Revision 1 – April 2012
Original Report – June 2011

Executive Summary

This Compliance Status Report (CSR) documents current and historical investigations performed at the former Fire Training Area (FTA) and the Departure/Arrival Airfield Control Group (DAACG) Chlorinated Solvents Area, at the Hunter Army Airfield (HAAF) in Savannah, Georgia. This report details the nature and extent of impacts associated with historic site operations as defined by CSR investigation and Interim Measure (IM) activities conducted between 1987 and 2010. The report interprets the current and historical data as they relate to horizontal and vertical delineation of impacts, potential migration of constituents in each medium, identification of constituents of potential concern (COPCs), and evaluation of potential impacts to human health and the environment. This CSR investigation was conducted in accordance with the requirements of the Georgia Hazardous Site Response Act (HSRA).

Due to their proximity and history, the FTA and DAACG Chlorinated Solvent Area are collectively identified as HAA-01 (Hazardous Site Inventory [HSI] No. 10395) for the purpose of this investigation. HAA-01 is located in the northwestern portion of the HAAF. The site is located west of the flightline and approximately 800 feet (ft) northwest of the control tower.

The former FTA consisted of a gravel covered concrete fire training pad, a steel structure utilized as a mock aircraft, a 17,000 gallon aboveground storage tank (AST) used to store fuel for training purposes, a 1,100 gallon AST used to contain water contaminated fuel and solvents, and associated underground piping. Typical activities included spraying water contaminated fuels on the mock aircraft, igniting the coated structure, and subsequently extinguishing the aircraft for training purposes. Fire training activities were discontinued at the site in 1991 and all components of the former FTA were removed in 1998 as part of soil remediation activities. Topography at the site gently slopes toward the Springfield Canal that is located 3,600 feet to the west. The Springfield Canal flows southwest before emptying into the Little Ogeechee River, five and a half miles downstream of HAAF.

Several investigations and remedial actions have been conducted at HAA-01 since 1987. Various phases of CSR investigations were performed at the site between 1999 and 2010. Investigations at the site have included the installation of soil borings and monitor wells; the collection and analysis of soil, sediment, groundwater, and surface water samples; human and ecological exposure assessments; and data evaluation.

In March 1987, the United States Army Environmental Hygiene Agency (USAEHA) conducted a preliminary assessment of soils in the vicinity of the former fire training

pad in order to confirm the absence or presence of impacts. Metals, polynuclear aromatic hydrocarbons (PAHs), and phthalates were detected in soil samples. In February 1990, a total of 6 monitor wells were installed in the shallow and deep portions of the uppermost aquifer at the Site. In addition, 6 soil borings and 3 sediment samples were collected to further define soil and groundwater contamination. In March 1992, three additional monitor wells and 7 soil borings were installed and samples were collected. Four sediment samples were also collected. Laboratory results of these investigations identified volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) in surface soils and drainage ditch sediment samples. Low concentrations of VOCs, SVOCs and metals were also identified in the groundwater samples.

In 1995, a source removal design investigation was conducted in which 4 additional monitor wells and 17 additional soil borings were installed to further define the extent of impacts to soil and groundwater. Groundwater samples were collected from each of the newly installed monitor wells and soil samples were collected from 11 of the 17 soil borings during this investigation. Laboratory analysis of both the soil and groundwater samples confirmed the presence of VOCs and SVOCs exceeding the Risk Reduction Standard (RRS) in the immediate vicinity of the curbed concrete pad. In addition, free phase product was identified in monitor well HMW-07 during this phase of the investigation. The results of this investigation were reported in a Pre-Final CSR, which was subsequently withdrawn in order to incorporate the results of additional investigation activities.

Between November 1997 and March 1998, soil remediation activities were performed at the former FTA. Soils identified during the previous investigations at concentrations exceeding HSRA notification standards were targeted for removal. Remedial activities included the removal of the former FTA components including the simulated aircraft structure, ASTs, underground transmission lines, fire training pad, 9,430 tons of soil, 233 tons of concrete debris, and 81,906 gallons of wastewater. At the completion of the soil remediation activities, laboratory analytical data from confirmatory soil samples showed that concentrations of constituents remained above the HSRA notification standards at multiple locations in the excavation.

Free product removal activities were initiated in February 1999 in the vicinity of monitor well HMW-7 and were performed using a belt skimmer system. While a limited volume of free product was recovered by the skimmer system, no product was detected in surrounding monitor wells during subsequent 1999 or 2000 gauging activities.

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

Between July 1999 and January 2000, supplemental CSR investigation activities were conducted, including the installation of 8 monitor wells, 31 soil borings and the collection of soil and groundwater samples for laboratory analysis. Human and ecological exposure assessments were also completed during this phase of investigation. The results of these investigations concluded that the extent of VOCs and SVOCs in soil and the extent of VOCs in groundwater were not completely delineated. Polychlorinated Biphenyls (PCBs) and pesticides were also identified in soil samples, and SVOCs and metals were identified in groundwater samples during this phase of investigation. Chlorinated solvents (cis 1,2-dichloroethene [DCE] and trans 1,2-DCE) were identified in groundwater north of the former FTA. Based on these results, the area north of the former FTA was designated as the DAACG Chlorinated Solvents Area.

In October and November 2001, investigation activities continued with the installation of 2 additional monitor wells, 9 soil borings and the collection of groundwater, surface water and soil samples for laboratory analysis to complete delineation. Six surface water samples were collected from the two drainage ditches adjacent to the former FTA.

In 2002, a Compliance Status Report (Law Engineering and Environmental Services, Inc. [Law] 2002) was prepared and submitted to the Georgia Environmental Protection Division (GAEPD) documenting investigation activities completed through 2001. The report identified several soil and groundwater samples that exceeded applicable RRS that were not fully delineated.

To address the deficiencies identified in the 2002 CSR, additional phases of investigation and remedial actions were completed between 2002 and 2004. In 2002 a vertical profile investigation was completed in the DAACG Area which included the installation of 17 vertical profile borings and the collection of approximately 8 groundwater grab samples from each boring for laboratory analysis. In 2003, 8 additional monitor wells were installed in the DAACG Area and sampled. A comprehensive groundwater sampling event was completed in both the former FTA and DAACG areas in 2004.

An Interim Removal Action (IRA) was conducted in 2003 to address free product and contaminated soil in the vicinity of HMW-7. The belt skimmer system was deactivated and removed during the IRA activities. Monitor well HMW-7 and the immediate surrounding area were excavated and removed for off-site disposal. A replacement monitor well was installed within the limits of the excavation. The results of the 2002

through 2004 investigation and monitoring activities and the 2003 IRA were documented in a CSR Addendum (Science Applications International Corporation [SAIC] 2005).

Following the submittal of the CSR Addendum, a semi-annual groundwater monitoring program was initiated. Starting with the July 2004 event and continuing through January 2008, monitor wells at both the former FTA and DAACG Area were sampled for laboratory analysis. Analytical methods used for sample analysis varied by year and by sample location over the four years of semi-annual groundwater monitoring.

Based on comments received from the GAEPD on the CSR Addendum, additional soil and groundwater investigation activities were conducted in 2009 and 2010. A comprehensive groundwater monitoring event was completed in February 2009 with samples collected from 10 monitor wells associated with the former FTA and 10 monitor wells from the DAACG area. All samples were submitted for laboratory analysis of VOCs, SVOCs, metals, pesticides, and herbicides. Based on the results of the February 2009 groundwater monitoring event, additional investigation of soil and groundwater was recommended in order to complete delineation of detected compounds to background and/or non-detect concentrations. A total of five soil borings, nine shallow surficial aquifer monitor wells and three deep surficial aquifer monitor wells were proposed to be installed along with the collection of soil and/or groundwater samples.

In November 2009 a focused soil sampling was performed within the former FTA, with 5 soil borings installed to complete horizontal delineation of previously detected compounds. In addition to samples collected from the soil borings, soil samples were also collected from shallow and deep intervals during the installation of 9 of 12 new monitor wells. These soil samples were collected to further characterize and/or delineate previously detected compounds present in soils within the DAACG Area. Based on the cumulative results of the historic and recent soil investigation activities, impacts in soils and have been adequately delineated both horizontally and vertically.

Additional groundwater investigation activities were initiated in December 2009, with the installation of 12 new monitor wells. Nine shallow surficial aquifer monitor wells (HA01-MW-09, through HA01-MW-17) and three deep surficial aquifer monitor wells (HA01-MW-12D, HA-01-MW-14D, and HA01-MW-18D) were installed to complete delineation of the previously identified groundwater impacts within the former FTA and DAACG Areas. Monitor well HA01-MW-18D was installed downgradient of monitor well COE-MW-3, at the request of the GA EPD in order to enhance the vertical

delineation in this area. This well was installed into the top of the Hawthorne Formation, at approximately 65 feet bls.

Following the installation and development of the new wells a comprehensive groundwater monitoring event was performed. Groundwater samples were collected from the 12 new monitor wells as well as 20 existing monitor wells within the former FTA and DAACG Area. The 20 existing wells were the same wells sampled during the February 2009 monitoring event. All groundwater samples collected from DAACG Area monitor wells were analyzed for metals, pesticides and VOCs. Groundwater samples collected from the former FTA were analyzed for VOCs. Select wells (8 total) from both the DAACG Area and the former FTA were also analyzed for SVOCs based on historic detections. The results of the additional investigation showed that impacts in groundwater were adequately delineated both horizontally and vertically. Results of this event were reported in the Compliance Status Report dated September 2011.

The Georgia EPD completed a review and issued comments on the CSR in January 2012. In response to these comments, monitor wells HA01-MW-12 and HA01-MW-14 were resampled in January 2012 and analyzed for VOCs. Laboratory analysis confirmed the absence of designated VOCs in the wells. In addition, deep monitor well HA01-MW-07D was installed in the vicinity of monitor well COE-MW-07 in order to enhance vertical delination. The well was installed and sampled in February 2012. Laboratory analysis showed no detections above the laboratory reporting limit.

Human Health Risk Assessment

A human health risk assessment (HHRA) was completed to evaluate the potential risks to human health at HAA-01 by comparing the maximum detected soil and groundwater constituent concentrations to the Types 1 through 4 RRS. The potential exposure to constituents detected in surface water and sediment were also evaluated by comparing the maximum detected concentrations to the Type 1 RRS and the Georgia In-Stream Water Quality Standards (IWQS) (surface water only). Type 1 and Type 2 standards were exceeded by 16 and 10 constituents in soil, respectively. In addition, 14 and 6 constituents were observed to exceed their respective Type 3 and Type 4 RRSs. Thirty-three constituents were detected in groundwater at concentrations that exceeded the Type 1 and Type 3 groundwater RRS. Eighteen constituents exceeded the Type 2 RRS and 17 constituents exceeded the Type 4 RRS for the shallow groundwater. Eight constituents detected in sediments exceeded the Type 1 and Type 3 RRS. Five constituents detected in sediments exceeded the Type 2 RRS for soil. None of the detected constituents in sediment exceeded the Type 4 RRS. Three constituents detected in surface water exceeded the Georgia in-stream water quality

standards (IWQS). All of the detected surface water constituents were compared with Type 4 RRS calculated based on exposure of a recreational receptor. None of the maximum detected concentrations exceeded the Type 4 RRS.

Ecological Risk Assessment

An ecological risk assessment (ERA) was also completed for HAA-01. The ERA presented the results of a screening level ERA (SLERA) and Step 3a of a baseline ERA (BERA) for ecological receptors at the site based on hazard quotients (HQs). Risks were characterized for ecological receptors at the site by considering direct contact with constituent of potential ecological concern (COPECs) in surface soil (0-2 ft below land surface [ft bls]) and through ingestion of prey tissue through a food web model to upper-trophic level wildlife. Overall, potential ecological risks are low to negligible for exposure to site surface soil. Potential risks modeled to upper-trophic level invertivorous birds and mammals are also low. Based on this assessment, ecological risks at the site were determined to be minimal and no further evaluation was determined to be necessary.

Conclusions

This CSR for HAA-01 has presented physical, analytical, and risk assessment data to support the conclusion that the potential impacts to the environment by past activities at the site have been sufficiently characterized in surface soil, subsurface soil, sediment, surface water and groundwater. Based on the data provided herein, the following conclusions are submitted for consideration by the GAEPD:

§ The CSR investigation has been completed, and the potential impacts to the environment by past activities at HAA-01 have been sufficiently characterized and delineated where necessary in surface soils, subsurface soils, sediment, surface water and groundwater.

§ A Corrective Action Plan (CAP) will be developed to address CVOC, benzene and aldrin impacts in groundwater in the DAACG Area and benzene and naphthalene impacts in groundwater in the former FTA. Additionally, soil impacts historically detected in the former FTA will also be carried forward in the CAP for further evaluation.

Upon approval of this document, preparation of the CAP will be initiated. The CAP will be prepared to identify the selected corrective action to be implemented in order to address residual compounds in groundwater and soil exceeding the Type 1 RRS.

Revision 1 – April 2012
Original Report – June 2011

1. Compliance Status Certification

I certify under penalty of law that this report and all attachments were prepared under my direction in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisionment for knowing violations.

Based on the findings of this report, with respect to the established risk reduction standards of the Rules for Hazardous Site Response, Rule 391-3-19-.07, the Installation acknowledges the identified constituents that exceed the Type 1-4 standards.

3. Introduction

ARCADIS U.S., Inc. (ARCADIS) has been retained by the U.S. Army Environmental Command and Hunter Army Airfield to perform investigation and remediation activities at HAAF in accordance with the requirements of the Performance Based Contract (PBC) number W91ZLK-05-D-0015. As previous investigations triggered notification to GAEPD, the HAA-01 site has been assigned HSI Site No. 10395. The GAEPD has required HAAF to pursue delineation and clean up of impacted soil and groundwater at HAA-01 in accordance with the Georgia Hazardous Site Response Act, Section 391-3-19-.06.

This CSR incorporates data obtained from recent investigations as well as previous investigations completed between January 1987 and January 2010. Recent field investigation activities were completed by ARCADIS between November 2009 and January 2010 in accordance with the scope in the Compliance Status Report Work Plan, Revision 1 (ARCADIS 2010). This CSR will also be utilized to address GAEPD comments received in a correspondence dated December 21, 2006 (GAEPD 2006) on the Revised Compliance Status Report for the former Fire Training Area (Science Applications International Corporation [SAIC] 2002) and the Addendum to the Compliance Status Report for the former Fire Training Area (SAIC 2005) that were not addressed as part of the Compliance Status Report Work Plan, Revision 1 (ARCADIS, 2010).

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

4. Site Background

4.1 Regulatory Status

Potential impacts to soil and groundwater were initially evaluated at the former FTA between 1987 and 1992. Based on the results of these initial investigations and the promulgation of the Georgia Hazardous Site Response Act, Official Code Georgia Annotated (O.C.G.A) in 1992, the site was listed on the HSI as Site No. 10395 in August 1995. During the performance of the initial CSR investigation conducted between 1999 and 2000, previously unidentified chlorinated solvent impacts were detected in groundwater north of the former FTA. This area was identified as the Departure/Arrival Airfield Control Group (DAACG) Chlorinated Solvents Area

Due to their proximity and history, the FTA and DAACG Chlorinated Solvent Area are collectively identified as HAA-01 (HSI No. 10395) for the purpose of this investigation. This CSR investigation was conducted to meet GAEPD HSRA requirements for compounds above regulatory thresholds. The most recent investigation activities conducted in 2009 and 2010 were based on the Compliance Status Report Work Plan (ARCADIS 2009) submitted to GAEPD in June 2009 and subsequently revised in May 2010. The combined results of the historical investigations and the recent investigation are included in this CSR. Findings from this CSR will be utilized to prepare a CAP to achieve compliance with GAEPD HSRA requirements.

4.2 Site Description and Setting

4.2.1 Site Description

HAAF is located in Chatham County, Georgia, in the southwestern portion of Savannah and covers approximately 5,400 acres (see Figure 4-1). The U.S. Army acquired the property from the United States Air Force (USAF) in 1967 for use as a flight training center. The mission of the facility is to provide command, control, training, administration, logistical, and civilian-military support to non-divisional units stationed at Fort Stewart and HAAF. Aircraft based at HAAF currently include combat, transport, and training helicopters. The airfield is also used for overseas mobilization of troops and equipment.

The former FTA is located in the northwestern portion of the HAAF. The site is located west of the flightline and approximately 800 feet northwest of the control tower, at the approximate geographic coordinates of 32º 01’ 10” north latitude and 81º 08’ 36” west

longitude (USGS 1980). The topography of the site slopes gently west toward the Springfield Canal. The canal flows southwest before emptying into the Little Ogeechee River Floodplain. The elevation of the site ranges from approximately 35 feet mean sea level (ft msl) at the eastern boundary of HAA-01 (fire training pad) to 14 ft msl along the northwestern boundary (the northern drainage ditch) of the site. A map depicting the site features is included as Figure 4-2. The site topography is depicted on Figure 4-3.

4.2.2 Regional Geology/Hydrogeology

HAAF is located on the Lower Coastal Plain physiographic province, which is typified by low relief that slopes toward the Atlantic Ocean. The geology is comprised of a seaward thickening sequence of unconsolidated sediments deposited from sediments eroded from the Blue Ridge Mountains. Previous regional investigations suggest that there have been minor amounts of structural deformation in the Savannah, Georgia, area during deposition of these sediments, starting in the early Cretaceous Period. The total thickness of the sediments in the Savannah, Georgia, area is more than 2,000 ft.

The regional hydrogeology in the vicinity of HAAF consists of two aquifers separated by a thick confining unit. The primary water supply aquifer in the Lower Coastal Plain of Georgia and Florida is the Floridan aquifer, which is the deeper of the two aquifers. The Floridan aquifer is a regionally extensive aquifer that is approximately 800 feet thick in the area of Savannah. It is comprised primarily of Oligocene-age and Eocene-age porous limestones. The uppermost aquifer system is the surficial aquifer at and surrounding Savannah, Georgia, and is underlain by two continuous clay units separating this aquifer from the Floridan. These two clay units, separating the aquifers, are named the Coosawhatchie Formation and Berryville Clay member of the Hawthorne Group (Huddlestun 1988). Fossils and sediment samples suggest that these two units were deposited during the Middle Miocene Period in a low-energy, open marine environment over a wide area. The open ocean depositional environment resulted in the widespread and continuous nature of these clay units. A deep test well in Savannah (GGS-3139) shows that the clay units extend from approximately 45 ft to 167 ft in depth near HAAF. It has been demonstrated that there is minimal potential for shallow groundwater to impact deeper groundwater quality as a result of the thick confining unit that separates the uppermost aquifer system from the underlying Floridan aquifer.

The sediments overlying the Hawthorne Group clays to land surface are composed of a sequence of near-shore to shoreface (barrier island) sediments that prograde over the Hawthorne Group marine clays. Published investigations have identified nine sets of overlapping relict beach ridges of Pleistocene age to Holocene age on the Lower Coastal Plain that prograde toward the Atlantic Ocean. Each barrier sequence forms a ridge (also termed terrace) that is progressively lower and closer to the modern barrier island. The ancient beaches formed during higher sea levels and are approximately parallel to the modern barrier island complex. Each barrier system is at a consistent elevation above sea level with approximately 20 ft of relief above surrounding land.

4.2.3 Hunter Army Airfield Depositional Model

HAAF is located on a relict beach ridge named the Pamlico Terrace, which has current elevations ranging from approximately 20 ft msl to 40 ft msl. This abandoned beach ridge was formed during the late Pleistocene (>10,000 years) age. The Pamlico Terrace sediments are approximately 50 ft thick at HAAF. The shallow sediments at HAAF are comparable to sediments that form the nearby modern barrier islands along the Atlantic Coast. Pamlico Terrace is older and is at a slightly higher elevation than the modern barrier beach. Common general characteristics of barrier island systems are:

- an exposed belt of sand separated from the mainland by a shallow body of water, such as a lagoon
- greater length than width
- a straight seaward margin with a lobate, crenulate, or cuspate landward margin
- a coarsening-upward sequence of sand with the uppermost portion of which consists of eolian dunes

These generalities of modern barrier islands can be used to predict the shallow stratigraphy at HAAF. Utilizing the general depositional model of the barrier island system, an understanding of the shallow sediments at HAAF can be placed into context for the interrelationships of the sand units, silt units, and clay units in the uppermost aquifer system observed at HAAF. The highest part of the ridge is the beach, comprised of fine- to medium-grained, well-sorted quartz sand. The beach itself is a massive sand with little clay and silt because it was reworked by constant wave action and migration of tidal inlets. This ridge is the location of the current airfields at HAAF and trends northeast to southwest through HAAF. East of the ridge was the shallow open Atlantic Ocean, which should consist of finer sands that were constantly reworked to form well-sorted sands that are finer when compared to the

beach. Grain size should decrease with increasing water depth because of the limited winnowing in deeper water by reduced wave action with depth.

Marshes and bays would have occurred behind the barrier to the west of the airfields. Deposits in this area are generally silts and clays characteristic of lower energy environments with some interbeds of sands. The sand units were deposited from tidal inlets that migrated along the barrier and wash-over fans from storms. Individual units will drape off of the central barrier island sands. Clays interbedded with the sands will compact with time to form somewhat continuous but thin units, which can be confining in nature.

4.3 Description of Each Known Source

4.3.1 Former Fire Training Area

The former FTA during operation consisted of a gravel covered concrete fire training pad (approximately 6,400 square foot area enclosed within a concrete curb), a steel structure utilized as a mock aircraft, a 17,000 gallon AST used to store fuel for training purposes located approximately 150 ft north of the training pad (secondary containment was a 2.5-ft high earthen berm), an 1,100 gallon AST located northeast of the 17,000 gallon AST used to contain water contaminated fuel and solvents, and associated underground piping (see Figure 4-2). Typical activities included spraying water contaminated fuels (#4 Jet Propulsion Fuel (JP-4) and diesel fuel) on the mock aircraft, the ignition and subsequent extinguishing of the aircraft for training purposes. Fire training activities were discontinued at the site in 1991 and all components of the FTA, along with contaminated soils, were removed in 1998 as part of soil remediation activities. The Site has not been used for any purpose since fire training activities ended in 1991.

Multiple regulated compounds have been detected in both soil and groundwater at the former FTA. The majority of these compounds are associated with the past fire training activities conducted in the area. These activities included the storage of petroleum fuels in ASTs and transmission of these fuels through underground pipelines. Releases may have potentially occurred from components of the former FTA fuel application system that may not have been structurally sound, resulting in releases of fuels to soils and/or groundwater. In addition, the application of these fuels to the simulated aircraft structure and the poor containment of excess water and foam generated during fire training exercises may also have contributed to constituents detected in soils and groundwater.

4.3.2 DAACG Chlorinated Solvents Area

While conducting subsequent field investigations at the former FTA in 2000, chlorinated solvents (cis-1,2-DCE and trans-1,2-DCE) were detected in a monitor well located north of the former FTA area. This area was subsequently designated as the DAACG Chlorinated Solvents Area. There is no documentation of activities conducted at HAA-01 prior to 1967. Additional investigations in this area, as well as historical record searches (no records were available for the area prior to the 1967 acquisition of the site by the Army), have been unsuccessful in identifying any potential sources of the chlorinated solvents in the area. Additionally, investigations performed to date have not identified a clear source of the chlorinated compounds. Investigation in the DAACG area has identified construction and demolition (C&D) debris in the vicinity of the DAACG Area, although it cannot be confirmed as a source for the chlorinated solvents.

4.3.3 Potentially Responsible Parties

HSRA Rules require the name, address, and contact information of any person(s) that may be a responsible party for the site, and a description of the type/amount of the regulated substance that was contributed to the release. The phrase "responsible party" is defined only as "a person who has contributed or who is contributing to a release". That phrase, as defined in O.C.G.A. § 12-8-92 and implemented through the application of principles of liability in O.C.G.A. § 12-8-96.1, implies a number of legal principles, defenses, and related definitions. Contact information:

Department of the Army
Headquarters, US Army Garrison, Fort Stewart / Hunter Army Airfield
Attn: Directorate of Public Works
Mr. Thomas Frye, Chief Environmental Division
1550 Frank Cochran Drive
Fort Stewart, Georgia 31314-4927

Based on the fact that only the U.S. Army used the former FTA and HAAF, it is assumed that all identified contamination within the boundaries of the FTA portion of this site are related to activities conducted at the former FTA. Therefore, the U.S. Army assumes all responsibility for the identified soil and groundwater contamination within the FTA boundaries. However, it is noted that no source or historic activities that may have caused a release of the constituents identified in the DAACG Area activities

have been identified. Activities conducted by the other parties in this area prior to 1967 are unknown.

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

5. Investigations and Monitoring Conducted at HAA-01

Investigations and remedial actions have been conducted at HAA-01 since 1987 with CSR investigation activities performed between 1999 and 2010. Investigations at the site have included the installation of numerous soil borings, monitor wells and the collection and analysis of soil, sediment, surface water and groundwater samples. A summary of all soil samples (Table 5-1a), sediment samples (Table 5-1b), surface water samples (Table 5-1c) and groundwater samples (Table 5-1d) collected at HAA-01 and the analytical methods used have been included in this report. The monitor well construction details are summarized in Table 5-2. A site map depicting historic and recent soil boring locations and monitor well locations is presented as Figure 5-1. A site map depicting all historical and current sediment and surface water sample locations is presented as Figure 5-2. Previous field investigation activities are summarized in the sections below.

5.1 1987 Preliminary Assessment

In March 1987, the USAEHA conducted a preliminary assessment of soils in the vicinity of the former fire training pad in order to confirm the absence or presence of contaminants. This preliminary assessment included the installation of 4 soil borings (BH-10 through BH-13). Samples were analyzed for Resource Conservation and Recovery Act (RCRA) 8 metals and select SVOCs by United States Environmental Protection Agency (USEPA) Methods 6010 and 8270, respectively. Metals, PAHs, and phthalates were detected in the soil samples. Results were reported in the *Hazardous Waste Study No. 37-26-0127-88 Investigation of Soil Contamination* (USAEHA 1987). A summary of the historical soil, groundwater, sediment, and surface water sample analytical results has been provided as Appendix A. Available field forms documenting historic field procedures, well development, and other field activities have been included as Appendix B.

5.2 1990 and 1992 Additional Assessments

Between 1990 and 1992, Environmental Science and Engineering, Inc. (ESE) conducted two additional phases of investigations as a follow up to the 1987 Preliminary Assessment. Investigation work conducted included completion of additional soil borings, installation and sampling of monitor wells, and sediment sampling.

In February 1990, a total of 6 monitor wells were installed in the shallow and deep portions of the uppermost aquifer in the FTA area. Shallow wells (HMW-02, HMW-04,

and HMW-06) were installed to depths ranging from approximately 13-15 ft bls. Deep wells (HMW-01, HMW-03, and HMW-04) were advanced to depths ranging from approximately 48-49 ft bls. In addition, 6 soil borings (HSB-1 through HSB-6) were installed to a maximum depth of 10 ft bls each, and 3 sediment samples (SD-1 through SD-3) were collected to further define the extent of potential impacts.

In March 1992, three monitor wells (HMW-07 through HMW-09) were installed to depths ranging from approximately 13 to 15 ft bls at the former FTA. Additionally, 7 soil borings (PSB-1 through PSB-7) were advanced to depths ranging from approximately 4-9 ft bls and samples were collected. Four sediment samples (HSD-1 through HSD-4) were also collected at locations PSS-1 through PSS-4 and submitted for analysis during this phase of investigation.

All samples collected during 1990 and 1992 investigations were submitted for laboratory analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), and RCRA metals (USEPA Method 6010). Laboratory results identified VOCs (ketones, petroleum compounds) and SVOCs (PAHs) in soils. Drainage ditch sediment samples contained elevated levels of PAHs and metals. Low concentrations of VOCs, SVOCs and metals were also identified in the groundwater samples. The results of the 1990 and 1992 investigations were reported in the *Final Significance of Contamination Report, Hunter Army Airfield Fire Training Area, Fort Stewart, Georgia* (ESE 1993). Delineation of contamination was not completed by this investigation.

5.3 1995 Source Removal Design Investigation

In 1995, a source removal design investigation was conducted by Law, in which 4 additional monitor wells (HMW-10 through HMW-13) and 17 additional soil borings (FTASB-01 through FTASB-17) were installed to further define the extent of impacts to soil and groundwater. Groundwater samples were collected from each of the newly installed monitor wells and 2 soil samples were collected from 11 of the soil borings during this investigation.

All samples collected during the 1995 investigation were submitted for analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), RCRA metals (USEPA Method 6010), total petroleum hydrocarbons (TPH) – gasoline range organics (GRO), and TPH – diesel range organics (DRO) (USEPA Method SW8015B). Laboratory analysis of both soil and groundwater samples confirmed the presence of VOCs (BTEX, PAH compounds) exceeding the RRS in the immediate vicinity of the former fire training pad. The horizontal extent of soil contamination was reported as delineated while groundwater contamination was reported as delineated vertically, but

not horizontally. In addition, free phase product was identified in monitor well HMW-07 during this phase of the investigation. The results of this investigation were reported in the 1996 Pre-Final CSR. This report was subsequently withdrawn in order to incorporate the results of additional investigation and soil removal activities. Results were later summarized in the Soil Remedial Action Report (Omega 1998).

5.4 1997 to 2000 Remedial Actions

Remedial actions were initiated in 1997 and continued through 2000. These remedial actions were based upon the results of the Source Removal Design Investigation (Law) as well as previously completed investigations. Remedial actions consisted of former FTA equipment removal, soil excavation, free product removal and confirmatory soil sampling activities.

Between November 1997 and March 1998, soil excavation activities were performed at the former FTA. Omega Environmental Services, Inc. (Omega) along with their subcontractor, Geosciences, Inc. conducted remedial activities including the removal of the former FTA components (simulated aircraft structure, ASTs, underground transmission lines, fire training pad) and impacted soils in the immediate area that exhibited signs of contamination. The excavation depths ranged from 5 to 8 ft bls. Approximately 9,430 tons of soil, 233 tons of concrete debris, and 81,906 gallons of wastewater were removed and disposed of during this phase of remedial activities. Twenty-seven confirmatory soil samples were collected from the sidewalls and base of the excavation. Confirmatory samples were analyzed for select RCRA metals, BTEX, pesticides, PCBs, and TPH. Soils identified during the previous investigations at concentrations exceeding HSRA notification standards were targeted for removal. However, the laboratory analytical data from confirmatory soil samples showed that concentrations of constituents remained above the HSRA notification standards at multiple locations in the excavation after removal activities were completed. Details of the remedial activities can be seen in the *Soil Remedial Action Report* (Omega 1998). A summary of the remedial action and the post-remedial action laboratory analytical results, as provided in the Revised Final CSR (Law 2002), has been included in Appendix A.

In February 1999, a second remedial action was initiated. Free product removal was initiated in monitor well HMW-7 using an automated belt skimmer system. The system was operated from February 1999 through October 1999. Records indicate that approximately 3 gallons of free product was recovered during that period. In October, the system was temporarily shut off to allow free product to equilibrate in the well. After 1 week, 2.4 feet of free product was observed in the well. The system was

restarted with a modified operation cycle (15 minutes on, 12 hours off) in October. In addition to restarting the system, six product delineation points (slotted well screen installed to 8 feet bls) were installed around the perimeter of HMW-7. Free product measurements in these points were collected on December 15, 1999, February 24, 2000, March 3, 2000, and March 11, 2000. No free product was detected during any of these measurements. The belt skimmer system remained in place after these measurements, but additional recovery data was not recorded. Monitor well HMW-7 was removed along with the additional delineation points in December 2003 (see Section 5.7).

5.5 July 1999 through January 2000

In July 1999, borings SB-18 through SB-29 and monitor well borings HMW-14 through HMW-17 were installed. Two soil samples, one from the surface (0-2 ft bls interval) and one from just above the water table, were collected from each boring and submitted for laboratory analysis of select VOCs (USEPA Method 8260) and select SVOCs (USEPA Method 8270). Six borings (SB-22 through SB-27) were also analyzed for pesticides (USEPA Method 8081) and PCBs (USEPA Method 8082) in addition to VOCs and SVOCs.

Based on the results of the July 1999 investigation, 11 additional soil borings (SB-30 through SB-40) and 4 additional monitor wells (HMW-14R, HMW-18, 19, and 20) were installed in January 2000. Samples were collected and submitted for laboratory analysis of select VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), and/or pesticides (USEPA Method 8081).

