalent well block radius, in feet (5);
r_w is the well radiusin feet (0.33);
T_{xx} is the transmissivity in the x-direction, in feet squared per day (7,000); and
T_{yy} is the transmissivity in the y-direction, in feet squared per day (7,000).

Use of this equation indicated that simulated values in the model cell containing well HAAF 11 (36Q392) when pumped at a rate of 748 gal/min would would be 8.9 ft less than the observed drawdown. A similar analysis for an Upper Floridan aquifer well pumped at a rate of 650 gal/min and using the same parameters, with the exception of a value of 40,000 ft^2/d for transmissivity, indicates that simulated values for a pumped well in this aquifer would require an adjustment of about 1.36 ft.

Comparison of Revised to Original Regional Model

Because the original regional model of Payne and others (2005) was modified by changing grid size and by assigning different hydraulic properties in the vicinity of HAAF, a comparison of the two models is provided to ensure the model is still an accurate representation of groundwater flow. Summaries of water-level residuals (simulated minus observed head) and simulated water budgets for the two models are presented (tables A–1 and A–2). Water-level residuals for the Upper and Lower Floridan aquifers are shown on maps plotted in figure A–4 and graphically in figure A–5.

Model results indicate that the revised regional model has water-level residuals and a simulated water budget similar to the original model of Payne and others (2005), and thus, the model remains equally representative of the hydrologic system (tables A–1, A–2). These results are expected because model revisions are limited to a 114.5 mi^2 area representing less than 1 percent of the model area. Water-level residuals for the revised regional model were slightly higher than those calculated from the original model for layers 5 and 7, with root mean square (RMS) of 10.2 and 9.91 ft, respectively (table A–1). Eighty percent of the residuals for layer 5 derived from the revised model were within –3.8 to 2.9 ft of the original regional model residuals.

The RMS of water-level residuals for layer 3 (11 ft) in the revised model was nearly double that in the original regional model (5.91 ft) but is acceptable for the purpose of the modified model. Simulated water levels in 8 of 10 wells in layer 3 showed residuals that increased by 0.34 to 3.4 ft when compared to the orginal regional model. Most of the increase in the RMS for layer 3 can be attributed to two wells that had water-level residuals of –19 ft (figs. A–4, A–5). These wells are located adjacent to one another in the same model cell, in an area where the grid size of the revised model was more than four times greater than in the original regional model. This larger grid size reduced the capability of the model to simulate steeper gradients in the vicinity of the Savannah area cone of depression and resulted in a greater residual. Because the larger grid size and related increase in RMS for layer 3 occurred away from the area of higher grid resolution in the vicinity of HAAF, model simulations at HAAF were not affected.

Simulated water budgets for the regional and revised models were similar, with only slight variation (table A–2). The revised model showed a slight increase in interaction with lateral boundaries and a slight decrease in interaction with the overlying general head boundary, specifically, (1) overall decreases in recharge from and discharge to the overlying general-head boundary, and (2) decreased outflow and increased inflow along lateral specified-head boundaries.

Table A–1. Comparison of water-level calibration statistics between the original (Payne and others, 2005) and revised regional models, year 2000 steady-state simulation.

[Residual equals simulated minus observed head]

391- 3-19-.06(3)(b)(3)(i)	**Analytical parameters selected and the rationale for selection;**	Y	Pgs. 5-1 through 5-5
391- 3-19-.06(3)(b)(3)(ii)	**A description of methods used to characterize sub-surface geology;**	Y	Appendix J, pg. 3-1
391- 3-19-.06(3)(b)(3)(iii)	**A description of methods used to characterize vertical and horizontal groundwater flow gradients, flow rates, and flow directions;**	Y	Pgs. 6-2 and 6-3
391- 3-19-.06(3)(b)(3)(iv)	**Methods used to determine hydraulic conductivities and other pertinent hydrogeological characteristics, including a description of any slug and/or aquifer tests;**	Y	Pgs. 5-1 and 5-2, Appendix A
391- 3-19-.06(3)(b)(3)(v)	**A description of groundwater monitoring well locations, and their installation and construction methods, including:**	Y	Figure 5-1, Appendix D, and Appendix J
391- 3-19-.06(3)(b)(3)(v)(I)	**A map (minimum scale 1"= 200') depicting all existing well locations including a survey of each well=s surface reference point and the elevation of its top-of-casing;**	Y	Figure 5-1 and Table 5-4
391- 3-19-.06(3)(b)(3)(v)(II)	**Type of well casing material;**	Y	Appendix D
391- 3-19-.06(3)(b)(3)(v)(III)	**Description of well intake design including screen slot size and length, filter pack materials and length, and method of filter pack emplacement;**	Y	Appendix D
391- 3-19-.06(3)(b)(3)(v)(IV)	**Method used to seal the well from the surface and any other features designed to prevent or minimize downward migration of**	Y	Appendix D

