COMPLETION OF SENIOR TECHNICAL REVIEW

This document has been produced within the framework of the ERT, Inc. (ERT) quality management system. As such, a senior technical review has been conducted. This included review of all elements addressed within the document, proposed or utilized technologies and alternatives and their applications with respect to project objectives and framework of U.S. Army Corps of Engineers regulatory constraints under the current project, within which this work has been completed.

12/18/12

Project Manager

COMPLETION OF INDEPENDENT TECHNICAL REVIEW

This document has been produced within the framework of ERT's quality management system. As such, an independent technical review, appropriate to the level of risk and complexity inherent in the project, has been conducted. This included a review of assumptions; alternatives evaluated; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the project objectives. Comments and concerns resulting from review of the document have been addressed and corrected as necessary.

GLOSSARY OF TERMS

Cultural Debris – Debris found on operational ranges or munitions response sites, which may be removed to facilitate a range clearance or munitions response, that is not related to munitions or range operations. Such debris includes, but is not limited to, rebar, household items (refrigerators, washing machines, etc.), automobile parts and automobiles that were not associated with range targets, fence posts, and fence wire. Cultural debris does not refer to items of cultural or historical significance.

Defense Site – All locations that are or were owned by, leased to, or otherwise possessed or used by the Department of Defense (DoD). The term does not include any operational range, operating storage or manufacturing facility, or facility that is used or was permitted for the treatment or disposal of military munitions.

Discarded Military Munitions (DMM) – Military munitions that have been abandoned without proper disposal or removed from storage in a military magazine or other storage area for the purpose of disposal. The term does not include unexploded ordnance (UXO), military munitions that are being held for future use or planned disposal, or military munitions that have been properly disposed of, consistent with applicable environmental laws and regulations. (10 U.S.C. 2710(e)(2)).

Explosive Hazard – A condition where danger exists because explosives are present that may react (e.g., detonate, deflagrate) in a mishap with potential unacceptable effects (e.g., death, injury, damage) to people, property, operational capability, or the environment.

Explosive Ordnance Disposal (EOD) – The detection, identification, on-site evaluation, rendering safe, recovery, and final disposal of unexploded ordnance and of other munitions that have become an imposing danger, for example, by damage or deterioration.

Explosives Safety – A condition where operational capability and readiness, people, property, and the environment are protected from the unacceptable effects or risks of potential mishaps involving military munitions.

Material Potentially Presenting an Explosive Hazard (MPPEH) – Material potentially containing explosives or munitions (e.g., munitions containers and packaging material; munitions debris remaining after munitions use, demilitarization, or disposal; range-related debris); or material potentially containing a high enough concentration of explosives such that the materia1 presents an explosive hazard (e.g., equipment, drainage systems, holding tanks, piping, or ventilation ducts that were associated with munitions production, demilitarization or disposal operations). Excluded from MPPEH are munitions within DoD's established munitions management system and other hazardous items that may present explosion hazards (e.g., gasoline cans, compressed gas cylinders) that are not munitions and are not intended for use as munitions.

Munitions and Explosives of Concern (MEC) – This term, which distinguishes specific categories of military munitions that may pose unique explosives safety risks means (A) UXO, as defined in 10 U.S.C. 101(e)(5); (B) DMM, as defined in 10 U.S.C. 2710(e)(2); or (C) munitions constituents (MC) (e.g., Trinitrotoluene [TNT], Cyclotrimethylenetrinitramine [RDX]), as defined in 10 U.S.C. 2710(e)(3), present in high enough concentrations to pose an explosive hazard.

Munitions Constituents (MC) – Any materials originating from UXO, DMM, or other military munitions, including explosive and nonexplosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions. (10 U.S.C. 2710(e)(3)) .

Munitions Debris (MD) – Remnants of munitions (e.g., fragments, penetrators, projectiles, shell casings, links, fins) remaining after munitions use, demilitarization, or disposal.

Munitions Response – Response actions, including investigation, removal actions and remedial actions to address the explosives safety, human health, or environmental risks presented by UXO, DMM, or MC, or to support a determination that no removal or remedial action is required.

Munitions Response Site (MRS) – A discrete location within an MRA that is known to require a munitions response.

Operational Range – A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities or, although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities. (10 U.S.C. 101(e)(3)(A) and (B)). Also includes "military range," "active range," and "inactive range" as those terms are defined in 40 Code of Federal Regulations §266.201.

Range – A designated land or water area that is set aside, managed, and used for range activities of the DoD. The term includes firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access, and exclusionary areas. The term also includes airspace areas designated for military use in accordance with regulations and procedures prescribed by the Administrator of the Federal Aviation Administration. (10 U.S.C. l0l (e)(l)(A) and (B)).

Unexploded Ordnance (UXO) – Military munitions that (A) have been primed, fuzed, armed, or otherwise prepared for action; (B) have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material; and (C) remain unexploded whether by malfunction, design, or any other cause. (10 U.S.C. 101(e)(5)(A) through (C)).

EXECUTIVE SUMMARY

Introduction and Scope

ERT, Inc., (ERT) conducted a Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) for the U.S. Army Corps of Engineers (USACE), Baltimore District (CENAB) at two Military Munitions Response Program (MMRP) sites at Fort Stewart (FTSW), Georgia. The work was performed as a performance-based task order under the Multiple-Award Military Munitions Services Contract (W912DR-09-D-0012, Delivery Order 0004). The USACE Savannah District (CESAS) provided project management for this task order. The two munitions response sites (MRS) identified are the Anti-Aircraft Range 90-mm – 2 (FTSW-002-R-01) and the Hero Road Trench Area (FTSW-008-R-01).

The purpose of the RFI is to adequately characterize the nature and extent of potential munitions constituents (MC) contamination and munitions and explosives of concern (MEC) hazards; determine the potential risks posed to human health and the environment from MC; and to collect or develop additional data for a Corrective Measures Study (CMS), as appropriate, to determine corrective measures, including no further action.

The scope of the RFI included digital geophysical mapping (DGM); intrusive investigations to identify location, density, and types of MEC; and environmental sampling to determine the distribution and concentrations of several MC (select metals, explosives, and degradation products associated with the dilute agent Chemical Agent Identification [CAIS] kits) in soil, sediment, and surface water. The Anti-Aircraft Range 90-mm – 2 MRS was investigated for both MEC and MC contamination, while the Hero Road Trench Area MRS was investigated for MC contamination only.

FTSW is located approximately 40 miles southwest of Savannah, Georgia and just north of Hinesville, Georgia. The cities of Pembroke and Richmond Hill are 1.5 and 2.2 miles north of FTSW, respectively. FTSW is an active installation that currently occupies approximately 280,000 acres. Previous investigations have identified MEC and/or historical activities associated with the use of munitions at the Anti-Aircraft Range 90-mm – 2 MRS and anecdotal evidence of the burial of dilute agent CAIS kits at the Hero Road Trench Area MRS. Findings from these previous investigations have led to this RFI.

Investigation Activities

MC

A total of 105 biased and random surface and subsurface soil samples were collected at the Anti-Aircraft Range 90-mm – 2 and Hero Road Trench Area MRSs, including 10 background samples. Ten surface and ten subsurface random soil samples and three duplicate samples were collected from the Anti-Aircraft Range 90-mm – 2 MRS and analyzed for select metals and explosives. Background soil samples were analyzed for select metals only; 1 duplicate background sample was collected. Sixteen surface and sixteen subsurface biased samples were collected as well as three duplicate samples from the Hero Road Trench Area MRS. Ten surface and ten subsurface random soil samples and two duplicates were also collected as well as five surface and five subsurface soil samples and one duplicate from five test pit locations. All surface and subsurface soil samples collected from the Hero Road Trench Area MRS were

analyzed for degradation products associated with the dilute agent CAIS kits, which include arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol.

Two sediment samples were collected at the north and south ends of the drainage ditch located within the Anti-Aircraft Range 90-mm – 2 MRS. Standing water was present at the north end of the drainage ditch where a sediment sample was collected; a surface water sample was also collected at this location. Sediment and surface water samples were analyzed for select metals and explosives.

Per the accepted Work Plan for this investigation, groundwater would only have been sampled if the U.S. Environmental Protection Agency (USEPA) Protection of Groundwater Soil Screening Levels (SSLs) for soil were exceeded. Groundwater samples were not collected at either MRS.

MEC

Comprehensive, statistically-based DGM followed by intrusive investigation of the Anti-Aircraft Range 90-mm – 2 MRS was conducted. A total of 1,199 targets were excavated in 24 grids and on 45 transects within the MRS.

A geophysical investigation, including DGM and intrusive work, at the Hero Road Trench Area MRS was performed to identify areas where dilute agent CAIS kits may have been disposed in burial pits. This MRS was investigated for MC only, as no historic or current evidence of MEC at this MRS exists.

Investigation Findings

MC

No explosives compounds or degradation products associated with dilute agent CAIS kits were detected in any soil samples. Residential soil regional screening levels (RSLs) were used as screening criteria at both MRSs, even though land use is not expected to change to residential at the Anti-Aircraft Range 90-mm – 2 MRS in the foreseeable future. The use of residential soil RSLs is therefore conservative criteria. Concentrations of aluminum were detected above the residential RSL in 8 soil samples (2 surface, 6 subsurface) collected from the Anti-Aircraft Range 90-mm – 2 MRS and above the background concentrations collected during the RFI (background screening value of 10,273 milligrams per kilogram [mg/kg]) in 5 soil samples (1 surface, 4 subsurface) from this MRS. Concentrations of arsenic were detected above the residential RSL in 22 soil samples (17 surface, 5 subsurface) collected from the Hero Road Trench Area MRS, but none of these detected concentrations were above background concentrations (background screening value of 2.1 mg/kg).

No explosives compounds were detected in the sediment or surface water samples collected at the Anti-Aircraft Range 90-mm – 2 MRS. The concentration of metals in all sediment samples were below residential RSLs.

Based on a review of the hydrogeological data (Section 3.10.1.1 of the Final Work Plan, January 2012), it appears unlikely that MC in shallow groundwater would migrate to the deeper aquifers that are used as a water supply for Fort Stewart. Therefore, as described in the Work Plan, a shallow groundwater investigation would only have been conducted if the soil sampling results exceeded USEPA “Protection of Ground Water” Soil Screening Levels (Soil-Groundwater SSLs) which are designed to evaluate the leaching potential of constituents from soils to groundwater. Only aluminum at the Anti-Aircraft Range MRS and arsenic at the Hero Road Trench Area MRS

exceeded the Soil-Groundwater SSLs. Aluminum is an essential element. Arsenic was detected in soil at concentrations less than background, therefore it is not likely to be site-related. Thus, it was determined that there was no need for groundwater sampling at either MRS.

MEC

The Hero Road Trench Area MRS was not investigated for MEC, since no historical or current evidence suggests the presence of MEC at this MRS. During the RFI, three MEC items (40-mm rounds) were recovered from the subsurface at the Anti-Aircraft Range 90-mm – 2 MRS. All 40-mm rounds were disposed of by FTSW explosive ordnance disposal personnel. Per the Department of Defense Explosive Safety Manual (DoD, 2010), a "moderate to high" probability for encountering MEC determination can be made if a search of available historical records and onsite investigation data indicates that, given the military or munitions-related activities that occurred at the site, there is more than a low probability that MEC are present. Per the DoD guidance and results of this RFI, the probability of encountering MEC in the Anti-Aircraft Range 90-mm – 2 MRS is therefore deemed to be "moderate to high."

Risk Assessment

Based on the Human Health Risk Assessment (HHRA) and Screening Level Ecological Risk Assessment (SLERA) performed for both MRSs, there are no human health or ecological risks associated with potential human contact with surface or subsurface soil, surface water, or sediment. Furthermore, the SLERA indicates that a detailed ecological risk assessment is not warranted.

Aluminum in subsurface soil was the only chemical of potential concern (COPC) for future human exposures at the Anti-Aircraft Range 90-mm – 2 MRS. The estimated hazard quotients (HQs) used to evaluate the non-cancer effects of aluminum are less than 1, indicating that non-cancer hazards would not occur due to soil exposure under the theoretical future scenarios. In addition, the concentration of aluminum in subsurface soil was greater than its corresponding generic USEPA SSL for the Protection of Groundwater in one out of 11 samples. However, this maximum detected value is within the same order of magnitude as the SSL, and aluminum is not generally considered a contaminant of great concern for leaching to groundwater.

For the SLERA, comparisons of detected analytes to benchmarks were done for sediment and surface water. Inorganics detected in sediment samples collected at the drainage ditch located within the Anti-Aircraft Range 90-mm – 2 MRS were below background soil levels and ecological sediment screening levels, although aluminum in sediment exceeded the ecological soil screening level. Aluminum is not expected to be associated with adverse ecological effects in the sediment at these levels.

Surface water results were compared to surface water freshwater criteria; no surface water background data were available. Copper, lead, and zinc exceeded the Georgia In-Stream Water Quality Standards at an assumed water hardness of 50 mg/l $CaCO^3$, but did not exceed the standards at an assumed water hardness of 100 mg/L $CaCO^3$. Since the water hardness of the ditch water was not measured, and since EPA water quality criteria are often listed at a water hardness of 100 mg/L $CaCO^3$, there are unlikely to be adverse effects from these concentrations in the ditch. Aluminum was also detected at a concentration higher than its freshwater screening criteria. However, the freshwater benchmark levels are based on potential exposures and toxicity for the most sensitive freshwater aquatic organisms and the drainage ditch is a limited aquatic

habitat due to the intermittence of the presence of water. Therefore, surface water in the drainage ditch at the Anti-Aircraft Range 90-mm – 2 MRS is not likely to be of ecological concern.

There were no COPCs identified at the Hero Road Trench Area MRS; therefore, no further HHRA or SLERA evaluation of this MRS was performed. Arsenic was detected at this MRS at a concentration greater than its corresponding generic USEPA SSL for the Protection of Groundwater; however, all detects of arsenic in soil at this MRS were below background levels, indicating that arsenic is not likely to be site-related.

MEC HA

The MEC Hazard Assessment methodology was used to assess potential explosive hazards to human receptors at the Anti-Aircraft Range 90-mm – 2 MRS where three MEC items were recovered during RFI activities. The Anti-Aircraft Range 90-mm – 2 MRS was scored as a 4, which indicates a low hazard potential at this MRS; the MRS score is a function of the size and location of the three MEC items found during the RFI. Based on the findings of this RFI, the Anti-Aircraft Range 90-mm – 2 MRS was given a Munitions Response Site Prioritization Protocol (MRSPP) rating of 4 and the Hero Road Trench Area MRS was given a rating of No Known or Suspected Hazard.

Conclusions

Based on the results of this RFI and the associated human health and ecological risk assessments, there is no release of MC at either the Anti-Aircraft Range 90-mm - 2 MRS or the Hero Road Trench Area MRS. A release of MEC has been found at the Anti-Aircraft Range 90-mm – MRS; this release is associated with a possible subsurface soil explosive hazard risk to humans. Based on the results of this investigation, a Corrective Measures Study is recommended for potential MEC hazards at the Anti-Aircraft Range 90-mm - 2 MRS; no further action is recommended for the Hero Road Trench Area MRS.

1.0 INTRODUCTION

ERT, Inc., (ERT) conducted a Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) for the U.S. Army Corps of Engineers (USACE), Baltimore District (CENAB), at two Military Munitions Response Program (MMRP) sites at Fort Stewart (FTSW), Georgia. The work was performed as a performance-based task order under the Multiple-Award Military Munitions Services Contract (W912DR-09-D-0012, Delivery Order 0004). The USACE Savannah District (CESAS) provides project management for this task order. The two munitions response sites (MRS) identified are the Anti-Aircraft Range 90-mm – 2 (FTSW-002-R-01) and the Hero Road Trench Area (FTSW-008-R-01).