After a review of the laboratory analytical data from these investigations, 2 additional soil borings (SB-41 and SB-42) were installed on January 31, 2000, to further define the extent of SVOCs detected in sample SB-38. One shallow interval (0-2 ft bls) sample and one deep interval (2-3 or 3-5 ft bls) sample was collected from each boring. The soil samples were submitted for analysis of select VOCs (USEPA Method 8260) and select SVOCs (USEPA Method 8270). Laboratory analytical results of the shallow interval samples from each of these 2 borings confirmed that the select SVOCs were not present and, therefore, analysis was not completed on the deeper interval of SB-42. Based on the results of the investigations, a CSR, dated March 31, 2000, was prepared and submitted to the GAEPD. After review of the report, a series of comments were generated by the GAEPD. Based on comments, the report was rescinded and additional investigations were completed.

Groundwater investigations were continued at HAA-01 in July 1999. As part of this phase of investigation, 6 temporary piezometers (HMW-14, HMW-15, HMW-16A, HMW-16B, HMW-16C, and HMW-17) were installed and sampled via low flow sampling techniques using a peristaltic pump and disposable polyethylene tubing. Groundwater samples were submitted for analysis of BTEX. Based on the laboratory analytical data, locations HMW-14, HMW-15, HMW-16A, and HMW-17 were converted into permanent monitor wells by overdrilling and removing the temporary piezometer. The laboratory analytical results for temporary piezometers HMW-16A, HMW-16B, and HMW-16C were utilized to determine the location of permanent monitor well HMW-16. Monitor well HMW-14 was installed on July 28, 1999, however, subsequent monitor well development activities revealed that HMW-14 did not have adequate volume for sampling (total well depth of 14 ft bls) and it was abandoned. In January 2000, replacement monitor well HMW-14R was installed to a depth of 20.37 ft bls in order to provide adequate groundwater for development and sampling.

In January 2000, two additional temporary piezometers (SB-38 and SB-40) were installed in order to fill data gaps identified after the July 1999 groundwater investigation. These piezometers were sampled via low flow sampling techniques using a peristaltic pump, with the samples submitted for analysis of VOCs (USEPA Method 8260) and SVOCs (USEPA Method 8270). Based on the laboratory analytical results, permanent monitor wells HMW-19 and HMW-20 were installed by overdrilling and removing the temporary piezometers at the borings at SB-38 and SB-40, respectively. In addition, HMW-18 was installed in order to delineate the southern boundary of the site. In January 2000, 7 monitor wells (HMW-2, HMW-12, HMW-14R, HMW-17, HMW-18, HMW-19, and HMW-20) were sampled via low flow sampling techniques. The groundwater samples were submitted for analysis of select VOCs (USEPA Method 8260), select SVOCs (USEPA Method 8270), and specific metals (arsenic, barium, lead) with the exception of HMW-2, which was only analyzed for lead as the background well.

5.6 October and November 2001

In October and November 2001, 2 additional monitor wells (HMW-21, HMW-22) were installed to the northwest and east, respectively, of monitor well HMW-14R in an attempt to delineate VOCs identified in groundwater. Monitor wells HMW-14R (analyzed for VOCs to confirm the results of the January 2000 monitoring event), HMW-21 and HMW-22 were sampled via low flow sampling techniques and analyzed for VOCs in November 2001. In addition to these wells, monitor well HMW-3 was sampled via low flow techniques and analyzed for VOCs, SVOCs, and 8 RCRA metals in order to evaluate the deepest portion of the uppermost aquifer, downgradient of the

former fire training pad. A summary of the monitor well construction details are presented on Table 5-2. Historic soil boring logs and monitor well construction logs have been included as Appendices B.

On October 31, 2001, six surface water samples (HSW-1 through HSW-6) were collected from the two drainage ditches adjacent to the former FTA and submitted to Accura Analytical Laboratory in Norcross, Georgia for laboratory analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), and RCRA metals (USEPA Method 6010). Samples were collected by directly filling sample containers from the stream flow at each sample location. The samples were collected as part of the ecological risk assessment to evaluate the potential impacts of groundwater discharge on surface water in the drainage ditches. Laboratory analysis of the surface water samples showed concentrations of benzene, toluene, ethylbenzene and xylenes (BTEX) compounds and naphthalene in one sample (HSW-1). The concentrations of all of these compounds were below the Georgia In-Stream Water Quality Standards (IWQS). It was noted that the location of HSW-1 was at the headwall of a pipe that carried storm water from the nearby flightline and most likely represented storm water flow from the flightline, not groundwater discharge from the HAA-01 area.

Nine (9) soil borings (SB-43, SB-43A, and SB-44 through SB-50) were also advanced to further investigate the presence VOCs, SVOCs, barium and chromium in soils at HAA-01. A background statistical evaluation was also completed during this phase of investigation in order to establish an upper background concentration (UBC) of metals in soils at the site. Results of this investigation, as well as data presented in the original CSR were documented in the *Revised Final Compliance Status Report* (Law 2002). Details of the UBC calculations have been included as Appendix E.

5.7 2003 Interim Removal Actions

In November and December 2003, Solutions To Environmental Problems, Inc. (STEP) conducted an Interim Removal Action (IRA) to address free product and contaminated soil present in the vicinity of HMW-7.

Prior to excavation and removal of the free product recovery system, the belt skimmer system was confirmed to be operational, then was manually removed from HMW-7. After the belt skimmer was removed, excavation to remove the contaminated soils and monitor well HMW-7 began. Excavation around monitor well HMW-7 began by removing the surface soil to a depth of 2 ft bls. Field screening of the excavated material was conducted using a photoionization detector (PID). The field screening was used in conjunction with visual and olfactory indicators to identify petroleum

contamination. Excavated material within 2 feet of ground surface did not exhibit indications of petroleum contamination, therefore this material was stockpiled next to the excavation and used as backfill material.

Soil excavation continued to a depth of 8 ft bls and encompassed an approximate 15 ft x 15 ft area around well HMW-7. Excavated material from 2 to 8 ft bls was placed inside roll off containers that were lined with plastic sheeting pending characterization to determine disposal requirements. The demolished monitoring well, including the gravel pad, protective casing, and bollards were considered petroleum contaminated non-hazardous construction debris and were placed in roll off containers. The six temporary piezometers surrounding the recovery well were also removed and placed with the debris from monitor well HMW-7. The debris and excavated soil were transported to the Savannah Regional Landfill for disposal.

Once the excavation had reached the dimensions specified in the Work Plan (STEP 2003), soil samples were collected from each of the sidewalls and the bottom center of the excavation. Samples were collected using EnCore^{tm} samplers from the bucket of the backhoe and submitted to an off-site laboratory for analysis of VOCs using USEPA Method 8260B. Laboratory analytical results of post excavation soil samples identified 12 compounds (2-butanone, acetone, benzene, carbon disulfide, cyclohexane, ethylbenzene, isopropyl benzene, methylcyclohexane, methylene chloride, tetrachloroethene (PCE), toluene, and total xylenes). Concentrations of these compounds were below the Type 1 RRS.

Monitor well HMW-23 was subsequently installed approximately 25 ft downgradient of the completed excavation. The well was installed to a total depth of 15 ft bls using a hollow stem auger. The well was constructed of a 2-inch inside diameter (ID), 10 ft length of factory slotted polyvinyl chloride (PVC) screen with a 2 inch solid PVC riser. Monitor well HMW-24 was installed within the limits of the excavation. The well was a 4-inch ID, 5-ft pre-packed PVC well screen with a bottom end cap and a 4-inch ID solid PVC riser. The well was pre-assembled and placed upright in the excavation. The excavation was then backfilled with gravel to approximately 1.5 ft above the top of the well screen. The remainder of the excavation was backfilled with stockpiled soil.

In December 2003, monitor well HMW-23 was purged and sampled for VOCs using USEPA Method 8260B. Prior to sampling, the well was purged of 3 well volumes and allowed to recharge. The sample was collected with a disposable bailer lowered into the well. Analytical results indicated that 17 VOCs were detected in groundwater including 1,2 dichlorobenzene, 1,2 dichloropropane, 1,4 dichlorobenzene, 2-butanone, benzene, carbon disulfide, chlorobenzene, cis-1 ,2 DCE, cyclohexane,

dichlorodifluoromethane, ethylbenzene, isopropyl benzene, methylcyclohexane, methyl-tert-butyl, ether, tetrachloroethene, toluene, and vinyl chloride. HMW-23 was subsequently sampled in March 2004 with analytical results similar with the exception of carbon disulfide, dichlorodifluourmethane, methyl-tert-butyl-ether, and PCE being absent from the laboratory analytical results. Of the constituents detected, benzene exceeded the maximum contaminant level (MCL), IWQS, and Type 4 RRS. Vinyl chloride exceeded its MCL. No other compounds were present at concentrations exceeding their respective MCL, IWQS, or Type 4 RRS in HMW-23.

5.8 Vertical Profile Investigation (2002-2003)

To further investigate the presence of chlorinated solvents in the DAACG Area, the U.S. Army Corps of Engineers (USACE) installed 12 vertical profile borings (DVP-1 through DVP-12) using geoprobe technology in August 2002. Groundwater samples were collected from the borings every 5 vertical feet below the groundwater table to a depth of approximately 45 or 50 ft bls. Approximately 8 samples were collected from each boring and submitted to an off-site laboratory for VOC analysis (USEPA Method 8260). Five additional vertical profile borings (DVP-13 through DVP-17) were installed by USACE in December 2002 to further delineate chlorinated solvents in groundwater to the southwest of the previously installed vertical profile borings.

Based on the laboratory analytical results of the vertical profile borings, eight permanent monitor wells (COE-MW-01 through COE-MW-08) were installed using Geoprobe® direct push technology (DPT) for plume delineation purposes in the DAACG Area in June 2003. Wells were constructed of a 1-inch diameter, 5-foot length of well screen and 1-inch diameter solid PVC riser. The results of this investigation were presented in the *Summary Package for the DAACG Chlorinated Solvents Area (HAA-16), Hunter Army Airfield, Georgia* (SAIC 2004). A summary of the Vertical Profile Boring investigation has been included in Appendix F. Following installation of the permanent monitor wells, the USACE collected groundwater samples from four existing monitor wells (HMW-14R, HMW-20, HMW-21, and HMW-22) located in the vicinity of the DAACG Area. Samples were analyzed for VOCs using USEPA Method 8260.

5.9 CSR Groundwater Monitoring Program (2004 – 2009)

Based on the anticipated approval of the Revised Final CSR (Law 2002) and the Addendum to the Compliance Status Report (SAIC 2005), semi-annual (January and July) groundwater monitoring activities were initiated at the former FTA and DAACG areas. Groundwater monitoring was completed on a semi-annual basis beginning in

July 2004 and was performed through January 2008. Due to a change in contractor, the performance of semi-annual sampling was suspended after January 2008. A summary of the semi-annual CSR groundwater monitoring activities performed between July 2004 and February 2009 are discussed in the following sections. Monitor well locations are shown on Figure 5-1. Laboratory analytical results from the CSR monitoring events are summarized in Appendix A. Details of the monitoring activities, including the laboratory analytical reports were summarized in Monitoring Only Reports for Calendar Year (CY)2005 (SAIC 2006), CY2006 (SAIC 2007), CY2007 (SAIC 2008), and January 2008 (SAIC 2008a). These Monitoring Only Reports were never submitted to the GAEPD as the installation was awaiting approval of the 2002 CSR. All historical groundwater data has been incorporated herein.

Beginning in July 2004, a semi-annual groundwater monitoring program was implemented in accordance with the recommendations provided in the Addendum to the Compliance Status Report (SAIC 2005). The monitoring program at the former FTA included the sampling and analysis of HMW-02, HMW-04, HMW-06, HMW-08, HMW-09, HMW-10, HMW-11, HMW-13, HMW-23, and HMW-24 for BTEX, polynuclear aromatic hydrocarbons (PAHs), and lead. The results of groundwater monitoring were to be used in the evaluation of potential corrective actions for the site.

In the DAACG Area, monitor wells COE-MW-01 through COE-MW-08, HMW-14R, and HMW-21 were monitored on a semi-annual basis. Laboratory analysis of VOCs was utilized in order to track the concentrations of 1,2-DCE, and vinyl chloride. The intent of the additional data collection was to provide an adequate basis for potential corrective action evaluation.

This groundwater monitoring program was implemented in July 2004 and continued on a semi-annual basis through January 2008. Laboratory analytical results for the FTA showed detections of multiple compounds with benzene, naphthalene, and 2-methylnaphthalene detected at concentrations above the Type 1, 3, and 4 RRS calculated in the previously submitted CSR (SAIC 2002). Laboratory analysis of samples associated with the DAACG area showed multiple exceedances of the Type 1, 3, and 4 RRS for 1,2-DCE, vinyl chloride, and benzene. A summary of this semi-annual groundwater monitoring data is shown on tables included in Appendix A.

5.10 Site Wide Investigation Activities (2009 - 2010)

Additional soil and groundwater investigations were completed at HAA-01, as discussed during the Tier I Partnering meeting held in Atlanta, Georgia on February 2, 2009, between November 2009 and January 2010 to further delineate the extent of soil

and groundwater impacts. All field investigation activities were performed in general accordance with the *Compliance Status Report Work Plan, Revision 1* (ARCADIS 2010), submitted to the GAEPD in May 2010.

5.10.1 Groundwater Monitoring Event (February 2009)

A comprehensive groundwater monitoring event was completed in February 2009 on monitor wells associated with the former FTA (HMW-02, 04, 06, 08, 09, 10, 11, 13, 23, and 24) and DAACG areas (COE-MW-01, 02, 03, 04, 05, 06, 07, 08, HMW-14R and HMW-21). The laboratory analysis of samples from both the former FTA and the DAACG area was expanded based on GAEPD comments on the Revised Final Compliance Status Report (SAIC 2002) and the Addendum to the Compliance Status Report (SAIC 2005) to include VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270), metals (USEPA Method 6010), pesticides (USEPA Method 8081), and herbicides (USEPA Method 8151). Prior to initiating groundwater sampling activities, groundwater level measurements were collected from shallow aquifer monitor wells that were to be sampled. Deep aquifer monitor wells were not gauged or sampled as part of the February 2009 groundwater monitoring event. Data collected was used to construct a potentiometric map for the shallow surficial aquifer. A summary of the groundwater level measurements and a potentiometric contour map for the shallow aquifer based on these measurements were presented in the CSR Work Plan (ARCADIS 2010).

Ten monitor wells at the former FTA (HMW-02, HMW-04, HMW-06, HMW-08, HMW-09, HMW-10, HMW-11, HMW-13, HMW-23, and HMW-24) and ten monitor wells at the DAACG Chlorinated Solvents Area (COE-MW-01, COE-MW-02, COE-MW-03, COE-MW-04, COE-MW-05, COE-MW-06, COE-MW-07, COE-MW-08, HMW-14R and HMW-21) were purged and sampled during the February 2009 monitoring event. Monitor wells were purged using low-flow techniques until water was free of visible sediment and field parameters (pH, temperature and conductivity) had stabilized. Monitor wells were then allowed to recharge and samples were collected in laboratory-provided containers. All groundwater samples were submitted to Shealy Laboratories in West Columbia, South Carolina for analysis by USEPA Method 6010 (metals), USEPA Method 8260 (VOCs), USEPA Method 8270 (SVOCs), USEPA Method 8151A (herbicides), and USEPA Method 8081A (pesticides).

A summary of the laboratory analysis for the February 2009 monitoring event was presented in the CSR Work Plan (ARCADIS 2010) where data was screened against USEPA MCLs and the Type 1 RRS. Laboratory analytical data showed the detection of 4 metals (arsenic, barium, chromium, and mercury), 14 pesticides (aldrin, alpha

chlordane, DDD, DDE, DDT, delta BHC, dieldrin, endosulfan I, endrin, gamma-chlordane, heptachlor epoxide, alpha BHC, beta BHC, and lindane) , 3 herbicides (2,4,5-TP, 2,4-D, and 2,4,5-trichlorophenoxyacetic acid), 14 VOCs (1,2 dichlorobenzene, 2-hexanone, acetone, benzene, 1-methylethylbenzene, chloroform, cis-1,2-dichloroethene, cyclohexane, ethylbenzene, methyl tert-butyl ether (MTBE), methylcyclohexane, toluene, vinyl chloride, and total xylenes) and 2 SVOCs (2-methylnaphthalene, naphthalene) at the former FTA. Laboratory analytical data showed the detection of 3 metals (arsenic, barium, and chromium), 3 pesticides (gamma-chlordane, beta BHC, and lindane) , 3 herbicides (2,4,5-TP, 2,4-D, and 2,4,5-trichlorophenoxyacetic acid), and 10 VOCs (1,1 dichloroethene, 2-hexanone, benzene, cis-1,2-dichloroethene, ethylbenzene, toluene, trans 1,2-dichloroethene, trichloroethene (TCE), vinyl chloride, and total xylenes) in wells associated with the DAACG Area.

Based on the results of the February 2009 groundwater monitoring event, additional investigation of soil and groundwater was recommended in order to complete delineation of detected compounds to background and/or non-detect concentrations. A total of five soil borings, nine shallow surficial aquifer monitor wells and three deep surficial aquifer monitor wells were proposed to be installed along with the collection of soil and/or groundwater samples.

5.10.2 CSR Soil Investigation (November 2009)

Soil investigation activities, as detailed in the CSR Work Plan were completed as part of delineation activities in both the former FTA and DAACG Area. Focused soil sampling was performed within the former FTA, with targeted intervals in 5 soil borings to complete delineation of previously detected compounds. In addition to samples collected from the soil borings, soil samples were collected from shallow (0-2 ft bls) and deep intervals (2 ft above groundwater table) during the installation of 9 new monitor wells (no additional samples were collected from the deep wells installed as well pairs) to further characterize and/or delineate detected compounds present in soils within the DAACG Area.

On November 3, 2009, ARCADIS mobilized to the site with ARM Environmental Services, Inc. a certified Georgia driller to begin CSR investigation activities. Soil samples associated with the former FTA were collected from one monitor well location (HA01-MW-17 from the 0-2 ft bls interval and from 2 feet immediately above the groundwater table) and from five soil borings (HA01SB001 through HA01SB005). Soil borings were advanced in the former FTA using Geoprobe® DPT. The locations of the soil borings and monitor wells are included on Figure 5-3. Soil boring, monitor well

boring, and monitor well construction logs have been included in Appendix C. The soil samples collected from HA01-MW-17 were analyzed for metals by USEPA Method 6010 and VOCs by USEPA Method 8260. The shallow soil sample was also analyzed for pesticides by USEPA Method 8081. The soil samples collected from the five soil borings were obtained from a target interval for analysis of specific constituents to complete delineation of historic detections. Soil boring samples, the interval sampled, and the compound(s) analyzed are as follows:

- HA01SB001 8'-10' bls analyzed for toluene (8260)
- HA01SB002 6'-6.5' bls analyzed for bis(2-ethylhexyl)phthalate (8270)
- HA01SB003 8'-10' bls analyzed for SVOCs (8270)
- HA01SB004 2'-4' bls analyzed for chromium (total)
- HA01SB005 2'-4' bls analyzed for chromium (total)

Soil samples were collected in the DAACG Area during the installation of eight shallow aquifer monitor wells (HA01-MW-09, through HA01-MW-16). A site map depicting the monitor well locations is included as Figure 5-3. Two soil samples were collected from each well boring using a split spoon sampler or hand auger at shallow soil sample locations. The first sample was collected from 0-2 feet bls interval and the second sample was collected from the 2 foot interval immediately above the groundwater table. The soil samples collected from each monitor well and boring were sent under Chain of Custody to Shealy Environmental Services, Inc. and analyzed for metals by USEPA Method 6010 and VOCs by USEPA Method 8260. In addition, shallow interval samples were analyzed for pesticides by USEPA Method 8081.

5.10.2.1 Soil Investigation Results

The laboratory results for both the former FTA and DAACG Area showed multiple detections of metals in the shallow and deep soil samples collected during this phase of investigation. Of these detections, only chromium (total) was detected above the Upper Background Concentrations (UBC) calculated as part of the *Compliance Status Report* (SAIC 2002) (See Appendix E for UBC calculations). Chromium was detected in monitor well samples HA01-MW-13 (4'-5') at 9.9 milligram per kilogram (mg/kg), HA01-MW-14 (1'-2') at 8.6 mg/kg, and HA01-MW-17 (6'-7') at 9.3 mg/kg, which are above the UBC of 7.7 mg/kg, but below the Type 1 RRS of 100 mg/kg. The laboratory analytical results from the November 2009 soil investigation activities conducted at the former FTA and the DAACG Area are summarized in Tables 5-3 and Table 5-4, respectively and the complete laboratory analytical reports have been included as Appendix G. The results of the 2009 soil investigation are summarized below.

Historical soil investigation data has been summarized and presented on Figures 5-4 through 5-19.

Fire Training Area

At the former Fire Training Area, one monitor well (HA01-MW-17) and five soil borings (HA01SB001 – HA01SB005) were installed to delineate compounds present in soil, identified during previous investigations (See Figure 5-1 for the location of historical soil sample locations) and Table 5-3 for a summary of the laboratory analytical results. The following summarizes the results of each sample:

Sample Location	Depth	Target Compound(s)	Result Summary
HA01-MW-17	1'-2' 6'-7'	VOCs, Metals, Pesticides	No exceedances of Type 1 RRS. **1'-2'**: 1,2,4-trichlorobenzene, toluene, arsenic, barium, chromium, lead, **6'-7'**: acetone, 1-methylethylbenzene, barium, cadmium, chromium, lead, mercury
HA01SB001	8'-10'	toluene	Not detected
HA01SB002	6'-6.5'	Bis(2-ethylhexyl)phthalate	Detected @ 540 (micrograms per kilogram (µg/kg), below Type 1 RRS of 50,000 µg/kg
HA01SB003	8'-10'	SVOCs	None detected
HA01SB004	2'-4'	chromium	Detected @ 4.9 mg/kg, below the UBC of 7.7 mg/kg and Type 1 RRS of 100 mg/kg
HA01SB005	0 -2'	chromium	Detected @ 2.6 mg/kg, below the UBC of 7.7 mg/kg and Type 1 RRS of 100 mg/kg

DAACG Chlorinated Solvents Area:

In the DAACG Chlorinated Solvents Area, eight monitor well borings (HA01-MW-9 through 16) were installed to complete delineation of compounds previously identified in soil (See Figure 5-3). The following table summarizes compounds detected above the Practical Quantitation Limit (PQL) in soil samples collected in the DAACG Area:

Compound	Location of Maximum Concentration	Maximum Concentration (µg/kg)	Type 1 RRS (µg/kg)
Carbon disulfide	HA01-MW-16 (10'-11')	8.0	820,000 (Regional Screening Level (RSL))
Chloromethane	HA01-MW-12 (1'-2')	6.9 J	40
Methyl acetate	HA01-MW-09 (6'-7')	9.5	78,000,000 (RSL)
1-methylethylbenzene	HA01-MW-10 (3'-4')	8.4	21,880
DDT	HA01-MW-14 (0'-1')	4.9	660

Metals (arsenic, barium, cadmium, chromium, lead, selenium, silver, and/or mercury) were detected at each location sampled. Concentrations were below the Type 1 RRS and the established UBC with the exception of chromium, detected in samples HA01-MW-13 (4'-5' interval), HA01-MW-14 (1'-2' interval), and HA01-MW-17 (6'-7' interval) at concentrations slightly above the 7.7 mg/kg UBC. A summary of the laboratory analytical data can be seen on Table 5-4 and the entire laboratory data package has been included in Appendix G.

5.10.3 Groundwater Investigation (December 2009)

Groundwater investigation activities performed in December 2009 included the installation of 12 new monitor wells, in accordance with the CSR Work Plan (ARCADIS 2010). Nine shallow surficial aquifer monitor wells (HA01-MW-09, through HA01-MW-17) and three deep surficial aquifer monitor wells (HA01-MW-12D, HA-01-MW-14D, and HA01-MW-18D) were installed to complete delineation of the previously identified groundwater impacts within the former FTA and DAACG Areas. Monitor well HA01-MW-18D was installed downgradient of monitor well COE-MW-3, at the request of the GA EPD (GA EPD, 2010) in order to enhance the vertical delineation in the vicinity of the highest groundwater concentrations. This well was installed into the top of the Hawthorne Formation, at approximately 65 feet bls. The new and existing wells at HAA-01 were sampled in December 2009.

Shallow monitor wells were installed such that the screened interval of each well bracketed the groundwater table. Construction details of the newly installed monitor wells are summarized in Table 5-2. Monitor well construction logs for 2009 have been included in Appendix C.

Monitor wells were installed using 4.25-inch ID hollow-stem augers (HSA). Soil samples were collected and logged at 5-foot intervals for visual classification using the Unified Soil Classification System (USCS) and screened with a PID during the drilling process. Once each monitor well boring was advanced to its terminal depth, a 10-foot, 2-inch diameter schedule 40, flush-threaded 10-slot PVC screen and 2-inch schedule 40 PVC riser were placed through the inside of the HSA to a depth slightly above the bottom of the boring. Filter pack material consisting of clean 20/40 sand was placed, by tremie, from the bottom of the boring to 2 ft above the top of the well screen. The monitor well was then surged to allow settling of filter pack material. If necessary, additional filter pack material was added after surging to maintain two feet of sand pack above the screened interval. A minimum of two feet of bentonite pellets was added on top of the filter pack. The bentonite was hydrated and allowed to set. After sufficient time, neat cement (grout) was placed in the remaining annulus to a depth of 1 ft bls. Each well was completed using either an 8-inch flush mount manhole or a 3-foot tall, steel aboveground surface completion. Once the grout and the concrete pad sufficiently cured, the newly-installed monitor wells were surged for approximately 10 minutes over the entire screened intervals. The monitor wells were then developed using the pumping / overpumping method outlined in the USEPA Region 4 guidance document titled *Design and Installation of Monitoring Wells* (USEPA 2008). Groundwater samples from the 12 new monitor wells and 20 existing monitor wells were collected in December 2009. Monitor wells were sampled in accordance with the USEPA Region 4 Operating Procedure for Groundwater Sampling (USEPA 2007). Low flow sampling was used to minimize disturbance of any sediment remaining in the wells after development and to reduce the volume of investigation derived waste generated. Prior to the collection of groundwater samples, each monitor well was gauged for depth to water. Water quality parameters (pH, temperature, specific conductance, dissolved oxygen (DO),oxidation-reduction potential (ORP) and turbidity) were collected during the purging process. All groundwater samples collected from DAACG Area monitor wells were analyzed for metals by USEPA Method 6010, pesticides by USEPA Method 8081 and VOCs by USEPA Method 8260. Groundwater samples collected from the former FTA were analyzed for VOCs by USEPA Method 8260. Select wells (8 total) from both the DAACG Area and the former FTA were analyzed for SVOCs by USEPA Method 8270, based on historic detections.

5.10.3.1 Groundwater Investigation Results

During the December 2009 groundwater sampling event conducted at the former FTA and DAACG Area, depth to groundwater measurements were collected from 43 wells associated with the site. The depth to groundwater measurements have been converted to water table elevations and are summarized in Table 5-5. The water table

elevations were used to prepare potentiometric surface maps for both the shallow and deep surficial aquifer units, which are included as Figures 5-20 and 5-21, respectively. Shallow groundwater flow is in a west – northwest direction and deep aquifer flow is in a northwest direction, consistent with the previously reported flow direction.

In December 2009, groundwater samples were collected from the 12 new monitor wells as well as 20 existing monitor wells currently utilized as the groundwater monitoring network for the former FTA and DAACG Area. A summary of the groundwater sampling analytical results is included on Table 5-6. Site maps depicting the December 2009 groundwater analytical results for former FTA and the DAACG Area are included as Figures 5-22 and 5-23, respectively. A summary of the cis 1,2-DCE, trans 1,2-DCE, vinyl chloride, and aldrin concentrations in groundwater are shown on Figures 5-24 through Figure 5-27, respectively. Multiple cross sections have been included as Figures 5-28a, b, c, and d (Geologic Cross Sections A-A', B-B', C-C', and D-D') showing the geologic findings at designated monitor well borings as well as a summary of the results of soil and groundwater samples at those designated locations. Concentrations of 1,1-DCE, acetone, benzene, carbon disulfide, TCE, toluene, and endrin aldehyde in groundwater are summarized on Figures 5-29 through 5-35, respectively. A summary of the historical groundwater monitoring data has been provided on tables included as Appendix A.

Former Fire Training Area:

In the former FTA, multiple compounds were detected above the PQL. Of these detections, three compounds were reported at concentrations exceeding the Type 1 RRS:

Compound	**Location of Maximum Concentration**	**Maximum Concentration (µg/L)**	**Type 1 RRS (µg/L)**
1,1,2,2 tetrachloroethane	HMW-13	0.84	0.2
Benzene	HMW-13	56	5
Naphthalene	HMW-13	100	20

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

VOCs detected in groundwater samples collected at the former FTA at concentrations above the PQL but below the Type 1 RRS include 1,2-dichlorobenzene (one detection), acetone (one detection), benzene (three detections), 1-methylethylbenzene (three detections), chlorobenzene (one detection), cyclohexane (two detections), ethylbenzene (three detections), methylcyclohexane (one detection), and total xylenes, (one detection). Barium (HA01-MW-16) was the only metal detected in samples analyzed for metals.

Semi-volatiles were analyzed at select locations (HMW-06, HMW-10, HMW-13, HMW-23, and HMW-24). Compounds detected above the PQL, but below the Type 1 RRS include: 2-methylnaphthalene (detected in two wells), 4-chlorobenzenamine (one detection), 4-methylphenol (one detection), and naphthalene (one detection).

DAACG Chlorinated Solvents Area:

In monitor wells associated with the DAACG Area, multiple compounds were detected in groundwater samples at concentrations above the PQL. Of the constituents detected, five were reported at concentrations exceeding the Type 1 RRS:

Compound	Location of Max Concentration	Max Concentration (micrograms per liter (µg/L))	Type 1 RRS (µg/L)
aldrin	COE-MW-1	4.6 J	0.02
cis-1,2-dichloroethene	COE-MW-3	7,800	70
vinyl chloride	COE-MW-3	1,000	2
benzene	COE-MW-3	11	5
trans-1,2-dichloroethene	COE-MW-3	230	100

VOCs detected in the DAACG Area above the PQL but below the Type 1 RRS include 1,1-DCE (five detections), 2-hexanone (one detection), acetone (two detections), benzene (five detections), carbon disulfide (one detection), cis-1,2-DCE (ten detections), toluene (three detections), trans-1,2-DCE (eight detections), TCE (two detections), vinyl chloride (five detections), total xylenes (two detections).

Metals detected in the DAACG Area above the PQL but below the Type 1 RRS include barium (fifteen detections), and chromium (three detections). Pesticides detected in the DAACG Area above the PQL but below the Type 1 RRS include aldrin (five detections), and endrin aldehyde (five detections).

SVOCs were only analyzed at two locations associated with the DAACG Area, HA01-MW-10 and HA01-MW-18D. No compounds were detected above the PQL in either sample.

5.11 Extent of Compounds in Soil

Soil investigations completed at the site have identified 53 compounds detected in soil at concentrations above the laboratory PQL. Eleven compounds were detected at concentrations exceeding the Type 1 RRS in soil samples and have been identified on isocontour maps, included as Figures 5-4 through 5-14. Compounds exceeding the Type 1 RRS in soil include benzene, total xylenes, acetone, ethylbenzene, benzo(a)pyrene, chrysene, benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, indeno(1,2,3-cd)pyrene, and lead. In general, the respective locations of VOCs and SVOCs listed are in the vicinity of the Former FTA, including areas around and below the excavation area. Compounds were also noted in a small lobe north of the FTA, extending toward the DAACG Area.

Detections of lead were also concentrated within the vicinity of the former excavation area, with multiple additional sporadic detections in each direction. The bulk of lead concentrations identified, including all delineation samples, were below the UBC previously established.

Compounds that have been identified in soils at concentrations below the Type 1 RRS, but above the laboratory PQL are shown on soil delineation maps included as Figures 5-15 - Extent of VOC Compounds in Soil, Figure 5-16 – Extent of SVOC (PAH) Compounds in Soil, Figure 5-17 – Extent of SVOCs in Soil, Figure 5-18 – Extent of Metals in Soil, and Figure 5-19 – Extent of Pesticides in Soil. In general, compounds detected were sporadic locations and at low concentrations. Compounds identified on these figures were delineated by perimeter samples collected.