RULE SECTION	DESCRIPTION OF REQUIREMENT	Y or Ξ	Location in CSR (i.e. pg.)
	contaminants along the well annulus; and		
391- 3-19-.06(3)(b)(3)(v)(V)	**Description of methods and procedures used to develop the wells.**	Y	Appendix J, pg. 3-18
391- 3-19-.06(3)(b)(3)(vi)	**Description of all sampling and analysis procedures used including:**		
391- 3-19-.06(3)(b)(3)(vi)(I)	**Procedures and timing for measuring groundwater elevations for each sampling event;**	Y	Appendix J, pg. 3-17
391- 3-19-.06(3)(b)(3)(vi)(II)	**Well evacuation procedures including well volume evacuated prior to sampling;**	Y	Appendix J, pg. 3-18
391- 3-19-.06(3)(b)(3)(vi)(III)	**Sample withdrawal techniques, sampling equipment and materials;**	Y	Appendix J, Section 3.6.2
391- 3-19-.06(3)(b)(3)(vi)(IV)	**Sample handling and preservation techniques;**	Y	Appendix J, pg. 4-9
391- 3-19-.06(3)(b)(3)(vi)(V)	**Equipment decontamination procedures;**	Y	Appendix J, Section 3.1.2
391- 3-19-.06(3)(b)(3)(vi)(VI)	**Chain-of-custody procedures;**	Y	Appendix J, Section 4.3
391- 3-19-.06(3)(b)(3)(vi)(VII)	**Lab techniques including references to analytical methods, including QA/QC procedures;**	Y	Appendix J, Table A-5
391- 3-19-.06(3)(b)(3)(vii)	**Description of procedures used to determine background groundwater concentrations;**	Y	Appendix K and Section 9
391- 3-19-.06(3)(b)(3)(viii)	**Map (minimum scale of 1" = 200') or less depicting the horizontal extent of contamination. Concentrations should be indicated by isoconcentration lines.**	Y	Figures 6-5 and 6-6
391- 3-19-.06(3)(b)(3)(ix)	**Map (minimum scale of 1" = 200') or less depicting the potentiometric surface of groundwater;**	Y	Figures 6-2a and 6-2b
391- 3-19-.06(3)(b)(3)(x)	**Maps and vertical cross-sections of appropriate scale depicting concentrations for all contaminants superimposed upon site stratigraphic features and monitoring wells; and**	Y	Figures 6-1a, 6-1b, 6-7 through 6-16.
391- 3-19-.06(3)(b)(3)(xi)	**Narrative and tabular summary of all pertinent field data and the results of all final lab analyses that are supported by sufficient**	Y	Tables 5-1 through 5-3c, 5-7 through 5-8