This project falls under the MMRP of the Defense Environmental Restoration Program (DERP). The Department of Defense (DoD) established the MMRP under the DERP to address unexploded ordnance (UXO), munitions and explosives of concern (MEC), discarded military munitions (DMM), and munitions constituents (MC) located on current and former military installations. MEC are a safety hazard and may constitute an imminent and substantial endangerment to field personnel and the public. Applicable provisions of Chapter 29 of the Code of Federal Regulations (CFR) 1910.120 apply. ERT performed all work in accordance with the Georgia Environmental Protection Division (GAEPD) issued RCRA Part B Permit, Section III, Corrective Action, with regulatory coordination, as appropriate, with the GAEPD. All activities involving work in areas potentially containing MEC hazards were conducted in full compliance with USACE, Department of the Army (DA), and DoD safety regulations. MEC/ Material Potentially Presenting an Explosive Hazard (MPPEH) was handled in accordance with installation guidance and followed procedures described in the accepted Work Plan (ERT, 2012).

The Project Delivery Team (PDT) consists of ERT, CENAB, CESAS, GAEPD, FTSW personnel, and the U.S. Army Environmental Command (USAEC).

1.1 Purpose and Scope

The overall purpose of the RFI is to determine whether the Anti-Aircraft Range 90-mm – 2 and the Hero Road Trench Area MRSs warrant further response actions pursuant to RCRA and the MMRP process. The objectives of the RFI are to: determine the nature and extent of potential MC contamination or MEC hazards; determine the potential risks posed to human health and the environment from MC; and to collect or develop additional data for a Corrective Measures Study (CMS), as appropriate, in order to determine corrective measures, including no further action.

The scope of the RFI included digital geophysical mapping (DGM); intrusive investigations to identify location, density, and types of MEC; and environmental sampling to determine the distribution and concentrations of several MC (select metals, explosives, and degradation products associated with the dilute agent CAIS kits) in soil, sediment, and surface water. The Anti-Aircraft Range 90-mm – 2 MRS was investigated for both MEC and MC contamination, while the Hero Road Trench Area MRS was investigated for MC contamination only.

1.2 Property Description and Problem Identification

FTSW is located approximately 40 miles southwest of Savannah, Georgia and just north of Hinesville, Georgia. The cities of Pembroke and Richmond Hill are 1.5 and 2.2 miles north of FTSW, respectively. Situated south of Interstate 16 and west of Interstate 95, FTSW boundaries are roughly defined by the intersection of Interstate 16 and Interstate 95 and the cities of

Richmond Hill, Hinesville, Glennville, Claxton, and Pembroke (Figure 1, Appendix A) (Malcolm Pirnie, 2006). FTSW is an active installation that currently occupies approximately 280,000 acres.

The two MRSs that are the subject of this RFI are the Anti-Aircraft Range 90-mm – 2 MRS and the Hero Road Trench Area MRS. Figure 2 of Appendix A shows the location of the two MRSs as well as surrounding features. Both MRSs are considered areas of concern (AOC) and are covered by the FTSW Hazardous Waste Facility Permit #HW-045(S) (Appendix J). The permit requires FTSW to properly manage the storage of hazardous wastes and to investigate and conduct corrective action at solid waste management units (SWMU) and AOCs.

Based on findings during previous investigations at the two MRSs, small amounts of MEC may be present at the Anti-Aircraft Range 90-mm – 2 MRS. An RFI of the two MRSs is necessary to characterize the nature and extent of impacts to human health and the environment. ERT collected data to identify environmental impacts associated with the Anti-Aircraft Range 90-mm – 2 MRS and the Hero Road Trench Area MRS and to assist with determining whether additional remedial actions are warranted.

1.3 Historical Information

FTSW has been utilized since 1940 for training and as a deployment platform. Training activities have included tank, field artillery, helicopter gunnery, small arms, and various infantry training.

Construction of the reservation that was to become FTSW began on September 10, 1940, on what was formerly the Camp Savannah Anti-Aircraft Firing Center. On November 18, 1940, the reservation's name was changed from Camp Savannah to Camp Stewart in honor of the Revolutionary War Brigadier General Daniel Stewart. The reservation was established as an anti-aircraft center with facilities to prepare artillery troops for overseas deployment. The reservation's mission of training anti-aircraft units ended on November 20, 1944, and all training terminated in December 1944. Army ground forces units were to have departed by April 30, 1945. A prisoner-of-war camp that was operated at the reservation was also closed. The reservation's mission was reestablished as a separation center for redeployed troops from August 6, 1945 until September 2, 1945. On September 30, 1945, Camp Stewart was inactivated, and the reservation became a training location for the Georgia National Guard (Malcolm Pirnie, 2006).

With the outbreak of hostilities in Korea in June 1950, Camp Stewart was reactivated on August 9, 1950 and was designated the 3rd Army Anti-Aircraft Artillery Training Center. In 1953, armor and tank training was added to the mission of the reservation. On March 21, 1956 Camp Stewart was re-designated as Fort Stewart and was designated a permanent Army installation. In 1959, FTSW became an armor and artillery firing center. Troop training at FTSW peaked in 1961 and 1962 in response to the Berlin and Cuban crises, respectively. The 1st Armored Division was relocated to the reservation during the Cuban crisis (Malcolm Pirnie, 2007).

In response to a need for more helicopter and light fixed wing aircraft in support of the Vietnam conflict, an element of the U.S. Army Aviation School at Fort Rucker, Alabama, was transferred to FTSW in 1966. Helicopter pilot training and helicopter gunnery courses became the new mission for FTSW. In 1967, the main mission for FTSW was to train Army aviators. The reservation was also used to maintain readiness for other active duty, Reserve, and National Guard personnel. In 1970, Vietnamese helicopter pilots began training at FTSW. Aviation

training at FTSW was phased out in 1973, when all aviation training was consolidated at Fort Rucker. By 1974, FTSW had become a training and maneuver area, providing tank, field artillery, helicopter gunnery, and small arms training for regular Army and National Guard units. FTSW supported training by providing facilities, conducting training opportunities, and assisting in the mobilization and deployment troops (Malcolm Pirnie, 2006).

Currently, the mission of FTSW is to sustain a quality of life and reservation support at the level necessary for divisions and non-divisional, tenant, and Reserve Component units to accomplish their training missions.

1.4 Previous Investigations

Previous investigations specific to the Anti-Aircraft Range 90-mm – 2 and Hero Road Trench Area MRSs include:

1.4.1 Final Closed, Transferred, and Transferring (CTT) Inventory Report

The Final CTT Inventory report presented the results of the Phase 3 CTT range inventory (Malcolm Pirnie, 2003). In addition to identifying the two MRSs that are being investigated under this task, the report also noted that FTSW occupies 279,081 acres, 274,988 of which are classified as operational range area and 4,093 acres are non-range areas. The Phase 3 inventory identified seven closed ranges totaling 483 acres within FTSW boundaries. No transferred or transferring ranges were identified.

1.4.2 Historical Records Review (HRR)

The HRR identified specific secondary explosives and munitions removed from the Anti-Aircraft Range 90-mm – 2 MRS through Explosive Ordnance Disposal (EOD) call responses, including C-4 plastic explosives, an M-222 Dragon anti-tank missile, M-7 grenades, and MK-2 grenades (Malcolm Pirnie, 2006). Munitions documented at the Anti-Aircraft Range 90-mm – 2 MRS include 40- and 90-mm anti-aircraft projectiles and unknown tank munitions. Additionally, 37-mm rounds are documented to have been issued to FTSW.

The HRR presents the history of the Hero Road Trench Area MRS, including a review of documented dilute agent CAIS kits at FTSW; the presence of a nearby former gas chamber and the wastewater treatment plant; and historical aerial photos documenting ground disturbance in the MRS between the years of 1941 and 1957. Specific potential constituents associated with the dilute agent CAIS kits include mustard agent (5% solution), lewisite (5% solution), chloropicrin (50% solution), and pure phosgene agent. According to the HRR, every dilute agent CAIS kit issued to FTSW was collected and accounted for during disposal activities in 1978. However, individual vials of agent were considered expendable.

The HRR also developed a preliminary conceptual site model (CSM) for each of the MRSs.

1.4.3 Confirmatory Sampling (CS) Report

A limited magnetometer-assisted visual survey was performed as part of the CS in the Anti-Aircraft Range 90-mm – 2 MRS. No MEC or munitions debris (MD) was identified during this survey. A single composite soil sample was collected and analyzed for aluminum, copper, zinc, lead, antimony, and explosives. Only zinc was found to be above FTSW background levels, though it was below U.S. Environmental Protection Agency (USEPA) Region 4 screening values (Malcolm Pirnie, 2007).

A limited magnetometer assisted visual survey was performed over the Hero Road Trench Area MRS. No MEC or MD was identified during the survey. A single composite soil sample was collected and analyzed for aluminum, copper, zinc, lead, antimony, and explosives. Samples were not analyzed for any dilute agent CAIS kit degradation products. Lead was found at levels above FTSW background levels. Visual observations made during the CS found undulating ground surface in the southernmost parts of the area, which was believed to be related to possible suspected burial activities. The MRS was enlarged based on these observations from 10 acres to approximately 34.5 acres. Prior to completion of the CS, 32 acres of this MRS were enclosed by chain link fence in 2005, followed by the fencing of an additional 2.243 acres in 2008.

1.5 Identification of Munitions Response Sites for the Current RCRA Facility Investigation

1.5.1 MRS Locations

The FTSW overall map is included as Figure 2 of Appendix A. Information regarding the boundaries of the MRSs was supplied to ERT by FTSW personnel. The Anti-Aircraft Range 90-mm – 2 MRS is a 77-acre area (Figure 3, Appendix A) located within a former 90-mm anti-aircraft range fan; five other former anti-aircraft and tank ranges also overlap this MRS (Figure 4, Appendix A). This MRS is approximately 2.8 miles northwest of the cantonment area. An ammunition supply point (ASP) is located within this MRS; as such, the MRS is subject to additional security with a secured, gated fence surrounding most of the MRS.

The Hero Road Trench Area MRS is approximately 34.5 acres in size and lies within the cantonment area (Figure 5, Appendix A). There is anecdotal evidence that dilute agent CAIS kits may have been disposed of in burial trenches within this MRS. Historical photos show areas of ground scarring that may be associated with these burial areas; an example of one of these photos is included as Figure 6 of Appendix A. Based on guidance included in the Army Memorandum: Interim Guidance for Chemical Warfare Materiel Responses (DA, 2007), dilute agent CAIS kits and associated chemicals must be treated as hazardous waste. Additionally, based on the Probability Assessment, the probability of encountering chemical warfare materiel during any subsequent actions or operations at FTSW is unlikely (USACE, 2010).

1.5.2 MRS History

The use of the Anti-Aircraft 90-mm – 2 range began in 1941 and ceased in 1944 (Malcolm Pirnie, 2006). The six historical anti-aircraft and tank ranges (Figure 4, Appendix A) that overlap this MRS were used from 1941 through 1964 (Malcolm Pirnie, 2006). These include two 90-mm anti-aircraft ranges, two 40-mm anti-aircraft ranges, a 90-mm tank range, and tank range where the munitions used are unknown. The Anti-Aircraft Range 90-mm – 2 MRS is positioned downrange of these ranges and does not overlap impact/target areas or firing points (Malcolm Pirnie, 2006). The ASP has been active within this MRS since the early 1980s (USACE, 1981 and 1983).

The Hero Road Trench Area MRS was identified in January 2003 when a former Directorate of Public Works (DPW) staff member reported that materials (i.e., mustard agent) had been buried in the vicinity. Initially, the MRS was identified as a 10-acre parcel located within the cantonment area (Malcolm Pirnie, 2006). The CS Report increased the MRS from 10 to 34.5 acres (Malcolm Pirnie, 2007). An Interim Remedial Action, which fenced 32 acres of the site and included the placement of twenty-one warning signs along the fence, was completed in 2005

(STEP, 2005). A time-critical removal action was conducted in 2008 to fence an additional 2.243 acres and add additional warning signs around the fence (SpecPro, 2009).

This Page Intentionally Left Blank

2.0 SITE DESCRIPTION AND ENVIRONMENTAL SETTING

2.1 Overall Site Description

FTSW, comprising approximately 280,000 acres, is bordered to the north and south by agriculture and wetlands, to the east by the Ogeechee River, and to the west by agricultural lands. The nearest cities are: Hinesville, next to the southern boundary and cantonment area; Richmond Hill, one mile to the east of the eastern boundary; Pembroke, two miles to the north of the northern boundary; Glennville, on the western boundary; and Savannah, about 41 miles to the northeast (Figure 1, Appendix A).

2.1.1 Surface Features

FTSW is in the Coastal Marine Flatlands region of the Atlantic Coastal Plain physiographic province, which is characterized by flat land areas with an average slope of less than 3 percent. The Coastal Marine Flatlands region's land surface consists of rolling terraces gently rising east to west. These terraces are separated by broad, low-lying areas with poor drainage. Elevations at FTSW average 33 feet above sea level east of the Canoochee River with a peak elevation of 183 feet above sea level near the western boundary (Malcolm Pirnie, 2006).

The Anti-Aircraft Range 90-mm – 2 MRS is relatively flat and covered with maintained grass; buildings, gravel and paved roads and parking areas, including the munition storage bunkers that are all located within the fenced area. The Hero Road Trench Area MRS consists of dense young forest and substantial undergrowth. The land area around the Hero Road Trench Area MRS within the cantonment area includes a wastewater treatment plant, a school, roads, and forested areas.

2.1.2 Meteorology

The climate of FTSW is considered humid subtropical. Average temperatures range from 52 degrees Fahrenheit (°F) in January to 81°F in July. The FTSW area receives approximately 50 inches of precipitation annually. September and October are typically the driest months and March the wettest month of the year (National Oceanic and Atmospheric Administration, 2012). The prevailing wind direction is to the northwest and average wind speed is from 0 to 5 miles per hour (mph). Thunderstorms, hurricanes, and tropical storms occur most frequently from May through September and can produce gusty surface winds well above 5 mph (Malcolm Pirnie, 2007).

2.1.3 Surface Water Hydrology

Four watersheds occur within FTSW's boundaries: the Altamaha, Canoochee, Lower Ogeechee, and Ogeechee Coastal watersheds. Most of FTSW is in the Canoochee River Watershed. FTSW has about 265 miles of freshwater rivers and streams and an additional 12 miles of brackish water streams (U.S. Army, 2010).

2.1.4 Geology

The bedrock in the area surrounding FTSW is composed primarily of rock formations ranging in age from the Precambrian (greater than 570 million years old) to Triassic (205 to 240 million years old) ages. This local bedrock is overlain with thick wedges of unconsolidated and partially consolidated sediments (US Army, 2010).

2.1.5 Soils

Most of the soil at FTSW is classified as sandy and infertile. Soils in low-lying, poorly drained areas are high in organic matter and can remain saturated with water for eight months or more every year (U.S. Army, 2010). Near FTSW, the parent material for all soils is water-lain sediments deposited prior to and during the Pleistocene Age. The soil at the Anti-Aircraft Range 90-mm – 2 MRS is classified as sand-silt/sand-clay. The soil at the Hero Road Trench Area is classified as clay-sand/clay-silt (Malcolm Pirnie, 2007).

2.1.6 Hydrogeology

The principal artesian aquifer in the FTSW region is generally 300 to 500 feet below surface and is isolated from the surface aquifer by a confining unit (SAIC, 1999). The surface aquifer is composed of a relatively thin layer of sands, gravels and clays. It is recharged directly from rainfall percolating through sediments. Primary recharge to the principal artesian aquifer occurs approximately 50 to 90 miles northwest of FTSW. Deep groundwater wells are used as drinking water sources for FTSW. There are 31 groundwater wells located on FTSW, five of which are used to supply drinking water to the cantonment area. The cantonment area wells range in depth from 500 to 800 feet and are cased to depths of 400 to 470 feet. The potable water capacity from the five active wells is approximately 10.4 million gallons per day (Malcolm Pirnie, 2006).