The remainder of compounds identified were detected in a very low percentage of samples collected and analyzed. Based on the frequency of detection, these samples and the samples that complete delineation of these compounds have been summarized on the table below:

5.12 Supplemental Investigation Activities (2012)

In January 2012, in response to GAEPD comments on the CSR submitted in September 2011, monitor wells HA01-MW-12 and HA01-MW-14 were re-sampled and and analyzed for VOCs in order to verify detections of select VOCs (acetone in MW-12 and toluene in MW-14) identified during the 2009 groundwater monitoring event. Each well was sampled in accordance with the USEPA Region 4 Operating Procedure for Groundwater Sampling (USEPA 2007). Low flow sampling was used to minimize disturbance of any sediment remaining in the wells after development and to reduce the volume of investigation derived waste generated. Prior to the collection of groundwater samples, each monitor well was gauged for depth to water. Water quality parameters (pH, temperature, specific conductance, dissolved oxygen (DO),oxidation-reduction potential (ORP) and turbidity) were collected during the purging process. Each groundwater sample collected was analyzed for VOCs by USEPA Method 8260. Laboratory analytical results showed no VOCs detected at concentrations exceeding the laboratory reporting limit.

In February 2012, a deep monitor well, HA01-MW-07D was installed at the request of the GAEPD in order to provide additional vertical delineation in the vicinity of existing monitor well COE-MW-07. The monitoring well was installed as a double cased well. Initially, a Geoprobe 7822 was used to advance 7 7/8-inch OD hollow stem augers to a depth of 45 feet bgs. As the augers were advanced, continuous soil samples were collected using a Geoprobe Macro Core sampler, screened with a PID, and visually

classified using the Unified Soil Classification System (USCS). A 4-inch surface casing was then installed and grouted to ground surface. Once the grout had sufficient time to cure, the borehole was advanced from the bottom of the surface casing to a terminal depth of 60 feet using mud rotary drilling with split spoon samples collected at 5-foot intervals for purposes of charactering lithology. The monitoring well was installed using a 10-foot, 2-inch diameter Schedule 40 PVC, flush-threaded 10-slot screen and 2-inch Schedule 40 PVC riser. Filter pack material consisting of clean 20/40 sand was placed, by tremie, from the bottom of the boring to 2 ft above the top of the well screen. The monitor well was then surged to allow settling of filter pack material. Two feet of bentonite pellets were added on top of the filter pack. The remaining annular space was filled with a neat Portland Type I cement. The well was completed at ground surface with a 3-foot tall steel aboveground surface completion. Once the grout and the concrete pad sufficiently cured, the newly-installed monitor well was surged for approximately 10 minutes over the entire screened interval. The monitor well was then developed using the pumping / overpumping method outlined in the USEPA Region 4 guidance document titled *Design and Installation of Monitoring Wells* (USEPA 2008). Prior to the collection of groundwater samples, the monitor well was gauged for depth to water. Water quality parameters (pH, temperature, specific conductance, dissolved oxygen (DO),oxidation-reduction potential (ORP) and turbidity) were collected during the purging process. The groundwater sample collected from HA01-MW-07D was analyzed for metals by USEPA Method 6010, VOCs by USEPA Method 8260, SVOCs by USEPA Method 8270, pesticides by USEPA Method 8081B and herbicides by USEPA 8151A. Laboratory analysis showed no compounds detected at concentrations exceeding the reporting limit.

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

6. Conceptual Site Model

Multiple phases of soil and groundwater investigation have been completed at the site. Investigations have concluded that previous fire training activities are the most likely source of BTEX compounds in the soil and groundwater in the vicinity of the former FTA. Multiple remedial measures have been completed to address these residual contaminants, including soil excavations and LNAPL recovery activities. Investigations in the DAACG area have been successful in identifying the compounds present and the extents of these compounds, although a source of these compounds has not been successfully identified. Table 6-1 identifies all compounds identified in media investigated at the site and the suspected source of the impacts (i.e. former Fire Training Area or DAACG Area).

Site Geology and Hydrogeology

Previous investigations conducted at or near the site indicate that the geologic sections consist of predominantly sand with interbeds of silty sand, and lesser clayey sand deposits to a depth of at least 100 ft bls. Shallow borings performed during the previous investigations indicated the surficial deposits at the site consist predominantly of fine-grained sand to a depth of at least 10 feet (ESE 1993, USAEHA 1987).

The subsurface soil conditions encountered during the CSR and previous investigations may be categorized into two general strata based on geologic and engineering characteristics. The upper zone soils extend from the surface to approximately 35 ft bls and consist of gray to brown, medium to coarse-grained, loose to medium-dense silty sand, with interbedded layers of clays, sand, and poorly graded sand. The soil is classified as silty sand (SM) according to the USCS. The lower zone soils begin at approximately 35 ft bls and continue to approximately 100 ft bls. The soil consists of gray, fine to medium-grained, loose to medium-dense, poorly graded sand and is classified as poorly graded sand (SP) according to the USCS (site geology obtained from the CSR Addendum, SAIC 2005).

Groundwater Gradients

The hydrology at HAA-01 has been characterized by groundwater monitor wells installed across the site at two different intervals (the shallow and deep surficial aquifer). The shallow surficial aquifer monitor wells range from a total depth of 11.5 to 20.5 ft bls, while the deep surficial aquifer monitor wells have total depths ranging from 48 to 65 ft bls. A list of the wells and corresponding historical water level elevations is

presented in Table 6-2. Typically, groundwater flow in the shallow and deep surficial aquifer direction is northwest across the DAACG Area with a horizontal groundwater gradient of approximately 0.017 feet per foot (ft/ft). At the former FTA, the groundwater flow direction is also to the northwest with an average horizontal groundwater gradient of approximately 0.042 ft/ft.

The vertical groundwater gradient has been historically measured at the site using 3 well clusters (HMW-1/HMW-2, HMW-3/HMW-4, and HMW-5/HMW-6). Calculated vertical gradients, developed from December 2009 well gauging data, range from 0.036 ft/ft to 0.075 ft/ft in a downward direction.

Hydraulic Conductivity Measurements

As detailed in the Revised Final CSR (Law 2002), the horizontal hydraulic conductivity was calculated for six wells located at the site using slug tests. Slug tests were conducted on wells HMW-03 and HMW-04 in 1992 by ESE and on wells HMW-10, 11, 12, and 13 in 1995 by Law. The Bouwer and Rice Method was used to analyze each of the test results and develop the hydraulic conductivity for the wells. Results of the analysis ranged from 1.8×10^{-3} feet per minute (ft/min) (HMW-03) to 8×10^{-4} ft/min (HMW-11) with an average hydraulic conductivity of 1.25×10^{-3} ft/min, as reported in the Revised Final CSR (Law 2002). Calculations of the hydraulic conductivity have been provided in Appendix H.

Groundwater Flow Rates

The average hydraulic conductivity (K) and average horizontal hydraulic gradient (I) were used to calculate an estimated velocity of horizontal groundwater flow beneath the site. An effective porosity (n_e) for the saturated soil was assumed to be 20% (based on sandy soils). The horizontal groundwater flow velocity was calculated using the Darcy velocity equation:

DAACG Chlorinated Solvents Area:

$V=KI/n_e = [(1.25 \times 10^{-3}$ ft/min)(0.017 ft/ft) / (0.20)] x (525,600 min/yr)= 56 feet per year (ft/yr)

former FTA:

$V=KI/n_e = [(1.25 \times 10^{-3}$ ft/min)(0.042 ft/ft) / (0.20)] x (525,600 min/yr)= 138 ft/yr

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

Based on CSR investigations, the extent of compounds in the soil and groundwater has been adequately delineated. Horizontal plume migration is limited, as demonstrated by the horizontal extent of soil and groundwater constituent plumes. Remedial measures completed have been successful in the removal of the former FTA source areas. Vertical migration has been confined by the clay unit, typical of the Hawthorne formation, identified between the depth of 55 to 65 ft bls.

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

7. Human Health Risk Assessment

The human health risk assessment for HAA-01 evaluated the potential risks to human health through the derivation of a RRS for each of the detected constituents in soil and groundwater and an evaluation of the potential exposure to constituents detected in surface water and sediment.

This remainder of the section is organized as follows:

- Potential receptors
- Exposure assessment
- Toxicity assessment
- Risk reduction standards
- Surface water and sediment evaluation
- Summary and conclusions

7.1 Potential Receptors

HAA-01 has not been actively utilized since 1991. Like many military bases, access to the site is restricted. Thus, trespassers are not expected at the site under current conditions. Since HAA-01 has been unoccupied since 1991, portions of the site are overgrown. Workers charged with periodically mowing or using the bush-hog to clear the site are the most likely potential human receptors. Similarly, this site has been used for non-residential uses, and it is unlikely that the site will be used for permanent, residential housing. HAA has a master plan (U.S. Army 2006) that indicates that the nearest family housing is over one mile to the southeast of this site.

The surface water features are unlikely to be accessed from HAA-01. The ditch banks are steeply sloped and heavily vegetated, thus precluding contact with surface water and sediments. Three water supply wells were identified within 1 mile of the site (as identified on Table 5.1 of the Revised Final Compliance Status Report (Law 2002) during completion of a water well survey (US Geological Survey [USGS], Georgia District, 2000). Water use from these wells is identified as commercial, agricultural, or military usage. Groundwater at the site is not used as a potable water supply. The deeper Floridan aquifer is used as the potable water supply, although the three water supply wells identified are upgradient of the site.

7.2 Exposure Assessment

In accordance with GAEPD guidance, default criteria for Types 1 and 3 RRS were identified. For Types 2 and 4 RRS, exposure factors from GAEPD guidance (GAEPD 1999) or USEPA guidance (USEPA 1997a) were used. These RRS values are therefore considered to be conservative (i.e., protective of human health) in that exposure to the identified and/or calculated concentrations is considered unlikely to cause significant carcinogenic or noncarcinogenic effects. Thus, if the soil or groundwater concentrations are less than the conservative RRS, then additional exposure scenarios related to soil and groundwater exposures will not be evaluated.

7.2.1 Soil Exposure

In accordance with GAEPD guidance, the Types 2 and 4 RRS for carcinogenic effects from potential exposure to soil are typically calculated using Equation 6 from Part B of the Risk Assessment Guidance for Superfund (RAGS Part B) (USEPA 1991). The Types 2 and 4 RRS for noncarcinogenic effects from potential exposure to soil are typically calculated using Equation 7 from RAGS Part B. Table 7-1 provides the equations used to derive the soil RRS.

The exposure factors used to calculate the Type 2 (i.e., residential) RRS include a body weight of 70 kilograms (kg) for an adult and 15 kg for a child, 30 years of exposure duration for an adult and six years for a child, a 114 milligram per day (mg/day) soil intake rate for an adult and 200 mg/day for a child, and an exposure period of 350 days per year. The inhalation rate was set at 15 cubic meters per day (m^3/day) based upon USEPA (1991) guidance for residential receptors.

The exposure factors used to calculate Type 4 (i.e., commercial) RRS are based on industrial exposure and include a body weight of 70 kg, 25 years of exposure duration, a 50 mg/day soil intake rate, and an exposure period of 250 days per year. The inhalation rate for the commercial worker was set at 20 m^3/day. Exposure factors for both Types 2 and 4 RRS were obtained from Georgia EPD guidance (EPD 1999; USEPA 1997a).

7.2.2 Groundwater Exposure

Types 2 and 4 RRS for carcinogenic and noncarcinogenic effects from potential exposure to groundwater were calculated using Equations 1 and 2, respectively, from RAGS Part B (USEPA 1991). The lowest criterion from Equation 1 or 2 was used as

the Types 2 and 4 RRS. The equations and parameter values used to calculate the RRS for exposure to groundwater are presented in Table 7-2.

The exposure factors used to calculate the Type 2 (i.e., residential) RRS include a body weight of 70 kg for an adult and 15 kg for a child, 30 years of exposure duration for an adult and six years for a child, a 2-liter-per-day (L/day) water intake rate for an adult and 1 L/day for a child, and an exposure period of 350 days per year. The inhalation rate was set at 15 cubic meters per day (m^3/day) based upon USEPA (1991) guidance for residential receptors.

The exposure factors used to calculate Type 4 (i.e., commercial) RRS are based on industrial exposure and include a body weight of 70 kg, 25 years of exposure duration, a 1-L/day water intake rate, and an exposure period of 250 days per year. The inhalation rate for the commercial worker was set at 20 m^3/day. Exposure factors for both Types 2 and 4 RRS were obtained from GAEPD guidance (EPD 1999; USEPA 1997a).

7.3 Toxicity Assessment

The toxicity values used to calculate Type 2 and Type 4 RRS (i.e., cancer slope factors [CSF] and reference doses [RFD]) were obtained from the USEPA RSL (USEPA 2011b) table. The values included in the RSL table were verified in the primary sources. The toxicity values are presented in Table 7-3.

7.4 Risk Reduction Standards

The primary objective of the risk evaluation was to compile the available analytical data on the regulated substances that were detected in soil and groundwater and to compare the data to the RRS. The Type 1 RRS was identified, and residential exposure factors were used to calculate the Type 2 RRS in soil and groundwater. The Type 3 RRS also was identified for soil and groundwater, and industrial exposure factors were used to calculate the Type 4 RRS for soil and groundwater. The physical and chemical properties used to derive the soil RRS are provided in Table 7-4.

In addition, the potential for the detected soil constituents to leach from soil to groundwater was evaluated by calculating soil screening levels (SSLs) protective of groundwater using USEPA methodology (1996, 2002b). For these calculations, the groundwater RRS were used as the groundwater criteria.

7.4.1 Soil Risk Reduction Standards

The Type 1 RRS (default residential criteria) for soil were determined using the definition in Rule 391-3-19-.07(6)(c) of GAEPD guidance (1999). The concentrations of constituents of concern (COCs) detected in soil above the water table were compared to the Type 1 RRS. Table 7-5 includes the maximum detected constituent concentration above the water table, the location of the maximum, and the Type 1 soil RRS. Sixteen constituents exceeded the Type 1 RRS. Sample HMW-12 collected in 1995 was reported as containing the highest concentrations of detected constituents. The results of this sample were reevaluated as part of Revision 1 of this report and showed that concentrations of the sample were incorrectly reported. Data were identified as being exaggerated by a factor of 1,000 and being reported without proper qualifiers (<). These data were corrected, and the risk assessment was updated to reflect these data.

The equations used to calculate the Type 2 RRS for soil are presented in Table 7-1. The Type 2 carcinogenic and noncarcinogenic calculated criteria are presented in Table 7-6 for adult residential receptors and Table 7-7 for child residential receptors. In addition, for each of the constituents evaluated, the RRS was the lower of the direct contact soil RRS calculated in Tables 7-6 and 7-7 and the SSL which is protective of groundwater and was derived based on the groundwater Type 1 RRS (see Table 7-10) or the groundwater Type 2 RRS (Table 7-11). The comparison of detected concentrations and the source of the Type 2 RRS is presented in Table 7-5. Ten constituents exceeded their Type 2 RRS.

The Type 3 RRS were derived in a manner similar to those of the Type 1 standards with the exception that industrial worker assumptions were used to derive the default direct contact RRS. The Type 3 RRS are presented in Table 7-8 together with the maximum soil concentration detected above the water table. As seen in the table, fourteen constituents exceed their Type 3 soil RRS.

The Type 4 RRS was derived by selecting the lower of the Type 4 direct contact RRS (Table 7-9) and the Type 4 SSL (Table 7-12). Table 7-20 presents the derivation of the Type 4 RRS for lead in soil. As seen in Table 7-12, six constituents were detected at a maximum concentration exceeding their Type 4 RRS.

7.4.2 Groundwater Risk Reduction Standards

The calculation of RRS for groundwater included the integration of the exposure and toxicity assessments. Information on potential exposures and toxicity values was combined to generate the Types 2 and 4 RRS. These criteria, as well as the default criteria for Types 1 and 3 RRS, were then compared to the maximum detected concentrations of the constituents detected in the shallow and groundwater at the site.

7.4.2.1 Residential Risk Reduction Standards

Residential RRS were calculated for groundwater as described above. The following sections further describe the Types 1 and 2 RRS.

- Type 1 RRS

  The Type 1 RRS (default residential criteria) for groundwater are defined in Rule 391-3-19-07(6)(b) (GAEPD 1999) as the concentrations listed in Table 1 of Appendix III (if available for the COCs). The comparison of maximum detected groundwater concentrations to the Type 1 RRS and the source of the Type 1 RRS are presented in Table 7-13 for the shallow groundwater. 33 constituents were detected at concentrations greater than the Type 1 RRS for groundwater.

- Type 2 RRS

  The equations and input parameters used to calculate the Type 2 RRS for the COCs in groundwater are presented in Table 7-2. Calculations of the Type 2 carcinogenic and noncarcinogenic criteria for groundwater are included in Table 7-14 for adults and in Table 7-15 for children. For each detected constituent, the least of the carcinogenic and noncarcinogenic criteria was then selected as the criterion for each receptor (adults and children), and the lower of the adult or child criterion was selected as the Type 2 RRS. A comparison of the maximum detected concentrations with the Type 2 RRS, along with the source of the Type 2 RRS, is included in Table 7-13 for the groundwater. Eighteen constituents exceeded the Type 2 RRS.

7.4.2.2 Nonresidential Risk Reduction Standards

Nonresidential RRS were calculated for groundwater as previously described in this risk evaluation. The following sections further describe the Types 3 and 4 RRS.

- Type 3 RRS

  The Type 3 RRS for groundwater are identical to the Type 1 RRS used for the residential scenario, according to GAEPD guidance (EPD 1999). The comparison of maximum detected concentrations to the Type 3 RRS for groundwater is presented in Table 7-16 for groundwater. This comparison shows that 33 constituents were detected at concentrations greater than the Type 3 RRS for groundwater.

- Type 4 RRS

  The equations and input parameters used to calculate a Type 4 RRS for the groundwater are presented in Table 7-2. Calculations of the Type 4 carcinogenic and noncarcinogenic criteria for groundwater are included in Table 7-17. For each constituent, the lesser of these two criteria was selected as the Type 4 RRS for groundwater. The comparison of maximum detected concentrations to Type 4 RRS for shallow groundwater presented in Table 7-17 shows that 17 constituents exceed the Type 4 RRS for groundwater.

7.4.3 Sediment

Table 7-18 presents the comparison of the sediment maximum concentration and the Types 1, 2, 3, and 4 RRS. Several of the PAHs were present at concentrations exceeding all of their standards. Twenty-six constituents were detected in sediments. The maximum detected concentrations were compared to the soil Type 1 through 4 RRS, as seen in Table 7-18. Eight constituents were identified as exceeding the Types 1 and 3 soil RRS. Three of these constituents, benzo(k)fluoranthene, chrysene, and lead did not exceed their Type 2 residential soil RRS. Only two constituents, benzo(a)pyrene and dibenz(a,h)anthracene exceeded their Type 4 soil RRS. Although there were exceedances of the RRS, it is unlikely that individuals would frequent the sediments at HAA-01 as often as indicated by the exposure frequency identified in the RRS soil calculations. Therefore, exposure to sediments is not expected to pose an unacceptable risk to receptors as the site.

Nonetheless, potential exposure of a recreational receptor was evaluated for the sediment. The constituents of interest for this evaluation are the five constituents (all PAHs) exceeding the Types 1, 2, and 3 RRS. Table 7-21 presents the equations used to evaluate the potential exposure to sediments. The potential receptor considered in this evaluation is an older child, ages 6 to 16 years old, wading in the drainage ditch. It

was assumed that this individual would wade in the drainage ditch twice a week for six months of the year or 48 days/year. Table 7-22 presents the exposure assumptions. The dermal parameters are included in Table 7-23, and the toxicity values used to evaluate sediment and surface water exposures are presented in Table 7-24. The Type 4 RRS or health-based concentration goals (HBGs) are presented in Table 7-25. The Type 4 (HBGs) are greater than the maximum detected concentrations.

7.4.4 Surface Water

Constituents detected in surface water were compared to their Georgia In-Stream Water Quality Standards (IWQS), or in the absence of the in-stream standards, their Type 1 RRS. Only 3 compounds, cadmium, chromium (total) and mercury were detected at maximum concentrations greater than their in-stream standards, as seen in Table 7-19. Type 4 RRS were calculated for a recreational receptor potentially exposed to all detected constituents in surface water. The equations used to derive the Type 4 RRS or HBG are presented in Table 7-26. Since several of the detected constituents are volatile, volatilization factors were derived and are presented in Table 7-27. The Type 4 standards are presented in Table 7-28. The maximum detected concentrations were below the Type 4 recreational receptor RRS. Therefore, there are no risks to human health from exposure to constituents in the surface water.

7.5 Summary and Conclusions

This human health risk assessment for HAA-01 (the former FTA and the DAACG Chlorinated Solvents Area site) evaluated the potential risks to human health by comparing the maximum detected soil and groundwater constituents to the Types 1 through 4 RRS. The potential exposure to constituents detected in surface water and sediment also was evaluated by comparing the maximum detected concentrations to the Type 1 RRS and Type 4 RRS for a recreational receptor.

The soil data collected above the shallow groundwater were compared to the RRSs. 16 constituents were detected at concentrations exceeding the Type 1 RRS and 10 constituents were detected exceeding the Type 2 standards. In addition, 14 and 6 constituents were observed to exceed their respective Type 3 and Type 4 RRSs, respectively.

The groundwater data were compared to the Types 1 through 4 RRS. A total of 33 constituents exceeded the Type 1 and Type 3 groundwater RRS. A total of 18 and 17

constituents exceeded the Type 2 and the Type 4 RRS for the shallow groundwater, respectively.

Eight constituents detected in sediments exceeded the Type 1 and Type 3 RRS. Five constituents detected in sediments exceeded the Type 2 RRS for soil. None of the detected constituents in sediment exceeded the Type 4 RRS. Three constituents detected in surface water exceeded the Georgia in-stream water quality standards (IWQS). All of the detected surface water constituents were compared with Type 4 RRS calculated based on exposure of a recreational receptor. None of the maximum detected concentrations exceeded the Type 4 RRS.

Revision 1 – April 2012
Original Report – June 2011

8. Ecological Health

This section presents the ERA that was conducted for the Site pursuant to GAEPD CSR guidance and HSRA regulations. The objective of the ERA is to evaluate whether ecological receptors may be adversely affected by exposure to site-related constituents. This ERA is intended to provide input for risk management decision-making for the Site, while maintaining a conservative approach that is protective of wildlife populations and communities.

8.1 Introduction

As previously mentioned, the HAA-01 is located on the northwestern portion of HAAF, west of the parking apron and runway and 800 feet northwest of the air control tower. HHA-01 is comprised of the former FTA and the DAACG Chlorinated Solvents Area identified just north of the former FTA.

A mixture of evergreen and deciduous plant species, typical to the marshy woodlands of the Coastal Plains, covers the northern portion of the site. The southern portion of the site (i.e., the former FTA) is a maintained grassy meadow. Two densely vegetated man-made drainage ditches lie to the north and south of the site and periodically contain stormwater drainage. These ditches receive drainage both from the parking apron and the site itself. The two ditches join on the western edge of the site and discharge to the Springfield Canal. Areas of mature hardwood and evergreen forest are located north and south of the two drainage ditches.

Topography at the site gently slopes toward the Springfield Canal that is located 3,600 feet to the west. The Springfield Canal flows southwest before emptying into the Little Ogeechee River. Five and a half miles downstream of HAAF, the Little Ogeechee River is classified, according to the Georgia Water Use Classifications and Water Quality Standards, as a water "generally supporting shellfish" (GAEPD 1999).

HAAF is expected to continue in its current role as an adjunct military facility to Fort Stewart. The facility, as a whole, is gated and fenced. Therefore, it is primarily military personnel or military contractors who have access to the former FTA site. According to sources at HAAF, there are no future development plans for the former FTA area.

Groundwater at the site occurs in the surficial aquifer at depths ranging from 2 to 15 ft bls and the deeper Floridian aquifer. The surficial aquifer is separated from the

Floridian Aquifer by a thick confining unit of clay. Recharge to the surficial aquifer occurs through precipitation on land directly above the aquifer.

As recommended by GAEPD regulations for a CSR under the HSRA regulations, the ERA was conducted in accordance with United States Environmental Protection Agency (USEPA) guidance. As such, the ERA is comprised of a SLERA followed by a BERA (USEPA 1997). Typically, the SLERA provides a conservative estimate of potential ecological hazards and compensates for uncertainty by incorporating numerous conservative assumptions. The purpose of the SLERA is to determine whether there is a high probability that there are no ecologically significant hazards; otherwise, a BERA is warranted (USEPA 1997, 2000a, 2001a). If a BERA is indicated, the information developed in the SLERA is used to help focus the BERA. The BERA is more complex than the SLERA and uses more realistic and site-specific information about potential exposures and effects in order to evaluate potential ecological hazards.

The approach used to assess ecological hazards associated with the Site is based on the USEPA eight-step process (USEPA 1997, 2000a, 2001a), as summarized in Figure 8-1. An expanded view of the USEPA eight-step process is provided in Figure 8-2. As illustrated on Figure 8-2, the USEPA paradigm divides Step 3 into two parts, Step 3a and Step 3b (USEPA 2000a). Step 3a allows for a more refined analysis of available information, while Steps 3b and beyond focus on further evaluation(s) for only those receptors, media, and constituents that are identified in previous steps. USEPA (2000a) states, "for the majority of sites, ERA activities will cease after the completion of Step 3a." The details of each step and how they relate to the Site ERA are described in the sections below.

The ERA process culminates in clearly defined scientific management decision points (SMDPs). The SMDPs represent critical steps where risk management decision-making occurs. Generally, the following types of decisions are considered at the SMDPs:

1. Whether the available information is adequate to conclude that ecological hazards (if any) are negligible and, therefore, there is no need for further action on the basis of ecological hazard.
2. Whether the available information is inadequate to make a decision at this point and the ecological risk assessment process should continue.
3. Whether the available information indicates a potential for adverse ecological effects and a more thorough assessment or remediation is warranted.

The remainder of the ERA is organized as follows:

- Ecological Risk Assessment Dataset Evaluation
- Screening-Level Ecological Risk Assessment
- Baseline Ecological Risk Assessment

8.2 Ecological Risk Assessment Dataset Evaluation

A statistical summary of the surface soil data (0-2 ft bls) is provided in Table 8-1. This table includes the number of detected samples, the minimum and maximum detected samples, a range of the detection limits, the maximum concentration, and the mean of the data based on Kaplan-Meyer (KM).

8.3 Screening Level Ecological Risk Assessment

This SLERA conservatively estimates potential hazards that may affect ecological receptors. The SLERA typically compensates for uncertainty in a precautionary manner by incorporating numerous conservative assumptions. The outcome of the SLERA is the conclusion that either there is a high probability that ecologically significant hazards are not posed to receptors, or that further assessment is warranted. Consistent with USEPA (1997) guidance, the SLERA for the Site is comprised of the following steps:

- Screening-Level Problem Formation
- Screening-Level Ecological Effects Evaluation
- Screening-Level Exposure Estimate and Risk Calculation
- Scientific Management Decision Point

8.3.1 Screening-Level Problem Formulation

Step 1 of the SLERA consists of both a screening-level problem formulation and a screening-level ecological effects evaluation. The screening-level problem formulation presents the background information, including a site characterization, potential ecological receptors, ecosystem characteristics, as well as information regarding the sources and effects of the potential chemicals (USEPA 1998). This information is used to develop a conceptual site model (CSM) that illustrates the potential relationships between stressors, pathways, and receptors.

ARCADIS MALCOLM PIRNIE

Revision 1 – April 2012
Original Report – June 2011

The following sections are included in the problem formulation:

- Environmental Setting
- Toxicological Profiles
- Media of Concern
- Potentially Exposed Receptors
- Potentially Complete Exposure Pathways
- Assessment and Measurement Endpoints

8.3.1.1 *Environmental Setting*

This section describes the ecological habitat at the Site based on observations made by Law personnel during a site visit conducted in January 2002 and by ARCADIS personnel in October 2008. Photographs of the site are presented in Appendix I.

The principal habitat types present at the former FTA are managed grassland and neighboring forestland. Managed grasslands are found at the former FTA and extend north and south to the drainage ditch in either direction. Managed grasslands are typified by planted grass of one or more species maintained by mowing, application of fertilizers, etc. Common fauna includes earthworms and other soil-dwelling invertebrates, birds such as robins, and mammals, such as shrews, rabbits, and raccoons. The former FTA, beyond the drainage ditches and within the isolated tree island between the northern and southern ditches, consists mainly of mixed hardwood bottomland forest with a few interspersed pines. Characteristic flora of this habitat type includes long-leaf pine (*Pinus pa/ustris*), loblolly pine (*P.taeda*), sweetgum (*Liquidambar styraciflua*), blackgum (*Nyssa sy/vatica*), live oak (*Quercus virginiana*), southern red oak (*Q. facata*), white oak (*Q. alba*), water oak (*Q. nigra*), and magnolia (*Magnolia sp.*). Saw-palmetto (*Serrenoa repens*) and honeysuckle (*lonicera sp.*) are commonly found as two of several understory plants. Fauna includes a wide variety of birds and mammals, including white-tailed deer (*Odocoileus virginianus*), wild turkey (*Meleagris gallopavo*), and gray squirrel (*Scurius carolinensis*).

The principal surface water body receiving drainage from the former FTA are the drainage ditches to the north and south which flow to the west toward Springfield Canal located 3,600 feet to the west. The ditches originate on the former FTA site and are fed by underground culverts from the flightline area. The ditches assist in draining the northern and southern end of the runways which are located just across Lightning

Road. These drainage ditches have concrete and asphalt waste lining both sides of the banks to prevent erosion (see Appendix I – Photographic Log). Flow in the ditches is governed by precipitation runoff. The ditches remain dry during periods of drought and swell during rain events. As a result, the ditches appear to be intermittent drainage conveyance, and any ponded areas of water provide essentially no viable aquatic habitat. To support this conclusion, vegetation growing in the ditches appears to be terrestrial, not wetland or aquatic rooted vegetation. This indicates that the ditches are at best an extremely marginal habitat for aquatic life and only during sporadic, temporary periods when they do contain water. Both sets of ditches are maintained by "bush hog" and are comprised predominantly of emergent grasses.

Additional drainage swales were identified along the northern portion of the site. These ditches were noted to receive waters from culverts originating from the airfield. Drainage appeared to be governed by precipitation runoff and flowed in a northern direction. During the October 2008 inspection, shallow water was observed at a depth of approximately 6 to 12 inches.

8.3.1.2 *Toxicological Profiles*

The mechanisms of ecotoxicity for constituents detected at the site vary depending on a wide range of factors, such as concentrations, receptor species, the exposure route (e.g., ingestion or direct contact), and physical factors (e.g., pH, temperature, oxygen levels, water hardness). Some of the effects that could be observed in wildlife are mortality, reduced reproductive ability, decreased fertility, decreased offspring survival, alteration of immune and behavioral function, decreased hatching success of eggs/larvae, and retarded growth (Sample et al. 1996, USEPA 2001b). The remainder of this subsection discusses mechanisms of ecotoxicity for chemicals detected at the site. These descriptions are presented without consideration of concentrations because the descriptions are intended to convey an understanding of potential effects, rather than to describe the concentrations at which these effects might occur.

Volatile Organic Compounds – VOCs tend to attenuate rapidly in surface soil, sediment, and surface water due to their inherent volatility. Although the effects of VOCs on ecological receptors are not well-understood, there have been extensive inhalation studies of the effects of VOCs under laboratory conditions. Inhaled volatile organics are typically metabolized in the body (often the liver), which may cause liver damage (depending on the organism) or the release of more toxic secondary metabolites. The VOCs or their metabolites may also cause neurological damage, and

many are mutagenic or carcinogenic. Additionally, some VOCs are fetotoxic and/or teratogenic (USEPA 2005; Sample et al. 1996).

Polynuclear Aromatic Hydrocarbons (PAHs) – PAHs (such as benzo(a)pyrene, chrysene, fluoranthene, and pyrene) are often released as a result of human activities, such as the incomplete combustion of fossil fuels or other organic materials. Some of these compounds are persistent and are known to be mammalian carcinogens, though the ecological effects of PAHs that are not carcinogenic are not well understood. Most PAHs are sorbed to solid particles in the environment, which radically reduces the bioavailability and toxicity of the sorbed PAHs. PAHs may be transformed by biotic and abiotic processes in the environment, and may bioaccumulate. PAHs have been shown to cause changes in liver enzymes and to perturb cell membranes but, in general, are not viewed as acutely toxic. Sublethal effects attributed to PAHs in aquatic animals include reduced reproductive ability and fertility, developmental abnormalities, delayed or retarded maturation, histological changes, and carcinogenesis (Neff, 1985).