RULE SECTION	DESCRIPTION OF REQUIREMENT	Y or Ξ	Location in CSR (i.e. pg.)
	QA/QC control data to validate the results.		
ADDITIONAL REQUIREMENTS			
391- 3-19-.06(3)(b)(4)	**A description of any human or environmental receptors who may have been or could potentially be exposed to a release at the site.**	Y	Section 8
391- 3-19-.06(3)(b)(5)	**A description of all properties which are part of the site including the address and location of such property, its legal description, and the property owner=s name, address and telephone number.**	--	NA
391- 3-19-.06(3)(b)(6)	**The name, address, and telephone number of any other person who may be a responsible party for the site and a description of the type and amount of regulated substances such party may have contributed to a release.**	--	NA
391- 3-19-.06(3)(b)(7)	**A summary of previous actions taken to eliminate, control or minimize any potential risk at the site, including actions taken to comply with the risk reduction standards.**	Y	Section 8.4
391- 3-19-.06(3)(b)(10)	**Attached to the front of the CSR, concise statement of the findings of the report presented in plain language, immediately followed by the certification required by 391-3-19-.06(4)(a).**	Y	Pgs. xv through xx and pg. 1-1
391-3-19-.06(4)(a)	**The CSR shall include a compliance certification regarding the responsible party=s own determination as to the status of a site or any individual property at a site with regard to the applicable risk reduction standards for all regulated substances evaluated by the CSR.**	Y	Pg. 2-1
391-3-19-.06(4)(b)	**The CSR certification shall be signed by the applicable person described in Items 1 - 4 of .03(6)(c). Where the CSR is submitted for two or more cooperating responsible parties, the certification may be signed by a duly authorized representative of said responsible parties.**	Y	Pg. 2-1
391-3-19-.06(4)(c)	**Any person signing the certification of compliance shall make the certification specified in the Rules.**	Y	Pg. 2-1

RULE SECTION	DESCRIPTION OF REQUIREMENT	Y or Ξ	Location in CSR (i.e. pg.)
391- 3-19-.06(5)(a)	**Within 7 days of submitting the CSR, RP shall publish a notice in both a major local newspaper of general circulation and the legal organ of the local governments in whose jurisdiction the site is located, announcing that such a report is available for inspection by the general public, including:**	Y	Section 10
391- 3-19-.06(5)(a)(1)	**The name, address, and location of the site as it appears on the HSI, and, if the plan applies to less that the full site, the street address and owner=s name of the applicable properties;**	Y	Title page and pg. 3-1
391- 3-19-.06(5)(a)(2)	**The statement provided in this section;**	Y	Section 10
391- 3-19-.06(5)(a)(3)	**Announcement of a 30-day comment period and the name, address, and phone number of the EPD contact person to whom written or oral comments can be made;**	Y	Section 10
391- 3-19-.06(5)(a)(4)	**Name, address, and phone number of the RP or its designated contact person; and**	Y	Section 10
391- 3-19-.06(5)(a)(5)	**Location where the report may be viewed or copied.**	Y	Section 10
391- 3-19-.06(5)(e)	**Within 7 days of submitting the CSR to EPD, the RP shall provide to the count government in the county in which the site is located and to the government of any city in whose jurisdiction the site is located the same information required above.**	Y	Section 10
391-3-19-.07(4)	**For corrective action to be in compliance with these standards, the following common elements are required:**		
391-3-19-.07(4)(a)	**Removal of all free product to the extent practicable.**	Y	Pgs. xv through xx
391-3-19-.07(4)(b)	**No soil remaining in place shall exhibit the hazardous waste characteristics of ignitability, corrosivity, or reactivity.**	Y	Pgs. xv through xx
391-3-19-.07(4)(c)	**Shall not allow exposure to concentrations which would cause food chain contamination, damage to soils or to biota which could impair the use of the soils for agricultural or silvicultural purposed, adverse effects on vegetation or wildlife, or the accumulation of vapors in**	Y	Pgs. xv through xx

RULE SECTION	DESCRIPTION OF REQUIREMENT	Y or Ξ	Location in CSR (i.e. pg.)
	buildings or other structures which pose a threat to human health and the environment.		
391-3-19-.07(4)(d)	**Shall protect the waters of the State from releases that would cause surface water to exceed the Georgia in-stream water quality standards.**	Y	Section 8
391-3-19-.07(4)(e)	**If the detection limit and/or the background concentration for a regulated substance is greater than the concentration specified in any risk reduction standard, the greater of the detection limit or background shall be used for determining compliance with the risk reduction standards.**	Y	Sections 8 and 9

__X__ **Groundwater work certified by a geologist, etc.**

_____ **Corrective Action Plan included.**