2.1.7 Demography and Land Use

In the 2010 U.S. Census, the Fort's population was listed as 4,942. Its primary residents are members of the 3rd Infantry Division.

The Anti-Aircraft Range 90-mm – 2 MRS is located within the operational range at FTSW and consists of an ASP within a fenced area that covers a majority of the MRS acreage. A cleared buffer area surrounding the fence is also included in this MRS. The ASP is a gated, secured area; entry to this area is controlled and monitored. This MRS is expected to continue as an ASP for the foreseeable future. No activities occur in the buffer area surrounding the fence line.

The Hero Road Trench Area MRS lies within the cantonment area and is surrounded by a gated, locked fence. The MRS is kept secured at all times; no activities occur within this MRS. While not currently planned for development, depending on the outcome of this RFI investigation, development of this site may occur.

2.1.8 Ecology

FTSW is a large, mostly undeveloped installation with more than 87 percent (243,000 acres) that comprises upland forest or forested wetlands, with the remaining 13 percent (37,000 acres) comprising open areas, including the cantonment area, ranges, and impact areas. The cantonment area is the "living and working" portion of FTSW (U.S. Army, 2010).

On a very broad scale, there are four types of ecosystems on FTSW: sandhills, pine flatwoods, upland forests, and wetlands (Malcolm Pirnie, 2006). Wetlands are mainly of the bottomland hardwood variety, with mixed types of vegetation and only occasional flooding. Isolated cypress ponds also occur. There are no threatened or endangered species or species of concern within either MRS (ERT, 2012).

3.0 RCRA FACILITY INVESTIGATION PROJECT OBJECTIVES

3.1 Conceptual Site Model (CSM) and Project Approach

The CSM is used to communicate and describe the current state of knowledge and assumptions about risks at a project site. The CSM presents the exposure pathway analysis by integrating information on the MEC and MC sources, receptors, and receptor/MEC interaction. There is no MEC CSM for the Hero Road Trench Area MRS, since there is no historical evidence to support the presence of MEC on the site.

The preliminary Human Health Risk Assessment (HHRA) CSMs for both MEC and MC and the preliminary Screening Level Ecological Risk Assessment (SLERA) CSM for MC at the Anti-Aircraft Range 90-mm – 2 MRS are presented in Figures 12 and 13 of Appendix B of the Work Plan (ERT, 2012), respectively. The preliminary HHRA CSM for this MRS shows potentially complete exposure pathways for human receptors for MC in the surface and subsurface, except for outdoor workers and trespassers where subsurface exposure pathways are incomplete. The preliminary HHRA CSM for this MRS shows potentially complete exposure pathways for MEC at the surface for trespassers, outdoor and construction workers as well as MEC in the subsurface for construction workers. The preliminary HHRA CSM shows incomplete exposure pathways for MEC in the surface and subsurface for future residents, which was a conservatively considered receptor for this RFI. The preliminary SLERA CSM for the Anti-Aircraft Range 90-mm – 2 MRS shows potentially complete exposure pathways for ecological receptors for MEC and MC in the surface and incomplete exposure pathways for MC in the subsurface.

The preliminary HHRA and SLERA CSMs for MC at the Hero Road Trench Area MRS are presented in Figures 14 and 15 of Appendix B of the Work Plan (ERT, 2012), respectively. The preliminary HHRA CSM for this MRS shows potentially complete exposure pathways for all human receptors for MC in the surface and subsurface, except for outdoor workers and trespassers, for which incomplete exposure pathways exist for MC in the subsurface. The preliminary SLERA CSM for this MRS shows potentially complete exposure pathways for ecological receptors for MC in the surface soil and incomplete exposure pathways for MC in the subsurface.

Discussion of impacts to the preliminary HHRA and SLERA CSMs for each MRS based on the RFI findings are presented in Section 5.0 of this report, where the revised CSMs, in both table and diagram format, are also presented.

3.2 Data Needs and Data Quality Objectives

3.2.1 Data Needs

Data were needed to assess the nature and extent of MEC and MC caused by past military activities at the Anti-Aircraft Range 90-mm – 2 MRS and MC caused by past military activities at the Hero Road Trench Area MRS, and to determine if further response actions pursuant to RCRA and the MMRP process are warranted. Data obtained included DGM surveys; intrusive investigations to identify the location, types, and density of MEC; and environmental sampling to determine the distribution and concentrations of MC in soil, sediment, and surface water. These data were used to quantify risks to human health and the environment and to assess MEC hazards.

3.2.2 Data Quality Objectives

Data Quality Objectives (DQOs) are qualitative and quantitative statements that specify the quality and level of data required to support the decision-making processes for a project. The DQOs were developed in support of the project objectives discussed in Section 1.1.

DGM and intrusive investigations were performed at the Anti-Aircraft Range 90-mm – 2 MRS to identify the nature and extent of MEC contamination. At the Hero Road Trench Area MRS, DGM and intrusive investigations were conducted for the purpose of investigating potential dilute agent CAIS kit burial pits. Tables 3-1 and 3-2 present the overall DQOs for the DGM and intrusive investigations. Environmental sampling was the primary means to identify the nature and extent of MC contamination. Tables 3-3 and 3-4 present the DQOs for soil sampling activities. Limited sediment and surface water samples were added to the sampling activities at the Anti-Aircraft Range 90-mm – 2 MRS at the request of GAEPD at Technical Project Planning (TPP) Meeting #2 in order to ensure MC has not accumulated in the main drainage trench; based on these discussions a table presenting the DQOs for these media was not developed as part of the Work Plan. In addition, laboratory analytical DQOs for environmental sampling were presented in the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP; Appendix E to the Work Plan). All DQOs were reviewed and accepted by the PDT prior to the commencement of RFI field activities; the DQO tables are presented exactly as they were in the Work Plan (ERT, 2012).

Table 3-1. DQO – DGM/Intrusive Investigation Anti-Aircraft Range 90-mm – 2 MRS

Data Quality Objective Element	Site-Specific DQO Statement
Project Objective(s) Satisfied	To characterize the nature and extent of MEC.
Data User Perspective(s)	To obtain data that satisfy compliance, risk, and if needed, corrective action requirements.
Contaminant or Characteristic of Interest	To determine the distribution and density of MEC.
Media of Interest	MEC in Soil
Required Sampling Locations or Areas and Depths	A. Perform DGM survey of MRS using EM61-MK2 integrated with robotic total station (RTS) or equivalent accuracy real-time kinematic (RTK) global positioning system (GPS). B. DGM survey coverage will be 5.56 acres via grid survey, determined through Visual Sample Plan (VSP) and UXO Estimator to be sufficient to determine 95% confidence that MEC density is less than or equal to 0.5 MEC item/acre. C. Hand excavation will be performed for each target identified above the target threshold. D. The results will be recorded via GPS and dig sheets.
Number of Samples Required	Each geophysical target identified above the target threshold will be intrusively investigated.
Reference Concentration of Interest or Other Performance Criteria	Determine density of MEC within the MRS.
Sampling Method	• DGM survey of 9.78 percent of the MRS, approximately 5.56 acres, using grids randomly placed by VSP. • Additional biased transects placed between bunkers, including approximately 13,630 linear feet of transects, based on request of GAEPD at TPP #1.
Analytical Method	EM61-MK2A

Table 3-2. DQO – DGM/Intrusive Investigation for the Hero Road Trench Area MRS	
Data Quality Objective Element	**Site-Specific DQO Statement**
Project Objective(s) Satisfied	To characterize the nature and extent of possible dilute agent CAIS kit burial/disposal pits.
Data User Perspective(s)	To obtain data that satisfy compliance, risk, and if needed, corrective action requirements.
Contaminant or Characteristic of Interest	To characterize the nature and extent of dilute agent CAIS kits and their degradation products within the MRS.
Media of Interest	Dilute agent CAIS kit burial/disposal pits in soil.
Required Sampling Locations or Areas and Depths	A. DGM survey of the MRS using the EM31 with RTS or Line & Fiducial navigation. B. Survey to be close to 100 percent coverage, with 15-foot lane spacing over the entire MRS. Based on discussions from TPP #2, the parking area on the southeastern boundary of the MRS will not be surveyed.
Number of Samples Required	A. Intrusively investigate potential burial sites with test pits/trenches based on historical photographs and DGM results. B. Determination of test pits/trenches location and number will be based on a discussion of the Test Pit Recommendation Memo (developed based on DGM results) with the PDT.
Reference Concentration of Interest or Other Performance Criteria	Determine presence/absence of any burial pits potentially containing dilute agent CAIS kits or related degradation products.
Sampling Method	Excavation of potential burial/disposal pit locations, each approximately 30 square feet in surface area.
Analytical Method	EM31

Table 3-3. DQO – Soil Sampling for the Anti-Aircraft Range 90-mm – 2 MRS

Data Quality Objective Element	Site-Specific DQO Statement
Project Objective(s) Satisfied	To characterize the nature and extent of MC contamination.
Data User Perspective(s)	To obtain data that satisfy compliance, risk, and if needed, corrective action requirements.
Contaminant or Characteristic of Interest	Analyze for metals (Al, Cu, Pb, and Zn) as identified in the MC Memo (Appendix H of the Work Plan) and explosives.
Media of Interest	Soil
Required Sampling Locations or Areas and Depths	A. Up to 10 biased soil samples will be collected in areas where there is visible evidence of energetic material, e.g., munitions items which are breeched. Biased soil samples will also be collected in areas of significant MD, where at least 50% of the munition could be identified by UXO Technicians, such that an assumption of MC in the vicinity could be tested by taking a sample. B. The depth for the biased soil samples will be just below the depth of the associated munition, or in the case of samples collected where there is visible evidence of energetic material in the top few inches of soil. C. Randomly placed discrete surface (0-12 inches) and subsurface (12-24 inches) soil samples will be taken at locations determined by VSP. Although the expectation is that no surface MEC or debris will be found at this MRS, past studies have shown levels of some metals (e.g., lead) at FTSW elevated above background levels; therefore, the surface soil must be investigated to support the risk assessment. D. Background surface soil samples collected from FTSW Solid Waste Management Units (SWMUs) used for development of existing background dataset. Availability of these SWMUs for sampling will be coordinated with FTSW personnel.
Number of Samples Required	A. Up to 10 biased samples based on (A. above). B. 10 random discrete surface samples (VSP determined). C. 10 random discrete subsurface samples (VSP determined). D. 10 background surface samples.
Reference Concentration of Interest or Other Performance Criteria	USEPA Regional Screening Levels (RSLs), FTSW SWMUs background dataset (for Pb values), and USEPA Ecological Benchmarks (See QAPP Worksheet #15 for more information).
Sampling Method	A. Obtain discrete, biased, and background soil samples using hand trowels. B. Obtain discrete random surface or subsurface soils using a hand auger or hand trowel, depending on depth.
Analytical Method	Metals analysis (exclusively Al, Cu, Pb, and Zn) by SW-846 Method 6020A/7471A and explosives analysis by SW-846 Method 8330B. For background dataset, Al, Cu, and Zn analysis by SW-846 Method 6020A/7471A as these are not part of the existing SWMU dataset (Pb is covered by the FTSW SMWU background dataset).

Table 3-4. DQO – Soil Sampling for the Hero Road Trench Area MRS	
Data Quality Objective Element	**Site-Specific DQO Statement**
Project Objective(s) Satisfied	To characterize the nature and extent of dilute agent CAIS kit degradation products.
Data User Perspective(s)	To obtain data that satisfy compliance, risk, and if needed, corrective action requirements.
Contaminant or Characteristic of Interest	Analyze for arsenic, 1,4- oxithiane, 1,4-dithiane, and thiodiglycol (degradation products from the dilute agent CAIS kits).
Media of Interest	Soil
Required Sampling Locations or Areas and Depths	A. Collect two biased soil samples from the side wall of each test pit/trench, one 0 to 12 inches bgs and a second sample from 1 foot to the bottom of the pit/trench. B. Biased subsurface soil samples will be collected from the soil horizon immediately above groundwater, and will be placed based on the distribution of DGM ground conductivity results and historical aerial photography. C. Randomly placed surface (0-12 inches) and subsurface (12-24 inches) soil samples will be taken at locations determined by VSP.
Number of Samples Required	A. Two biased soil samples collected from each test pit/trench, up to a total of 8 biased samples in test pits/trenches. B. 16 biased surface and subsurface soil samples placed based on distribution of DGM ground conductivity results and historical aerial photography. C. 10 random discrete surface samples (VSP determined). D. 10 random discrete subsurface samples (VSP determined)
Reference Concentration of Interest or Other Performance Criteria	USEPA Regional Screening Levels (RSLs), FTSW SWMUs background dataset, and USEPA Ecological Benchmarks (See QAPP Worksheet #15 for more information).
Sampling Method	A. Obtain discrete surface and subsurface soil samples from excavation trenches/pits using hand trowels. B. Obtain discrete biased and random surface and subsurface samples using a hand auger.
Analytical Method	Metals analysis (exclusively arsenic analysis) by SW-846 Method 6020A/7471A and organosulfur residues (1,4-dithiane, 1,4-oxathiane, and thiodiglycol) by SW-846 Method 8270D/8321.

4.0 CHARACTERIZATION OF MUNITIONS AND EXPLOSIVES OF CONCERN AND MUNITIONS CONSTITUENTS

This section describes the RFI field activities performed. All activities were performed in accordance with the accepted Work Plan (ERT, 2012).

4.1 Munitions and Explosives of Concern Characterization

4.1.1 General Approach

4.1.1.1 Equipment

Geophysical and navigational equipment used to identify locations for intrusive investigation are listed below. The excavator used in both areas of investigation is described briefly as well.

- Geonics EM61-MK2: This is a time-domain electromagnetic (TDEM) device consisting of a computer, data logger (Juniper Systems Allegro CX), and cart assembly that carries an upper and lower copper coil towed on wheels. This instrument measures the response of the immediate area to a primary pulsed electromagnetic (EM) field, generated in the lower copper coil. The EM61-MK2 is able to discriminate between surface and subsurface conductive materials more efficiently than most other metal detection devices. The device was integrated with the Real Time Kinematic (RTK) Global Positioning System (GPS) (described below) for navigation. See Appendix G, photographs 03, 07, 08, and 09 showing the EM61-MK2 in use.
- Geonics EM31: This is a frequency-domain electromagnetic (FDEM) device consisting of a computer, data logger (Juniper Systems Allegro CX), and the transmitter and receiver coils, which are carried by the operator. This instrument measures the response of the immediate area to an EM field, generated by the transmitter coil. The EM31 measures both the quadrature component (ground conductivity) in units of milliseimens/meter (mS/m) and in-phase component (metal detection) in units of parts per thousand (ppt). The device was planned to be integrated with a robotic total station (RTS) for navigation, but dense vegetation in the Hero Road Trench Area MRS prevented practical use of the RTS due to a line-of-sight requirement for operation. The instrument was operated in line and fiducial mode for navigation, where reference to surveyed stakes allowed geo-referencing of the survey data. See Appendix G, photographs 51, 52, 53, and 54 showing the EM31 in use.
- Schonstedt GA-52Cx: This magnetic locator is a hand-held gradiometer that detects the magnetic field of a ferromagnetic object. The instrument controls consist of an on/off sensitivity switch with four sensitivity settings and a volume control. It responds to the difference in the magnetic field between two sensors spaced about 0.51 m apart. The response is a change in the frequency of the signal emitted by the piezoelectric speaker. The instrument provides audio detection signals that peak in frequency when the locator's tip is held directly over the target. The locator can be oriented in any direction without producing a significant change in the frequency of the tone from its idling frequency. The GA-52Cx was used by qualified UXO personnel for instrument assisted surface clearance, anomaly avoidance, and for intrusive clearance. See Appendix G, photograph 02 showing the Schonstedt in use.