Herbicides and Organochlorine Pesticides

While some herbicides and organochlorine pesticides (e.g., aldrin, dieldrin, endrin) may exhibit acute toxicity, the most toxicity is due to due to long-term, chronic effects. These effects may include reduced fecundity, chronic lethality, neurological effects, cessation of feeding, and bone degeneration (Nimmo and McEwen 1994; Fontenot 1999a, b). The mode of action for herbicides and organochlorine pesticides is not well understood, but they generally disrupt electrolyte balance in neurons and prevent them from conducting nerve impulses normally (Ware 1994). This manifests neurological effects such as reduced mobility, tremors, loss of equilibrium, convulsions, abnormal flexure, and lethargy or prostration. In addition, pesticides are well-known for causing eggshell thinning in birds and, thereby, reducing reproductive success (Newman 1998; Sample et al. 1996). In general, the organochlorine pesticides have very low water solubility and are considered insoluble (Nimmo 1985). However, they are soluble in polar solvents, and will preferentially move into fatty tissues. This fact, combined with the very slow breakdown rates, indicates that they will bioconcentrate into organisms in the lower levels of the food chain (such as worms) and will biomagnify into organisms in the higher levels of the food chain (such as raptors).

Inorganics – Many trace inorganics (e.g., cobalt, copper, chromium, iron, manganese, nickel, molybdenum, selenium, and zinc) are important in plant and animal nutrition, but the optimal concentration ranges are usually narrow (Leland and Kuwabara 1985). Other inorganics are nonessential, such as lead, cadmium, and mercury, and are toxic

to receptors at very low concentrations. Mechanisms of toxicity depend on the nature of the reactivity of the inorganic itself (Efroymson et al. 1997a). They may alter or inhibit enzyme activity, interfere with deoxyribonucleic acid (DNA) synthesis or electron transport, or block uptake of essential elements. Little is known about mechanisms of toxicity of constituents in earthworms (Efroymson et al. 1997b).

Trace metals such as chromium, copper, and zinc are essential for healthy enzyme function, and some organisms cannot survive without these metals. However, these naturally occurring constituents may cause adverse effects when exposure occurs at concentrations that significantly exceed background concentrations. Imbalances in the essential trace metals may cause a decrease in photosynthetic ability, poor spawning/hatching success, teratogenesis, susceptibility to predation and disease, reduced growth, mortality, histopathological changes, organ dysfunction of the liver or kidneys, neurological defects, changes in respiration and osmoregulation, and anemia. Some metals may bioaccumulate, but this mechanism is thought to be a less important ecological concern. Because these constituents are naturally occurring, many organisms have a capacity (albeit limited) to biotransform and/or eliminate naturally occurring inorganics (Newman 1998; Leland and Kuwabara 1985).

8.3.1.3 *Media of Concern*

Surface soil is the primary environmental media at the Site with which contact by ecological receptors is possible. There are no direct seeps of groundwater to soil that could serve as foraging grounds for ecological receptors. Furthermore, as discussed in Section 8.3.11, the drainage ditches only temporarily hold surface water and, for the most part, they are covered with terrestrial grass. The limited portions of the drainage ditches that do hold water during high rain events are lined with concrete and/or asphalt and do not provide suitable habitat for aquatic life (i.e., fish and benthic invertebrates). The lack of aquatic life in the drainage ditches prevents any upper-trophic level birds or mammals from foraging in the ditches. As a result, groundwater, surface water, and sediment are not considered to be direct and complete exposure pathways and are therefore not identified as media of concern for ecological receptors at the site. However, based on comments from the GADEP, the sediment was evaluated as if it were soil with a terretrial perspective. The site-specific CSM is depicted in Figure 8-3.

8.3.1.4 *Potentially Exposed Receptors*

The identification of the categories of receptors most likely to be exposed helps to focus the SLERA. Potentially exposed receptors are designated based on the available habitat associated with the Site. Section 8.3.1.1 provides a description of the habitat associated with the Site as well as wildlife observed or potentially present in these habitats. As described above and presented in the CSM, potentially exposed receptors include terrestrial wildlife (i.e., mammals and birds), soil invertebrates, and terrestrial plants.

As part of the identification of potentially exposed receptors, it is necessary to identify protected species that may be exposed to site constituents. The listings of threatened and endangered as well as tracked, rare, and unusual species were obtained from the Georgia Department of Natural Resources (GADNR, 2010) and the US Fish and Wildlife Service (USFW, 2010) online databases for Chatham County. No threatened or endangered species were identified at the Site, and the habitat present at the Site was found not to be suitable to support threatened or endangered species. The list of threatened and endangered species and habitats is presented in Table 8-2.

8.3.1.5 *Potentially Complete Exposure Pathways*

A complete exposure pathway is "one in which the chemical can be traced or expected to travel from the source to a receptor that can be affected by the chemicals" (USEPA 2001c). Therefore, a constituent, its release and migration from the source, a receptor, and the mechanisms of toxicity of that constituent must be demonstrated before a complete exposure pathway can be identified. The table below summarizes the potential exposure routes for the site, which is also illustrated in the CSM (Figure 8-3).

Ecological Community	Possible Exposure Routes
Terrestrial wildlife (i.e., birds and mammals)	Incidental ingestion of surface soil Direct contact of surface soil Ingestion of prey tissue
Terrestrial soil invertebrates (i.e., earthworms)	Direct contact of surface soil Ingestion of surface soil
Terrestrial plants	Direct contact of surface soil

8.3.1.6 *Assessment and Measurement Endpoints*

Assessment endpoints are the explicit expression of the ecological values to be protected (USEPA 1997). The selection of assessment endpoints depends on knowledge of the receiving environment, knowledge about the constituents released (including their toxicological properties and the relevant concentrations), and understanding of the values that will drive risk management decisions (Suter et al. 1995). Consistent with USEPA (1998) guidance, two elements are required to define an assessment endpoint: the specific valued ecological entity and the characteristic about the entity that is important to protect.

USEPA guidance provides that Superfund remedial actions should be designed not to protect organisms on an individual basis, but to protect local populations and communities of biota (USEPA 1999). Thus, the first management principle for conducting an ecological risk assessment is to provide a basis for selecting a response action "that will result in the recovery and/or maintenance of healthy local populations/communities of ecological receptors that are or should be present at or near the site" (USEPA 1999). The USEPA (1999) guidance also notes, as an exception to this rule, that threatened and endangered species may be evaluated on an individual basis. In concept, however, this focus is justified on the basis that, given the stressed nature of a threatened and endangered population, effects on individuals could impact the local population.

For the site, assessment endpoints include the following:

- Sustainability of mammal populations
- Sustainability of avian populations
- Sustainability of terrestrial plant communities
- Sustainability of terrestrial soil invertebrate communities (i.e., earthworms)

Because direct measurement of assessment endpoints is often difficult or infeasible, surrogate endpoints, called measurement endpoints, are used to provide the information necessary to evaluate whether the values associated with the assessment endpoint are being protected. A measurement endpoint is defined as a measurable ecological characteristic and/or response to a stressor (USEPA 1998). Hazard Quotients serve as the measurement endpoints for the SLERA. The HQ is the ratio of the exposure point concentration (EPC) of a given constituent to its ecotoxicity screening value (ESV). Exposure point concentrations in the SLERA are identified as the maximum concentrations of chemicals.

ESVs are chemical concentrations in environmental media below which there is negligible hazard to receptors exposed to those media (USEPA 2000a). ESVs are generally based on effects such as mortality and reproductive impairment, and are assumed to be widely applicable to sites around the United States for screening purposes (USEPA 1997). For most constituents and receptors, the data available to generate ESVs are limited and related to effects on individual organisms, rather than subpopulations or communities. Given these limitations, conservative assumptions are used to ensure that the ESVs are protective. Where ESVs are published, users are cautioned to recognize that such screening values do not constitute remediation goals, as they are sometimes based on highly conservative exposure assumptions and/or wildlife receptors that may not be applicable to a particular site. As such, their robustness and biological association with the assessment endpoint may be limited.

8.3.2 Screening-Level Ecological Effects Evaluation

The screening-level ecological effects evaluation (also Step 1 of the SLERA) involves the identification of ESVs for each detected constituent at the Site. As described above, ESVs are based on conservative assumptions to ensure that the values are protective and applicable to a wide variety of sites. Regardless, ESVs provide a starting point for the SLERA as they provide an indication of the worst-case measure of the potential for adverse impacts.

The ESVs used for this SLERA are consistent with GAEPD recommendations for HSRA and were identified from the USEPA Region 4 Ecological Screening Values (R4; USEPA 2001b). These values represent only highly conservative ESVs, as is appropriate for a SLERA (USEPA 1997; 1998; 2000a). These ESVs do not represent the range of ESVs that are available from a variety of other regulatory and scientific sources.

8.3.3 Screening-Level Exposure Estimate and Risk Calculation

The screening-level exposure assessment is Step 2 of the SLERA process and consists of the identification of exposure estimates, hazard calculations, and the evaluation of uncertainties (USEPA 1997, USEPA 2001a). These form the lines of evidence necessary to support the SMDP at the conclusion of the SLERA (Section 8.3.4).

As a first step in the data screening process, chemicals with a detection frequency less than or equal to 5 percent were eliminated from further analysis (USEPA 1989, 2001).

Then, exposure estimates for the SLERA were identified using the maximum detected concentrations for each constituent (USEPA 1997, USEPA 2001a). This conservative is appropriate for a SLERA. Exposure estimates are presented in Table 8-3 for surface soil and Table 8-7 for sediment assessed as soil.

Potential hazards to ecological receptors are calculated by dividing the exposure estimates (i.e., the maximum detected concentrations) by the conservative ESVs. The resulting ratio, the HQ, is a highly conservative surrogate for one or more of the assessment endpoints identified in Section 8.3.1.6. HQs equal to or less than a value of 1 (to one significant figure) indicate that adverse ecological impacts are unlikely (USEPA 1997). HQs greater than 1 indicate that further evaluation is warranted. Therefore, the constituents with HQs greater than 1 are carried forward as COPECs into Step 3a of the BERA.

8.3.3.1 Surface Soil

Results of the SLERA for surface soil are presented in Table 8-3 and indicate 10 constituents in surface soil (0 to 2 feet bls) had maximum HQs greater than 1, and therefore were identified as COPECs: anthracene, benzo[a]pyrene, bis(2-ethylhexyl)phthalate, fluoranthene, phenanthrene, pyrene, 4,4'-DDT, dieldrin, cadmium, and chromium.

Eleven constituents in surface soil lack ESVs and were therefore identified as COPECs (Table 8-3): acetone, CFC-11, acenaphthylene, benz[a]anthracene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzoic acid, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, and indeno[1,2,3-cd]pyrene.

8.3.3.1 Sediment as Soil

Results of the SLERA for sediment that was assessed as soil from a terrestrial perspective are presented in Table 8-7 and indicate 8 constituents in sediment had maximum HQs greater than 1, and therefore were identified as sediment as soil COPECs: anthracene, benzo[a]pyrene, fluoranthene, naphthalene, phenanthrene, pyrene, chromium, and lead.

Sixteen constituents detected in sediment lack ESVs and were therefore also identified as COPECs (Table 8-7): acetone, carbon disulfide, CFC-11, 2,4,6-tribromophenol, 2-fluorobiphenyl, 2-fluorophenol, 4-bromofluorobenzene, acenaphthylene, benz[a]anthracene, benzo[b]fluoranthene, benzo[g,h,i]perylene,

benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluorene, and indeno[1,2,3-cd]pyrene.

8.3.4 Scientific Management Decision Point

The SMDP represents a critical step in the ecological risk assessment process where risk management decision-making occurs (Figures 8-1 and 8-2). Generally, the following types of decisions are considered at this SMDP:

- Whether the available information is adequate to conclude that ecological hazards are negligible and, therefore, there is no need for remediation to mitigate ecological hazards.
- Whether the available information is not adequate to make a decision at this point, and the ecological risk assessment process should continue.
- Whether the available information indicates a potential for adverse ecological effects, and a more thorough assessment or remediation is warranted.

As described above, the SLERA for the Site identified 21 COPECs, therefore, the possibility of adverse effects to ecological receptors cannot be ruled out, and the initial step of a BERA is warranted.

8.4 Baseline Ecological Risk Assessment

The BERA is designed to more realistically identify the nature and extent of ecological hazards to support informed risk management decision-making (USEPA 1997, 2000a). This approach contrasts with the SLERA, which is designed to conservatively rule out further evaluation of constituents and media that clearly do not pose a significant ecological hazard. As indicated on Figure 8-1 and Figure 8-2, the BERA process involves numerous steps. These steps are executed in a manner appropriate to the conditions at any individual site (USEPA 1997, 2000a).

The USEPA process shows that the BERA begins with Step 3, the Problem Formulation (Figure 8-1). A more detailed look at the Step 3 shows that it is typically divided into Step 3a and Step 3b (Figure 8-2). “Step 3a serves to introduce information to refine the hazard estimates from Steps 1 and 2. For the majority of sites, ERA activities will cease after Step 3a” (USEPA 2000a). Step 3a provides a “reality check” so that “sites that do not warrant further study are not carried forward” (USEPA 2000a).

Step 3b, the "additional problem formulation" is initiated only for those sites that warrant further study.

This section presents Step 3a of the BERA for the site. This approach is consistent with the following ecological risk assessment guidance and guidelines:

§ *ECO-Update: Role of Screening-level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (USEPA 2001a)

§ *Ecological Risk Assessment Guidance for Superfund* (USEPA 1997)

§ *Guidelines for Ecological Risk Assessment* (USEPA 1998)

This section presents Step 3a of the BERA for the site. Step 3a of the BERA is a refinement of the Step 2 exposure estimates and hazard characterization, and focused only on the COPECs and media that progress beyond the SLERA. Since further ecological evaluation was indicated, it was conducted with the intent to be an "incremental iteration of exposure, effects, and risk characterization" (USEPA 2001a). Therefore, the assumptions used in Step 3a are refinements of the conservative estimates of exposure and toxicological impacts, to site-specific (or receptor-specific) estimates of exposure, and alternative screening values (ASVs) (USEPA 2001b). Hazards were recalculated using these refined assumptions to further eliminate the number of COPECs that are retained for further evaluation in the BERA process.

Risk characterization in Step 3a is based on HQs generated for direct contact COPECs using ASVs and for bioaccumulative COPECs based on food chain modeling. The calculated HQs are considered within the context of weight-of-evidence and ecological significance of the hazard estimates. A weight-of-evidence approach is a means to evaluate the value of the information provided by measurement endpoints and observations made about a site (Menzie et al. 1996; Barnthouse 2007). This approach is particularly useful when conflicting predictions of hazard are obtained. The weight-of-evidence provided by the HQs and field observations are evaluated to make conclusions regarding hazard characterization.

Step 3a involves the following:

- Refinement of COPECs
- Refinement of Exposure Point Concentrations
- Alternative Screening Values

- Hazards to Upper-trophic Level Wildlife
- Hazard Characterization
- Uncertainties
- Summary and Conclusions

8.4.1 Refinement of COPECs

The refinement of the COPECs identified in the SLERA is necessary to help focus and streamline further risk assessment activities on the constituents that pose the greatest potential hazard to ecological receptors (USEPA 1997, 2001a). It is intended as an "incremental iteration of exposure, effects, and risk characterization" (USEPA 2001a). The outcome of this screening is that constituents are either excluded as COPECs or retained for further evaluation in the BERA process. The process for refining the COPECs generally consists of two steps: 1) the comparison of maximum detected concentrations with background concentrations; and 2) using the upper confidence limits on the mean (UCLs) as the EPCs and comparing those to alternative ESVs. The comparison to background step is applicable for inorganic constituents, and is not applicable for organic constituents, under most circumstances, because these constituents are not naturally occurring. Soil background levels for inorganics were identified from the Final Compliance Status Report for the Fire Training Station at HAAF (Law, 2002) and were incorporated into the BERA screen.

8.4.2 Refinement of Exposure Point Concentrations

Exposure point concentrations (EPCs) were calculated based on the upper confidence limit of the mean of the data (UCLs) by statistical software provided by USEPA (ProUCL). This program calculates the UCLs based on different statistical assumptions and then selects the most representative statistic based on characteristics of the data set such as sample size, measures of variance, and frequency of detection (FOD). The most recent available version of the ProUCL software (version 4.00.05, USEPA 2010) was utilized to calculate UCLs for each COPEC. UCLs were calculated for datasets with a minimum of 5 samples detected. The lower of the UCL or the maximum detected value was used as the EPC for the refined data screen. Output files from ProUCL are presented in Appendix J.

8.4.3 Alternative Screening Values

An expanded list of ecological screening values (i.e., alternative screening values [ASVs]) was used to screen the UCLs. There are several reasons to include ASVs, and the methodology is consistent with the approach for, "incremental iteration of exposure, effects, and risk characterization" (USEPA 2001a, 1997c). For example, some constituents may not have screening values in the guidance used in the SLERA. Also, an expanded list of ASVs may provide insight into the type or likelihood of impacts (e.g., acute vs. chronic effects, threshold effects levels, severe effects levels, median effects levels, probable effects levels). ASVs used for this BERA were obtained from the following sources:

- USEPA Ecological Soil Screening Levels (EcoSSLs) (2005)
- USEPA Region 5 Ecological Screening Levels (USEPA 2003; R5)

A summary of the refined HQs and their likelihood for adverse impacts based on direct contact with surface soil is discussed in the Risk Characterization (Section 8.4.5) and presented in Table 8-4 for soil and Table 8-8 for sediment assessed as soil.

8.4.4 Risks to Upper-Trophic Level Wildlife

Preliminary ingestion-based food chain modeling is used in Step 3a of the BERA to evaluate potential adverse effects to upper-trophic level wildlife from bioaccumulative COPECs. The remainder of this section provides general information regarding the following components of the model:

- Wildlife Receptors and Exposure Parameters
- Bioconcentration Factors
- Food Chain Ingestion Modeling
- Toxicity Reference Values
- Wildlife Dose Models

8.4.4.1 *Wildlife Receptors and Exposure Parameters*

Indicator species were chosen to represent a cross-section of feeding guilds for selected assessment endpoints and allow for an estimation of rates of survival, growth, and reproduction for populations of receptors they represent.

Feeding guild and indicator species are as follows:

- Invertivorous bird - American robin (*Turdus migratorius*)
- Invertivorous mammal - Short-tailed shrew (*Blarina brevicaudus).*

A graphical representation of the terrestrial receptors identified for the site for food chain modeling is presented in Figure 8-3. The shrew and robin were selected because these species are known to be susceptible to food chain exposures. Earthworms comprise a major component of the shrew and robin diets and accumulate persistent compounds (USEPA 1993). As a conservative measure, the diet of both the shrew and the robin were assumed to consist of 100% earthworms. As such, if hazards are not predicted for these species, then hazards would not be expected for species with lesser exposures to bioaccumulative constituents (e.g., herbivores). In addition, dietary and toxicological information is available for these species (e.g., USEPA 1993; Sample et al. 1996), making food chain modeling feasible.

The short-tailed shrew is one of the most common mammals in America and may be present in the site vicinity. The short-tailed shrew also represents a conservative species for use in the BERA because it has a very high ingestion rate, and it consumes a high percentage of earthworms in its diet compared with other mammalian species. If hazards are not predicted for this species, then hazards should not be expected for species with lesser exposures to bioaccumulative constituents (e.g., herbivorous mammals).

The American robin is prolific throughout the United States, with a home range that includes Georgia. This bird is likely to forage in open areas and the ecotone between woodlands and open areas (i.e., edge habitat), and thus may be exposed to bioaccumulative COPECs at the site. The American robin also can be used as a surrogate species to represent other species that are likely to be present at the site and in the adjacent woodlands, but for which less exposure-related and toxicological information is available. Hazards to the American robin could identify potential hazards to other species with similar diets.

Exposure parameters for each receptor were obtained from USEPA's Wildlife Exposure Factors Handbook (USEPA, 1993). One of the exposure parameters, the size of the home range, is an important factor in estimating the amount of time a receptor spends onsite and thus, the amount of exposure to COPECs. This is accounted for by using a site use factor (SUF) in the equation. As a conservative measure, the SUF was set to 1 implying that the receptors obtain their entire diet from the site.

8.4.4.2 *Bioconcentration Factors*

Soil bioconcentration factors (BCFs) used for the food chain modeling were obtained from constituent- specific documentation for USEPA Ecological Screening Levels for Soil (EcoSSL; USEPA 2007). Tissue concentrations for invertebrates in dry weights were converted to wet weight assuming a moisture content of 83.3%.

8.4.4.3 *Toxicity Reference Values*

COPEC-specific toxicity reference values (TRVs) were obtained from the toxicological database presented in USEPA's Ecological Soil Screening Level (EcoSSL) documents (USEPA 2005) and Oak Ridge National Laboratory (ORNL). Toxicological benchmarks are typically reported as no observed adverse effect levels (NOAELs) and lowest observed adverse effect levels (LOAELs). TRVs reported as NOAELs were converted to LOAELs using a factor of 10. Both NOAELS and LOAELs for each COPEC are used in the food chain modeling so that a range of predicted food chain impacts can be evaluated.

8.4.4.4 *Wildlife Dose Models*

Food chain ingestion-based exposure calculations were performed for the identified representative receptor species to characterize potential exposures to constituents via the food chain and to identify potential adverse effects for wildlife at the site. Ingestion modeling is based on species-specific exposure parameters and ingestion intake requirements. The use of upper bound concentrations is intended to represent, in effect, a reasonable maximum exposure estimate. The following model is used to calculate the ingestion based exposure for each indicator receptor:

$$ADD = \frac{\left\{\left[\left(IR_f \times C_f\right) + \left(IR_s \times C_s\right)\right] \times AUF \times SUF\right\}}{BW}$$

Where:

ADD	=	Average daily dose of COPEC (mg/kg-day)
IR_f	=	Ingestion rate of food (kg/d)
C_f	=	Concentration of a COPEC in food (mg/kg)
IR_s	=	Ingestion rate of soil (kg/d)
C_s	=	Concentration of a COPEC in soil (mg/kg)
SUF	=	Site use factor (unitless)
BW	=	Body weight (kg)

To estimate the concentration of COPEC in food (C_f), the following equation is used:

$$Cf = (C_s \times \%Plant \times BCF) + (C_s \times \%Invert \times BCF) + (C_s \times \%Flesh \times BAF)$$

Where:

C_f = Concentration of a COPEC in food (mg/kg)
C_s = Concentration of a COPEC in soil (mg/kg)
BCF= Bioconcentration factor (unitless) (Table 5)
BAF= Bioaccumulation factor (unitless) (Table 5)
%Plant = Percentage of plants in diet
%Invert = Percentage of invertebrates in diet
%Flesh = Percentage of flesh in diet (mammals, birds, etc.)

Estimated ingestion intakes were divided by TRVs to obtain HQs for the bioaccumulative COPECs. A HQ value of 1 or less is considered to indicate that adverse effects are not expected. An HQ above 1 indicates the need for further refinement. Results are presented in Tables 8-5 and 8-6 for the shrew and robin, respectively from exposure to soil and Tables 8-9 and Table 8-10 also for shrew and robin from exposure to sediment assessed as soil.

8.4.5 Risk Characterization

This section presents the results of the ecological risk assessment and discusses the potential hazards to ecological receptors per constituent below. Where possible, hazards are discussed quantitatively, based the relative magnitude of the HQs. If HQs could not be calculated due to a lack of toxicity data, the results are discussed qualitatively. The following COPECs did not have identified ESVs: 2,4,6-tribromophenol, 2-fluorobiphenyl, 2-fluorophenol, 4-bromofluorobenzene in sediment and benzoic acid in soil. Ecotoxicological information for those constituents is limited and their effects were not quantitatively evaluated. The qualitative assessment of benzoic acid in surface soil is described below.

Benzoic Acid

ASVs for benzoic acid were not identified; therefore, hazard from benzoic acid is qualitatively assessed. Benzoic acid or carboxybenzene is a common food additive and is used in the synthesis of other organic chemicals (Perrin and Armarego 1988). It is also naturally occurring in plants (notably berries and apples) and has been found in the urine of elephants (WHO IPCS 2000). The oral LD_{50} for rats is 3040 mg/kg, for

mice it is 1940–2263 mg/kg. The one surface soil sample where benzoic acid was detected was located at HMW-10 at a concentration of 0.51 mg/kg. The one low detection of a chemical that is known to naturally occur indicates no possibility of potential adverse effects to ecological receptors at the site.

Benzo[a]anthracene

Benzo[a]pyrene (BaA) was detected in 6 out of 7 sediment samples. The HQ calculated for direct exposure to sediment assessed as soil using the R5 ESL was above 1 (Table 8-8). Because BaA is considered a bioaccumulative chemical and the HQ for direct contact to terrestrial organisms exceeded the threshold value of 1, it was also assessed in a dose model to upper-trophic level wildlife.

Potential hazards to the short-tailed shrew and American robin were conservatively estimated for dietary exposure to BaA using a diet consisting of 100% earthworms and the sediment UCL as the EPC. HQs for both the shrew and the robin slightly exceeded 1 (3) when based on the NOAEL TRV and were below 1 (0.3) when based on the LOAEL TRV (Table 8-9 and 8-10).

Benzo[a]pyrene

Benzo[a]pyrene (BaP) was detected in 12 of 39 samples, with a maximum concentration of 26 mg/kg and a UCL of 3.6 mg/kg. BaP was also detected in 5 of 7 sediment samples, with a maximum concentration of 27 mg/kg and a UCL of 14 mg/kg. The HQ calculated for direct exposure to both surface soil and sediment assessed as soil using the R5 ESL were above 1 (Tables 8-4 and 8-8). Because BaP is considered a bioaccumulative chemical and the HQ for direct contact to terrestrial organisms exceeded the threshold value of 1, it was also assessed in a dose model to upper-trophic level wildlife.

Potential hazards to the short-tailed shrew and American robin were conservatively estimated for dietary exposure to BaP using a diet consisting of 100% earthworms and the surface soil and sediment UCLs as the EPCs. HQs for both the shrew and the robin were below 1 when based on both NOAEL and LOAEL TRVs and surface soil (Tables 8-5 and 8-6). HQs for both the shrew and the robin slightly exceeded 1 (2) when based on the NOAEL TRV and were below 1 (0.2) when based on the LOAEL TRV (Table 8-9 and 8-10).

Chrysene

Chrysene was detected in 6 out of 7 sediment samples. The HQ calculated for direct exposure to sediment assessed as soil using the R5 ESL was above 1 (Table 8-8). Because chrysene is considered a bioaccumulative chemical and the HQ for direct contact to terrestrial organisms exceeded the threshold value of 1, it was also assessed in a dose model to upper-trophic level wildlife.

Potential hazards to the short-tailed shrew and American robin were conservatively estimated for dietary exposure to chrysene using a diet consisting of 100% earthworms and the sediment UCL as the EPC. HQs based on the NOAEL TRV (6 and 7 for the shrew and the robin, respectively) exceeded 1. However HQs based on the LOAEL TRV were below 1 (Table 8-9 and 8-10).

Dieldrin

Dieldrin was detected in only 3 of 20 samples, with a maximum concentration of 0.043 mg/kg. Because of the small number of samples where dieldrin was detected, a UCL could not be calculated and the maximum concentration was used instead to calculate hazard. The direct contact HQ calculated using the maximum concentration and the ASV (EcoSSL) was 9 (Table 8-4). Because dieldrin is considered a bioaccumulative chemical and the HQ for direct contact exceeded the threshold value of 1, it was also assessed in a dose model to upper-trophic level wildlife.

Potential hazards to the short-tailed shrew and American robin were conservatively estimated for dietary exposure to dieldrin using a diet consisting of 100% earthworms and the maximum concentration as the EPC. The HQ based on the NOAEL TRV for the shrew (4) exceeded 1 while the LOAEL-based HQs for the shrew (0.4) was below 1 (Table 8-5). For the robin, only the NOAEL-based HQ exceeded 1 (16; Table 8-6) and the NOAEL TRV slightly exceeded 1 (2; Table 8-6).

Lead

Lead was a COPC for sediment assessed as soil. All detected lead concentrations in both soil and sediment were below the screening level with the exception of one detection in sediment sample SD_3 collected in 1990 (356 mg/kg). Potential hazards to the short-tailed shrew and American robin were conservatively estimated for dietary exposure to lead using a diet consisting of 100% earthworms and the concentration at SD-3 as the EPC. The HQs for the shrew were 1 and 2 based on the NOAEL and the

LOAEL, respectively (Table 8-9). For the American robin, the HQs were 8 and 16 based on the NOAEL and the LOAEL, respectively (Table 8-10). The HQs based on the second highest concentration in sediment of 29 mg/kg were below 1 for both the shrew and were 1 and 2 based on the NOAEL and the LOAEL, respectively for the robin.

8.4.6 Risk Characterization Results

Calculated HQs based on NOAEL TRVs for both the shrew and the robin for exposure to dieldrin in surface soil and BaA, BaP, and chrysene in sediment were above 1, while HQs for same COPECs were all below 1 if based on LOAEL TRVs. The HQs for both the robin and the shrew from exposure to lead concentration in one sample in sediment were above 1; however the HQs based on the second highest sample were below one for the shrew or 1 and 2 based on the NOAEL and the LOAEL, respectively for the robin. Because the LOAEL-based TRVs are much more realistic estimate of potential adverse effects, adverse effects to upper-trophic level wildlife from exposure to these COPECs at the site are considered unlikely.

Hazard to terrestrial wildlife from exposure to dieldrin in surface soil is especially unlikely because dieldrin was only detected in a small area of the site. Dieldrin was only detected in 3 out of 20 surface soil samples (SB-025, SB-026, and SB-027). As such, the HQs were calculated based on maximum concentrations from three samples in the localized area. The true EPC of dieldrin is likely much lower. Further, this localized area (with a radius of approximately 200 feet) represents a small percentage of the shrew's average foraging range (1 acre). Moreover, this area is maintained short grass without cover which is not ideal habitat for shrew or other small wildlife mammals. Because hazard from exposure to the area with dieldrin impacts is low, a remediation action level was not developed.

Hazard to terrestrial wildlife from exposure to sediment is also unlikely. The area of the drainage ditches represent a small percentage of the shrew and robin's average foraging range **and less than the de minims areal extent typically used in an ecological risk assessment of 1-2 acres (Suter et al. 1995; Henning and Shear 1998; Efroymson et al. 2003).**

8.4.7 Uncertainties

A BERA is designed to evaluate potential hazards to ecological receptors by incorporating iterative changes that reduce uncertainty (when possible). Uncertainties associated with the ERA are summarized in Table 8-11.

8.4.8 Summary and Conclusions

This ERA presents the results of a SLERA and Step 3a BERA for ecological receptors at the Site based on HQs. An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely (USEPA 2004a). An HQ greater than 1 indicates that adverse effects of some kind may have occurred in the past or may occur in the future and that further analysis of potential ecological hazards may be warranted.

Hazards were characterized for ecological receptors at the site by considering direct contact with COPECs in surface soil (0-2 ft bls) and through ingestion of prey tissue through a food web model to upper-trophic level wildlife. Overall potential ecological hazards are low to negligible for exposure to site surface soil. Most chemicals have HQs below 1. The two COPECs with direct contact HQs above 1 were relatively low (2 for benzo(a)pyrene and 9 for dieldrin). Potential hazards modeled to upper-trophic level invertivorous birds and mammals are also low, with LOAEL-based HQs less than 1 for the robin and only slightly above 1 for the shrew. The LOAEL-HQ that exceeded 1 is based on three localized detections of dieldrin, which represent a very small portion of the overall exposure area.

Based on this assessment, ecological hazards at the Site are minimal and no further evaluation is required.

Original Report – June 2011

9. Public Involvement

The opportunity for public involvement will be provided in accordance with the GAEPD, *HSRA*, Section 391-3-19-.06(5). A copy of the CSR will be made available to the public at the Live Oak Public Library, Chatham County, located at 2002 Bull Street, Savannah, GA 31419. Additionally, a public notice will be published in the Savannah Daily News and in The Frontline, a Fort Stewart publication announcing that the CSR is available for inspection by the public. A statement including the following will be included in the public notice:

"*The Georgia Environmental Protection Division, Department of Natural Resources, State of Georgia (GAEPD) has placed this site on the Hazardous Site Inventory pursuant to its authority under the Hazardous Site Response Act and Rules promulgated thereunder. As required by the Rules for Hazardous Site Response, the responsible party for this site was required to investigate the site and submit a compliance status report to GAEPD summarizing the results of that investigation. GAEPD is currently reviewing the compliance status report to determine if corrective action is needed for regulated substances that have been released at this site. Before GAEPD decides whether corrective action is needed, the public has the opportunity to review the compliance status report and provide comments to GAEPD about the report.*"

The notice will also include the announcement of a 30-day public comment period beginning on the date of the notice and will provide the location of the above referenced library where the CSR can be viewed. The public notice will also provide the name, address and telephone number of the responsible party or its designated contact person and the GAEPD contact person to whom written or oral comments can be made. The GAEPD will be provided with an exact copy of the public notice within 15 days of the publication of the notice. The Chatham County government will be provided with the same written notice within 7 days of the submittal of the CSR to the GAEPD.

Revision 1 – April 2012
Original Report – June 2011

10. Conclusions

In November and December 2009, soil and groundwater investigations were completed at the former FTA and DAACG Area to complete delineation of previously detected compounds in soil and/or groundwater. Results of soil laboratory analysis in the former FTA showed the detection of several compounds above the PQL, including several metals, VOCs, and one SVOC (bis[2-ethylhexyl]phthalate). Of the contaminants detected, none exceeded the Type 1 RRS. In addition, the reported metals concentrations were below the calculated UBC, with the exception of chromium concentrations at 3 locations. Groundwater samples collected and analyzed in January and February 2012 provided further delineation of compounds in groundwater.

The laboratory analysis of soil samples collected from new monitor well locations in the DAACG area showed detections of VOCs, metals, and pesticides. Of these compounds, no exceedances of the Type 1 RRS were observed. In addition, the majority of metal compounds detected were observed to be below the established UBC. The majority of VOCs detected can be identified as either naturally occurring (carbon disulfide), common laboratory artifacts (acetone, chloromethane), or were detected at low concentrations qualified as estimated.

Results of groundwater laboratory analysis in the former FTA area revealed detections of multiple compounds in exceedance of the Type 1 RRS (benzene, 1,1,2,2-tetrachloroethene and naphthalene). Detections of these compounds are consistent with previous groundwater monitoring results at the FTA. In addition, multiple compounds were detected at concentrations above the PQL but below the RRS. Laboratory analytical results for monitor well HA01-MW-17, installed northwest of existing monitor well HMW-10 to delineate benzene in the former Fire Training Area, revealed no detection of benzene. As shown on Figure 5-31, the extent of benzene in groundwater has been horizontally delineated to non-detect concentrations.

Groundwater laboratory analysis of the new monitor wells installed in the DAACG area, as well as analysis of the existing monitor well network in the DAACG area, showed detections of multiple compounds exceeding the Type 1 RRS or the MCL when no RRS has been established (aldrin, benzene, cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride). Multiple compounds were also detected at concentrations below the RRS. In general, metals detected in groundwater were below the established UBC. Taking these factors into account, it can be concluded that COCs in groundwater are delineated in the DAACG Area.

Revision 1 – April 2012
Original Report – June 2011

The human health risk assessment for HAA-01 (the former FTA and the DAACG Chlorinated Solvents Area site) evaluated the potential risks to human health by comparing the maximum detected soil and groundwater constituents to the Types 1 through 4 RRS. The potential exposure to constituents detected in surface water and sediment also was evaluated by comparing the maximum detected concentrations to the Type 1 RRS. Sixteen constituents were detected in soil at concentrations exceeding the Type 1 RRS and ten constituents were detected at concentrations exceeding the Type 2 standards. In addition, 14 and 6 constituents exceeded the Type 3 and Type 4 RRS, respectively. A total of 33 constituents were detected in groundwater at concentrations that exceeded the Type 1 and Type 3 groundwater RRS. Additionally, 18 and 17 constituents exceeded the Type 2 and Type 4 RRS, respectively, for the shallow groundwater. Eight constituents detected in sediments exceeded the Type 1 and Type 3 RRS. Five constituents detected in sediments exceeded the Type 2 RRS for soil. None of the detected constituents in sediment exceeded the Type 4 RRS. Three constituents detected in surface water exceeded the Georgia in-stream water quality standards (IWQS). All of the detected surface water constituents were compared with Type 4 RRS calculated based on exposure of a recreational receptor. None of the maximum detected concentrations exceeded the Type 4 RRS.

The ERA presented the results of a SLERA and Step 3a BERA for ecological receptors at the site based on HQs. Risks were characterized for ecological receptors at the site by considering direct contact with COPECs in surface soil (0-2 ft bls) and through ingestion of prey tissue through a food web model to upper-trophic level wildlife. Overall potential ecological risks are low to negligible for exposure to site surface soil. Most chemicals have HQs below 1. The two COPECs with direct contact HQs above 1 were relatively low (2 for benzo(a)pyrene and 9 for dieldrin). Potential hazards modeled to upper-trophic level invertivorous birds and mammals are also low, with LOAEL-based HQs less than 1 for the robin and only slightly above 1 for the shrew. The LOAEL-HQ that exceeded 1 is based on three localized detections of dieldrin, which represent a very small portion of the overall exposure area (vicinity of SB-025, SB-026, and SB-027). Based on this assessment, ecological hazards at the site were determined to be minimal with no further evaluation required.

11. Recommendations

This CSR for HAA-01 has presented physical, analytical, and risk assessment data to support the conclusion that the potential impacts to the environment by past activities at the site have been sufficiently characterized in surface soil, subsurface soil, sediment, surface water and groundwater. Based on the data provided herein, the following conclusions are submitted for consideration by the GAEPD:

§ The CSR investigation has been completed, and the potential impacts to the environment by past activities at HAA-01 have been sufficiently characterized and delineated where necessary in surface soils, subsurface soils, sediment, surface water and groundwater.

§ A Corrective Action Plan (CAP) will be developed to address CVOC, benzene and aldrin impacts in groundwater in the DAACG Area and benzene and naphthalene impacts in groundwater in the former FTA. Additionally, soil impacts historically detected in the former FTA will also be carried forward in the CAP for further evaluation.

Upon approval of this document, preparation of the CAP will be initiated. The CAP will be prepared to identify the selected corrective action to be implemented in order to address residual compounds in groundwater and soil exceeding the Type 1 RRS.

Notes:

*Denotes sample depth, not screened interval.

BTEX	Benzene, Toluene, Ethylbenzene, Xylene
NA	Not analyzed
RCRA Metals	Arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver analyzed by USEPA Methods 6010, 7060, 7421, 7471, and 7740
SVOCs	Semi-volatile organic compounds analyzed by USEPA Method 8270
TPH-GRO/DRO	Total petroleum hydrocarbons for gasoline range organics and diesel range organics analyzed by USEPA Method 8015B
VOCs	Volatile organics compounds analyzed by USEPA Method 8240 or 8260
Other	Alkalinity, chloride, nitrate, nitrite, sulfate, sulfite, and total organic carbon
	Duplicate information

	Sample Date	11/4/2009	11/4/2009	11/10/2009	11/3/2009	11/3/2009	11/3/2009	11/3/2009
Chemical Name	Type 1 RRS							
SVOCs continued - USEPA Method SW8270 (µg/kg)								
N-Nitrosodiphenylamine	6,460	NA	NA	NA	NA	< 83 U	NA	NA
Pentachlorophenol	3,300	NA	NA	NA	NA	< 410 U	NA	NA
Phenanthrene	110,000	NA	NA	NA	NA	< 83 U	NA	NA
Phenol	50,000	NA	NA	NA	NA	< 83 U	NA	NA
Pyrene	500,000	NA	NA	NA	NA	< 83 U	NA	NA

Notes:
* - Duplicate sample
- Indicate the analyte was detected above the Georgia HSRA Type 1 Risk Reduction Standards
BOLD - indicate the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
ft bgs - feet below ground surface
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
µg/kg - Micrograms per Kilogram
mg/kg - Milligrams per Kilogram
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
SVOCs - Semi-volatile Organic Compounds
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
VOCs - Volatile Organic Compounds

Notes:
* - Duplicate sample
 - Indicate the analyte was detected above the Georgia HSRAType 1 Risk Reduction Standards
BOLD - indicate the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
ft bgs - feet below ground surface
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
µg/kg - Micrograms per Kilogram
mg/kg - Milligrams per Kilogram
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
SVOCs - Semi-volatile Organic Compounds
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
VOCs - Volatile Organic Compounds

NOTES ON LAST PAGE

Notes:

- Indicate the analyte was detected abovethe Type 1 RRS or detection limit where no RRS has been established

* - Duplicate sample
NA
BOLD - indicate the analyte was detected above the PQL
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
H - Sample was prepped or analyzed beyond the specified holding time.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte ir the sample.
µg/L - Micrograms per Liter
mg/L - Milligrams per Liter
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
SVOCs - Semi-volatile Organic Compounds
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.

UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
VOCs - Volatile Organic Compounds
+ - HMW-23 was re-sampled in January 2010 as a result of broken VOA vials in the December 2009 sample shipment

NA = Not Applicable

Table 7-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-01 (Former Fire Training Area and DAACG Chlorinated Solvent Area)
Hunter Army Airfield, Savannah, Georgia

ROUTE-SPECIFIC RRSs:

Oral:

$$(RRS_o)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ BW\ x\ (AT_C\ or\ AT_{NC})\ x\ (10^6\ mg/kg)}{IRs\ x\ EF\ x\ ED\ x\ [SF_O\ or\ (1/RfD_O)]}$$

Inhalation:

$$(RRS_i)_{C\ or\ NC} = \frac{(TCR\ or\ THI)\ x\ (AT_C\ or\ AT_{NC})\ x\ BW}{[(1/VF)\ +\ (1/PEF)]\ x\ EF\ x\ ED\ x\ [SF_I\ or\ (1/RfD_I)]}$$

where:

$$PEF = \frac{LS\ x\ V\ x\ DH}{A}\ x\ \frac{(1000\ g/kg)\ x\ (3{,}600\ sec/hr)}{RPF\ x\ (1\text{-}G)\ x\ (Um/Ut)^3\ x\ F_x}$$

$$VF = \frac{LS\ x\ V\ x\ DH}{A}\ x\ \frac{(3.14\ x\ \alpha\ x\ T)^{1/2}}{2\ x\ Dei\ x\ E\ x\ Kas\ x\ (10^3\ kg/g)}$$

$$\alpha = \frac{Dei\ x\ E}{E\ +\ [ps\ x\ (1\text{-}E)/Kas]}$$

$$Dei = Di\ x\ E^{0.33}$$

$$Kas = H/(RT\ x\ Kd)$$

Cancer Effects RRS:

$$RRS_C = \frac{1}{\frac{1}{(RRS_O)_C} + \frac{1}{(RRS_I)_C}}$$

Non-Cancer Effects RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{(RRS_O)_{NC}} + \frac{1}{(RRS_I)_{NC}}}$$

RRS = Minimum result of RRS_C and RRS_{NC}.

where:

α	Alpha; calculation intermediate (cm^2/sec).
A	Contiguous area of contamination (20,250,000 cm^2; USEPA [1991] default).
AT_C	Averaging time for cancer effects (25,550 days).
AT_{NC}	Averaging time for non-cancer effects (10,950 for adult residents; 2,190 days for child residents; 9,125 days for site workers); ED x 365 days/year.
BW	Body weight (70 kg for adult receptors; 15 kg for child resident
DH	Diffusion Height (2 m, USEPA [1991] default
Dei	Effective diffusivity (cm^2/sec).
Di	Diffusivity in air (cm^2/sec); constituent specific.
E	Total soil porosity (0.35 unitless, USEPA default)
ED	Exposure duration (30 years for adult resident; 6 years for child resident; 25 years for site worke
EF	Exposure frequency (350 days/year for resident receptors; 250 days/year for site worke
Foc	Fraction organic carbon in soil (0.02 unitless, USEPA default
Fx	Function of Ut/Um (unitless); $Fx = 0.18 \times [8x^3 + 12x] \times \exp(-x^2)$, where $x = 0.886 \times (Ut/Um)$.
G	Fraction of vegetative cover (unitless) (0
H	Henry's Law Constant (atm-m^3/mol); constituent specific.

Table 7-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-01 (Former Fire Training Area and DAACG Chlorinated Solvent Area)
Hunter Army Airfield, Savannah, Georgia

IR_{air}	Inhalation rate (15 m^3/day for residents; 20 m^3/day for site workers).
IR_{soil}	Incidental soil ingestion rate (114 mg/day for adult resident; 200 mg/day for child resident; 50 mg/day for site worker).
Kas	Soil-air partition coefficient (g soil/ cm^3 air).
Kd	Soil-water partition coefficient (cm^3/g or mL/g); constituent specific. Kd is calculated as Foc × Koc.
Koc	Organic carbon partition coefficient (cm^3/g or mL/g); constituent specific.
LS	Length of side of contaminated area (45 m, USEPA default
PEF	Particulate emission factor (4.63 x 10^9 m^3/kg, USEPA default).
ps	True soil or particle density (2.65 g/cm^3, USEPA default).
RfDi	Reference dose for inhalation (mg/kg/day
RfDo	Reference dose for ingestion (mg/kg/day
RPF	Respirable particle fraction (0.036 g/m^2/hr).
RRS	Risk reduction standard for soil (mg/kg); minimum of the RRS_C (based on cancer effects) and the RRS_{NC} (based on non-cancer effects), which are based on the route-specfic RRSs (RRSo for the oral route and RRSi for the inhalation route).
RT	Product of the ideal gas constant (8.206 x 10^{-5} atm-m^3/mol/K) and the absolute temperature (K); RT = 0.02445 atm-m^3/mol at 25ºC (298 K).
SF	Cancer slope factor or oral (SF_o) or inhalation (SF_i) exposure (kg-day/mg).
T	Exposure interval (7.9 x 108 sec, USEPA default
TCR	Target cancer risk (unitless); results presented for TCR value of 10^{-5} (10^{-4} for Class C carcinogens).
THI	Target hazard index (unitless); results presented for THI value of
Um	Wind speed, annual average (3.0 m/sec)
Ut	Equivalent threshold value of windspeed at 10 meters (12.8 m/sec
V	Wind speed in the mixing zone (2.25 m/sec, USEPA default
VF	Volatilization factor (m^3/kg).

SAMPLE CALCULATIONS, Tetrachloroethene, Industrial Exposure (Type 4

$$x = 0.886 \times \frac{12.8 \text{ m/sec}}{3.0 \text{ m/sec}} = 3.780$$

$$Fx = 0.18\,[(8 \times 3.780^3) + (12 \times 3.78)] \times \exp(-(3.780^2)) = 5.36E\text{-}05$$

$$Dei = 0.079 \text{ cm}^2\text{/sec} \times (0.35)^{0.33} = 0.05587 \text{ cm}^2\text{/sec}$$

$$Kas = \frac{1.03 \times 10^{-2} \text{ atm-m}^3\text{/mol}}{(0.02445 \text{ atm-m}^3\text{/mol}) \times 0.02 \times 95.5 \text{ cm}^3\text{/g}} = 2.20E\text{-}01 \text{ g/cm}^3$$

$$\alpha = \frac{0.05587 \text{ cm}^2\text{/sec} \times 0.35}{0.35 + [2.65 \text{ g/cm}^3 \times (1 - 0.35)/2.21 \times 10^1 \text{ g/cm}^3)]}$$

$$= 2.40E\text{-}03 \text{ cm}^2\text{/sec}$$

$$VF = \frac{45 \text{ m} * 2.25 \text{ m/s} * 2 \text{ m}}{2.03 \times 10^7 \text{ cm}^2} \times \frac{(3.14 \times 2.4 \times 10^3 \text{ cm}^2\text{/sec} \times 7.9 \times 10^8 \text{ sec})^{1/2}}{2 \times 0.05587 \text{ cm}^2\text{/sec} \times 0.35 \times 2.21 \times 10^1 \text{ g/cm}^3 \times 10^{-3} \text{ kg/g}}$$

$$= 2{,}816 \text{ m}^3\text{/kg}$$

CANCER EFFECTS:

Oral:

$$(RRS_O)_C = \frac{10^{-5} \times 70 \text{ kg} \times 25{,}550 \text{ days} \times 10^6 \text{ mg/kg}}{50 \text{ mg/day} \times 250 \text{ days/yr} \times 25 \text{ yrs} \times (2.1 \times 10^3 \text{ kg-day/mg})}$$

$$= 27{,}250 \text{ mg/kg}$$

Table 7-1
Risk Reduction Standard Equations for Exposure to Soil
HAA-01 (Former Fire Training Area and DAACG Chlorinated Solvent Area)
Hunter Army Airfield, Savannah, Georgia

Inhalation:

$$(RRS_I)_C = \frac{10^{-5} \times 70\ kg \times 25{,}550\ days}{[(1/2{,}818\ m^3/kg) + (1/4.63 \times 10^9\ m^3/kg)] \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (9.1 \times 10^4\ kg\text{-}day/mg)}$$

$$= 443\ mg/kg$$

CANCER EFFECTS RRS:

$$RRS_C = \frac{1}{\frac{1}{27{,}250\ mg/kg} + \frac{1}{443\ mg/kg}} = 436\ mg/kg$$

NON-CANCER EFFECTS:

Oral:

$$(RRS_O)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days \times 10^6\ mg/kg}{50\ mg/day \times 250\ days/yr \times 25\ yrs \times [1/6.0 \times 10^2\ mg/kg\text{-}day]}$$

$$= 12{,}260\ mg/kg$$

Inhalation:

$$(RRS_I)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{[(1/2{,}818\ m^3/kg) + (1/4.63 \times 10^9\ m^3/kg)] \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (1/1.1 \times 10^2\ kg\text{-}day/mg)}$$

$$= 158\ mg/kg$$

NON-CANCER EFFECTS RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{12{,}260\ mg/kg} + \frac{1}{158\ mg/kg}} = 156\ mg/kg$$

RRS = Minumum result of RRS_C (443 mg/kg) and RRS_{NC} (156 mg/kg) = 156 mg/kg

Table 7-2
Risk Reduction Standard Equations for Exposure to Groundwater
HAA-01 (Former Fire Training Area and DAACG Chlorinated Solvent Area)
Hunter Army Airfield, Savannah, Georgia

ROUTE-SPECIFIC RRSs:

Oral:

$$(RRS_o)_{C\ or\ NC} = \frac{(TCR\ or\ THI) \times BW \times (AT_C\ or\ AT_{NC})}{IR_w \times EF \times ED \times [SF_O\ or\ (1/RfD_O)]}$$

Inhalation:

$$(RRS_i)_{C\ or\ NC} = \frac{(TCR\ or\ THI) \times (AT_C\ or\ AT_{NC}) \times BW}{K \times IR_a \times EF \times ED \times [SF_I\ or\ (1/RfD_I)]}$$

Cancer Effects RRS:

$$RRS_C = \frac{1}{\frac{1}{(RRS_O)_C} + \frac{1}{(RRS_I)_C}}$$

Non-Cancer Effects RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{(RRS_O)_{NC}} + \frac{1}{(RRS_I)_{NC}}}$$

RRS = Minimum result of RRS_C and RRS_{NC}.

where:

AT_C	Averaging time for cancer effects (25,550 days).
AT_{NC}	Averaging time for non-cancer effects (10,950 for adult residents; 2,190 days for child residents; 9,125 days for site workers); ED x 365 days/year.
BW	Body weight (70 kg for adult receptors; 15 kg for child resident)
ED	Exposure duration (30 years for adult resident; 6 years for child resident; 25 years for site worker
EF	Exposure frequency (250 days/year).
IR_{air}	Inhalation rate (15 m^3/day for residents; 20 m^3/day for site workers).
IR_w	Ingestion rate of drinking water (2 L/day for adult residents; 1 L/day for child residents and site workers) (USEPA 1997a).
K	Volatilization factor for volatile organic compounds (VOCs) from household tap water (0.5 L/m^3) (USEPA 1991).
RfDi	Reference dose for inhalation (mg/kg/day)
RfDo	Reference dose for ingestion (mg/kg/day)
RRS	Risk reduction standard for soil (mg/L); minimum of the RRS_C (based on cancer effects) and the RRS_{NC} (based on non-cancer effects), which are based on the route-specfic RRSs (RRSo for the oral route and RRSi for the inhalation route).
TCR	Target cancer risk (unitless); results presented for TCR value of 10^5 (10^{-4} for Class C carcinogens).
THI	Target hazard index (unitless); results presented for THI value of 1

SAMPLE CALCULATIONS, Tetrachloroethene, Industrial Exposure (Type 4)

CANCER EFFECTS:

Oral:

$$(RRS_O)_C = \frac{10^{-5} \times 70\ kg \times 25{,}550\ days}{1\ L/day \times 250\ days/yr \times 25\ yrs \times (2.1 \times 10^3\ kg\text{-}day/mg)}$$

$$= 1.36\ mg/L$$

Table 7-2
Risk Reduction Standard Equations for Exposure to Groundwater
HAA-01 (Former Fire Training Area and DAACG Chlorinated Solvent Area)
Hunter Army Airfield, Savannah, Georgia

Inhalation:

$$(RRS_I)_C = \frac{10^{-5} \times 70\ kg \times 25{,}550\ days}{0.5\ L/m^3 \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (9.1 \times 10^{-4}\ kg\text{-}day/mg)}$$

$$= 0.314\ mg/L$$

CANCER EFFECTS RRS:

$$RRS_C = \frac{1}{\frac{1}{1.36\ mg/L} + \frac{1}{0.314\ mg/L}} = 0.26\ mg/L$$

NON-CANCER EFFECTS:

Oral:

$$(RRS_O)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{1\ L/day \times 250\ days/yr \times 25\ yrs \times [1/6.0 \times 10^3\ mg/kg\text{-}day]}$$

$$= 0.61\ mg/L$$

Inhalation:

$$(RRS_I)_{NC} = \frac{1 \times 70\ kg \times 9{,}125\ days}{0.5\ L/m^3 \times 250\ days/yr \times 25\ yrs \times 20\ m^3/day \times (1/1.1 \times 10^{-2}\ kg\text{-}day/mg)}$$

$$= 0.11\ mg/L$$

NON-CANCER EFFECTS RRS:

$$RRS_{NC} = \frac{1}{\frac{1}{0.61\ mg/L} + \frac{1}{0.11\ mg/L}} = 0.095\ mg/L$$

RRS = Minumum result of RRS_C (0.26 mg/L) and RRS_{NC} (0.095 mg/L) = 0.095 mg/L

USEPA cancer weight-of-evidence categories are as follows:
Group A: Human Carcinogen (sufficient evidence of carcinogenicity in humans)
Group B: Probable Human Carcinogen
B1 - limited evidence of carcinogenicity in humans
B2 - sufficient evidence of carcinogenicity in animals with inadequate or lack of evidence in humans
Group C: Possible Human Carcinogen (limited evidence of carcinogenicity in animals and inadequate or lack of human data)
Group D: Not Classifiable as to Human Carcinogenicity (inadequate or no evidence)
Group E: Evidence of Noncarcinogenicity for Humans (no evidence of carcinogenicity in adequate studies)
LI: Likely to be carcinogenic to humans.

* The IRIS summary for ethylbenzene states that ethylbenzene is not classifiable as to human carcinogenicity due to the lack of animal bioassays and human studies.
[a] Oral RfDs for cadmium are for diet/water.

kg-day/mg Kilogram-day per milligram mg/kg Milligram per kilogra NA Not Available. Not a carcinogen.

Notes:
Parameters were obtained from USEPA Regional Screening Level (RSL) Table (2011) where available, otherwise, they were obtained from literature sources cited as follows: CFATE (SRC 2008); HSDB (NLM 2008); J&E (USEPA 2003); Lyman, et al. (L90, 1990); RAIS (ORNL 2009); SCDM (USEPA 2004).

alpha	attenuation coefficient - calculation intermediate.	cm^3/g	Cubic centimeter per gram.	m^3/kg	Cubic meter per kilogram.
atm-m^3/mole	Atmosphere - cubic meter per mole.	g/cm^3	Gram per cubic centimeter.	NA	Not available or applicable.
calc	Calculated.	Koc	Organic carbon partition coefficient.	NV	Not volatile.
cm^2/sec	Square centimeter per second.	Kas	Soil-air partition coefficient.	ref	Reference.

	Maximum exceeds Risk Reduction Standard.
mg/kg	Milligrams per kilogram.
NA	Not applicable.
RRS	Risk Reduction Standard.
[a]	Source of Type 1 RRS: A-I: Appendix I notification requirement (NC) ("App I NC"). A-III: Appendix III. DL: Detection limit. GW: Appendix III Table 1 times 100. PCB: Appendix I value for PCBs. PRGc-Res: Calculated default residential carcinogenic preliminary remediation goal. PRGnc-Res: Calculated default residential non-carcinogenic preliminary remediation goal.
[b]	Source of Type 2 RRS: RRSa: Calculated site-specific residential risk reduction standard based on adult exposure. RRSc: Calculated site-specific residential risk reduction standard based on child exposure. SSL: Soil screeening level for Migration to Groundwater. Type 1 RRS.
[c]	Constituent detected in a composite sample but not in the grab samples. Therefore, a concentration is not reported.

	Risk Reduction Standard exceeded.
mg/kg	Milligrams per kilogram.
NA	Not applicable.
RRS	Risk Reduction Standard.
[a]	Source of Type 3 RRS: A-1: Appendix I notification requirement (NC) ("App I NC"). A-III: Appendix III. DL: Detection limit. GW: Appendix III Table 1 times 100. PCB: Appendix I value for PCBs. PRGc-Res: Calculated default industrial carcinogenic preliminary remediation goal. PRGnc-Res: Calculated default industrial non-carcinogenic preliminary remediation goal. BK: Background.
[b]	Source of Type 4 RRS: RRS: Calculated site-specific industrial risk reduction standard. SSL: Soil screeening level for Migration to Groundwater. Type 3 RRS.
[c]	Constituent detected in a composite sample but not in the grab samples. Therefore, a concentration is not reported.

The Type 4 RRSc (for carcinogens) is calculated using a target cancer risk (TCR) of 1E-05; RRSnc (for noncarcinogens) is calculated using a target hazard index (THI) of 1.

The lead Type 4 RRS is presented in Table 7-20.

mg/kg Milligram per kilogram. NA Not available. RRS Risk Reduction Standard for Soil.

Equation 10 (USEPA Soil Screening Guidance, 1996):
Screening Level in Soil (mg/kg) = $Cw \times \left\{ K_d + \left[\frac{\theta_w + \theta_a H'}{\rho_b} \right] \right\}$

Cw	Type 1 GW RRS x DAF (mg/L).	=	constituent specific
DAF	Dilution attenuation factor.	=	20
K_d	soil-water partition coefficient (L/kg).	=	$K_{oc} \times f_{oc}$
K_{oc}	soil organic carbon/water partition coefficient (L/kg).	=	constituent specific
f_{oc}	fraction organic carbon in soil (g/g).	=	0.002
θ_w	water-filled soil porosity (Lwater/Lsoil).	=	0.3
θ_a	air-filled soil porosity (Lair/Lsoil).	=	$n-\theta_w = 0.134$
ρ_b	dry soil bulk density (kg/L).	=	1.5
n	soil porosity (Lpore/Lsoil).	=	$1-(\rho_b/\rho_s) = 0.43$
ρ_s	soil particle density (kg/L).	=	2.65
HLC	Henry's Law Constant (atm-m³/mol).	=	constituent specific
H'	dimensionless Henry's Law Constant (unitless)	=	HLC x 41

[a] Type 1 Groundwater Risk Reduction Standard (GW RRS) from Table 7-13.

atm-m^3/mole Atmosphere - cubic meter per mole. L = Liter.
kg = Kilogram. mg = Milligrams.

Equation 10 (USEPA Soil Screening Guidance, 1996):
Screening Level in Soil (mg/kg) = $Cw \times \left\{ K_d + \left[\frac{\theta_w + \theta_a H'}{\rho_b} \right] \right\}$

Cw	Type 2 GW RRS x DAF (mg/L).	=	constituent specific
DAF	Dilution attenuation factor.	=	20
K_d	soil-water partition coefficient (L/kg).	=	$K_{oc} \times f_{oc}$
K_{oc}	soil organic carbon/water partition coefficient (L/kg).	=	constituent specific
f_{oc}	fraction organic carbon in soil (g/g).	=	0.002
θ_w	water-filled soil porosity (Lwater/Lsoil).	=	0.3
θ_a	air-filled soil porosity (Lair/Lsoil).	=	$n-\theta_w = 0.134$
ρ_b	dry soil bulk density (kg/L).	=	1.5
n	soil porosity (Lpore/Lsoil).	=	$1-(\rho_b/\rho_s) = 0.43$
ρ_s	soil particle density (kg/L).	=	2.65
HLC	Henry's Law Constant (atm-m³/mol).	=	constituent specific
H'	dimensionless Henry's Law Constant (unitless)	=	HLC x 41

[a] Type 2 Groundwater Risk Reduction Standard (GW RRS) from Table 7-13.

atm-m^3/mole	Atmosphere - cubic meter per mole.	L =	Liter.
kg =	Kilogram.	mg =	Milligrams.

Equation 10 (USEPA Soil Screening Guidance, 1996):
Screening Level in Soil (mg/kg) = $Cw \times \left\{ K_d + \left[\frac{\theta_w + \theta_a H'}{\rho_b} \right] \right\}$

Cw	Type 4 GW RRS x DAF (mg/L).	=	constituent specific
DAF	Dilution attenuation factor.	=	20
K_d	soil-water partition coefficient (L/kg).	=	$K_{oc} \times f_{oc}$
K_{oc}	soil organic carbon/water partition coefficient (L/kg).	=	constituent specific
f_{oc}	fraction organic carbon in soil (g/g).	=	0.002
θ_w	water-filled soil porosity (Lwater/Lsoil).	=	0.3
θ_a	air-filled soil porosity (Lair/Lsoil).	=	$n-\theta_w = 0.134$
ρ_b	dry soil bulk density (kg/L).	=	1.5
n	soil porosity (Lpore/Lsoil).	=	$1-(\rho_b/\rho_s) = 0.43$
ρ_s	soil particle density (kg/L).	=	2.65
HLC	Henry's Law Constant (atm-m³/mol).	=	constituent specific
H'	dimensionless Henry's Law Constant (unitless)	=	HLC x 41

[a] Type 4 Groundwater Risk Reduction Standard (GW RRS) from Table 7-16.

$atm\text{-}m^3/mole$	Atmosphere - cubic meter per mole.	L =	Liter.
kg =	Kilogram.	mg =	Milligrams.

Table 7-13

RRSc (cancer effects) is calculated using a target cancer risk (TCR) of 1E-05; RRSnc (non-cancer effects) is calculated using a target hazard index (THI) of 1.

mg/L Milligrams per liter.
NA Not available; insufficient toxicity data.
RRS Risk reduction standard (mg/L); for each constituent, the minimum of the cancer-effects (RRSc) and the non-cancer-effects (RRSnc).

Detected Regulated Substance	Oral	Inhalation	(mg/L)	Oral	Inhalation	(mg/L)	(mg/L)

RRSc (cancer effects) is calculated using a target cancer risk (TCR) of 1E-05; RRSnc (non-cancer effects) is calculated using a target hazard index (THI) of 1.

mg/L Milligrams per liter.
NA Not available; insufficient toxicity data.
NC Not a suspected carcinogen.
RRS Risk reduction standard (mg/L); for each constituent, the minimum of the cancer-effects (RRSc) and the non-cancer-effects (RRSnc).

RRSc (cancer effects) is calculated using a target cancer risk (TCR) of 1E-05; RRSnc (non-cancer effects) is calculated using a target hazard index (THI) of 1.

mg/L Milligrams per liter.
NA Not available; insufficient toxicity data.
NC Not a suspected carcinogen.
RRS Risk reduction standard (mg/L); for each constituent, the minimum of the cancer-effects (RRSc) and the non-cancer-effects (RRSnc)

Gorgia Instream Water Standard exceeded.

[a] Georgia Instream Water Quality Standards, Rule 391-3-6-03, Effective June 5, 2011. Chronic freshwater values used.
[b] Source of Type 1 RRS:
DL: Detection limit.
A-III: Appendix III.
[c] The standard referenced is the Georgia Instream Water Standard. If a standard is not available, the Type 1 RRS were used. Constituents that had a maximum detected concentration less than the detection limit were considered to exceed the standard.
[d] Source of Type 4 RRS:
r: Recreational user (Youth Wader) RRS derived on Table 7-28.
A-III: Appendix III.
[e] The standard referenced is the Type 4 RRS. Although mercury does not have a Type 4 RRS available, mercury did not exceed the Type 1 RRS.
[f] Chromium VI was used as a surogate.

mg/L Milligrams per liter.
NA Not available.
RRS Risk Reduction Standard.