- Topcon RTK GPS: The HiPerGa model of Topcon RTK GPS was used at the Anti-Aircraft Range 90-mm – 2 MRS, and controlled with an Allegro CX field computer running Carlson SurvCE software. High-powered systems were used, transmitting at up to 35 watts. The base station was set up daily at points listed in the surveyor report (Appendix D). When integrated with the EM61-MK2, the rover was mounted on a tripod above the top coil. NMEA 0183 data sentences were transmitted from the rover to the Allegro; both GGA and GSA sentences were transmitted. See Appendix G, photograph 01, 03, 07, and 08 showing the RTK GPS in use. When used for target reacquisition, the rover was mounted above a survey pole.
- Compact excavator: An IHI Model 35N2 compact excavator was used to complete trenching operations in the Hero Road Trench Area MRS and to complete certain difficult excavations in the Anti-Aircraft Range 90-mm – 2 MRS. See Appendix G, photographs 15, 60, and 61 showing the excavator in use.

4.1.1.2 Geophysical Investigation Process

Anti-Aircraft Range 90-mm – 2 MRS

The geophysical investigation at this MRS consisted of a survey with the EM61-MK2 integrated with RTK GPS over 24 grids and along multiple transects. The rationale for quantity and location of the grid transects is briefly described below and presented in detail in Section 3.5.13 of the Work Plan (ERT, 2012).

UXO Estimator software (v2.2) was used to define a minimum area of investigation in the MRS under the assumption that 56.84 acres could be investigated, as agreed upon by the PDT at the TPP #1 meeting; minutes are presented in Appendix K. The software calculated the DGM survey acreage necessary to determine with a 95% confidence that there are 0.5 UXO items or less present per acre was 5.56 acres.

VSP software, developed by Pacific Northwest National Laboratory, was then used to randomly place survey grids of various sizes (in order to investigate narrow areas between the bunkers, road, and fence) to meet the coverage determined by UXO Estimator in the MRS. These grids and transects are shown in Appendix B-3. Grid sizes are summarized in Table 4-1.

Due to the presence of the fence within the MRS boundary and numerous closely-spaced munition storage bunkers in the MRS, additional DGM transects were placed at the request of GAEPD and are shown in Appendix B-3, with a total length of approximately 13,630 feet. These biased transects were placed in order to determine MEC distribution and density in these areas, should they differ from the rest of the MRS.

Hero Road Trench Area MRS

The geophysical investigation at this MRS consisted of a survey with the EM31 along parallel transects covering the entire MRS, with the purpose of identifying any potential burial or disposal pits where dilute agent CAIS kits may be present; this MRS was investigated for MC only as no historic or current evidence of MEC at this MRS exists. Ground conductivity anomalies were targeted for intrusive investigation by trenching or auger holes in conjunction with soil sampling for MC.

Brush clearance was a considerable effort at this MRS, with roughly 50% of the brush having to be cut. This was accomplished by a subcontractor, mainly by use of a brush hog. Brush was cleared along north-south oriented transects to allow passage of the EM31 operator.

Upon review of the first set of EM31 data collected, it was discovered that transects in the MRS had been laid out at a spacing of 20 feet rather than the 15 feet that was agreed upon in order to meet the DQO that appears in the Work Plan (ERT, 2012). Upon coordination with CENAB, it was determined that ERT needed to include additional transects to meet the DQO. This resulted in transects with 10-foot spacing throughout the MRS (Appendix B-4). This modification to the Work Plan was accepted by USACE following the *Transect Spacing at the Hero Road Trench Area* memorandum dated 14 June 2012 (Appendix K). Approximately 45,700 linear meters (28.4 miles) of EM31 data were collected in the MRS, covering approximately 139,350 square meters (34.4 acres).

Results of the EM31 investigation were reported in the subsequent *Final Hero Road Trench Area MRS Test Pit* memorandum to the PDT dated 27 July 2012 (Appendix K), including contour maps of quadrature and in-phase of anomalies as well as the recommended test pit/trench targets. Based on review and discussion of this memo, the number and location of the test pit/trenches as well as biased soil sampling locations (Figure 7, Appendix A) was agreed upon by the PDT prior to ERT commencing intrusive activities.

4.1.1.3 Intrusive Investigation Process

Anti-Aircraft Range 90-mm – 2 MRS

The targets mapped using the EM61-MK2 within grids and on transects were added to dig sheets (Appendix C-2). Once the dig sheets were reviewed and accepted by CENAB, coordinates were uploaded to the RTK GPS and flagged using non-metallic pin flags by field geophysicists. During the reacquisition process, the EM61-MK2 was used by field geophysicists to reacquire each anomaly and refine its location following procedures outlined in the Work Plan (ERT, 2012). New response values (in mV) and offset distances and directions were documented on the dig sheet for each anomaly. Occasionally, anomalies were merged or the signal could not be reacquired (i.e., 'no finds' potentially caused by an erroneous original signal that may have been the result of noise); these instances are documented on the dig sheets (Appendix C-2). One hundred percent of electromagnetic targets within grids and along transects were intrusively investigated.

UXO teams completed all excavations manually or by use of mini-excavator and documented the findings on dig sheets (Appendix C-2). Depth to contact, contact type, and other notes were also included on the dig sheet. The UXO team excavated until the anomaly was encountered. MEC/MPPEH was handled in accordance with installation guidance and followed procedures described in the Work Plan (ERT, 2012). Due to the potential safety hazard, the FTSW EOD Team was called to inspect and remove any MEC items (as documented in Appendix C-5). MD was removed and stored in a secure location on-site until the appropriate inspection was completed, per the Explosives Site Plan (ESP), and items were reclassified as material documented as safe (MDAS). Cultural debris was also removed. MDAS was brought to ERT for recycling and scrap metal was disposed of off-site.

Hero Road Trench Area MRS

This MRS was investigated for MC only as no historic or current evidence of MEC at this MRS exists. The excavator was used to excavate 5 trenches at anomaly locations representative of possible burial areas as described in the *Final Hero Road Trench Area MRS Test Pit* memorandum dated 27 July 2012 (Appendix K). The trenches were approximately 30 square feet in area and depths ranged from 4 feet to 6 feet. Soil samples were collected in each trench

as described in Section 4.2.1 and the Trench Report included in Appendix L. Additional single anomaly locations in this MRS were investigated by hand augering and soil sampling as described in Section 4.2.1, per the 27 July 2012 accepted *Final Hero Road Trench Area MRS Test Pit* memorandum (Appendix K).

4.1.2 Geophysical Quality Control

4.1.2.1 Instrument Verification Strip

As part of the Geophysical System Verification (GSV) procedure, an instrument verification strip (IVS) was installed according to the accepted Work Plan (ERT, 2012) in the southeast corner of the Anti-Aircraft Range 90-mm – 2 MRS, outside of the fenced ASP (Figure 3, Appendix A). The IVS consisted of a row of five industry standard objects (ISOs), which are metal pipes, buried in a straight line. The IVS was constructed prior to data collection, as documented in the *Instrument Verification Strip at Fort Stewart, GA* memorandum to USACE dated 29 June 2012 (Appendix K), which includes the proposed and accepted final designs of the IVS.

The EM61-MK2 was used to survey the IVS at the beginning and end of each day to document dynamic repeatability of the data. One pass was made over the ISOs to confirm sensor operation and one pass was made to confirm that the site noise had not changed. If the sensor performance and system noise were within specifications before and after each day of surveying, it was reasonable to expect that the system was performing within acceptable bounds throughout the day. If the sensor performance was within performance criteria in the morning and not in the evening, the data were examined to determine if any of it was usable. No major data quality issues were identified during the project with respect to the IVS. IVS results are presented in Appendix B-2.

4.1.2.2 Daily Quality Control Tests

For both the EM31 and EM61-MK2, a static background test was performed to quantify instrument background readings or electronic drift and to locate potential interference spikes in the time domain. A minimum of 3 minutes of static background data was collected after instrument warm up. The instrument operator monitored readings to confirm stability.

A vibration test, also known as a cable shake test, was used to identify shorting cables and problematic connectors. All cables were shaken for one minute with the instrument held in a static position. When shorts were found, the associated cables and/or connectors were tightened or replaced immediately. The vibration test was repeated once repairs were complete. Acceptance criteria included an absence of data spikes in the data profile during the test. If data spikes persisted, troubleshooting procedures were initiated.

A static standard response test was performed to determine impulse response and repeatability of the instrument to a standard test item. A minimum of three minutes of static standard response (spike) data was collected after the vibration test. For the EM31, the instrument was held in place over a manhole located near the Hero Road Trench Area MRS. For the EM61-MK2, a 12-inch long, 0.5-inch diameter piece of rebar was used. The instrument operator monitored readings to confirm stability. The acceptance criterion was ±20% of responses for the static spike test between pre-survey and post-survey tests.

All quality control tests for the EM31 are presented in Appendix B-1, and all quality control tests for the EM61-MK2 are presented in Appendix B-2.

4.1.2.3 Blind Seeding Program

A blind seed program was implemented in the production survey areas for the Anti-Aircraft Range 90-mm – 2 MRS to verify that the DQOs concerning geolocation, sensor performance, anomaly selection, and anomaly resolution requirements were met. The "seeds" used were small ISOs, or metal pipes, buried in the grids and along transects at locations unknown to geophysicists collecting or processing data. Due to the limits of the EM31 ability to detect small items, no blind seeds were placed in the Hero Road Trench Area MRS.

Blind seed items were placed by a UXO Tech at the time of civil survey and transect layout. One blind seed item was placed in each of the 24 survey grids and one was placed along a transect. The ISOs were buried in a vertical orientation at a depth of less than 6 inches. Locations were documented by licensed surveyors and are presented in Appendix B-3.

The surveyed locations were provided to the ERT Project Geophysicist (not to the Field Geophysicists) and the Senior Geophysicist after completion of data processing and target selection. All blind seeds detected are shown on target lists in the dig sheets in Appendix C-2. The seed locations were also submitted to the USACE Geophysicist for review.

4.1.2.4 Repeatability

To determine positional and data repeatability in the Anti-Aircraft Range 90-mm – 2 MRS, one line 100-ft long per grid was repeated after a survey. The repeat line was walked in the same direction of travel as the original line. Errors in position repeatability outside acceptable tolerances indicated a problem in navigation by the operator or in the navigation equipment. Errors in amplitude repeatability outside acceptable tolerances indicated detector system problems or operator errors. Acceptance criteria for data repeatability include ±20% for response amplitude and ±20 cm for positional accuracy. All grids were acceptable. Furthermore, operating the instrument on the IVS daily confirmed the dynamic repeatability of the data.

To determine positional and data repeatability in the Hero Road Trench Area MRS, two repeat lines were collected on the final day of the survey over a distance of approximately 850 meters, and there was no significant difference between original and repeat data, as shown in Appendix B-1.

4.1.2.5 Navigational Accuracy

The RTK GPS was used to collect DGM data and to reacquire anomalies at the Anti-Aircraft Range 90-mm – 2 MRS. The base station was set up on monuments or survey nails daily with coordinates provided by a licensed surveyor, and the rover was always checked on a nearby point to ensure the coordinates were correct and that the signal was "fixed" at the highest accuracy. Geophysical technicians monitored the GPS state on the Allegro console during data collection, and paused or stopped work if the signal deviated from fix.

As an additional navigational check in the grids, a "QC Spike" was utilized, where a small ISO or rebar was placed at a grid corner (with known coordinates), and the location was provided to the data processor to ensure the anomaly was detected at the correct location.

In the Hero Road Trench Area MRS, handheld GPS units of sub-meter accuracy were used to navigate along transects for the purpose of brush clearance.

The horizontal accuracy of the EM31 data in the Hero Road Trench Area MRS is constrained by the positions of stakes placed by licensed surveyors at end points and along transects. Additionally, flags were placed every 20 meters between surveyed stakes. Fiducial marks were placed in EM31 data files when the instrument passed over the stakes or flags, and the data were normalized between the fiducial marks; the use of the line and fiducial method of navigation meets the DQO requirement from the Work Plan (ERT, 2012).

4.1.3 Geophysical Data Analysis

4.1.3.1 Processing and Target Selection

EM61-MK2 and EM31 data were transferred from the data loggers via data card. Data was reviewed and converted from R61/R31 format to M61/M31 format using Dat61 and Dat31 software, respectively. Data were integrated with the positioning data and converted to Geosoft .xyz format and transferred to the Senior Geophysicist for QC review, data analysis, and target selection.

Data were downloaded and reviewed for completeness and accuracy at the end of each survey day by the Field Geophysicist, then electronically transferred to the Senior Geophysicist for additional review and processing utilizing Geosoft Oasis Montaj with UX Detect, as follows:

- Latency corrections were performed based on instrument latency;
- Data were reviewed for precision, accuracy, response, completeness, and sensitivity. Line paths were plotted to evaluate across-track sampling in grids. A velocity map was generated to locate any areas where collection speed was above 3 miles per hour;
- EM61-MK2 data were gridded using the minimum curvature algorithm with a cell size of 0.5 feet;
- A series of color maps were produced from the gridded data; and
- Line paths were posted over the mapped data, and reviewed for coverage completeness.

At the Anti-Aircraft Range 90-mm – 2 MRS, individual targets were selected for subsequent intrusive investigation in grids and along transects. Based on IVS results (documented in the *Instrument Verification Strip at Fort Stewart, GA* memorandum dated 29 June 2012, Appendix K), a target threshold of 5 mV on Channel 2 was determined for optimum target detectability. All anomalies exceeding this threshold were isolated for analysis using the Blakely peak picking algorithm in the Oasis Montaj UX-Detect extension. Each automatically selected target was manually reviewed. Any targets displaying abnormal decay or association with cultural features were deselected, but were maintained in the target database. All other targets were identified on a dig sheet along with characteristics of the target to be used during re-acquisition and intrusive investigation. Dig sheets are presented in Appendix C-2.

One hundred percent of target anomalies were intrusively investigated following acceptance of the dig sheets by CENAB.

At the Hero Road Trench Area MRS, M31 files were further processed in DAT31 after conversion from R31 format. First, fiducial corrections were applied to normalize the position

data along the survey transects using local coordinates (raw distances in meters). Second, the data collected in a given day was transformed from local coordinates to Universal Transverse Mercator Zone 17N coordinates based on known survey stake locations. Finally, all data collected over the survey period were compiled into a master data file (.xyz format) to be uploaded to a Geosoft Oasis Montaj database. In Oasis Montaj, the following steps were performed:

- EM31 data were gridded using the minimum curvature algorithm with a cell size of 3.75 feet;
- A series of color maps were produced from the gridded data; and
- Line paths were posted over the mapped data, and reviewed for coverage completeness.

A contour map of the geophysical responses was generated, and recommendations were made for the test pit/trench locations at the Hero Road Trench Area MRS, as documented in the *Final Hero Road Trench Area Test Pit* memorandum dated 27 July 2012 (Appendix K).

For quality control and interim reporting of the DGM data, DID MMRP-04-009 was followed, and the following file formats were provided to USACE for each transect group and each grid: .xyz, .gdb, .target-gdb, .map, and .grd.

4.1.3.2 Grids and Transects, Anti-Aircraft Range 90-mm – 2 MRS

All grid corners and transect end points (for long transects only) were staked out by licensed surveyors. Grid corner and transect endpoint coordinates are presented in Appendix D.

Twenty-four grids were placed randomly using VSP and adjusted to fit between obstacles such as fences and paved areas. A few grids were moved from their proposed locations on account of obstructions and the presence of standing water in drainage ditches. The number of targets and dimensions within each grid are summarized in Table 4-1.