Table 7-20
Type 4 Risk Reduction Standard for Lead in Soil Based on Adult Worker Exposure Scenario
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Cohlorinated Solvent
Fort Stewart/Hunter Army Airfield - Savannah, Georgia

$$\mathbf{RRS_{lead}} = \left[\frac{(PbB - PbB_b) \times AT}{BSF \times EF} - C_w \times I_w \times A_w \right] (I_s \times A_s)^{-1}$$

where:

$$\mathbf{PbB} = \frac{PbB_{fetal}}{GSD^{1.645} \times R}$$

where:

A_s	=	0.12	=	Absolute gastrointestinal absorption factor for ingested lead in soil and lead in dust derived from soil (unitless).
AT	=	365	=	Averaging time (days/year).
A_w	=	0.2	=	Absolute gastrointestinal absorption factor for ingested lead in drinking water (unitless).
BSF	=	0.4	=	Biokinetic slope factor relating increase in typical adult blood lead concentration to average daily lead uptake (µg/dL blood lead increase per µg/day lead uptake).
C_w	=	15	=	Concentration of lead in the groundwater (µg/L, Type 3 risk reduction standard).
EF	=	219	=	Exposure frequency (days/year).
GSD	=	2.04	=	Geometric standard deviation.
I_s	=	0.05	=	Ingestion rate for indoor soil-derived dust (g/day).
I_w	=	1	=	Ingestion rate of groundwater (L/day).
PbB_{fetal}	=	10	=	Goal for the 95th percentile blood lead concentration among fetuses born to female workers exposed to site soils (µg/dL).
PbB	=	Calc.	=	Goal for the cental estimate of blood lead concentration in female workers exposed to site soils, intended to ensure that the fetal blood lead concentration does not exceed 10 µg/dL (µg/dL).
PbB_b	=	1.38	=	Typical blood lead concentration in adults in the absence of site exposures (µg/dL).
R	=	0.9	=	Constant of proportionality between fetal blood lead concentration at birth and maternal blood lead concentration (unitless).
RRS_{lead}	=	Calc.	=	Risk reduction standard for lead in soil based on adult worker exposure (mg/kg).

CALCULATION:

$$PbB = \frac{(10\ \mu g/dL)}{(2.04)^{1.645} \times 0.9} = 3.44\ \mu g/dL$$

$$RGO_{lead} = \left[\frac{(3.44\ \mu g/dL - 1.38\ \mu g/dL) \times (365\ days/year)}{0.4\ (\mu g/dL)/(\mu g/day) \times (219\ days/year)} - 2.8\ \mu g/L \times 1\ L/day \times 0.2 \right] \times (0.05\ g/day \times 0.12)^{-1}$$

$$= 930\ mg/kg$$

Source: Appendix IV, Georgia Adult Lead Model, of the HSRA regulation.

Table 7-21
Site-Specific Standard / Health-Based Concentration Goal Equations for Sediment
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Chlorinated Solvent
Fort Stewart / Hunter Army Airfield - Savannah, Georgia

ROUTE-SPECIFIC CONCENTRATION GOALS:

Oral:
$$(HBG_o)_{C\ or\ NC} = \frac{(TCR\ or\ THQ) \times BW \times (AT_C\ or\ AT_{NC}) \times (10^6\ mg/kg)}{IRsed \times EF \times ED \times (CSF_o\ or\ [1/RfD_o])}$$

Dermal:
$$(HBG_d)_{C\ or\ NC} = \frac{(TCR\ or\ THQ) \times BW \times (AT_C\ or\ AT_{NC}) \times (10^6\ mg/kg)}{SSAsed \times SedAR \times ABSd \times EF \times ED \times (CSF_a\ or\ [1/RfD_a])}$$

HBG BASED ON CANCER EFFECTS: (combining all exposure routes)

$$HBG_C = \frac{1}{[1 / (HBG_o)_C] + [1 / (HBG_d)_C]}$$

HBG BASED ON NON-CANCER EFFECTS: (combining all exposure routes)

$$HBG_{NC} = \frac{1}{[1 / (HBG_o)_{NC}] + [1 / (HBG_d)_{NC}]}$$

HBG = MINIMUM of HBG_C and HBG_{NC}

Variable Definitions:

ABSd	Dermal absorption efficiency (unitless) (Table 7-23).
AT_C	Averaging time for cancer effects (days) (Table 7-22).
AT_{NC}	Averaging time for non-cancer effects (days) (Table 7-22).
BW	Body weight (kg) (Table 7-22).
CSF	Cancer slope factor for oral (CSF_o) or dermal (adjusted to an absorbed dose, CSF_a) exposure (kg-day/mg [inverse mg/kg/day]) (Table 7-24)
ED	Exposure duration (years) (Table 7-22).
EF	Exposure frequency (days/year) (Table 7-22).
IRsed	Ingestion rate of sediment (mg/day) (Table 7-22).
HBG	Health-based concentration goal for sediment (mg/kg).
RfD	Reference dose for oral (RfD_o) or dermal (adjusted to an absorbed dose, RfD_a) exposure (mg/kg/day) (Table 7-24).
SedAR	Sediment-to-skin adherence rate (mg/cm²/day) (Table 7-22).
SSAsed	Exposed skin surface area for sediment contact (cm²) (Table 7-22).
TCR	Target cancer risk (unitless).
THQ	Target hazard quotient for non-cancer effects (unitless).

Table 7-22
Receptor Exposure Parameters
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Chlorinated
Fort Stewart / Hunter Army Airfield - Savannah, Georgia

Parameter	Symbol	Units	Recreational Receptor-Wader Youth (6 to 16 years)	[ref]

[a] The averaging time for cancer risk is the expected lifespan of 70 years expressed in days. The averaging time for non-cancer hazard is the total exposure duration (ED) expressed in days.
[b] The IRsed was set at 50 mg/day equal to that of the site worker.
[c] EFsed and EFsw were set at 48 days/year for the recreational receptor assuming twice a week during the six warm months of the year.
[d] SSAsed and SSAsw is the average surface area of feet and lower legs.
[e] The sediment-to-skin adherence factor is equal to that of a child exposed to wet soil.
[f] The surface water exposure was assumed to be one hour per day; the surface water ingestion rate is equal to one tenth of the swimming ingestion rate.

Table 7-26
Site-Specific Standard / Health-Based Concentration Goal Equations for Wading in Surface Water
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Chlorinated Solvent
Fort Stewart / Hunter Army Airfield - Savannah, Georgia

ROUTE-SPECIFIC CONCENTRATION GOALS:

Oral: $$(HBG_o)_{C\ or\ NC} = \frac{(TCR\ or\ THQ) \times BW \times (AT_C\ or\ AT_{NC})}{IRsw \times EF \times ED \times [\ CSF_o\ or\ (1/RfD_o)\ ]}$$

Dermal: $$(HBG_d)_{C\ or\ NC} = \frac{(TCR\ or\ THQ) \times BW \times (AT_C\ or\ AT_{NC})}{SSAsw \times DA \times EF \times ED \times [\ CSF_a\ or\ (1/RfD_a)\ ]}$$

Inorganics: $$DA\ [0] = \frac{K_p \times ETsw}{1000\ cm^3/L}$$

Organics: $$DA\ [1] = \frac{2\ FA \times K_p}{1000\ cm^3/L} \times \sqrt{(6\ \tau \times ETsw) / \pi} \qquad \text{if } ETsw \le t^*$$

or $$DA\ [2] = \frac{FA \times K_p}{1000\ cm^3/L} \times \left(\frac{ETsw}{1 + B} + \frac{2\ \tau\ (\ 1 + 3\ B + 3\ B^2\ )}{(1 + B)^2} \right) \qquad \text{if } ETsw > t^*$$

Inhalation: $$(HBG_i)_{C\ or\ NC} = \frac{(TCR\ or\ THQ) \times (AT_C\ or\ AT_{NC})}{VFsw \times ETsw \times CF \times EF \times ED \times [\ IUR\ or\ (1/RfC)\ ]}$$

where: $$VFsw = \frac{(1000\ L/m^3)}{(1/k_l)\ + [1/(H_o \times k_g)\ ]} \times \frac{SA}{Hb \times Wb \times Um}$$ (USEPA 1988)

HBG BASED ON CANCER EFFECTS: (combining all exposure routes)

$$HBG_C = \frac{1}{[\ 1 / (HBG_o)_C\ ]\ +\ [\ 1 / (HBG_d)_C\ ]\ +\ [\ 1 / (HBG_i)_C\ ]}$$

HBG BASED ON NON-CANCER EFFECTS: (combining all exposure routes)

$$HBG_{NC} = \frac{1}{[\ 1 / (HBG_o)_{NC}\ ]\ +\ [\ 1 / (HBG_d)_{NC}\ ]\ +\ [\ 1 / (HBG_i)_{NC}\ ]}$$

HBG = MINIMUM of HBG_C and HBG_{NC}

Variable Definitions:	
τ	Lag time for dermal absorption through the skin (hour) (Table 7-23).
AT_C	Averaging time for cancer effects (days) (Table 7-22).
AT_{NC}	Averaging time for non-cancer effects (days) (Table 7-22).
B	Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (unitless) (Table 7-23).
BW	Body weight (kg) (Table 7-22).
CF	Conversion Factor 0.042 day/hour.
CSF	Cancer slope factor for oral (CSFo) or dermal (adjusted to an absorbed dose, CSFa) (Table 7-24).
DA	Dermal absorption factor (L/cm²/day), calculated using Equation [0], [1], or [2], as appropriate.
ED	Exposure duration (years) (Table 7-22).
EF	Exposure frequency (days/year) (Table 7-22).

Site-Specific Standard / Health-Based Concentration Goal Equations for Wading in Surface Water
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Chlorinated Solvent
Fort Stewart / Hunter Army Airfield - Savannah, Georgia

ETsw	Exposure time for wadding water contact (hours/day) (Table 7-22).
FA	Fraction of absorbed water (unitless) (Table 7-23).
H	Henry's law constant (atm-m³/mol) (Table 7-4).
Hb	Height of mixing zone (2 m).
HBG	Health-based concentration goal for groundwater (mg/L).
H_o	Dimensionless Henry's law constant (unitless); calculated as $H_o = H/RT$.
IRsw	Incidental ingestion rate of surface water (L/day) (Table 7-22).
IUR	Inhalation Unit Risk (m³/mg) (Table 7-24).
k_g	Gas-phase mass transfer coefficient (m/sec) $\approx (8.3 \times 10^{-3}$ m/sec) $\times [(18$ g/mol)/MW$]^{0.333} \times (T/298)^{1.005}$.
k_l	Liquid-phase mass transfer coefficient (m/sec) $\approx (2.0 \times 10^{-5}$ m/sec) $\times (T/298) \times [(32$ g/mol)/MW$]^{1/2}$.
K_p	Permeability coefficient (cm/hour) (Table 7-23).
MW	Molecular weight (g/mol) (Table 7-4).
RfC	Reference concentration (mg/m³) (Table 7-24).
RfD	Reference dose for oral (RfDo), or dermal (adjusted to an absorbed dose, RfDa), exposure (mg/kg/day) (Table 7-2
RT	Product of the universal gas constant ($R = 8.206 \times 10^{-5}$ atm-m^3/mol/K) and the relevant Kelvin temperature (T = 298.15 K); RT = 0.02447 atm-m^3/mol.
SA	Source area (1 m^2).
SSAsw	Exposed skin surface area for surface water contact (cm²) (Table 7-22).
t*	Time required to reach steady state (hour) (Table 7-23).
TCR	Target cancer risk (unitless).
THQ	Target hazard quotient for noncancer effects (unitless).
Um	Mean wind speed (m/sec).
VFsw	Volatilization factor from surface water (L/m³).
Wb	Width of mixing zone (1 m).

Table 7-27
Water Volatilization Factors
Human Health Risk Assessment
HAA-01 Former Fire Training Area and Departure/Arrival Airfield Control Group (DACG) Chlorinated Solvent
Fort Stewart / Hunter Army Airfield - Savannah, Georgia

Constituent	Enthalpy of vaporization at at soil temp. [a] (cal/mol) (ΔH_v)	Henry's Law Constant at soil temp. [a] (unitless) (Ho')	Gas-Phase Mass Transfer Coefficient (cm/s) (K_g)	Liquid-Phase Mass Transfer Coefficient (cm/s) (K_L)	Overall Mass Transfer Coefficient (cm/s) (Ki)	Exposed Water Volatilization Factor [b] (L/m^3) (VFsw)

NOTES ON LAST PAGE

Notes:
[ ] - Duplicate sample
BOLD - indicates the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
mg/kg - Milligrams per Kilogram
SVOCs - Semi-volatile Organic Compounds
VOCs - Volatile Organic Compounds

Table 8-2
Federal- and State-Listed and Candidate Species of Potential Occurrence
Ecological Risk Assessment
HAA-01 (Former Fire Training Area and Departure/Arrival Airfield Control Group (DAACG) Chlorinated Solvent Area)
Hunter Army Airfield - Savannah, Georgia

Scientific Name	Common Name	Global Rank	State Rank	Federal Status	State Status	Habitat	Habitat Present?
Amphibians							
Ambystoma cingulatum	Frosted Flatwoods Salamander	G2	S2	LT	T	Pine flatwoods; moist savannas; isolated cypress/gum ponds	no
Pseudacris brimleyi	Brimley's Chorus Frog	G5	S1			Moist forests; swamps; bottomlands	no
Rana capito	Gopher Frog	G3	S3		R	Sandhills; dry pine flatwoods; breed in isolated wetlands	no
Stereochilus marginatus	Many-lined Salamander	G5	S3			Sluggish, swampy streams and bayheads with substrate of leaf litter	no
Birds							
Ammodramus maritimus	Seaside Sparrow	G4	S3			Salt marshes	no
Charadrius melodus	Piping Plover	G3	S1	LT	T	Sandy beaches; tidal flats	no
Charadrius wilsonia	Wilson's Plover	G5	S2		T	Sandy beaches; tidal flats	no
Haematopus palliatus	American Oystercatcher	G5	S2		R	Sandy beaches; tidal flats; salt marshes	no
Haliaeetus leucocephalus	Bald Eagle	G5	S2		T	Edges of lakes & large rivers; seacoasts	no
Himantopus mexicanus	Black-necked Stilt	G5	S3			Shallow ponds; lagoons	no
Lanius ludovicianus migrans	Migrant Loggerhead Shrike	G4T3Q	S3			Open woods; field edges	no
Mycteria americana	Wood Stork	G4	S2	LE	E	Cypress/gum ponds; marshes; river swamps; bays	no
Nyctanassa violacea	Yellow-crowned Night-heron	G5	S3S4			River swamps; marshes; cypress/gum ponds	no
Nycticorax nycticorax	Black-crowned Night-heron	G5	S4			River swamps; marshes; cypress/gum ponds	no
Passerina ciris	Painted Bunting	G5	S3			Lower coastal plain in thickets, woodland borders, and brushy areas	no
Picoides borealis	Red-cockaded Woodpecker	G3	S2	LE	E	Open pine woods; pine savannas	no
Rynchops niger	Black Skimmer	G5	S1		R	Tidal ponds; sandy beaches	no
Sterna antillarum	Least Tern	G4	S3		R	Sandy beaches; sandbars	no
Tyto alba	Barn owl	G5	S3S4			Georgia habitat information not available	no
Fish							
Acipenser brevirostrum	Shortnose Sturgeon	G3	S2	LE	E	Estuaries; lower end of large rivers in deep pools with soft substrates	no
Acipenser oxyrinchus oxyrinchus	Atlantic Sturgeon	G3T3	S3			Georgia habitat information not available	no
Moxostoma robustum	Robust Redhorse	G1	S1		E	Medium to large rivers, shallow riffles to deep flowing water; moderately swift current	no
Umbra pygmaea	Eastern Mudminnow	G5	S2S3			Sluggish streams, ponds, and sloughs with mud bottoms and heavy vegetation	no
Invertebrates							
Toxolasma pullus	Savannah Lilliput	G2	S2		T	Large rivers to small creeks, oxbows, and sloughs	no
Mammals							
Eubalaena glacialis	Northern Atlantic Right Whale	G1	S1	LE	E	Open ocean	no
Lasiurus intermedius	Northern Yellow Bat	G4G5	S2S3			Wooded areas near open water or fields	no
Pseudorca crassidens	False Killer Whale	G4	SNRN			Open ocean	no
Trichechus manatus	Manatee	G2	S1S2	LE	E	Open ocean; estuaries; tidal rivers	no
Reptiles							
Caretta caretta	Loggerhead Sea Turtle	G3	S2	LT	E	Open ocean; sounds; coastal rivers; beaches	no
Chelonia mydas	Green Sea Turtle	G3	S1	LT	T	Open ocean; sounds; coastal rivers; beaches	no
Clemmys guttata	Spotted Turtle	G5	S3		U	Heavily vegetated swamps, marshes, bogs, and small ponds; nest and possibly hibernate in surrounding uplands	no
Crotalus adamanteus	Eastern Diamond-backed Rattlesnake	G4	S4			Early successional habitats on barrier islands and mainland; pine flatwoods; sandhills	no
Dermochelys coriacea	Leatherback Sea Turtle	G2	S1	LE	E	Open ocean; sounds; coastal beaches	no
Gopherus polyphemus	Gopher Tortoise	G3	S2		T	Sandhills; dry hammocks; longleaf pine-turkey oak woods; old fields	no
Lepidochelys kempii	Kemp's or Atlantic Ridley	G1	S1	LE	E	Open ocean; sounds; coastal rivers; beaches	no
Malaclemys terrapin	Diamondback Terrapin	G4	S3		U	Entire coast, estuarine and marine edge; All saltmarsh, beaches	no

Notes:
Global rarity rank: 1 = very rare to 5 = very common globally.
State rarity rank: 1 = very rare to 5 = very common.
State protection status: E = Endangered, T = Threatened, R = Rare, U = Unusual.
U.S. protection status: LE = Listed Endangered, LT = Listed Threatened, Candidate.

NSV No screening value

[a] Ecological soil screening values from the following sources:
USEPA Region 4 Ecological Screening Values (USEPA 2001b; R4).

[b] The maximum hazard quotient (HQ) is the ratio of the maximum constituent concentration to the screening value. HQs are rounded to one significant figure.

[c] Constituents with a hazard quotient (HQ) greater than 1 (HQ > 1) or without a screening value (NSV) were considered constituents of potential ecological concern (COPECs) for screening level assessment.

[d] The screening value is based on phthalates.

Table 8-11

Uncertainties in the Ecological Risk Assessment

Ecological Risk Assessment

HAA-01 - Former Fire Training Area and DAACG Chlorinated Solvents Area

Hunter Army Airfield, Georgia

Assumptions	Description And Discussion Related To Uncertainties in ERA	Level of Uncertainty
Analytical Sampling and Data Analysis		
Limited number of samples	Frequently, there are only a limited number of samples used in ERAs, and very often they are collected in a biased manner (i.e., targeting "hot spots"). This type of sampling often lacks statistical power and does not likely represent the concentrations in the environment in which wildlife exposure occurs. Similarly, limited data used to estimate uptake into organisms may overestimate exposure via the food web.	Overestimate of exposure and risk
Use of maximum concentrations	Maximum concentrations are used to represent the upper estimate exposures. This practice compensates for uncertainty contributed by limited numbers of samples, but overestimates exposure and risk.	Overestimate of exposure and risk
Detection limits	Detection limits may exceed ESVs (e.g., PAHs) or thresholds for adverse impacts are well below the analytical methods used in ERA (e.g., compounds that are known or suspected to cause endocrine effects).	May underestimate risk or effect on risk estimate unknown
Degradation of chemicals not considered	ERAs are almost exclusively based on concentrations of target compounds, and little if any attention is given to degradation compounds that could be more toxic than the original chemical. Conversely, chemical concentrations may decrease over time due to natural physical processes.	Effect on risk estimate unknown
Toxicology and ESVs		
Toxicity and exposure data for a limited number of species	Uncertainties exist in many aspects of the toxicology relied upon for conducting ERAs (Newman 1998; Lovett Doust et al. 1993). Toxicity and wildlife exposure data are only available for a limited number of species (most of them laboratory test species) under a strictly defined set of test conditions that deviate from natural conditions (Sample et al. 1996; Suter 1996; Sample et al. 1997).	Effect on risk estimate unknown
Laboratory testing	In current practice, more than 95 percent of the resources in toxicology are focused toward the study of single chemicals (Cassee et al. 1998), while wildlife exposures rarely occur on a chemical-specific basis. Simplistic extrapolations from laboratory species to wildlife species and testing conditions to field conditions are not likely accurate, and are rarely, if ever, validated against natural conditions (Power 1996; Tannenbaum 2003).	Effect on risk estimate unknown
Adaptation and tolerance	There is little consistency and no quantitative methodology for the consideration of the diminished bioavailability (and, thereby, diminished toxicity) even though this process is well documented (e.g., Alexander and Alexander 1999; Alexander 2000). Similarly, tolerance and adaptation are not considered directly (Millward and Klerks 2002; Grant 2002). Furthermore, the white rat often used in toxicological testing is bred to minimize differences between lab animals, thereby diminishing the genetic variability that gives wildlife some capability for adaptation and tolerance (Tannenbaum 2003).	Overestimate of risk
Predator-prey interactions	There are relatively few studies that actually evaluate the effects of toxicity on predator-prey interactions, or on competition for scarce resources (Atchison et al. 1996), the very conditions within which all wildlife exists (Kapustka and Landis 1998).	Effect on risk estimate unknown

Table 8-11

Uncertainties in the Ecological Risk Assessment

Ecological Risk Assessment

HAA-01 - Former Fire Training Area and DAACG Chlorinated Solvents Area

Hunter Army Airfield, Georgia

Assumptions	Description And Discussion Related To Uncertainties in ERA	Level of Uncertainty
Hazard Quotients		
HQs based on maximum	The SLERA HQ is based on the maximum detected concentrations and the most conservative ESVs available (USEPA 1997; 2000). HQs in the BERA are based on the exposure point concentration (minimum of the UCL and the maximum concentration).	Overestimate of risk
Elevated HQs for background concentrations	HQs may exceed a value of 1 for background concentrations of naturally occurring metals (Tannenbaum 2003). This is due to many of the toxicology and ESV uncertainties already discussed.	Overestimate of risk
Interpretation of HQs	An HQ less than or equal to a value of 1 indicates that adverse impacts to wildlife are considered unlikely (USEPA 2001c). However, there is no clear guidance for interpreting the HQs that exceed a value of 1, except that this point of departure indicates that adverse effects of some kind may have occurred or may occur in the future.	Effect on risk estimate unknown
HQs for individual used to evaluate risks to populations	HQs are based on the types of impacts that could occur to individuals (i.e., those individuals exposed to maximum concentrations) and they completely fail to address ecological exposure and risk at spatial scale of populations (Tannenbaum 2003; Durda and Preziosi 1999).	Overestimate of risk to wildlife populations
HQs with unrealistic magnitudes	HQs are seen at magnitudes that suggest that every animal should die upon acute exposure (i.e., in the hundreds or thousands) (Tannenbaum et al. 2003). Often, physical conditions at a site demonstrate that this is not the case.	Overestimate of risk
No evaluation of dermal or inhalation pathways	The dermal and inhalation exposure pathways are generally considered “insignificant” due to protective fur and feathers. Under certain conditions, these exposure pathways may occur, but adequate information is rarely available by which to evaluate them.	Potentially an underestimate of risk

BERA	Baseline Ecological Risk Assessment.
COPC	Constituent of potential concern
ERA	Ecological risk assessment.
ESV	Ecological screening value.
HQ	Hazard quotient.
PAH	Polynuclear aromatic hydrocarbon
RTV	Reference toxicity value.
SLERA	Screening level ecological risk assessment.

- APPROXIMATE WATER TABLE
- SOIL SAMPLE

NOTES:
1) ND - Not detected above the PQL.
2) J values are estimated at concentrations below the practical quantitation limit (PQL).
3) µg/L - micrograms per liter
4) mg/kg - milligrams per kilogram
5) RRS - GAEPD HSRA Risk Reduction Standards (Type 1)
6) **BOLD** - Constituent detected above laboratory detection limit.
7) **BOLD** - Constituent exceedances of Type 1 RRS.
8) Not all compounds analyzed are shown. All detections of compounds are shown.

NOTES:
1) All concentrations expressed in micrograms per liter (µg/L).
2) Concentrations shown are those detected above the practical quantitation limit (PQL).
3) J values are estimated at concentrations below the practical quantitation limit (PQL).
4) If there is a ND, the compound was not detected above PQL.
If no value is listed, it was not analyzed for the target compound.

Notes:
* - Duplicate sample
Highlighted - Indicate the analyte was detected above the Georgia HSRA Type 1 Risk Reduction Standards
BOLD - indicate the analyte was detected above the detection limit.
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value.
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample
ft bls - feet below land surface
µg/kg - Micrograms per Kilogram
mg/kg - Milligrams per Kilogram
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003).
SVOCs - Semi-volatile Organic Compounds
VOCs - Volatile Organic Compounds

Other									
Moisture	13.9	26.2	19.8	19.7	26.6	27.1	23.2	25.4	27

Notes:
BOLD - indicate the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
NA - Not analyzed
U - The analyte was not detected above the reporting limit
µg/kg - Micrograms per Kilogram
mg/kg - Milligrams per Kilogram
VOCs - Volatile Organic Compounds
SVOCs - Semi-volatile Organic Compounds

Notes:
BOLD - indicate the analyte was detected.
B - Analyte was detected in an associated blank as well as in the sample.
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
NA - Not analyzed
U - The analyte was not detected above the reporting limit.
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
µg/L - Micrograms per Liter
mg/L - Milligrams per Liter
VOCs - Volatile Organic Compounds
SVOCs - Semi-volatile Organic Compounds

Notes:
* - Duplicate sample
- Indicate the analyte was detected abovethe Type 1 RRS or MCL where no RRS has been established
BOLD - indicate the analyte was detected
B - Analyte was detected in an associated blank as well as in the sample.
D - Sample was diluted for analysis.
H - Sample was prepped or analyzed beyond the specified holding time
J - The analyte was positively identified, but the associated numerical value is the approximate concentration of the analyte in the sample.
MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations (5/2009)
µg/L - Micrograms per Liter
mg/L - Milligrams per Liter
NA - Not analyzed
RRS - GAEPD Rule 391-3-19-.07 Risk Reduction Standard (July 23, 2003)
RSL - USEPA Regional Screening Level for Tap Water (12/10/2009)
SVOCs - Semi-volatile Organic Compounds
T - Tentitively Identified Compound
U - The analyte was not detected above the reporting limit
UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value
UJ - The analyte was not detected above the reporting limit; however, the reported quantitation limit is approximate and may, or may not represent the actual limit of quantitation necessary to accurately and precisely measure analyte in the sample.
JL - The analyte is possibly biased low or a false negative based on QC data
VOCs - Volatile Organic Compounds

Historic Field Procedures, Field Forms, and Historic Well Construction Logs

CSR Field Procedures

Extracted from 2002 CSR preapred by Law Engineering and Environmental Services, Inc.

APPENDIX C

C1.0 SOIL BORING AND WELL CONSTRUCTION PROCEDURES

The procedures used to advance the soil borings, install the temporary piezometers, and install and develop the monitoring wells at the former FTA at HAAF are described below.

C1.1 SOIL BORINGS

Soil borings were advanced using Geoprobe®, hand auger, and standard soil penetration testing procedures. These procedures are described below.

C1.1.1 Geoprobe® Procedures

Twenty-nine soil borings were advanced and samples were collected using a Geoprobe® sampling device. Soil samples were collected in four-foot intervals beginning at the ground surface, as shown on Tables 3.1 and 3.2. Sampling continued until ground water was encountered. The soil samples were logged in the field in accordance with the Unified Soil Classification System (USCS). Soil borings were filled with bentonite/cement grout or bentonite chips upon completion of soil sampling.

Soil samples obtained with the Geoprobe® were collected with a 1.4 inch inside diameter (I.D.), 2-inch outside diameter (O.D.) acetate-lined tube sampler. Sampling techniques are described in Section C2.2.

The soil samples collected from soil borings SB-30 through SB-40, HMW-14R, and HMW-18 were screened in the field using a Photovac Microtip photoionization detector (PID). Soil samples collected from soil borings SB-18 through SB-29, HMW-14, HMW-15, HMW-16, and HMW-17 were not screened. The PID was calibrated on a daily basis with 100 ppm isobutylene in air calibration gas according to manufacturer's instructions. Appendix D provides the soil boring logs and Appendix C-1 provides Field Sampling Reports (FSRs) of these soil borings.

The Geoprobe® equipment was steam-cleaned or washed with tap water and phosphate-free (Alconox™) soap and rinsed with pesticide-grade methanol and organic-free water prior to use and between each boring to reduce the potential for cross contamination.

C1.1.2 Hand Auger Procedures

Eight soil borings were advanced using a stainless steel hand auger. Surface grass/debris were removed and the hand auger bucket was inserted into the ground and advanced to the desired depth. Once the bucket was extracted, the soil was placed into a decontaminated stainless steel bowl and homogenized. Sampling procedures are described in Section C2.2.

The hand auger was washed with tap water and phosphate-free (Alconox™) soap and rinsed with pesticide-grade methanol and organic-free water prior to use and between each boring to reduce the potential for cross contamination.

C1.1.3 Split-Spoon Soil Sampling Procedures

Three soil borings were advanced using a truck-mounted drill rig equipped with hollow-stem augers and split-spoon soil samplers. Soil samples collected with a split-spoon sampling device were collected in accordance with ASTM Method D1686-84. Soil samples were collected on continuous basis from ground surface to boring termination using the following procedures. At each sample interval, the split-spoon sampler measuring 1.4-inch I.D., 2-inch O.D. was inserted into the boring. The sampler was seated 6 inches to penetrate any loose cuttings and then driven an additional foot with blows of a 140-pound hammer falling 30 inches. The number of hammer blow required to drive the sampler the final foot was recorded and designated the "standard penetration resistance". The penetration resistance when properly evaluated is an index to engineering properties of the soil. After each interval was sampled the boring was advanced to the next sample interval with the hollow stem augers. Soil samples collected using a split-spoon sampler were collected for lithologic description, field screening for qualitative VOCs using a PID, and laboratory analysis. A small portion of each soil sample was removed from the split-spoon and placed in a "zip-lock" bag, sealed and set aside to allow for volatilization. These soil screening samples ("zip-lock" bag sample) were screened in the field for qualitative volatile organic compounds (VOCs) using a PID, and inspected for staining and odor. The lithology of each soil sample was classified in accordance with the Unified Soil Classification System (USCS). The PID was calibrated on a daily basis with isobutylene in air calibration gas according to the manufacturer's instructions. Soil samples were selected for laboratory analysis based on the field screening results where the PID indicated the presence of VOCs in the soils. Sampling procedures are described in Section C2.2.

C1.2 Temporary Piezometer Installation and Sampling

Eight temporary piezometers were installed to determine placement of the permanent monitoring wells. The piezometers were constructed of a 1.0 inch diameter PVC screen and casing and were installed into the soil boring that was advanced using the Geoprobe®. The screen was ten feet in length with a slot size of 0.010-inch. Select piezometer locations were converted to monitoring wells. For those locations the temporary piezometer was removed, the soil boring was overdrilled, and a monitoring well was installed. Locations that were not designated to be converted to a monitoring well were abandoned using a bentonite/cement grout or bentonite chips to ground surface after the casing and screen were removed.

C1.3 TYPE II MONITORING WELL INSTALLATION

Ten Type II (single cased) groundwater monitoring wells (HMW-14, HMW-14R, HMW-15, HMW-16, HMW-17, HMW-18, HMW-19, HMW-20, HMW-21, and HMW-22) were installed at the site. The borings were drilled by a truck-mounted drill rig using continuous flight hollow stem augers. Monitoring wells were installed in accordance with guidance set forth in U.S. Army Corps of Engineers document EM1110-1-4000, *Monitor Well Design, Installation, and Documentation at Hazardous and/or Toxic Waste Sites*. Wells were designed to screen the uppermost water-bearing zone in the soil at the site. Appendix D provides well construction information for the Type II monitoring wells.

Monitoring wells HMW-14 through HMW-17 were constructed of two-inch I.D. flush joint, threaded schedule 40 PVC pipe with ten feet of 0.010-inch machine slotted screen. Well borings were advanced using a 4.25-inch hollow-stem auger. Clean No. 1 sand of 20/40 gradation was placed into the annulus between the well screen and the borehole using a tremie pipe. Monitoring wells HMW-14R, HMW-18, HMW-19, HMW-20, HMW-21, and HMW-22 are constructed of two-inch I.D. flush joint, threaded schedule 40 PVC pipe with ten feet of 0.006-inch machine slotted screen. Well borings were advanced using a 6.25-inch hollow-stem auger. Clean silica sand of 30/60 gradation was placed into the annulus between the well screen and the borehole using a tremie pipe.

The sand filter pack was installed to approximately two to three feet above the screen and was capped with a bentonite seal approximately 0.5 to 1.5 feet thick. Clean potable water was used to set the sand pack. The volume of water used was recorded on the monitoring well installation diagram (presented in Appendix D). Proper placement of the filter sand was confirmed by taped measurements. Cement-bentonite grout was

installed in the annular space from the top of the bentonite seal to within approximately six inches to a foot of the ground surface using a tremie pipe. A waterproof cap was installed on the riser pipe and an above-grade lockable protective cover and concrete well pad was placed around each well.

C1.4 WELL DEVELOPMENT

Upon completion of monitoring well installation activities, each newly installed well was developed. The purpose of well development is to remove excess sediment, recover any water lost during drilling, clear formational pathways which may have been blocked during drilling, and draw representative groundwater into the screen. Monitoring wells were developed in accordance with guidance set forth in U.S. Army Corps of Engineers document EM1110-1-4000, *Monitor Well Design, Installation, and Documentation at Hazardous and/or Toxic Waste Sites*. The monitoring wells were developed using the pump and surge technique by using a QED purge pump equipped with surge rings or a surge block and submersible pump. The development process was accomplished by causing the groundwater within the well to move vigorously through the screen while removing the water and sediment from the well. The purge pump was raised and lowered through the well screen section producing an agitation action.

Well development was completed at least 48 hours before sampling of each new monitoring well. The monitoring wells were developed using an air driven displacement pump. Development continued until a minimum of five well volumes had been removed, less than 0.1 foot. of sediment remained at the bottom of the monitoring well, and pH, specific conductance, and temperature measurements were stabilized. During well development, pH, temperature, and specific conductivity (SC) were measured to evaluate the effectiveness of the development activities. Measurements were performed with a QED Purge Saver FC-4000 in-line meter or a Horiba™ multi-meter. The meter was calibrated on a daily basis according to manufacturer's instructions. The well was considered developed after five well volumes were removed and the water quality indicator parameters had stabilized. Stabilization of parameters is defined as 10% between two consecutive readings.

In addition, the wells were to be developed to below 5 nephelometric turbidity units (NTUs). The turbidity of the water was measured with a DRT-15C turbidimeter calibrated daily per manufacturer's instructions. Development parameters are summarized in Table C.1.

A photograph of the ground water taken from the developed monitoring well was made of at least a one liter clear glass sample container of the water, using 35 mm color print film, a suitable back-light and background, and close enough to show the clarity of the water. Photographs are presented in Appendix C-2.

C1.5 MONITORING WELL ABANDONMENT

Monitoring well HMW-14 was abandoned because the well was determined to not be representative of groundwater conditions at the site due to turbidity and incorrect well screen placement. HMW-14 was abandoned by removing the bottom well plug and filling the annular space with grout (injected through a tremie pipe) while removing the polyvinyl chloride (PVC) well screen and risers. Once the annular space was filled with grout, the location was completed to ground surface with concrete. Well abandonment procedures were conducted in accordance with guidance set forth in U.S. Army Corps of Engineers document EM1110-1-4000, *Monitor Well Design, Installation, and Documentation at Hazardous and/or Toxic Waste Sites* and Georgia Water Well Standards.

C1.6 SITE SURVEY

The monitoring wells and soil sampling locations were surveyed for horizontal location and elevation. The horizontal locations of monitoring wells and sampling locations were surveyed to a horizontal accuracy of 1.0 foot. The top-of-casing elevations were surveyed to the nearest 0.01 foot. Coordinate values used were Georgia State Plane, East Zone, North American Datum of 1983 (NAD). Ground surface elevations for monitoring wells and soil sampling locations were surveyed to the nearest 0.1 foot. The National Geodetic Vertical Datum (NGVD) of 1929 was used as the reference datum for elevations. Existing monitoring wells that were sampled were surveyed for horizontal location and top-of-casing elevation. The survey was conducted by Donaldson, Garrett & Associates, Inc., a licensed State of Georgia land surveyor.

C2.0 SAMPLING PROCEDURES

The sampling procedures conducted at the former FTA located at HAAF are described below.

C2.1 SAMPLE CONTAINERS AND SAMPLE IDENTIFICATION

Sample containers and preservatives were supplied by the laboratory in accordance with Table C.2. Field personnel identified the location of the sample collected; the date upon which it was obtained; the type of sample; whether or not a preservative was used, and if so, what type; and the respective project number. This information was documented in the Field Sampling Report (FSR). This same information was then placed on the sample identification label, which in turn was affixed to the sample container. Sample labels were filled out with indelible ink.

C2.2 SOIL SAMPLING

Soil samples were collected from a Geoprobe® sampler and/or hand augers and/or split-spoon sampler. Soil samples obtained with the Geoprobe® were collected with a 1.4 inch inside diameter (I.D.), 2-inch outside diameter (O.D.) acetate-lined tube sampler. The acetate liner was split and the soil sample was immediately collected for volatile organic compounds (VOCs) using three Encore® samplers. The remaining soil from the selected interval was placed into a decontaminated stainless steel bowl and homogenized. The homogenized soil was placed into two, 4-ounce (oz) glass jars for semi-volatile organics (SVOCs), and/or pesticides/PCBs, and moisture content.

Soil sample collection procedures from a stainless steel hand auger were performed in the following manner: Surface grass/debris were removed and the hand auger bucket was inserted into the ground and advanced to the desired depth. Once the bucket was extracted, the soil was placed into a decontaminated stainless steel bowl and homogenized. The homogenized soil was placed into one, 4-oz glass jar for SVOCs and moisture content. The samples were individually placed in water-tight zip-lock bags and packed in a cooler with bags of ice in order to maintain sample integrity. Soil samples and QA splits were submitted to the following laboratories for the analyses shown on Table 3.2:

Soil samples were collected with a 1.4-inch I.D., 2-inch O.D. 2-foot in length split-spoon sampler. At each sample interval, the split-spoon sampler was inserted into the boring and seated 6 inches to

penetrate any loose cuttings and then driven an additional foot with blows of a 140-pound hammer falling 30 inches. Soil samples from split-tube samplers were gently removed from the split-tube and placed on clean aluminum foil and securely wrapped and sealed with the aluminum foil and placed on ice pending the results of the headspace gas analysis and completion of visual inspection. A small portion of each soil sample will be placed in a self-sealing plastic bag and placed to the side to allow for volatilization. A photoionization detector (PID) was used to analyze the headspace gas in the bag. The PID gives a relative response to the presence of VOCs, but do not identify individual VOC constituents. The soil samples were also inspected for visual evidence of contamination, e.g., free-phase product and/or staining. The results of the field screening were used to select samples for laboratory analysis. Soil samples for VOC analysis were collected from the soil core from the split-spoon prior to homogenizing. The soil was placed into a decontaminated stainless steel bowl and homogenized. Soil samples for SVOCs and metals analysis were then collected from the homogenized soil.

Soil samples collected from soil borings SB-18 through SB-29, and SB-43 to SB-50, and HMW-14 through HMW-17 were sent to:

Severn Trent Labatories (STL) – Savannah
5102 LaRouche Avenue
Savannah, GA 31404

Because STL-Savannah could not provide data on a 48 hour turn-around time at the scheduled sampling event, the soil samples collected from soil borings SB-30 through SB-42 and HMW-14R, and HMW-18 were sent to:

Analytical Services Inc. (ASI)
110 Technology Parkway
Norcross, GA 30092

QA Split Samples:

Accura Analytical Laboratory, Inc.

6017 Financial Drive
Norcross, GA 30071

C2.3 GROUNDWATER SAMPLING

Groundwater samples were collected from monitoring wells and temporary piezometers. The procedures used to collect the samples are described below.

C2.3.1 Preliminary Observations

Prior to sampling, each monitoring well was inspected for damage and usability. The well cover was carefully opened to limit the potential for foreign material to enter the well. Upon opening the well, both a tri-gas monitor and a PID measurement were collected and entered into the logbook. Prior to purging and sampling, the depth to groundwater and total depth of the well were measured in each well with an electrical water level indicator.

C2.3.2 Groundwater Level Measurement

Each well was marked with an easily identifiable permanent reference survey point that was located on the highest point of the well casing. The depth to groundwater and total depth of the well was measured using an electrical water-level indicator. The instruments used were a electronic water-level meter and product probe. The water-level/product probe indicator was washed with an Alconox™ and water mixture and rinsed with potable water prior to each use. The depth to groundwater was measured and recorded in the field notebook.

C2.3.3 Well Purging

Monitoring wells were purged prior to sampling to provide fresh formation water for sampling. Purging was conducted in accordance with procedures set forth in U.S. Army Corps of Engineers guidance document EM200-1-3, *Requirements for the Preparation of Sampling and Analysis Plans.* Monitoring wells were purged with a QED stainless steel and Teflon bladder pump or a peristaltic pump and dedicated Teflon tubing until a minimum of 3 well volumes had been removed, and pH, specific conductance, and temperature had stabilized. In addition, the wells were to be purged to 5 NTUs. A pair of new gloves were used during the purging and sampling of each well.

The water quality parameters of temperature, pH, and specific conductance were measured with a Purge Saver FC-4000 in-line meter or a Horiba™ multi-meter. The meter was calibrated on a daily basis according to manufacturer's instructions. The physical appearance of the groundwater removed during purging was also recorded. Purging was considered complete when the water quality parameters stabilized. Stabilization of parameters is defined as: variation of pH less than 0.2 pH units between two consecutive readings, variation of temperature less than 0.5 degrees Celsius between two consecutive readings, and less than 10% variation of specific conductance between two consecutive readings. The turbidity of the water was measured with a DRT-15C turbidimeter and calibrated daily per manufacturer's instructions. Table C.3 presents the final well stablization parameters.

The formula used to calculate the volume of standing water in the well casing and filter pack based on the initial water level is presented below:

$$V = \pi ((r_1^2 - r_2^2)\,\phi + r_2^2) \times H \times 7.48$$

Where: V	=	volume, in gallons	
	H	=	height of water in well screen and filter pack in feet
	r_1	=	radius of borehole in feet
	r_2	=	radius of well in feet
	ϕ	=	porosity of filter pack, assumes 30 percent
	π	=	3.14
	7.48	=	conversion factor for cubic feet to gallons

The value of V was then multiplied by 3 (or 5 for development) to obtain the minimum well bore volume required to remove from the well.

C2.3.4 Groundwater Sample Collection

Monitoring Wells

Plastic sheeting was placed on the ground surface in the vicinity of the well to be sampled. Groundwater samples were obtained from each well as soon as the well recovered after purging. The groundwater samples were obtained with a QED stainless steel and Teflon bladder pump or a peristaltic pump with Teflon tubing utilizing low-flow sampling techniques. The flow rate on the pump was lowered to 100 milliliters (mls) +/- 20 mls per minute (as recommended by the EPA) for the collection of VOCs. Groundwater samples for VOC analysis were collected by pulling water into the Teflon tubing and

stopping the peristaltic pump, manually pinching the tubing closed and then removing the tubing pulled from the well with the water retained in the tubing. The pinch was removed from the tubing allowing the column of water to drain from the tubing into the sample container without passing through the pump's roller mechanism. Three 40-ml VOA vials were filled allowing no headspace for VOCs. After the VOCs were collected, the SVOCs and metals containers were filled. The SVOC samples were collected using a Teflon bailer and clean nylon rope. The SVOCs were collected in two, 1-liter amber glass bottles and the metals were collected in a 500 ml polyethylene bottle pre-preserved with nitric acid. The samples were individually placed in water-tight zip-lock bags and packed in a cooler with bags of ice in order to maintain sample integrity. Groundwater samples and QA splits were submitted to the following laboratories for the analyses shown on Table 3.2:

Groundwater Samples:

Analytical Services Inc. (ASI)
110 Technology Parkway
Norcross, GA 30092

Severn Trent Labatories (STL) – Savannah
5102 LaRouche Avenue
Savannah, GA 31404

QA Split Samples:

Accura Analytical Laboratory, Inc.
6017 Financial Drive
Norcross, GA 30071

Temporary Piezometers

The temporary piezometers were sampled within hours after installation with a peristaltic pump. The VOCs were collected by pulling up the tubing and reversing the pump to allow the VOA vials to be filled from the bottom end of the tubing with water that had not been through the pump head. Three, 40-ml VOA vials were filled allowing no headspace for VOCs. After the VOCs were collected, the SVOCs containers were filled (for piezometer samples SB-38 and SB-40). The SVOCs were collected in two, 1-liter amber glass bottles. The samples were individually placed in water-tight zip-lock bags and packed in a cooler with bags of ice in order to maintain sample integrity. The piezometer groundwater samples were submitted to the following laboratories for the analyses shown on Table 3.2:

Piezometer samples collected from locations HMW-14, HMW-15, HMW-16A, HMW-16B, HMW-16C and HMW-17 were sent to:

Severn Trent Laboratories (STL) – Savannah
5102 LaRoche Avenue
Savannah, Georgia 31404

Because STL-Savannah could not provide data on a 48 hour turn-around time, samples collected from piezometer locations SB-38 and SB-40 were sent to:

Analytical Services Inc. (ASI)
110 Technology Parkway
Norcross, GA 30092

C3.0 FIELD SAMPLE RECORD KEEPING AND CUSTODY PROCEDURES

Field documentation and custody procedures used at HAAF are described below.

C3.1 FIELD DOCUMENTATION

Field activities were documented in the field notebook and summarized by the Site Manager on a Daily Quality Control Report (DQCR). To provide for proper identification in the field and proper tracking in the laboratory, samples were labeled in a clear and consistent fashion. Field personnel maintained a permanently bound field notebook. This notebook was water resistant with sequentially numbered pages. Field activities were recorded with a waterproof permanent marker.

C3.2 CHAIN OF CUSTODY

Sample custody was initiated at the time of sample collection by placing the labeled sample into an iced cooler in the possession of the sampling personnel. A line item on the chain-of-custody record was filled out by the sampling personnel. The chain-of-custody record was used to track custody of samples during transport and shipping. Prior to sample shipping, the field representative signed, dated, and listed the time and confirmed the completeness of descriptive information contained on the form. The chain-of-custody form accompanied the samples. Each individual who subsequently assumed responsibility for the samples signed the chain-of-custody record. The field chain-of-custody record terminated upon laboratory receipt of samples. All entries were recorded in ink. Each sample had a corresponding entry on a chain-of-custody record. The chain-of-custody form included:

- Site name
- The unique sample I.D. name or number
- Sample type
- Date and time of the collection
- Number of containers
- Signature of sampler(s)
- Signature of persons involved in the chain of custody and inclusive dates and times of possession

C4.0 GENERAL DECONTAMINATION PROCEDURE

Decontamination was performed in accordance with the following standard operating procedures.

C4.1 GENERAL DECONTAMINATION PROCEDURE

Equipment that came in contact with potentially contaminated materials, soil, or water was cleaned prior to each use on this project. Decontamination consisted of a combination of steam cleaning and/or Alconox™ soap wash and potable water rinse.

C4.2 DRILLING EQUIPMENT

Drilling rigs and downhole equipment were cleaned and decontaminated at a designated decontamination station before each boring or well was installed. Equipment was inspected before use to determine if fluids (oils, lubricants, hydraulic fluids, etc.) were leaking. Drilling equipment was decontaminated as follows:

- The entire rig was steam cleaned upon arrival on-site.
- The back of the rig, including the jacks, mast, kelly bar, platform, hoists, spindles, cathead, etc., was steam cleaned between borings, as necessary.

Downhole drilling and sampling tools were decontaminated before each boring or well installation as described below:

- Steam clean
- Clean with tap water and laboratory grade, phosphate free detergent, with a brush.
- Rinse with tap water.
- Rinse with pesticide-grade methanol.
- Flush with organic-free water and allow to air dry as long as possible.

C4.3 SAMPLING EQUIPMENT

The following cleaning procedures were used for preparing sampling equipment prior to field use:

- Clean with tap water and Alconox™ soap using a brush if necessary to remove particulate matter and surface films.
- Rinse thoroughly with tap water.

- Rinse thoroughly with organic-free water.
- Rinse with pesticide-grade methanol.
- Rinse thoroughly with organic-free water and allow to air dry as long as possible.
- The equipment was wrapped with aluminum foil, if appropriate, to prevent contamination if the equipment was stored or transported.

TABLE C.1

Summary of Monitoring Well Development Parameters

Well Name	Development Date	pH	Specific Conductance	Temperature (°C)	Turbidity (NTU)
HMW-14	8/25/1999	6.46	0.028 (mS/cm)	26.3	1062

WELL DEVELOPMENT FORMS

WELL DEVELOPMENT DATA

PROJECT NAME Hunter Army Airfield PROJECT NO. 11-3551-0320

DEVELOPED BY ~~Aderholt~~ Bill Craig CHECKED BY [illegible] SHEET 1 OF 4

WELL NO. HMW-10 SITE LOCATION Fire Training Area

1. a. Date of installation: 10-03-95 b. Date of development: 10-07-95 to 10-09-9
2. Static Water Level
   a. Before development: 7.54 (TOC) ft. date/time 10-07-95 823
   b. At least 24 hrs. after development: 7.63 (TOC) ft. date/time 10-10-95 906
3. Organic Vapor
   a. Before development: 0 ppm b. After development: 0 ppm
4. Quantity of water loss during drilling, if used: 0 gal.
5. Quantity of standing water in well and annulus before development: 8.77 gal.
6. Depth from top of well casing to bottom of well: 16.31 ft. (from well installation diagram)
7. a. Well diameter: 2 in. b. Screen length: 10.17 ft.
8. Minimum quantity of water to be removed: 177.12 gal. (attach calculation)
9. Depth to Top of Sediment
   a. Before development: 16.09 ft. b. After development: 16.09 ft.
10. Physical character of water (before/after development): before - grayish color, slight fuel odor
    after - water has a grayish tint
11. Type and size of well development equipment: 2in x 5ft PVC/stainless steel airlift pump manufactured by QED Groundwater Specialist, powered driven by a Ulass air compressor
12. Description of surge technique, if used: manually surged with airlift pump with surge rings and wiper attached
13. Height of well casing above ground surface: 2.8 ft. (from well installation diagram)
14. a. Quantity of water removed: 49.5 gal. b. Time for removal: 4 hrs 25 mins hr./min.
15. a. -Liter water sample collected: 1016 (10-09-95) (time) b. Wate: sample photographed? YES NO (circle one)
16. Final turbidity in nephelometric units: 49 NTUs
17. Final Imhoff cone measurements < 0.75 mL/L, if applicable: NA

WELL DEVELOPMENT DATA

PROJECT NAME Hunter Army Airfield CSR PROJECT No. 12001-9-3411

DEVELOPED BY JAH / KB/MJ CHECKED BY _____ SHEET 1 OF 2

1. Well No.: HAAW-16 Site Location: FTA - Hunter Army Airfield
2. Date of Installation: 7-29-99
3. Date of Development: 9-2-99
4. Static Water Level: Before Development 11.72 ft.; At Least 24 hrs. After _____ ft.
5. Organic Vapor: Before Development 0.2 ppm; After Development 0.0 ppm qpd
   Borehole PID 14.0 ppm Borehole PID 3.4 ppm
6. Quantity of Water Loss During Drilling, If Used: 2.0 gal.
7. Quantity of Standing Water in Well and Annulus Before Development: 4.08 gal.
8. Depth From Top of Well Casing to Bottom of Well: 16.06 ft. (from Well Installation Diagram)
9. Well Diameter: 2 in.
10. Screen Length: 10 ft.
11. Minimum Quantity of Water to be Removed: 30.4 gal.
12. Depth to Top of Sediment: Before Development 16.06 ft.; After Development _____ ft.
13. Physical Character of Water (Before/After Development): Black, very turbid, strong petroleum odor.
14. Type and Size of Well Development Equipment: QED 45" Development pump (PVC)
15. Description of Surge Technique, If Used: Hand surged with pump equipped with washers at top and bottom. Surged 10 times initially. Pumped at optimum rate of 0.2 Liters per minute.
16. Height of Well Casing Above Ground Surface: 1.77 ft. (from Well Installation Diagram)
17. Quantity of Water Removed: _____ gal. Time for Removal: _____ hr. / min.
18. 1-Liter Water Sample Collected: _____ (Time) Photographed? Y / N
19. Final Turbidity in Nephelometric Units: _____ NTUs
20. Final Imhoff Cone Measurements < 0.75 mL/L, If Applicable: NA

DEVELOPED BY TMK/DAH/MWH CHECKED BY _____ SHEET 1 OF 2

1. Well No.: HMW-20 Site Location: FORMER FIRE TRAINING AREA
2. Date of Installation: 1-9-00
3. Date of Development: 1-12-00
4. Static Water Level: Before Development 6.91 ft.; At Least 24 hrs. After 6.50 ft.
5. Organic Vapor: Before Development 1.6 ppm; After Development _____ ppm
6. Quantity of Water Loss During Drilling, If Used: 15 gal for charging gal.
7. Quantity of Standing Water in Well and Annulus Before Development: W.C- 8.06' _____ gal.
8. Depth From Top of Well Casing to Bottom of Well: 14.97 ft. (from Well Installation Diagram)
9. Well Diameter: 2" in.
10. Screen Length: 9.69 ft.

14.97
- 6.91
8.06 WATER COLUMN

11. Minimum Quantity of Water to be Removed: 115 gal.
12. Depth to Top of Sediment: Before Development 14.91 ft.; After Development NA ft.
13. Physical Character of Water (Before/After Development): Ver. turbid dark gray brown
14. Type and Size of Well Development Equipment: AIR DISCHARGE PUMP
15. Description of Surge Technique, If Used: SURGE PUMP UP/DOWN
16. Height of Well Casing Above Ground Surface: 2.5 ft. (from Well Installation Diagram)
17. Quantity of Water Removed: 222 gal. Time for Removal: 7.2 hrs hr. / min.
18. 1-Liter Water Sample Collected: 1205 (Time) Photographed? (Y) / N
19. Final Turbidity in Nephelometric Units: 45.5 NTUs
20. Final Imhoff Cone Measurements < 0.75 mL/L, If Applicable: _____

HUNTER/ESE

AAAP 10-4-85

MONITOR WELL CONSTRUCTION

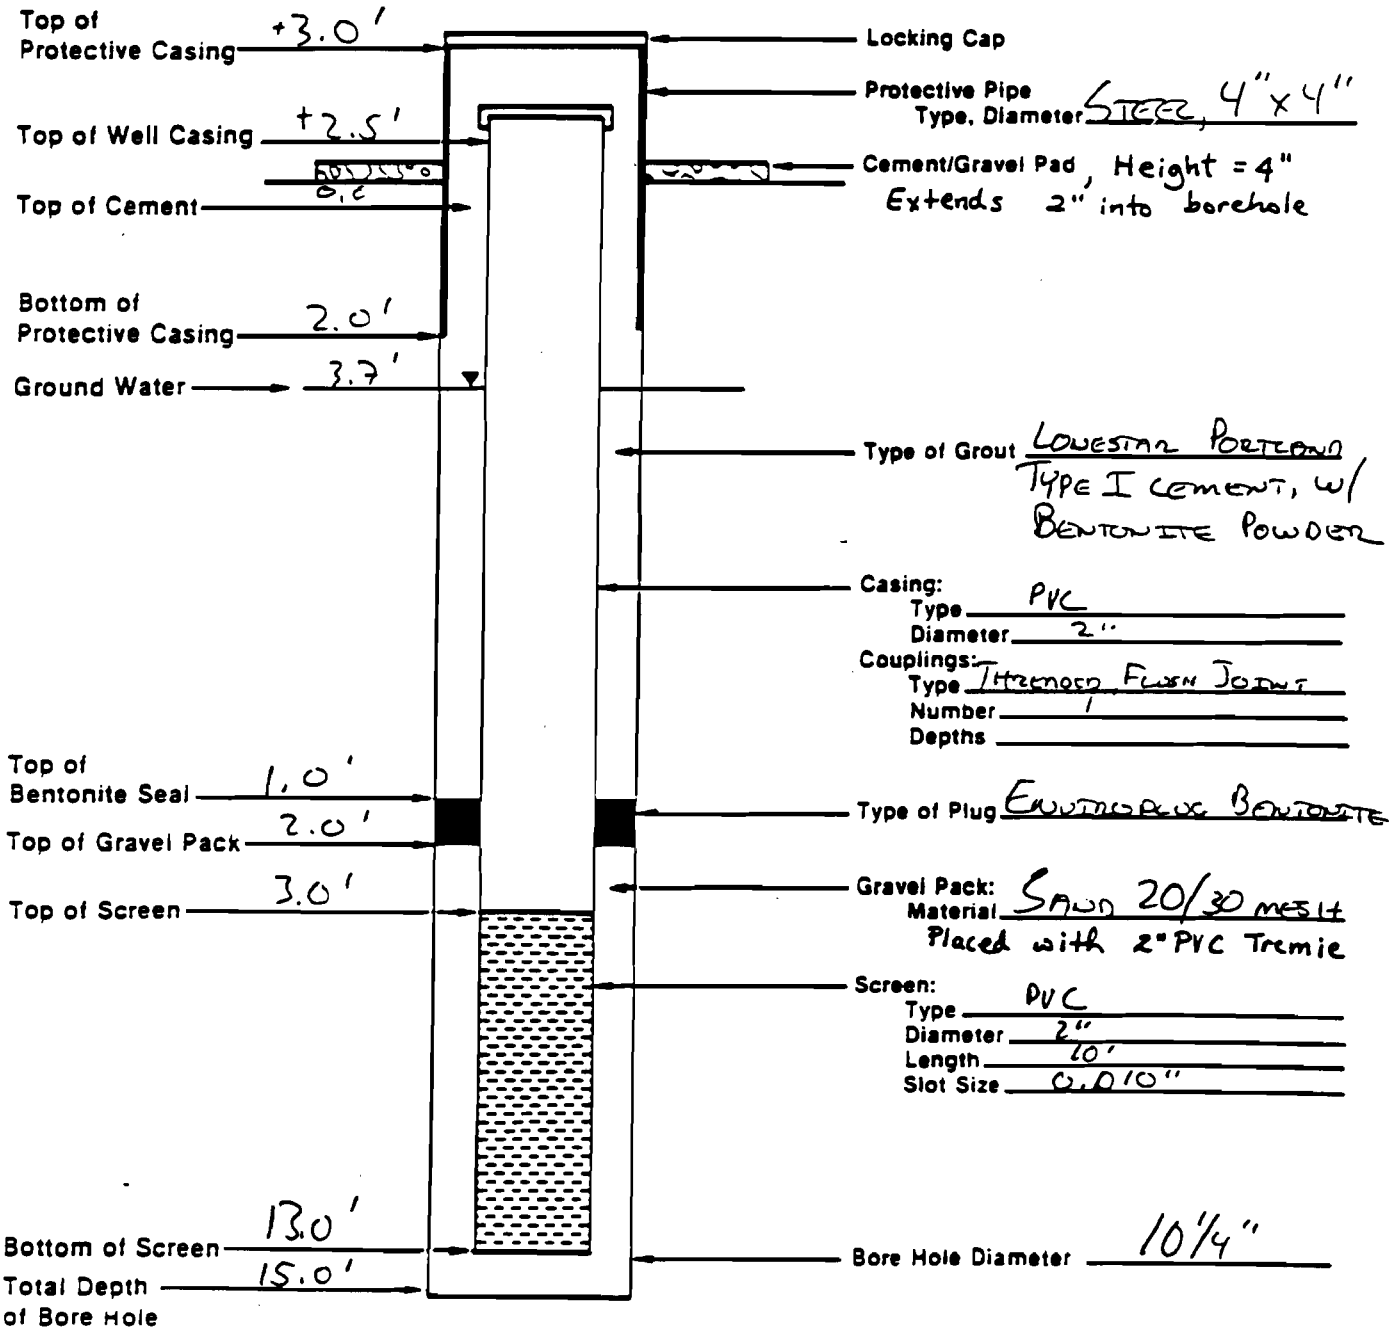
Logged By: J. TRENT
Drilling Contractor: LATNC ENVIRONMENTAL
Driller's Name: MARK BARLOW
Well Number: HMW-6

Client: ARMY CORPS OF ENGINEERS
Location: FT. STEWART - HUNTER AAF
Job Number: 3902018
Date/Time: Start 2-12-90/1315 Finish 2-12-90/1415

Comments (Lost circulation interval, Water level changes, Hole collapse interval, etc.):
Complete Grout : 1415, 2-12
Begin Development: 0915, 2-13
Elapsed Time : 19.0 hr.

Method of Development : Pumping
Total Volume of Water Extracted : 85 gal.