Table 4-1. Grids in Anti-Aircraft Range 90-mm – 2 MRS		
Grid	**Dimensions (m x m)**	**Number of Targets**
G01	10 x 100	78
G02	10 x 100	57
G03	10 x 100	29
G04	10 x 100	109
G05	10 x 100	42
G06	10 x 100	29
G07	10 x 100	27
G08	10 x 100	54
G09	10 x 100	48
G10	30 x 30	13
G11	30 x 30	12
G12	30 x 30	15
G13	30 x 30	16
G14	30 x 30	19
G15	30 x 30	19
G16	30 x 30	18
G17	30 x 30	10
G18	30 x 30	27
G19	30 x 30	13
G20	30 x 30	29
G21	30 x 30	16
G22	30 x 30	23
G23	30 x 30	26
G24	30 x 30	89
	Total	**818**

A total of 6 long, north-south oriented transects and a total of 39 short east-west oriented transects were collected between the 40 munition storage bunkers of the ASP. These were submitted to USACE in three groups for review, and targets were numbered starting at 1 in each group. For this report, an "A," "B," or "C" has been added to the target numbers for each group on the dig sheets to make them unique yet preserve the original field designation (Appendix C-2). The total number of targets on the transects was 376, and all were intrusively investigated.

4.1.3.3 Analysis of EM31 data, Hero Road Trench Area MRS

Anomalies were manually digitized from the EM31 conductivity map. The absolute value of the conductivity readings was used to identify a list of preliminary targets for investigation of potential dilute agent CAIS kit burial pits. Targets with the highest readings that fell within

areas of known ground scars (from 1957 air photo) were recommended as trenching locations, and other targets were recommended as biased soil sampling locations. The accepted trench and soil sample locations are presented in the *Final Hero Road Trench Area Test Pit* memorandum dated 27 July 2012 (Appendix K).

4.2 Munitions Constituents Characterization

The MC Sampling Rationale Memo (Appendix H of the Work Plan) details associated MC and munitions found or expected to be found at each MRS. Based on this memo, samples from the Anti-Aircraft Range 90-mm – 2 MRS were analyzed for aluminum, copper, lead, zinc, and explosives. The Hero Road Trench Area MRS samples were analyzed for the degradation products associated with the dilute agent CAIS kits, which include arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol. Worksheet #12 of the accepted MC QAPP (ERT, 2012) contains additional detail about the analytical parameters and procedures for the RFI sampling. In addition, ERT standard operating procedures addressing these sampling activities are contained as Attachments to the MC QAPP (ERT, 2012).

Field activities were performed in accordance with the accepted Work Plan (ERT, 2012). Slight deviations from the Work Plan (ERT, 2012) that occurred based on field conditions are documented in the applicable sections of this RFI Report. A USACE representative provided oversight during all sampling activities. Soil sampling was a mixture of random and biased discrete surface and subsurface samples. Biased sampling and trench locations for the Hero Road Trench Area MRS were accepted by the PDT and detailed in the *Final Hero Road Trench Area Test Pit* memorandum dated 27 July 2012 (Appendix K).

The number and types of samples collected during RFI field activities are summarized in Table 4-2. Soil, sediment, and surface water sampling results are summarized in Section 5.3 and presented in Appendix E.

4.2.1 Anti-Aircraft Range 90-mm – 2 MRS

Twenty soil samples and two duplicate samples were collected in the Anti-Aircraft Range 90-mm – 2 MRS at 10 locations randomly chosen by VSP (Figure 8, Appendix A). At each location, one sample was collected at the surface 0 to 12 inches bgs and a subsurface sample was collected from 12 to 24 inches bgs. Surface and subsurface soil samples collected from the Anti-Aircraft Range 90-mm – 2 MRS were analyzed for select metals and explosives.

The random co-located surface and subsurface soil samples FTSW-AA-SO-19 and FTSW-AA-SO-20 were relocated approximately 30 feet southeast of the original location because it was determined during field activities that VSP had placed this sample location on an asphalt road. Biased soil samples were not collected at the Anti-Aircraft Range 90-mm – 2 MRS as there was no visible evidence of energetic material, e.g., breeched munitions items or large areas of MD.

Collection of the surface and subsurface soil samples occurred after clearing the sampling location of grass and other organic material; a disposable scoop was used to collect each surface soil sample and subsurface soil samples were collected via soil auger. Decontamination of the soil auger was conducted after each subsurface soil sample collection per the accepted Work Plan. Each scoop used for collection of the surface sample and set of gloves was disposed of after each surface sample was taken. Investigative derived waste (IDW) was contained within a lidded bucket until the end of the day when it was placed inside of a 10-gallon steel drum; due to

the limited amount of IDW generated, the use of a 55-gallon drum, as stated in the Work Plan (ERT, 2012), was not necessary. The IDW was sampled for Toxicity Characteristic Leaching Procedure (TCLP) disposal characterization as described in Section 5.3.3.

For a few of the sampling locations within the Anti-Aircraft Range 90-mm – 2 MRS, a pick was used to loosen either gravel or dense clay between where the surface and subsurface samples were collected. When using the pick, any loose soil was removed from the subsurface sampling location using a disposable clean scoop prior to inserting the decontaminated hand auger into the hole to collect the actual sample. Therefore, there was no cross-contamination concern associated with the use of the pick to help access the sampling locations.

Due to the compact, hard nature of the soil, a decontaminated knife was also used to break up the surface roots in order to access some of the surface sampling locations. Any soil that came into contact with the knife was removed from the sampling location using a disposable scoop prior to inserting the decontaminated hand auger into the hole to collect the actual sample. Therefore, there was no cross-contamination concern associated with the use of the knife to help access the sampling locations.

4.2.2 Hero Road Trench Area MRS

Thirty-two biased soil samples, and three duplicate samples, were collected at 16 locations where the DGM ground conductivity results showed that there may be disturbed soil; these samples were in locations that were not selected for the large test trenches. Twenty soil samples and two duplicate samples were collected at 10 locations randomly chosen by VSP. At each random soil sampling location, one soil sample was collected at the surface 0 to 12 inches bgs and a subsurface sample was collected from 12 to 24 inches bgs. At each biased soil sampling location, one sample was collected at the surface 0 to 12 inches bgs and a subsurface sample was collected from 7.5 to 10 feet bgs, per the rationale provided in the *Final Hero Road Test Pit* memorandum, dated 27 July 2012 (Appendix K). Random and biased soil sampling locations are presented in Figure 9 of Appendix A.

The area of each soil sampling location was first cleared of brush and other surface organic material to reach the surface of the soil. Sampling and decontamination procedures at the random and biased sampling locations within the Hero Road Trench Area MRS were conducted as described in Section 4.2.1. Random and biased surface soil samples were collected using a disposable scoop while the subsurface soil samples were collected via hand auger. Due to the nature of the subsurface (clay soil that was difficult to auger through) within the Hero Road Trench Area MRS, rather than hand auger to the bottom depth for some of the subsurface samples, an excavator was used to get access to the subsurface sampling location. When this occurred, the excavator was used to excavate subsurface material after collection of the surface sample and the GPS unit was utilized to reacquire the subsurface sampling location so that the surface and subsurface samples were still co-located. No soil cross-contamination was introduced by utilizing the excavator as a 1 foot soil buffer was utilized between the depth excavated with the excavator and the top of the subsurface sample. For example, if the subsurface sample was collected between 7 and 8 ft bgs, the use of the excavator was stopped at 6 ft bgs and the sampler switched back to utilizing the decontaminated hand auger to remove and discard the soil from 6 to 7 ft bgs and then collect the actual subsurface sample per the Work Plan.

Random and biased surface and subsurface soil samples were analyzed for select metals and degradation products associated with the dilute agent CAIS kits, as described in the MC Sampling Rationale Memo in Appendix H of the accepted Work Plan (ERT, 2012). Ten soil samples, two from each trench (one surface and one subsurface) and one duplicate sample were collected within the five trenches as described in the Trench Report presented in Appendix L. Surface and subsurface soil samples collected from the trenches were also analyzed for the degradation products associated with the dilute agent CAIS kits. Locations of the five trenches are presented in Figure 10 of Appendix A.

4.2.3 Background

As the existing FTSW SWMU background dataset does not include data for aluminum, copper and zinc, ten background surface soil samples and one duplicate sample were collected within a subset of the same SWMUs sampled during the development of the background dataset. Background samples were collected during RFI field activities from six locations previously used to develop the background dataset; determination of these sample locations was coordinated with FTSW personnel. Due to the inaccessibility of many of the previous SWMU background sample locations, two surface soil samples were taken within the same SWMU at some of the locations in order to provide a total of 10 background samples and satisfy the DQO for soil sampling (Table 3-3) for the Anti-Aircraft Range 90-mm – 2 MRS. Sampling and decontamination procedures were conducted for background sampling as described in Section 4.2.1. Background sampling locations are presented in Figure 11 of Appendix A.

4.2.4 Sediment and Surface Water Samples

At the request of GAEPD, two sediment samples and one duplicate sample were collected at the north and south ends of the drainage ditch located within the Anti-Aircraft Range 90-mm – 2 MRS (Figure 8, Appendix A).

The sediment samples were discrete samples collected 0 to 12 inches bgs. The samples were collected using a hand auger, which closely resembles a tube sampler. The auger was placed on top of the sediment and then turned to advance the auger into the sediment to a depth of 12 inches bgs. While being advanced, the sediment was pushed up into the collection area of the augur. After removal of the auger from the hole made by the auger, the sample collector filled the appropriately labeled 8-ounce amber glass jars for explosives analysis and 4-ounce amber glass jar for metals analysis, and properly preserved for transport to the analytical laboratory.

Approximately 8 inches of standing water was present at the north end of the drainage ditch where a sediment sample was collected; a surface water sample was also collected at this location prior to sediment sample collection. The standing water was sampled by submerging two 1-liter amber glass bottles beneath the surface of the water. A 250-milliliter plastic bottle containing preservative was filled from one of the 1-liter bottles for metals analysis. Surface water samples were appropriately labeled and properly preserved for transport to the analytical laboratory.

Sediment and surface water sampling locations are presented in Figure 8 of Appendix A.

5.0 INVESTIGATION RESULTS AND REVISED CONCEPTUAL SITE MODEL

5.1 Intrusive Investigation Findings

5.1.1 Anti-Aircraft Range 90-mm – 2 MRS

A total of 1,199 targets were excavated in 24 grids and on approximately 13,630 feet of transects in the Anti-Aircraft Range 90-mm – 2 MRS. Three items considered to be MEC were found in the subsurface. These were all 40-mm rounds, and were disposed of by FTSW EOD (Appendix C-5). These results are presented in Table 5-1.

MD was abundant in most grids and along the transects. Common items were .50 caliber bullets, shipping rings and plugs, and fragments. Nearly-intact rounds that were MDAS included two 90-mm Armor Piercing (AP) rounds, and one fired 37-mm round.

Table 5-1. Intrusive Results in Anti-Aircraft Range 90-mm – 2 MRS

Grid	Targets	# MEC found	MEC summary	Notable MD
G01	78	0		
G02	57	0		
G03	29	0		
G04	113	0		
G05	45	0		
G06	29	0		
G07	27	0		
G08	54	0		
G09	49	0		90-mm AP round

The locations of MEC and notable MD items are shown in Figure 12 of Appendix A. MEC and MD are also highlighted in the dig sheets shown in Appendix C-2. Photos of MEC items are presented in Appendix C-3.

5.1.2 Hero Road Trench Area MRS

Sixteen biased, single anomaly locations in the Hero Road Trench Area MRS were investigated by hand auguring and soil sampling as described in Section 4.2.1, per the accepted *Final Hero Road Trench Area Test Pit* memorandum dated 27 July 2012 (Appendix K). Five trenches were excavated at the MRS to investigate geophysical anomalies as discussed in Section 4.1.3.3 and described in the Trench Report (Appendix L). The items found at the biased soil sampling locations and within the trenches are summarized in Table 5-2 and presented in Figure 7 of Appendix A; photographs of several items are also presented in the Trench Report (Appendix L). The locations of the excavated trenches are shown in Figure 10 of Appendix A.

Table 5-2. Intrusive Results in Hero Road Trench Area MRS

Location	Item Found
Biased 1	Misc. metal scrap
Biased 2	Loose metal scrap
Biased 3	Pile of lumber, glass, and metal
Biased 4	Misc. metal scrap
Biased 5	Misc. metal scrap
Biased 6	Misc. metal scrap
Biased 7	Metal pins and scrap wire
Biased 8	Misc. metal scrap
Biased 9	Adjacent to metal structure
Biased 10	Buried metal plate
Biased 11	Misc. metal scrap
Biased 12	Rusted metal chair
Biased 13	Misc. metal scrap
Biased 14	Misc. metal scrap
Biased 15	Misc. metal scrap
Biased 16	Misc. metal scrap
Trench 1	Metal cable, metal drum, and drum remnants
Trench 2	Steel drums and construction debris
Trench 3	Steel drum and barbed wire
Trench 4	Metal scrap, glass bottles
Trench 5	Wire fence adjacent

5.2 Analysis of Intrusive Findings

5.2.1 Overview

In the Anti-Aircraft Range 90-mm – 2 MRS, UXO Estimator (v2.2) was used to evaluate the actual findings in the grids to determine an estimate of the density of MEC within the MRS. The area of the MRS (excluding paved areas), the DGM coverage, the UXO density hypothesis of 0.5 UXO/acre, the desired confidence of 95%, and the actual number of MEC items found were entered. The software outputs an "average UXO density," which is independent of desired confidence. It also outputs two numbers inversely related by confidence and the hypothesis. First, the UXO density (MEC/acre) is displayed at the 95% confidence; this number is always higher than the average UXO density and may be considered a likely upper limit to the density of MEC in the MRS. Second, the confidence that the UXO density is less than the hypothesis of 0.5 UXO/acre is displayed; this number is always lower than 95% when the UXO density is above 0.5 UXO/acre.

UXO Estimator was not used to evaluate the Hero Road Trench Area MRS because this MRS was investigated for MC only. Analyses of MC results are discussed in Section 5.3.

5.2.2 Anti-Aircraft Range 90-mm – 2

The area of the Anti-Aircraft Range 90-mm – 2 MRS is 56.84 acres, excluding paved areas, buildings, and the munition storage bunkers. The area covered by DGM in the grids and on the transects was 7.102 acres, which is greater than the coverage identified in the DQO (Table 3-1). Based on finding three MEC items, UXO Estimator outputs that the average UXO density is 0.546, the UXO density at 95% confidence is 1.038, and the confidence that the UXO density is below 0.5 MEC/acre is 51.03%. Based on this statistical analysis, up to approximately 59 MEC items (56.84 acres x 1.038 MEC/acre) may be present in the subsurface of this MRS, and intrusive findings indicate that most would be 40-mm rounds with possible 37-mm and 90-mm rounds. Per the Department of Defense Explosive Safety Manual (DoD, 2010), a "moderate to high" probability for encountering MEC determination can be made if a search of available historical records and onsite investigation data indicates that, given the military or munitions-related activities that occurred at the site, there is more than a low probability that MEC are present. Per the DoD guidance and results of this RFI, the probability of encountering MEC in the Anti-Aircraft Range 90-mm – 2 MRS is therefore deemed to be "moderate to high."

As stated in Section 4.1.1.2, the transects placed to investigate the area around the ammunition storage magazines were added at the request of GAEPD. No MEC was discovered along these transects, but MD items found included a 90-mm AP round, and .50 caliber rounds, cartridges, and fragments.

5.2.3 Hero Road Trench Area

Based on the DGM results and the trenching conducted at the areas that appeared most likely to be burial pits, there is no physical evidence that dilute agent CAIS kits were improperly buried at the Hero Road Trench Area MRS. Only metallic scrap and other debris were found in the trenches or soil sample locations investigated in this MRS.

5.3 Munitions Constituents

Environmental sampling of soil, surface water, and sediment for MC was completed as described in Sections 3.2 and 4.2. The data summary tables for all samples are presented in Appendix E-1. A formal screening of the data to identify chemicals of potential concern (COPCs) is presented in Section 6.0. Figure 13 and 14 in Appendix A show the soil sampling results that exceed the screening levels by location.