Depths in Reference to Ground Level



NOT TO SCALE

TYPE II MONITORING WELL INSTALLATION DIAGRAM

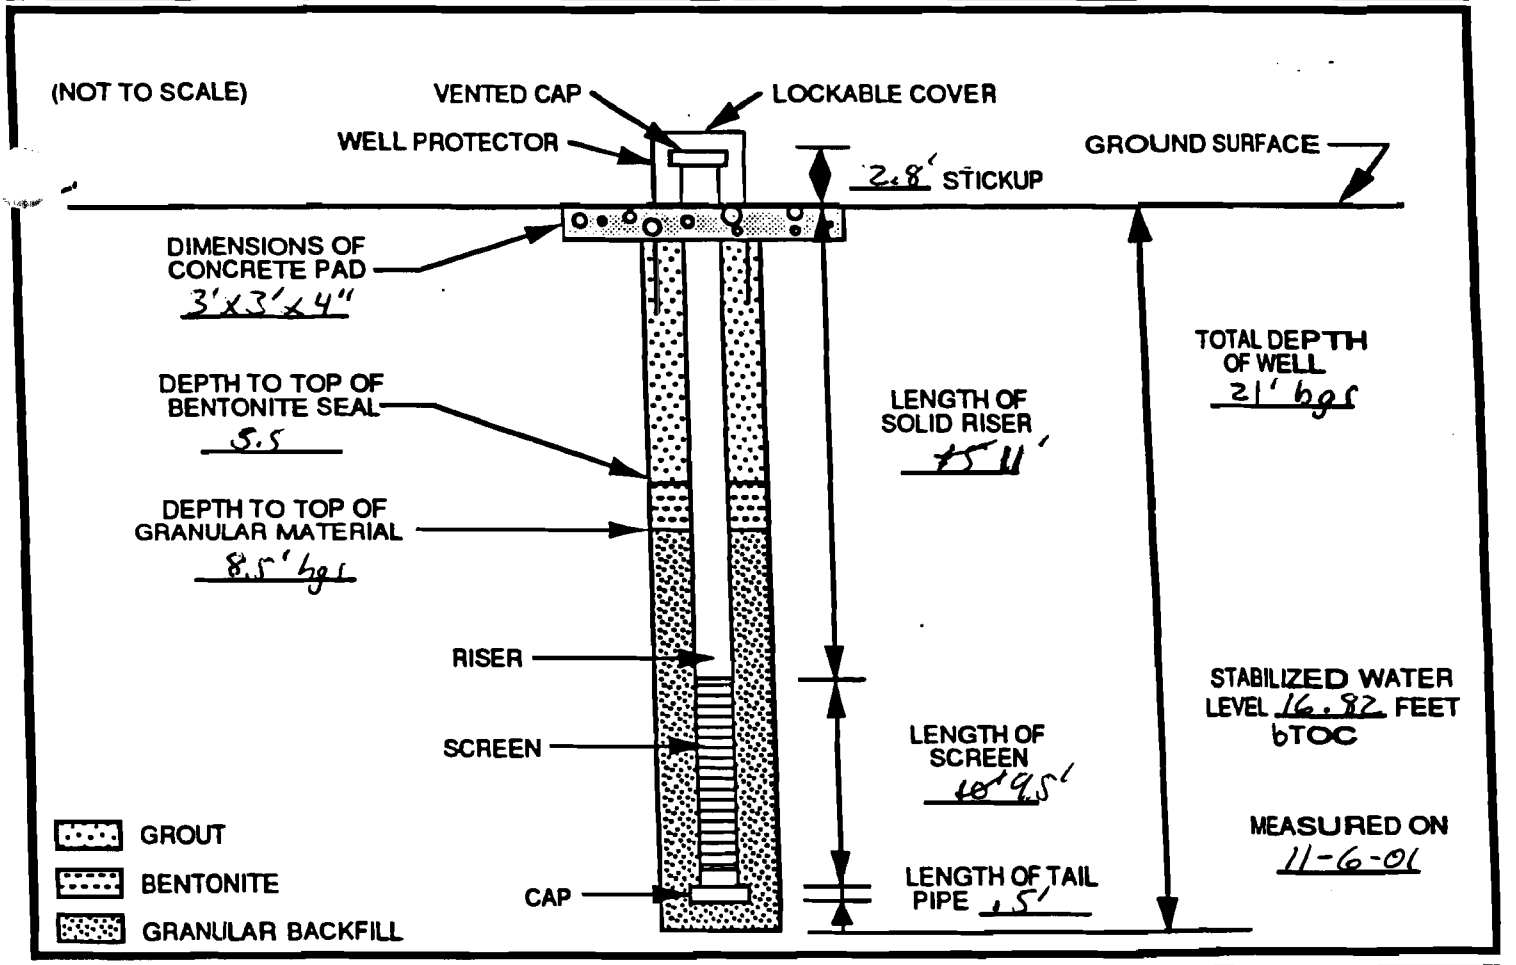
JOB NAME HUNTER AAF
WELL NO. HMW 22 JOB NO. 12001-9-3411
DATE 11-1-01 TIME 7:35 AM
WELL LOCATION SB-46

GROUND SURFACE ELEVATION 35.45 ft AMSL
TOP OF SCREEN ELEVATION 24.45 ft AMSL
REFERENCE POINT ELEVATION TOC = 38.19ft AMSL
TYPE SAND PACK QTZ SAND GRADATION 30/65
SAND PACK MANUFACTURER STANDARD SAND & SILICA CO.
SCREEN MATERIAL PVC-2" MANUFACTURER BOART LONGYEAR
RISER MATERIAL PVC-2" MANUFACTURER DIAMOND DRILLING CORP.
RISER DIAMETER 2-INCH
DRILLING TECHNIQUE Hollow Stem Auger
AUGER SIZE AND TYPE 6 1/4" I.D. / HSA

BENTONITE TYPE 3/8" PELLET VOLCLAY / POLYBOND MANUFACTURER CETCO
CEMENT TYPE TYPE I PORTLAND CEMENT MANUFACTURER FLORIDA ROCK
BOREHOLE DIAMETER ~ 12-INCHES
SCREEN DIAMETER 2-INCH SLOT SIZE .006
LAW ENVIRONMENTAL, INC. FIELD REPRESENTATIVE JOHN MARTIN
DRILLING CONTRACTOR BETTS ENVIRONMENTAL
AMOUNT BENTONITE USED 2-5 gal BUCKETS
AMOUNT CEMENT USED 2-94lb bags / 4-80lb bags Pea
AMOUNT SAND USED 10-50-lb bags
STATIC WATER DEPTH (after dev.) 16.82 ft. bTOC



QA / QC

TYPE II MONITORING WELL INSTALLATION DIAGRAM

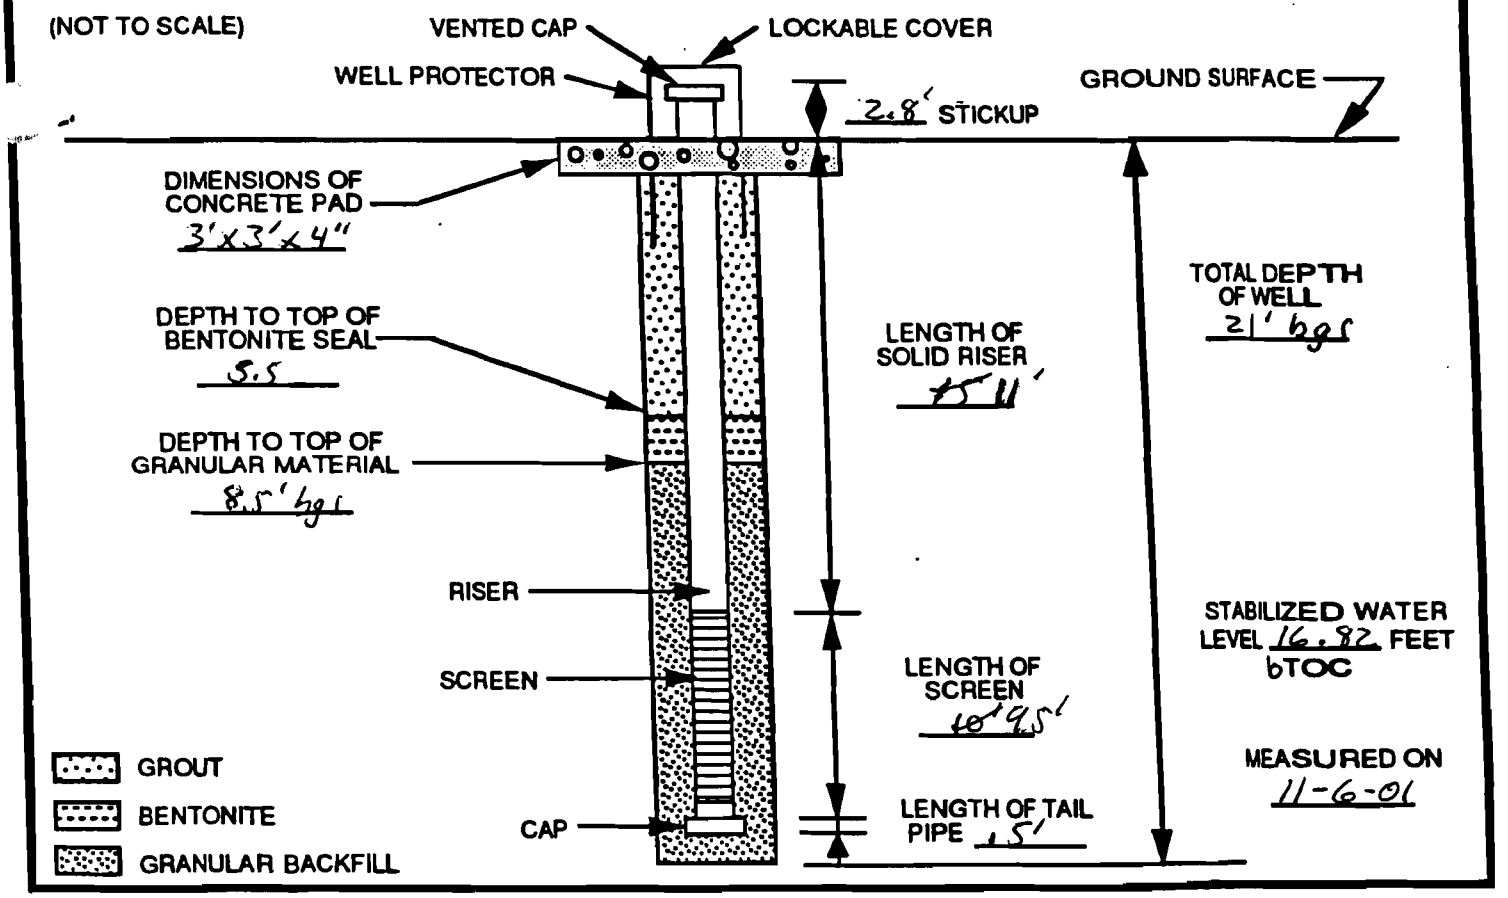
JOB NAME Hunter AAF
WELL NO. HAMW 22 JOB NO. 12001-9-3411
DATE 11-1-01 TIME 7:35 AM
WELL LOCATION SB-46

GROUND SURFACE ELEVATION 35.45 ft AMSL
TOP OF SCREEN ELEVATION 24.45 ft AMSL
REFERENCE POINT ELEVATION TOC = 38.19ft AMSL
TYPE SAND PACK QTZ SAND GRADATION 30/65
SAND PACK MANUFACTURER STANDARD SAND & SILICA CO.
SCREEN MATERIAL PVC-2" MANUFACTURER BOART LONGYEAR
RISER MATERIAL PVC-2" MANUFACTURER DIAMOND DRILLING CORP.
RISER DIAMETER 2-INCH
DRILLING TECHNIQUE Hollow Stem Auger
AUGER SIZE AND TYPE 6 1/4" I.D. / HSA

BENTONITE TYPE 3/8" PELLET VOLCLAY / POREGOLD MANUFACTURER CETCO
CEMENT TYPE TYPE I PORTLAND CEMENT MANUFACTURER FLORIDA ROCK
BOREHOLE DIAMETER ~ 12-INCHES
SCREEN DIAMETER 2-INCH SLOT SIZE .006
LAW ENVIRONMENTAL, INC. FIELD REPRESENTATIVE JOHN MARTIN
DRILLING CONTRACTOR BETTS ENVIRONMENTAL
AMOUNT BENTONITE USED 2-5gal BUCKETS
AMOUNT CEMENT USED 2-94lb bags / 4-80lb bags
AMOUNT SAND USED 10-50-lb bags
STATIC WATER DEPTH (after dev.) 16.82 ft. bTOC



QA / QC

Drilling Method Hollow-Stem Auger

Drilling Contractor ARM Environmental Services, Inc.

Drilling Fluid None

Development Technique(s) and Date(s)

Submersible pump 11/12/2009

Fluid Loss During Drilling N/A gallons

Water Removed During Development 85 gallons

Static Depth to Water 4.98 feet below M.P.

Pumping Depth to Water 52 feet below M.P.

Pumping Duration 1 hours

Yield 1.42 gpm Date 11/12/2009

Specific Capacity gpm/ft

Well Purpose Groundwater Monitoring

Remarks Borehole was drilled to 50.0', but bottom 1.0' collapsed, thus the well was set at 49.0'.

Prepared by B. Wolf

WATER SAMPLING LOG

Project No. GP08HAFS.H01A.NAL.TM

Date 2-2-09

Site Location: HAA-001/Fire Tng Area, HAAF

Monitoring Well Number HMW-02

Rep./Field Blank No. _____

Sample Collection Time 1110

Weather- clear - 60°F

Sampling Method Low Flow

Evacuation Data.

Depth to bottom of well (ft bls) 15.0

Casing stick-up above concrete (feet) _____

Depth to water from top of casing 14.21

Screened Interval (ft bls) 4.6 - 14.6

Water Column 0.79 (ft) Gallons in well 0.12

Casing Diameter: 2"

Evacuation Volume (x) = _____

Casing Volume 1"=0.04 gal gal/ft, 2"=0.16 gal/ft

Field Parameters:

Time	Gallons Purged	Temp (°C)	pH (SU)	DO (mg/L)	Cond. (mS/cm)	Turb (NTU)	Redox (mV)	Flow (mL/min)	Depth to Water (ft)

WATER SAMPLING LOG

Project No. GP08IIAFS.I101A.NALTM
Site Location: IIAA-001/Fire Tng Area, IIAAF
Rep./Field Blank No.
Weather SUNNY 52°F

Date
Monitoring Well Number HMW-04
Satnple Collection Time 09?-C
Sampling Method Low Flow

Evacuation Data:'

Depth to bottom of \~el(ft-ls) 15.0
Depth to water from top of caring 9.49
Water Column 5.51 (ft) Gallons in Well 0.9
Evacuation Volume (x) =

Casing stick-up above concrete (feet)
Screened Interval (ft bls) 3.0-13.0
Casing Diameter: 2"
Casing Volume 1"=0.04 gal gal/ft, 2"=0.16 gal/ft

Field Parameters:

Time	Gallons Purged	Temp (°C)	pH (SU)	DO (mg L)	Cond. (~~µmhos~~/cm)	Turb (NTU)	Redox (mV)	Flow (mL min)	Depth to Water (ft)
0935	0.1	15.61	6.51	3.03	0.278	99	97	0.08	9.53
0940	0.1	16.46	6.58	1.33	0.302	6.7	64	0.08	9.57
0945	0.1	16.51	6.59	1.34	0.303	6.2	63	0.08	9.59
0950	0.1	16.50	6.59	1.31	0.303	7.6	62	0.09	9.60

Analvses

Analytical Parameter	Sample Bottles	Preservative
8260B – VOCs	40mL VOA vials	<4°C/HCl
82707 – SVOCs	1 lt Amber Glass	<4°C
– Pesticides	1 lt Amber Glass	<4°C
– Herbicides	1 lt Amber Glass	<4°C
– Metal	500 ml Plastic	<4°C/Nitric Acid

Historic Remedial Action Summaries

Summary of Source Removal Activities – Former FTA

Omega Environmental Services with subcontractor Geosciences, Inc., conducted soil remediation activities at the FTA located at Hunter Army Airfield from November 1997 to March 1998. The soil remediation activities included the decontamination and removal of the simulated aircraft structure, aboveground storage tanks, fuel transmission lines, concrete pad, and sump pit structure. Soils, free-phase product, and wastewater were removed from the area and transported to off-site disposal facilities. The horizontal limits of the excavation are shown on Figure 3 (page B-13) and the depth of the excavation ranged from 5 to approximately 8 feet below ground surface. The remediation generated 9,430 tons of contaminated soils, 233 tons of demolished concrete debris, and 81,906 gallons of wastewater. A total of 27 confirmation soil samples were collected from the side walls and floor of the excavation and analyzed for RCRA metals; benzene, toluene, ethylbenzene, xylenes (BTEX); organochlorine pesticides, polychlorinated biphenyls (PCBs) and total petroleum hydrocarbons (TPH). Contaminated soils were excavated to a depth and lateral extent where the constituent concentrations were less than the HSRA Notification Concentrations. The confirmation soil samples indicated that constituents were still present in the soils beneath the excavation. *Soil Remedial Action Report*, dated December 1998 presents the soil remediation activities in detail. Maps of the excavation and confirmation soil sampling locations along with a summary of the laboratory analytical data of the confirmation samples is provided in the following appendix.

Footnotes:

BDL -- Below Detection Limit
VOC -- Volatile Organic Compound
RCRA -- Resource Conservation and Recovery Act
PAH -- Polynuclear Aromatic Hydrocarbon
PCB -- Polychlorinated Biphenyl
HSRA -- Hazardous Site Response Act
TCLP -- Toxicity Characteristic Leaching Procedure, 40 CFR sec. 260
NA -- Not Analyzed

"J" flagged benzene values that have been reported for this project were calculated for benzene hits below the reporting limit. When benzene was present, this value was multiplied by the appropriate correction factor, taking into account the weight of the sample analyzed and the dilution factor.

HSRA Thresholds correspond to levels presented in "Regulated Substances and Soil Concentrations that Trigger Notification," Appendix I of Georgia's Rules for Hazardous Site Response, Chapter 391-3-19. Results exceeding HSRA Thresholds are present in bold and italicized print in Table 1.

TCLP Hazardous Levels correspond to the maximum regulatory level for concentrations of contaminants using the TCLP Method presented in 40 CFR sec. 261.24.

*HSRA does not list a specific regulatory limit or threshold for TPH. However, the Georgia Environmental Protection Division (EPD) sometimes requires analytical testing of groundwater if TPH in soil is not vertically delineated to BDL above the groundwater table. Also, EPD considers a TPH result greater than 10,000 mg/kg as indicative of free product.

**HSRA does not list specific regulatory limits for these constituents. However, releases of these constituents may be regulated by HSRA or EPD on a case-by-case basis under broader authorities of Georgia's Rules and Regulations for Water Quality Control, Chapter 391-3-6, or other EPD Programs.

The confirmatory soil samples presented in Table 1 were submitted to the primary lab in six shipments (approximately 10 to 15 samples per shipping cooler). Each of the six shipping coolers contained one trip blank and one Quality Control (QC) sample. The trip blank laboratory reports were all BDL. The QC samples were designated with an "X" after the respective duplicate/split sample identification (i.e., EB-F5 and EB-F5-X). Other duplicate/split samples were submitted as Quality Assurance (QA) samples to the U.S. Army Corps of Engineers laboratory. The QA samples were designated with a "QA" after the respective duplicate/split sample identification (i.e., EB-E7 and EB-E7-S-QA).

Appendix E

UBC Background Concentration Summary

during storage in laboratory refrigerators. Because trichlorofluoromethane was only detected in soil samples by ESE in 1992, and is not indicative of fire training activities, possible contamination of samples during storage is likely. The presence of these compounds detected in samples is believed to be laboratory artifact or indicative of the concrete/asphalt construction debris fill materials present at the Site. Therefore, the focus of the 1999/2000 CSR assessment activities was the complete delineation of arsenic, barium, lead, VOCs and PAHs in groundwater, and VOCs, PAHs, barium, chromium, organochlorine pesticides, and PCBs in soils. As required by the Georgia EPD January 2001 comments, the 2001 CSR assessment activities for soils included the delineation of the previously detected acetone, methylene chloride, and phthalates along with VOCs, SVOCs, barium, and chromium. The 2001 CSR assessment activities for ground water were focused on VOCs.

Concentrations of regulated substances detected in surface and subsurface soil samples collected during the CSR assessment activities conducted in 1999 to 2001 are summarized in Tables 4.3 and 4.4. Concentrations of regulated substances detected in groundwater samples collected during the CSR activities and previous investigations are summarized in Tables 4.5. Figures 4.8A, 4.8B, 4.8C, 4.9A, 4.9B, 4.9C, 4.10, and 4.11 present the distribution and extent of site-specific regulated substances detected in surface and subsurface soil. Figure 4.12 presents the distribution and extent of site-specific regulated substances detected in groundwater.

4.3.1 Background Concentrations

Soil

During the course of the investigation of the former FTA, 63 soil samples were obtained and analyzed for RCRA metals (arsenic, barium, cadmium, lead, mercury, nickel, selenium and silver). Since there was no known release of metals at the Site, it could not be determined which, if any, of the samples were representative of a release, and which were representative of background conditions. Therefore, a statistical evaluation which initially considered all of the available soil metals data was performed.

The soils data was first evaluated for identification of statistical outliers. The Grubbs Outlier test referenced in USEPA Statistical Analysis of Ground Water Monitoring Data at RCRA Facilities, dated April 1989 and ASTM E178-75 was used to determine the outliers. Normally, outlier data points are left in the data set and are statistically evaluated with the other data points. To be conservative in the evaluation of the metals in soil at the HAAF former FTA site, the outliers were removed from the data set prior to the statistical analysis. If a data point was an outlier for one metal, it was removed from all of the

metals data sets. Six samples which displayed statistical outliers for any metal were removed from the data sets for all metals. The outliers removed from the data set are listed below.

BH-10 (0-1 ft)	Barium concentration outlier
BH-11 (0-1 ft)	Arsenic and Lead concentration outliers
BH-13	Arsenic, Lead, and Mercury concentration outliers
BH-13 (0-1 ft)	Lead concentration outlier
FTASB-11 (SB-11) (0.5-1)	Barium concentration outlier
HMW-13 (8-10 ft)	Chromium concentration outlier

Sample locations BH-10, BH-11, BH-13, and SB-11 are located within the area where fuels were used in fire training exercises which is considered to be a source area.

A statistical evaluation was then performed on the remaining data after the outliers had been removed. Statistical methods were selected based on the distribution of the data and the number of non-detects. The data were evaluated for normality using the Filliben, Shapiro-Francia, and Shapiro-Wilk tests. Log-normal data sets (arsenic, barium, chromium, lead, and selenium) were logarithmically transformed. Upper background concentrations (UBCs) were then selected on the transformed data using the mean plus 1.645 standard deviations. A non-parametric analysis was then performed on the remaining data sets that did not normalize by log transform (cadmium, mercury, and silver) and were assigned a UBC equal to the maximum observed value. In the case of mercury, the maximum observed value (0.40 mg/kg in sample BH-12) exceeded the UBC for arsenic, lead, selenium, and silver. Therefore, the next highest maximum observed value (0.39 mg/kg in sample BH-13) was selected as the mercury UBC. The statistical evaluation yielded UBCs for each of the eight metals analyzed and are listed below. The statistical plots and statistical calculations used to select UBCs for each of the eight metals are included in Appendix H.

Metal	UBC (mg/kg)	Statistical Method	HSRA Table 2, Appendix III Values
Arsenic	2.6	Log-normal data Mean + 1.645 std. Dev	20
Barium	28	Log-normal data Mean + 1.645 std. Dev	1000
Cadmium	2.6	Non-Parametric, Max observed value	2
Chromium	7.7	Log-normal data Mean + 1.645 std. Dev	100
Lead	53	Log-normal data Mean + 1.645 std. Dev	75
Mercury	0.39	Non-Parametric, Max observed value	0.5
Selenium	1.9	Log-normal data Mean + 1.645 std. Dev	2
Silver	2.6	Non-Parametric, Max observed value	2

As indicated above, the UBC for arsenic, barium, chromium, lead, mercury, and selenium are below the HSRA Table 2, Appendix III values (which are based on GAEPD's estimate of statewide background). The UBCs were then used to evaluate where metals concentrations exceeded background and if the extent of metals could be delineated using the existing data. The results of the evaluation indicated that most of the exceedences of the background concentration (i.e., UBCs) were within the excavated area and areas immediately adjacent to the excavated area. The evaluation also indicated that the extent of the metals in soils was not completely delineated to the north and west of the excavated area. Additional delineation for chromium was conducted to the north of HMW-13 and to the west of HMW-11, for barium to the west of SB-13 (Figure 4.11).

Groundwater

Background groundwater samples from off-site locations were not collected during the 1999/2000 CSR assessment activities. However, review of previous groundwater analytical data collected during 1995 indicated that VOCs, PAHs, and metals (except barium) were not detected in groundwater samples

collected from wells HMW-1 (deep) and HMW-2 (shallow). Barium was detected at 0.042 mg/L in well HMW-1 and 0.095 mg/L in well HMW-2 during the 1995 sampling event; however, it should be noted that sampling was performed using a Teflon® bailer and not low-flow sampling devices. Since these wells were located hydraulically upgradient from the former FTA, wells HMW-1 and HMW-2 are considered representative of background conditions for groundwater at the Site.

4.3.2 Surface Soil Sampling and Analyses

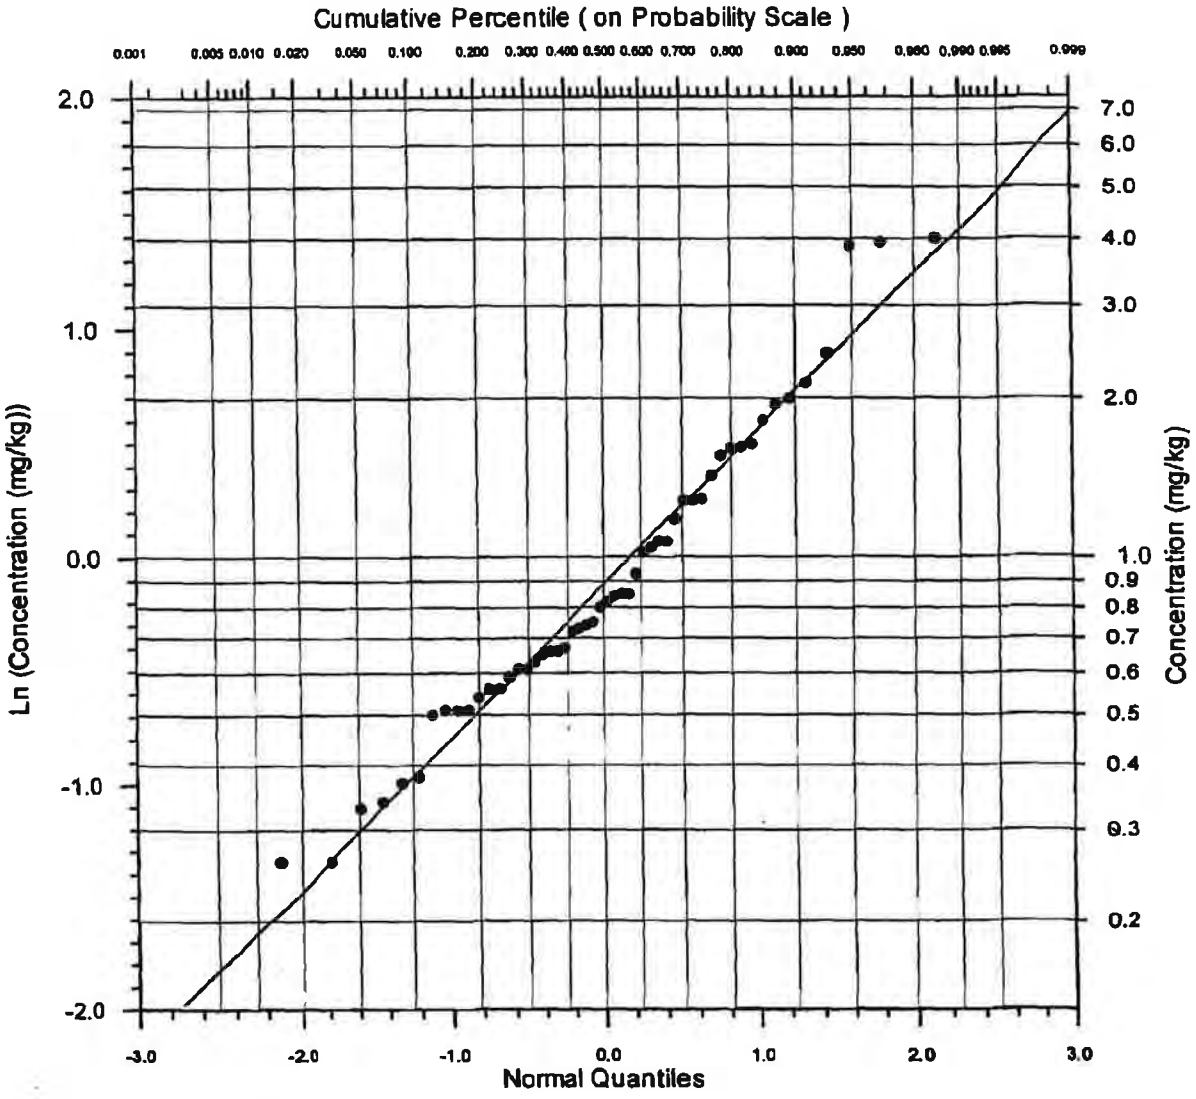
A summary of the laboratory analyses of surface soil samples collected during previous investigations is provided in Appendix A. The laboratory analytical reports for the surface soil samples collected during the CSR assessment activities are provided in Appendix F. A summary of HSRA-regulated substances detected in surface soil samples collected during the CSR assessment is provided in Table 4.3. The following text summarizes the results from both the previous investigations and the CSR assessment. Please refer to Section 4.3 for an explanation of the potential sources of these substances.

Laboratory analyses of the surface soil samples indicated the presence of four VOCs (acetone, tetrachloroethene, toluene, and trichlorofluoromethane) at concentrations greater than their respective practical quantitation limits (PQLs). The number of detections, the maximum concentrations detected, and the location in which the maximum concentration was detected for site-specific VOC regulated substances in surface soil samples are presented below:

Constituent	No. of Detections	Maximum Concentration Detected (mg/kg)	Location
Acetone	8	0.17	HMW-16
Tetrachloroethene	1	0.0061	SB-18
Toluene	1	0.021	SB-06
Trichlorofluoromethane	3	0.014	PSB-1

Laboratory analyses of the surface soil samples also indicated the presence of 17 SVOCs reported at concentrations greater than their respective PQLs. Included are the following regulated substances: acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, bis(2-Ethylhexyl)phthalate, chrysene,

STATISTICAL DATA AND STATISTICAL PLOTS



LEGEND:

● Arsenic (mg/kg)

LN(Data) Passed the Shapiro-Francia Normality Test indicating the Data are Lognormal.

LEGEND:

- Cadmium (mg/kg)

Due to high percentage of non-detects the data can not be validly normalized.
Probability Plot is Detects-Only. 79% NDs.

Upper Background Concentration: **2.6 mg/kg**
Based on non-parametric analysis, UBC is set equal to the maximum observed value.
5% Significance Level and 98% expected coverage.

Total of 63 samples, of which 57 data points were used for UBC and 12 for Probability Plot.
No Data Points are determined to be statistical outliers.
By ASTM Designation E178-75, 1975.
5% significance level.
Six data points, BH-10 (<1.98), BH-11 (1.99), BH-13 (0.02), BH-13 (3.87), FTASB-11 (2.2), and HMW-13 (<2.3), are rejected due to being outliers in other metals data sets.

By ASTM Designation E178-75, 1975.
5% significance level.
Five data points, BH-10 (12.80), BH-11 (4.16), BH-13 (2.84), BH-13 (9.10) and FTASB-11 (4.8), are rejected due to being outliers in other metals data sets.

LEGEND:

- Lead (mg/kg)

LN (Data) Passed The Coefficient of Skewness Test of Normality Indicating the data are lognormal. Probability Plot is Detects-Only. 25% ND. Aitchison's Adjustment used for UBC calculation.

Upper Background Concentration: **53 mg/kg**
Based on LN (Data) Adjusted Mean + 1.645 Adjusted Standard Deviations.
LN (Data) Adjusted Mean: 1.7158 SD: 1.3668

Total of 62 samples, of which 56 data points were used for UBC and 42 for Probability Plot.
Three Data Points, BH-11 (1163.00), BH-13 (1179.00) and BH-13 (1185.00), are statistical outliers.
By ASTM Designation E178-75, 1975.
5% significance level.
Three data points, BH-10 (645.00), FTASB-11 (15.0), and HWM-13 (3.2),
are rejected due to being outliers in other metals data sets.

LEGEND:

- Mercury (mg/kg)

The Data Failed all Tests of Normality.
Probability Plot is Detects-Only. 44% NDs.

Upper Background Concentration: **0.39 mg/kg**
The maximum observed value, 0.40mg/kg, was not used for the UBC,as it was from a sample location that exceeded the UBC for another parameter. Based on non-parametric analysis, the UBC was set equal to the next highest value detected.
5% Significance Level and 98% Expected Coverage.

Total of 63 samples, of which 57 data points were used for UBC and 32 for Probability Plot.
One Data Point, BH-13 (0.79), is a statistical outlier.
By ASTM Designation E178-75, 1975.
5% Significance Level.
Five data points, BH-10 (0.40), BH-11 (0.38), BH-13 (0.38), FTASB-11 (0.034), and HWM-13 (0.03), are rejected due to being outliers in other metals data sets.

LEGEND:

- Silver (mg/kg)

Due to high percentage of non-detects the data can not be validly normalized.
Probability Plot is Detects-Only. 79% NDs.

Upper Background Concentration: **2.6 mg/kg**
Based on non-parametric analysis, UBC is set equal to the maximum observed value.
5% Significance Level and 98% expected coverage.

Total of 63 samples, of which 57 data points were used for UBC and 12 for Probability Plot.
One Data Point, BH-13 (<7.98), is determined to be a statistical outlier.
By ASTM Designation E178-75, 1975.
5% significance level.
Five data points, BH-10 (<3.99), BH-11 (<3.99), BH-13 (<3.99), FTASB-11 (2.2), and HMW-13 (<2.3), are rejected due to being outliers in other metals data sets.

Re: Response to 3/19/01 Meeting Letter
Hunter Army Airfield
HSI #10105

Dear Col. Stanley:

The Georgia Environmental Protection Division (EPD) has received your compliance status report (CSR) response letter dated March 5, 2001 and your April 16, 2001 correspondence following up on our March 19, 2001 meeting regarding the above referenced site. EPD was asked to address issues raised during our meeting pertaining to calculated background concentrations, the methodology used to calculate the background concentrations, and future sampling locations:

1. Background Concentrations - The proposed background concentrations presented on page 5 of CSR response are acceptable to EPD. It should be noted that although Table 2 of Appendix III should not be used for determining site-specific background concentrations, it is useful for comparative purposes in that most background concentrations will be below those levels.

2. Statistical Calculations – The statistical methods described can be used for determining background concentrations; however, they do not necessarily apply to all sites due to variations in site-specific data. The method used to determine multiple outliers in a dataset should be stated in the revised CSR and included in an appendix along with the other statistical methods used in the CSR.

3. Proposed Sampling Locations – The sample locations shown in Figure 1 of the CSR response surrounding SB-30 appear sufficient to delineate the site with the following exceptions. Two more sample locations (in addition to SB-45) are needed to delineate the southern boundary near SB-35. One location is needed to the west of SB-45 and south of SB-36. The other location to be added is to the east of SB-45 across Lightning Road. The purpose of proposed sampling locations SB-47 and SB-48 is unclear and needs to be explained before EPD can comment on them.

For specific answers to questions concerning risk assessment calculations and ecological evaluations, you may contact Michelle Burgess or Ahmet Bulbakaya at (404) 656-7802. Please contact David Brownlee of the Hazardous Site Response Program at (404) 657-8600 if you have questions regarding this letter.

Sincerely,

Jane Hendricks
Unit Coordinator
Hazardous Sites Response Program

NOTES:
Bold values exceed the maximum contaminant level (MCL).
BGS Below ground surface.
Data Qualifiers
U Indicates that the compound was not detected above the reported sample quantitation limit.
J Indicates that the value for the compound is an estimated value.