5.3.1 Soil Samples

A total of 101 soil samples and duplicates were collected at the Anti-Aircraft Range 90-mm – 2 and Hero Road Trench Area MRSs. Of the 101 soil samples, 22 random samples (10 surface, 10 subsurface, and 2 duplicates) were collected at the Anti-Aircraft Range 90-mm – 2 MRS, 68 samples (16 biased surface, 16 biased subsurface, 10 random surface, 10 random subsurface, 5 surface trench, 5 subsurface trench, and 6 duplicates) were collected at the Hero Road Trench Area MRS, and 11 background samples (10 surface and 1 duplicate) were collected around FTSW. The number and sample type are summarized in Table 4.2.

At the Anti-Aircraft Range 90-mm – 2 MRS the 20 soil samples and two duplicate samples were analyzed for select metals and explosives.

At the Hero Road Trench Area MRS the 68 soil samples were analyzed for degradation products associated with the dilute agent CAIS kits, which includes arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol.

Ten background samples collected from six sites previously used to develop the background dataset (SAIC, 1999) were analyzed for select metals only; Section 6.2.1 details how the background dataset was established.

No explosives compounds or degradation products were found above the detection limit in any of the surface or subsurface soil samples. Arsenic was detected in 22 soil samples (17 surface, 5 subsurface) in the Hero Road Trench Area MRS. It is noted that the arsenic detections are "J" qualified, indicating an estimated value, and because the reporting limits (0.92-1.2 mg/kg) are greater than the residential RSL (0.67 mg/kg), this adds some uncertainty to the analysis. However, since the reported concentrations of arsenic are less than background for both surface and subsurface soils, it is not considered to be site-related and is not carried through the risk assessments.

Arsenic was also detected at levels exceeding the Soil-Groundwater screening level, which could indicate a potential impact to groundwater. However, since the detected soil concentrations did not exceed the established background level for arsenic (2.1 mg/kg) at Fort Stewart, and, as noted in Section 6.2.1.3, the Soil-Groundwater screening levels are very conservative, it is unlikely that these concentrations in soil would lead to unacceptable levels of arsenic in groundwater. Select metals analysis for the Anti-Aircraft Range 90-mm – 2 MRS and background samples included aluminum, copper, lead, and zinc. Each of these metals was detected in the Anti-Aircraft Range 90-mm – 2 MRS surface and subsurface soil samples and background samples.

As discussed in greater detail in Section 6.0, aluminum was detected in 8 soil samples (2 surface, 6 subsurface) from the Anti-Aircraft Range 90-mm – 2 MRS and 2 background samples at levels above the residential screening level, but below the industrial screening level. Aluminum was

detected in 5 samples (1 surface, 4 subsurface) from the Anti-Aircraft Range 90-mm – 2 MRS at levels greater than background. Aluminum was also detected at the Anti-Aircraft Range 90-mm at concentrations exceeding the Soil-Groundwater screening levels, indicating a potential impact to groundwater. However, since aluminum is an essential element, and is below the industrial screening level, it is unlikely to be associated with any potential health risks. Copper, lead, and zinc were detected below the residential and industrial screening levels in the Anti-Aircraft Range 90-mm – 2 MRS. Copper was detected in 3 samples (2 surface, 1 subsurface) from the Anti-Aircraft Range 90-mm – 2 MRS at levels above background.

5.3.2 Surface Water and Sediment Samples

Two sediment samples and one duplicate sample were collected in the Aircraft Range 90-mm – 2 MRS. The sediment samples were collected from the north and south ends of the drainage ditch within the Aircraft Range 90-mm – 2 MRS (Figure 8, Appendix A). A co-located surface water sample was also taken at the north end of the drainage ditch; the south end of the drainage ditch did not contain water. Sediment and surface water samples were analyzed for select metals and explosives.

No explosives were detected in the sediment or surface water samples. All select metals were detected in the sediment samples, but at concentrations below both risk-based and ecological screening levels. All select metals were detected in the surface water sample, but only aluminum was detected at a one concentration greater than its ecologically-based freshwater criterion.

5.3.3 IDW Investigation Results

The containerized decontamination water was sampled for Toxicity Characteristic Leaching Procedure (TCLP) disposal characterization, including:

- Volatile organic compounds (VOCs) by SW-846 Method 8260B/1311
- Semi-volatile organic compounds (SVOCs) by SW-846 Method 8270D/1311
- Pesticides by SW-846 Method days to analysis 8081B/3510/1311
- Herbicides by SW-846 Method 8151A/3510/1311
- Metals by SW-846 Method 6010C/3015/7470A/1311

There were no detections for VOCs, SVOCs, pesticides, and herbicides. There were four detections for metals, specifically arsenic, barium, chromium, and lead. Levels for all four metals were significantly below the maximum contaminant concentration (MCC) for each, which are the TCLP limits. Results of the IDW analysis are included in Appendix E-3. The IDW was disposed of by Bear Environmental Services.

5.4 Data Quality Assessment

The data quality assessment (DQA) describes the evaluation of data quality indicators (DQIs) that were used to assess the overall quality of the analytical data collected for this RFI. The DQIs are assessed with respect to the DQOs. Project DQOs (provided in Section 3.2.2) establish the data end uses and end users and provide objective criteria by which the data quality can be measured. More importantly, the DQO process identifies the up-front protocols, processes, procedures, and methods by which the DQOs can be met. With the appropriate planning for

project DQOs, their achievement provides the basis for concluding that the acquired investigation data is scientifically sound, legally defensible, and adequate for their intended use.

The specific DQOs for precision, accuracy, representativeness, comparability, completeness, and sensitivity (PARCCS) were established in the project-planning phase. DQOs may be qualitative statements, while others set quantitative criteria or goals. Both are evaluated in the DQA (Appendix E-3).

5.4.1 Data Evaluation

Environmental samples were collected and analytical data were evaluated to support technical conclusions and recommendations. These data (i.e., concentration values and laboratory qualifiers) were incorporated into one database. Following an initial review to ensure that all Level IV Contract Laboratory Program (CLP) elements were received from the laboratory, hard copy data packages were submitted to the data validator for validation. The applied data validation qualifiers were incorporated into the database once the data validation reports (DVRs) were received and reviewed.

5.4.2 Environmental Analytical Laboratory

Environmental and field quality control (QC) samples were analyzed by ALS Laboratory Group (ALS) of Middletown, Pennsylvania and Salt Lake City, Utah; ALS, Middletown was the lead laboratory. ALS is accredited in accordance with the *National Environmental Laboratory Accreditation Conference*, and certified to perform the specified methods by the National Environmental Laboratory Accreditation Program and the DoD *Environmental Laboratory Accreditation Program*, in compliance with the DoD Quality System Manual (DoD, 2010b). The laboratory analyzed all environmental samples (i.e., soil, sediment, and surface water) and field QC samples (i.e., equipment rinsate blanks, field duplicates, matrix spikes, and matrix spike duplicates) using accepted laboratory standard operating procedures based on the *SW-846 Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (USEPA, 2007). Laboratory analyses were conducted using the QC requirements and quality assurance (QA) objectives as outlined in the accepted UFP-QAPP (ERT, 2012). Soil, sediment, and surface water samples collected from the Anti-Aircraft Range 90-mm – 2 MRS were analyzed for select metals (aluminum, copper, lead, and zinc) and explosives; soil samples collected from the background area were analyzed for select metals only; and soil samples collected from the Hero Road Trench Area MRS were analyzed for arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol. CLP Level IV data packages and accompanying electronic data deliverables are presented in Appendix E-2.

5.4.3 Analytical Data Validation

Analytical data were independently validated for laboratory adherence to method QA/QC criteria by Meridian Consultant Group, Inc. (MCGI) of Annapolis, Maryland using specifications established in the approved UFP-QAPP (ERT, 2012), and according to the pertinent parts of the *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004a), *National Functional Guidelines for Organic Data Review* (USEPA, 1999a), and the QA/QC requirements for the analytical methods used for the analyses. All data received from the laboratories were subjected to an initial review by the ERT Project Chemist to ensure that all Level IV CLP elements were submitted. DVRs that were produced from the data validation effort are presented in Appendix E-3.

Analytical data were validated according to the guidelines and procedures described in the documents listed in above. The data validator was responsible for the following:

- reviewing laboratory data packages and applying required control,
- using professional judgment where specific limits were not specified,
- qualifying affected data points on the applicable result forms; and,
- preparing a DVR for actions taken.

5.4.4 Data Bias Assessment

The DQA was conducted using the analytical QC data (by matrix and by parameter) and the data validation results. The analytical QC data were evaluated for the number of results observed within the set acceptance criteria. When the data are observed as being lower or higher than the criteria, a bias existed.

5.4.5 Data Quality Management

The project database was populated with analytical results from samples collected during the RFI. In certain cases, data were selected for incorporation into or exclusion from the database; the selection processes are described below.

- All laboratory and field QC results were marked to prevent incorporation into the usable data population; and
- All duplicate values (same sample location) were identified with a unique sample identification to identify them for appropriate incorporation into the usable data population.

It was discovered in the field that samples collected during one day of field of activities in the Hero Road Trench Area MRS were given incorrect sample identification numbers. Since the mislabeled samples were taken from the biased sampling locations, which had been previously numbered before sampling, those locations and time of sampling were known. The sample identification numbers were all corrected before the samples were received at the laboratory, and correct sample identification numbers were double and triple checked by the sampling team lead. Maps, field notes, and correspondence between the sampler and sampling team leader were used to ensure that the analytical results were attributed to the correct sample.

5.4.6 Data Quality Summary

Achievement of the DQOs provides the basis for concluding that the acquired investigation data are scientifically sound, legally defensible, and adequate for their intended use. An overview of the results of the DQA follows; a complete assessment of the data quality is presented in Appendix E-3.

- The data validation process found no systematic problem and produced minor qualifications of the results.
- Completeness for the RFI field and analytical activities is > 95 percent.
- Overall project accuracy is > 90 percent.

- Overall analytical precision is > 90 percent.
- Overall field duplicate precision (all matrices/all parameters) is > 90 percent.
- Representativeness was achieved.
- Comparability was achieved.

5.5 Revised Conceptual Site Models

Section 3.0 presented the preliminary CSMs for the Anti-Aircraft Range 90-mm – 2 and Hero Road Trench Area MRSs. This section discusses changes to the preliminary CSMs based on the findings of the RFI, and presents revised CSM tables and diagrams per MRS. The revised CSMs describe the current state of knowledge about hazards and risks at the site based on the intrusive investigations and MC sampling completed at each MRS.

Tables 5-3 and 5-4 present detailed revised CSMs for each MRS, including facility and physical profiles (setting, layout, structures, terrain, vegetation, significant features, and security), land use and exposure profiles (receptors), ecological (habitat, species) and munition release profiles (types, transport mechanisms, migration routes, and pathway analysis).

Figures 15 through 18 of Appendix A present the revised HHRA and SLERA CSMs, as described in the below sections.

5.5.1 Anti-Aircraft Range 90-mm – 2 MRS

Table 5-3 describes that human receptors are potentially present at the Anti-Aircraft Range 90-mm – 2 MRS for exposure to MEC in the surface and subsurface; however, based on RFI intrusive investigation findings, pathways are considered incomplete, except the pathway for MEC in the subsurface for construction workers, which is considered potentially complete.

Table 5-3 also describes that human and ecological receptors are potentially present at the Anti-Aircraft Range 90-mm – 2 MRS for exposure to MC in the soil, sediment, and surface water; however, based on the RFI sampling results and the HHRA and SLERA described in Section 6.0, pathways are considered incomplete for human and ecological receptors.

Figures 15 and 16 of Appendix A present the revised HHRA and SLERA CSMs for the Anti-Aircraft Range 90-mm -2 MRS.

Table 5-3. Conceptual Site Model for the Anti-Aircraft Range 90-mm – 2 MRS

Profile Type	Site Characterization
Facility Profile	**Location and Area:** • 77 acre area located within a former 90-mm anti-aircraft range fan, approximately 2.8 miles northwest of the FTSW cantonment area.
	Structures: • An ammunition supply point (ASP) is located within this MRS, which contains munition bunkers.
	Boundaries: • Bounded by surrounding upland forest.

Table 5-3. Conceptual Site Model for the Anti-Aircraft Range 90-mm – 2 MRS

Profile Type	Site Characterization
	Security: • Due to an ASP being located in the MRS, there is additional security with a secured, gated fence surrounding the MRS.
	Utilities: • Utilities include underground and overhead power lines, and underground pipes.
Physical Profile	**Topography:** • Elevation is approximately 33 feet above sea level, relatively flat and covered with maintained grass, buildings, gravel and paved roads and parking areas.
	Vegetation: • Maintained grass. • Upland Forest outside the MRS boundary.
	Wetlands: • No wetlands are located within this MRS.
	Soil: • Sandy silt or sandy clay.
	Hydrology: • Located in the Canoochee River Watershed. • Drainage ditch runs through the center of the MRS.
	Hydrogeology: • No groundwater wells are located in this MRS. • The principal artesian aquifer is a deep aquifer that is isolated from the surface aquifer by a confining unit. This aquifer supplies drinking water to the FTSW area. • The surface aquifer is composed of a relatively thin layer of sands, gravels and clays. It is recharged directly from rainfall percolating through sediments.
Land Use and Exposure Profile	**Current Land Use:** • Consists of an active ASP, which is a gated, secured area where entry is controlled and monitored. • A cleared buffer area surrounding the ASP fence is also included in the MRS. No activities occur in the buffer area.
	Cultural, Archaeological and Historical Resources: • Based on available information, there is no indication that cultural, archaeological, or historical resources are present in this MRS.
	Current Human Receptors: • Outdoor Workers • Trespassers
	Potential Future Land Use: • No change in Land Use for the foreseeable future.

Table 5-3. Conceptual Site Model for the Anti-Aircraft Range 90-mm – 2 MRS

Profile Type	Site Characterization
	Potential Future Human Receptors: • No changes are anticipated to the current human receptors; however, future residents are conservatively considered. • Future Construction Workers
Ecological Profile	**Degree of Disturbance:** • Extensive disturbance **Receptors:** • Biota
Munitions/Release Profile	**Munitions Types:** • Based on EOD calls and possible munitions items - Small Arms (.45 caliber, .50 ball, .30 caliber, .50 caliber, 7.62mm) - Projectiles (37mm High explosive (HE), 40 mm HE dual purpose, 90mm HE, 75mm, 76mm, 105mm, 152mm, 155mm) - Grenades (40mm, M7 Riot, fragmentation grenade) - Rockets (Dragon II high explosive anti-tank guided missile, 3.25- inch target rocket)
	Release Mechanisms: • Historical Range Use
	Maximum Probable Penetration Depth: • As the MRS is not an impact area, and ASP as-built records indicate minimal ground disturbance during construction, it was anticipated that MEC may be located in the shallow subsurface between 6 inches and 2 feet.
	MEC Density: • Based on the three MEC items found during RFI field activities, the average MEC density was determined to be 0.546 MEC/acre.
	Munitions Debris: • Numerous MD items have been found and may be encountered at the MRS.
	Associated Munitions Constituents: • Aluminum • Copper • Lead • Zinc • Explosives
	Transport Mechanisms/Migration Routes: • MEC - Movement of a potential item by a person - Intrusive activities (e.g., construction activities) • MC - Natural processes such as wind or lateral movement by surface runoff - Physical and chemical processes such as infiltration, adsorption, and/or dispersion

Table 5-3. Conceptual Site Model for the Anti-Aircraft Range 90-mm – 2 MRS

Profile Type	Site Characterization
	Pathway Analysis: • MEC. Receptors are potentially present and pathways are incomplete for exposure to MEC in the surface; however, for intrusive activities in the subsurface, a potentially complete pathway exists as a source of MEC in the subsurface remains at this MRS. • MC. Receptors are potentially present; however, pathways are incomplete for soil, sediment, and surface water as no source of MC has been identified at this MRS.

5.5.2 Hero Road Trench Area MRS

Table 5-4 describes that human and ecological receptors are potentially present at the Hero Road Trench Area MRS for exposure to MC in the soil; however, based on the RFI soil sampling results and the HHRA and SLERA described in Section 6.0, pathways are considered incomplete for human and ecological receptors.

Figures 17 and 18 of Appendix A present the HHRA and SLERA CSMs for the Hero Road Trench Area MRS.

Table 5-4. Conceptual Site Model for the Hero Road Trench Area MRS

Profile Type	Site Characterization
Facility Profile	**Location and Area:** • Approximately 34.5 acres in size and lies within the cantonment area of FTSW.
	Structures: • There are no structures within the MRS.
	Boundaries: • The MRS is bounded by a fence.
	Security: • MRS is surrounded by a gated, locked fence.
	Utilities: • Adjacent to the MRS is a power line.
Physical Profile	**Topography:** • Relatively flat.
	Vegetation: • Dense young forest and substantial undergrowth.
	Wetlands: • No wetlands are located within this MRS.
	Soil: • Clay-sand and clay-silt.

Table 5-4. Conceptual Site Model for the Hero Road Trench Area MRS

Profile Type	Site Characterization
	Hydrology: • Located in the Canoochee River Watershed. FTSW has about 265 miles of freshwater rivers and streams and an additional 12 miles of brackish water streams. There are no surface water bodies within this MRS.
	Hydrogeology: • No groundwater wells are located within this MRS. • The Principal Artesian aquifer is isolated from the surface aquifer by a confining unit. • The surface aquifer is composed of a relatively thin layer of sands, gravels and clays. It is recharged directly from rainfall percolating through sediments.
Land Use and Exposure Profile	**Current Land Use:** • The MRS is kept secured at all times and no activities occur within the MRS.
	Cultural, Archaeological and Historical Resources: • Based on available information, there is no indication that cultural, archaeological, or historical resources are present in this MRS.
	Current Human Receptors: • Outdoor Workers • Trespassers
	Potential Future Land Use: • Future land use is contingent upon the outcome of this RFI investigation; as this MRS lies within the cantonment area, development of the site may occur.
	Potential Future Human Receptors: • No changes are anticipated to the current human receptors • Future Residents • Future Construction Workers
Ecological Profile	**Degree of Disturbance:** • The MRS consists of dense young forest and substantial undergrowth. • This MRS is not currently in use. • There are no surface water bodies within this MRS.
Munitions/Release Profile	**Munitions Types:** • Dilute agent CAIS Kits.
	Release Mechanisms: • Improper disposal or burial.
	Maximum Probable Penetration Depth: • Expected to be located 2 to 10 feet below the surface in potential burial pits.
	MEC Density: • No MEC was expected or encountered during RFI activities at this MRS.
	Munitions Debris: • No MD was expected or encountered during RFI activities at this MRS.

Table 5-4. Conceptual Site Model for the Hero Road Trench Area MRS

Profile Type	Site Characterization
	Associated Munitions Constituents: • Arsenic • 1,4-oxithiane • 1,4-dithiane • thiodiglycol
	Transport Mechanisms/Migration Routes: • MC - Natural processes such as wind or lateral movement by surface runoff. - Physical and chemical processes such as infiltration, adsorption, and/or dispersion.
	Pathway Analysis: • Receptors are potentially present; however, pathways are incomplete for soil as no source of MC has been identified at this MRS.

This Page Intentionally Left Blank

6.0 BASELINE RISK ASSESSMENT FOR MC AND RISK CHARACTERIZATION FOR MEC

This section describes the Baseline Risk Assessment (BLRA) for the FTSW RFI. The BLRA is being conducted under the RCRA Part B Permit, with regulatory coordination with the GAEPD. The BLRA includes a HHRA and SLERA, and focuses on MC only. The potential hazards associated with MEC are addressed in Section 6.5.

The BLRA has been prepared in accordance with the following GAEPD and USEPA guidance:

- Guidance for Selecting Media Remediation Levels at RCRA Solid Waste Management Units (GAEPD, 1996)
- RFI Guidance, Volumes I through IV, Interim Final, EPA/530-SW- 89-031 (USEPA, 1989a)
- Risk Assessment Guidance for Superfund (RAGS), Volume 1, Human Health Evaluation Manual (Part A) (USEPA, 1989b)
- RAGS, Volume I, Human Health Evaluation Manual. Part E, Supplemental Guidance for Dermal Risk Assessment, Final (USEPA, 2004b)
- RAGS, Volume I: Human Health Evaluation Manual. Part F, Supplemental Guidance for Inhalation Risk Assessment (USEPA, 2009)
- Guidance for Data Usability in Risk Assessment (Part A) (USEPA, 1992a)
- Supplemental Guidance to RAGS: Calculating the Concentration Term (USEPA, 1992b)
- Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment (USEPA, 1995a)
- Guidance for Risk Characterization (USEPA, 1995b)
- Soil Screening Guidance (USEPA, 1996a)
- Exposure Factors Handbook (USEPA, 2011a) and the EPA OSWER Directive 9200.1-120, Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors (USEPA, 2014a)
- Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002)
- Amended Guidance of Ecological Risk Assessment at Military Bases: Process Considerations, Timing of Activities, and Inclusion of Stakeholders. USEPA Region 4, 4WD-OTS Memorandum June 23, 2000 (USEPA, 2004c).
- Ecological Risk Assessment Guidance for Superfund (ERAGS): Process for Designing and Conducting Ecological Risk Assessments; EPA 540-R-97-006 (USEPA, 1997)

6.1 Conceptual Site Models

A CSM identifies contaminant sources and transport mechanisms, potential human or ecological receptors, and exposure scenarios. A CSM is an effective tool in the planning phases of a RFI to

define the goals of the investigation, streamline the risk evaluation, and to develop appropriate response actions. It identifies complete exposure pathways for the media affected by site-related contamination. Understanding site conditions and land uses helps to accurately identify potential receptors under current and likely future scenarios, as well as the most appropriate corrective action, if necessary.

CSMs for current and future human and ecological receptor exposure scenarios at the Anti-Aircraft Range 90-mm – 2 MRS and Hero Road Trench Area MRS have been developed to aid in understanding and describing the MRSs, and to present assumptions regarding:

- Suspected sources and types of constituents present,
- Constituent release and transport mechanisms,
- Affected media,
- Potential exposure routes, and
- Potential human and ecological receptors

The preliminary HHRA and SLERA CSMs for the Aircraft Range 90-mm – 2 MRS and Hero Road Trench Area MRS are discussed in Section 3.1 and are presented in Figures 12 through 15 of Appendix B of the Work Plan (ERT, 2012). The revised HHRA and SLERA CSMs for the Anti-Aircraft Range 90-mm – 2 MRS and Hero Road Trench Area MRS are discussed in Section 5.5 and presented in Figures 15 through 18 of Appendix A of this report.

6.1.1 Constituents Present, Constituent Release and Transport Mechanisms, and Affected Media

Based on past uses of the Anti-Aircraft Range 90-mm – 2 MRS, MEC, MD, and possible MC have been found or are suspected to be present. Based on anecdotal evidence, the Hero Road Trench Area MRS was investigated for potential MC contamination associated with the dilute agent CAIS kits; no MEC is suspected to be present at this MRS. MEC items and associated MC that were found during the RFI are discussed in Section 5.0.

Constituent release and transport mechanisms and affected media must be considered to delineate potential exposure routes. Previous investigations at the Anti-Aircraft Range 90-mm – 2 and Hero Road Trench Area MRSs have determined that potentially impacted media include surface soil and subsurface soil; therefore, soil was the focus of this investigation. Additionally, two sediment samples and one surface water sample were collected from a drainage ditch within the Anti-Aircraft Range 90 mm – 2 MRS at the request of GAEPD.

Soil samples from the Anti-Aircraft Range 90 mm – 2 MRS were analyzed for select metals (aluminum, copper, lead, and zinc) and explosives. The rationale for selecting these metals is outlined in Appendix H (MC Sampling Rationale Memo) of the Work Plan (ERT, 2012). In addition, sediment and surface water samples collected from the drainage ditch located within the Anti-Aircraft Range 90-mm – 2 MRS were collected and analyzed for select metals and explosives.

The Hero Road Trench Area MRS investigations are related exclusively to potential MC contamination from dilute agent CAIS kits, which anecdotal evidence suggests may have been

disposed in burial pits within the MRS. Thus, for the Hero Road Trench Area MRS the specific constituents that were investigated included arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol.

Based on a review of the hydrogeological data (SAIC, 1999), it appears unlikely that MC in shallow groundwater would migrate to the deeper aquifers that are used as a water supply for FTSW. The principal artesian aquifer is generally 300 to 500 feet below surface and is isolated from the surface aquifer by a confining unit (SAIC, 1999). The surface aquifer is composed of a relatively thin layer of sands, gravels and clays. It is recharged directly from rainfall percolating through sediments. Per the accepted Work Plan for this investigation, groundwater would only have been sampled if the USEPA Protection of Groundwater Soil Screening Levels (SSLs) for soil were exceeded. Generic SSLs are developed by USEPA using default soil and contaminant leaching parameters, which are generally conservative values (USEPA, 1996b). For this screening procedure, the generic SSLs are used because the necessary site-specific parameters for soil, such as soil organic carbon content, were not available for either MRS in this investigation in order to develop site-specific groundwater SSLs.

6.1.2 Potential Receptors and Exposure Routes

The potential receptor evaluation for development of the CSMs considered criteria such as:

- Current and future land use on and near the MRS;
- Zoning status and/or deed restrictions of the MRS and adjacent properties;
- Current and future access to the MRS and to the affected media;
- Existing and/or planned exposure controls (e.g., engineered containment structures);
- Present and planned MRS activities;
- Extent that the MRS is developed and vegetated; and
- Potential for soils to be disturbed (e.g., soil-invasive activities).

Table 6.1 summarizes the potentially exposed receptors and the exposure pathways that were considered in the BLRA. These pathways are also shown in the HHRA CSMs for the Anti-Aircraft Range 90-mm – 2 MRS and Hero Road Trench Area MRS for human receptors in Figures 15 and 17, respectively, and the SLERA CSMs are shown in Figures 16 and 18 for the ecological receptors at each MRS.

Human Receptors

The Anti-Aircraft Range 90-mm – 2 MRS is located within the operational range at FTSW and is an active ASP. As such, there are activities related to ammunitions constantly ongoing at the site, and the area is gated and secured with controlled, monitored entry. Surrounding the fence is a cleared buffer area in which no activities occur. A gate and signs restrict vehicle traffic on FTSW to authorized personnel and visitors. Current surface soil exposure at the Anti-Aircraft Range 90-mm – 2 MRS could occur for outdoor workers and trespassers, although the general public does not have access to the Anti-Aircraft Range 90-mm – 2 MRS. Although current trespassing is very unlikely due to the secure nature of the site (the site is guarded and is surrounded by a secure fence), and due to the distance of the site from the nearest residences, this potential receptor is included in the CSM and the BLRA. In the future, if construction occurs,

subsurface soil could be brought to the surface, resulting in exposure to mixed surface/subsurface soil for future construction workers or residents, if the MRS is developed for residential use. It is noted that the potential soil exposures to current child trespassers would be much less than would occur under a future residential scenario in which resident children could be exposed to soils on a daily basis, therefore, the current child trespasser scenario is qualitatively evaluated.

Since sediment from the drainage ditch located in the center of the Anti-Aircraft Range 90-mm – 2 MRS could also be contacted, sediment results were screened against human health risk-based screening levels. However, because water exists at this location only intermittently, potential exposures to possible contaminants in water at this location are expected to be low for human receptors.

For the Hero Road Trench Area MRS, the current outdoor worker and trespasser scenarios are possible, along with future construction workers and future residents, in the event that the MRS is developed in the future. The Hero Road Trench Area MRS is surrounded by a wastewater treatment plant, a school, roads, and forested areas.

Surface soil exposure at the Hero Road Trench Area MRS could occur for outdoor workers or trespassers. In the future, if construction occurs, subsurface soil could be brought to the surface, resulting in exposure to mixed surface/subsurface soil for future construction workers, or for future residents, if the MRS is developed for residential use. Potential human exposure routes for surface and subsurface soil could include incidental ingestion, dermal contact, and inhalation of particulates. Since volatile compounds are not typically associated with munitions, they were not investigated in this RFI and will not be considered in the BLRA.

Domestic use of shallow groundwater does not currently occur at FTSW. Based on the hydrogeological information detailed in SAIC, 1999, MC in shallow groundwater is not likely to migrate to the deeper aquifer that is used as a water supply for FTSW; therefore, potential exposures via deeper groundwater are not considered as part of the BLRA.

Potential human receptors that may occur outside of the boundaries of FTSW are also not considered in the HHRA.

Ecological Receptors

Most of the Anti-Aircraft Range 90-mm – 2 MRS is enclosed by a fence, relatively flat, and covered with maintained grass and buildings. Sediment and intermittent, standing water exists in the drainage ditch located within the Anti-Aircraft Range 90-mm – 2 MRS.

The presence of MC at the Hero Road Trench MRS was expected to be located 2 to 10 feet below the surface in potential burial pits. The MRS lies within the cantonment area and is surrounded by a fence. The MRS consists of dense young forest and substantial undergrowth.

For ecological receptors, surface soil, sediment, and surface water samples were evaluated in the SLERA (see Section 6.3). Subsurface soil is of lower concern for ecological receptors, and thus was not evaluated.

Table 6-1. Summary of Potential Receptors and Exposure Routes

MRS	Media	MC	Potentially Exposed Receptors	Potential Exposure Routes
Anti-Aircraft Range 90-mm – 2	Surface Soil	Select metals (Al, Cu, Pb, Zn) and explosives	Outdoor workers and trespassers Biota (e.g., birds, mammals, soil invertebrates, reptiles)	Incidental ingestion, dermal contact, and inhalation of particulates Ingestion, dermal contact
	Surface/ Subsurface Soil	Select metals (Al, Cu, Pb, Zn) and explosives	Future construction workers and future residents	Incidental ingestion, dermal contact, inhalation of particulates
	Sediment/ Surface Water	Select metals (Al, Cu, Pb, Zn) and explosives	Outdoor workers, trespassers, future construction workers, and future residents Biota (e.g., birds, mammals, soil invertebrates, reptiles)	Ingestion, dermal contact Ingestion, dermal contact
Hero Road Trench Area	Surface Soil	Arsenic and organosulfur residues (1,4-dithiane; 1,4-oxathiane; and thiodiglycol)	Outdoor workers and trespassers Biota (e.g., birds, mammals, soil invertebrates, reptiles)	Incidental ingestion, dermal contact, and inhalation of particulates Ingestion, dermal contact
	Surface/ Subsurface Soil	Arsenic and organosulfur residues (1,4-dithiane; 1,4-oxathiane; and thiodiglycol)	Future construction workers and future residents	Incidental ingestion, dermal contact, inhalation of particulates

6.2 Human Health Risk Assessment

The HHRA for the Anti-Aircraft Range 90-mm – 2 MRS and Hero Road Trench Area MRS included the following key steps:

1. Screening against risk-based screening levels and soil background to identify COPCs
2. Exposure assessment, including characterizing the site setting and identifying current and potential future human receptors and exposure pathways (as was done in the development of the CSMs), along with calculating exposure point concentrations, and estimating the potential intake of COPCs
3. Identify toxicity information for each COPC
4. Characterize site-specific risks
5. Discuss uncertainties associated with the HHRA

6.2.1 Screening to Identify Chemicals of Potential Concern

Site-specific COPCs are the chemicals detected during the field investigation that warrant evaluation in the quantitative HHRA. The screening process selects COPCs based on comparison of site-related chemicals to conservative risk-based screening criteria and to background concentrations of metals in soil. FTSW-wide soil background data and statistics that were developed as part of a 16 SWMU RFI (SAIC, 1999) were used, along with the additional background soil samples analyzed during this investigation for aluminum, copper, lead, and zinc (Table F-1, Appendix F). The background values were calculated as outlined in the Work Plan, which is consistent with GAEPD guidance (GAEPD, 1996) and USEPA RAGS guidance (USEPA, 2001a).

The screening process for surface soil, subsurface soil, and sediment followed these steps:

1. Comparison to Health Risk-Based Screening Levels: Risk-based screening criteria are tabulated in the USEPA RSL table (USEPA, 2014b) for both residential and industrial exposure scenarios. The maximum detected concentration of a chemical in soil was compared to its generic USEPA RSL, protective to an incremental cancer risk level of $1x10^{-6}$ (for carcinogens) or a non-cancer hazard quotient level of 0.1 (that is, the published RSL is adjusted down by 10 if it is based on a non-cancer effect). For both the Anti-Aircraft Range 90-mm – 2 MRS and the Hero Road Trench Area MRS, maximum detected concentrations were screened against the residential soil RSLs, while the industrial soil RSLs are also displayed based on the current use of the Anti-Aircraft Range 90-mm – 2 MRS. These published, generic RSLs are based on potential exposures via the dermal, ingestion, and inhalation routes. Only chemicals with concentrations in soil that exceed the RSLs were retained as COPCs. Sediment results were also compared to the soil RSLs, because there are no published screening levels based on human contact with sediment.
2. Comparison to Background Soil Concentrations: Inorganic constituents in soil were eliminated as COPCs for the HHRA if the maximum detected concentration was less than two times the average site-specific background concentration. Sediment results were also compared to soil background. There are two sources of soil background data used in this HHRA: surface soil and subsurface soil background previously established (SAIC, 1999) and background data collected as part of this investigation.

The screening of COPCs is consistent with both GAEPD (GAEPD, 1996) and USEPA guidance (USEPA, 2001a).

Tables F-2 through F-5 of Appendix F summarize the detected constituents in soil and the screening criteria used to select or eliminate a COPC for the HHRA, along with the frequency of detection, and the minimum and maximum detected concentrations. The results of the COPC screening for the HHRA are presented in the following subsections.

6.2.1.1 Anti-Aircraft Range 90-mm – 2 MRS

Surface Soil

Aluminum was detected in all surface soil samples collected from the Anti-Aircraft Range 90-mm – 2 MRS (11 samples, including 1 duplicate). Concentrations in 2 samples were detected at levels greater than the residential soil RSL (7,700 mg/kg), but less than the industrial RSL (110,000 mg/kg). One sample, which is also the maximum detected concentration (10,900 mg/kg), was detected at a concentration greater than, but of a similar order of magnitude to, background (10,273 mg/kg).

Copper was detected in 10 of the 11 samples collected, but no concentrations are greater than either the residential or industrial RSLs. The maximum detected concentration (4.6 mg/kg) is greater than background (3.1 mg/kg).

Lead and zinc were detected in all 11 samples, but no concentrations are greater than either the residential or industrial RSLs. No detected concentrations are above background.

No explosives were detected in any of the surface soil samples.

For surface soil, only aluminum is greater than its residential soil RSL; however, the maximum detected concentration is similar to the site-specific background concentration. Therefore, there are no COPCs selected in surface soil at the Anti-Aircraft Range 90-mm – 2 MRS for the HHRA.

Surface soil results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-2 of Appendix F.

Subsurface Soil

Aluminum was detected in all subsurface soil samples collected from the Anti-Aircraft Range 90-mm – 2 MRS (11 samples, including 1 duplicate). Concentrations in 6 samples were detected at levels greater than the residential soil RSL (7,700 mg/L), but less than the industrial RSL (110,000 mg/kg). Aluminum was detected in 4 samples at a concentration greater than, but of a similar order of magnitude to, background (10,273 mg/kg).

Copper was detected in 2 of the 11 samples collected, but no concentrations are greater than either the residential or industrial RSLs. The maximum detected concentration (8.8 mg/kg) is greater than background (3.1 mg/kg).

Lead and zinc were detected in all 11 samples, but no concentrations are greater than either the residential or industrial RSLs or background.

No explosives were detected in any of the 11 samples.

For subsurface soil, only aluminum is detected at levels greater than both the residential soil RSLs and the site-specific background, although it is not greater than the industrial soil RSLs that are more appropriate for this MRS. Therefore, aluminum is selected as a COPC for the HHRA in subsurface soil for the Anti-Aircraft Range 90-mm – 2 MRS, and will be evaluated for future construction workers and future residents in the following sections of the HHRA.

Subsurface soil results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-3 of Appendix F.

Sediment

Aluminum was detected in all sediment samples collected from the Anti-Aircraft Range 90-mm – 2 MRS (2 samples), but no concentrations are greater than either the residential or industrial RSLs or background.

Copper was detected in one of the 2 samples collected, but not at a concentration greater than either the residential or industrial RSLs or background.

Lead and zinc were detected in all samples, but no concentrations are greater than either the residential or industrial RSLs or background.

No explosives were detected in either of the 2 samples.

In sediment from the ditch within of the Anti-Aircraft Range 90-mm – 2 MRS, no sample results are greater than residential or industrial soil RSLs, or site-specific soil background concentrations; therefore, there are no selected COPCs in sediment for the HHRA.

Sediment results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-6 of Appendix F.

6.2.1.2 Hero Road Trench Area MRS

Surface Soil

Arsenic was detected in 17 of the 35 surface soil samples collected and the maximum concentration detected was 1.2 mg/kg. All detects are greater than the residential RSL (0.67 mg/kg), but less than the industrial RSL (3 mg/kg). No sample results are greater than background (2.1 mg/kg).

There were no detected concentrations of 1,4-oxithiane, 1,4-dithiane, or thiodiglycol.

Although arsenic was detected in surface soil at levels greater than the residential soil RSL, all sample results are less than the site-specific background concentration. Therefore, there are no COPCs selected in surface soil at the Hero Road Trench Area MRS for the HHRA.

Surface soil results for the Hero Road Trench Area MRS and comparison values are presented in Table F-4 of Appendix F.

Subsurface Soil

Arsenic was detected in 5 of the 33 subsurface soil samples collected and the maximum concentration detected was 1.1 mg/kg. All detects are greater than the residential RSL (0.67 mg/kg), but less than the industrial RSL (3 mg/kg). No sample results are greater than background (2.1 mg/kg).

There were no detected concentrations of 1,4-oxithiane, 1,4-dithiane, or thiodiglycol.

Although arsenic was detected in subsurface soil at concentrations greater than its residential soil RSL, all sample results are less than the site-specific background concentration. Therefore, there are no COPCs selected in subsurface soil at the Hero Road Trench Area MRS for the HHRA.

Subsurface soil results for the Hero Road Trench Area MRS and comparison values are presented in Table F-5 of Appendix F.

6.2.1.3 Comparison of Soil Concentrations to Soil-to-Groundwater SSLs

In addition to the screening against risk-based soil RSLs and soil background levels, chemicals detected in soil were compared to the generic USEPA SSLs for Protection of Groundwater (USEPA, 2014b)[1], also shown in Tables F-2 through F-5 of Appendix F. At the Anti-Aircraft Range 90-mm – 2 MRS, only aluminum in subsurface soil, at a detected concentration of 30,200 mg/kg, is greater than its corresponding generic USEPA SSL for the Protection of Groundwater (23,000 mg/kg) in one sample out of 11; however, this maximum detected value is within the same order of magnitude as the SSL, and due to the relatively large allowable concentration of aluminum in soil (USEPA, 2014b), aluminum is not generally considered a contaminant of great concern for leaching to groundwater.

At the Hero Road Trench Area MRS, arsenic is detected at a concentration greater than its corresponding generic USPEA SSL for the Protection of Groundwater (0.29 mg/L); however, as noted above, all detects of arsenic at this MRS are below background levels.

It should be noted that the Soil-Groundwater SSLs are very conservative as they were designed for initial screening of contaminants only. Thus, the equations used are based on conservative, simplifying assumptions about the release and transport of contaminants in the subsurface, and are based on protective risk-based ground water concentrations or maximum contaminant levels (MCLs).

All other metals analyzed were detected in concentrations less than Protection of Groundwater SSLs; therefore, it is not expected that leaching of these metals to groundwater will occur. Based on these results, no groundwater was sampled for either MRS.

6.2.1.4 Summary of Selected COPCs for the HHRA

Because no COPCs were selected in surface soil or sediment at the Anti-Aircraft Range 90-mm – 2 MRS, and only aluminum was selected as a COPC in subsurface soil at that MRS, the following sections focus on the assessment of the combined aluminum surface/subsurface soil data set for the future construction worker and future resident receptors, although all potential receptors are discussed.

No COPCs were selected in surface or subsurface soil at the Hero Road Trench Area MRS; therefore, no further evaluation of this MRS is necessary in the HHRA.

6.2.2 Exposure Assessment

Future human receptors for the Anti-Aircraft Range 90-mm – 2 MRS combined surface soil and subsurface soil include future construction workers and future residents.

Future land use is expected to remain the same as current land use for the Anti-Aircraft Range 90-mm – 2 MRS, although construction or excavation could take place, potentially exposing construction workers to subsurface soil. In addition, based on GAEPD guidance, a future residential receptor was also evaluated.

[1] Although it is preferable to use site-specific parameters, these site-specific soil characteristics have not been measured at Fort Stewart, as described in Section 6.1.1.

Reasonable maximum exposure (RME) risk estimates were calculated in this HHRA. The RME scenario is defined as the maximum exposure that is reasonably expected to occur (USEPA, 1989b), and exposure parameters are chosen with the understanding that the combination of variables for a given pathway would result in an estimate of the RME for that pathway. Average or central tendency exposure scenarios were not evaluated in this HHRA.

6.2.2.1 Exposure Routes and Exposure Assumptions

The potentially exposed receptors and exposure routes for the Anti-Aircraft Range 90-mm – 2 MRS are outlined below. The exposure factors used to estimate exposures are summarized in Tables F-8 through F-12 of Appendix F.

Surface Soil

Under current land use, outdoor workers and trespassers could be exposed to surface soil. Relevant exposure pathways to surface soil include incidental ingestion, dermal contact, and inhalation of particulates, although current vegetative cover is likely to reduce dust emissions to low levels. However, since no COPCs were selected in surface soil at the Anti-Aircraft Range 90-mm – 2 MRS for the HHRA, current surface soil exposures were not evaluated.

Surface and Subsurface Soil

Under future land use, construction workers could be exposed to soil both on the surface and soil that is currently at depth when digging foundations or servicing utilities. In addition, future residents could be exposed to this mixed surface/subsurface soil once the subsurface soil has been moved to the surface. Relevant exposure pathways include incidental ingestion, dermal contact, and inhalation of particulates.

USEPA (1996b and 2002) guidance does not recommend estimating intakes (i.e., mg/kg-day) for the air inhalation pathway. Rather, risks and hazards are determined by comparing estimated particulate air concentrations (calculated as described in the following subsection), adjusted for exposure frequencies/durations/time, with inhalation toxicity values. Chronic inhalation toxicity factors developed by USEPA assume continuous (i.e., daily, 24-hour exposure) long-term exposure. Therefore, it is necessary to adjust for the fraction of time breathing contaminated air for daily exposures less than 24 hours, using the Exposure Time (ET) factor; it is assumed that construction workers and residents could be exposed for 8 of 24 hours per day.

Tables F-8 through F-12 of Appendix F summarize the exposure factors for the HHRA. It should be noted that because no COPCs were selected in surface soil, Tables F-8 and F-10, which list exposure factors for current outdoor workers and current trespassers potentially exposed to surface soil, were not applied in the HHRA.

6.2.2.2 Quantification of Exposure

The exposure point concentration (EPC) is a conservative estimate of the average concentration of a COPC, calculated from the analytical results of every sample for a particular environmental medium to which a receptor may be exposed. The upper confidence limit (UCL) on the mean was estimated for each COPC in soil and subsurface soil. USEPA ProUCL statistical software (USEPA, 2011b) was used to calculate 95% UCLs of the mean of datasets with non-detects, and perform other statistical analyses on every dataset (including those with non-detects). The UCL or maximum detected concentration, whichever is smaller, was selected as the EPC.

The EPC for the combined surface/subsurface soil aluminum data set is: 9,103 mg/kg.

Per USEPA (1996a and 2002), EPCs for COPCs in airborne fugitive dust should be based on soil EPCs and were estimated using the following equation:

$$C_{air} = \frac{C_{soil}}{PEF}$$

Where:

C_{air} = COPC concentration in air at the exposure point (mg/m^3)
C_{soil} = COPC exposure-point concentration soil (mg/kg)
PEF = Particulate emission factor (m^3/kg)

The PEF relates the concentration of the soil COPC to the concentration of dust particles in the air. This calculation addresses dust generated from open sources, which is termed "fugitive" because it is not discharged into the atmosphere in a confined flow. The USEPA's default PEF of 4.63E+09 m^3/kg was used for the determination of the COPC concentration in air.

The equations used to estimate risks for future construction workers and future residents were as follows:

Incidental Ingestion of Soil

CDI = (CS x IR x FI x EF x ED x CF) / (BW x AT-NC or AT-C)

where:
CDI=Chronic Daily Intake (mg/kg-day)
CS=Chemical Concentration in Soil (mg/kg)
IR=Incidental Soil Ingestion Rate (mg/day)
FI=Fraction Ingested from Site (unitless)
EF=Exposure Frequency (days/year)
ED=Exposure Duration (years)
BW=Body Weight (kg)
AT-NC=Averaging Time – Noncancer (days)
AT-C=Averaging Time – Cancer (days)
CF=Conversion Factor (kg/mg)

Dermal Contact with Soil

CDI = (CS x SA x AF x DA x EF x ED x CF) / (BW x AT-NC or AT-C)

where:
CDI=Chronic Daily Intake (mg/kg-day)
CS=Chemical Concentration in Soil (mg/kg)
SA=Surface Area for Contact (cm^2/event)
AF=Adherence Factor (mg/cm^2)
DA=Dermal Absorption Fraction (unitless)
EF=Exposure Frequency (days/year)
ED=Exposure Duration (years)
BW=Body Weight (kg)
AT-NC=Averaging Time – Noncancer (days)
AT-C=Averaging Time – Cancer (days)

CF=Conversion Factor (kg/mg)

Inhalation of Particulates

Estimated Air Exposure Concentration (mg/m^3) = (CA x ET X EF x ED)/(AT)

where:

CA=Chemical Concentration in Air (mg/m^3)
ET=Exposure Time (unitless)
EF=Exposure Frequency (days/year)
ED=Exposure Duration (years)
BW=Body Weight (kg)
AT-NC=Averaging Time – Noncancer (days)
AT-C=Averaging Time – Cancer (days)

The exposure factors applied are listed for future construction workers in Table F-9 and for future residents in Table F-11 of Appendix F.

6.2.3 Toxicity Assessment

Reference doses (RfDs) and reference concentrations (RfCs) were obtained from the following hierarchy of primary sources, as specified by USEPA guidance:

- USEPA's Integrated Risk Information System (IRIS) (on-line) (USEPA, 2012a);
- USEPA's Provisional Peer Reviewed Toxicity Values (PPRTVs);
- Agency for Toxic Substances and Disease Registry's (ATSDR) Minimal Risk Levels (MRLs); and
- Other sources, as necessary.

Dermal reference doses may be different from oral values (USEPA, 2004b), and may be adjusted for oral absorption efficiency. In this HHRA, aluminum was a COPC, and was assumed to have an oral absorption efficiency of 100%, so that the oral reference dose was used without adjustment for the dermal pathway.

For the inhalation of particulates pathway, the inhalation chronic toxicity factors derived by USEPA (i.e., inhalation unit risks [IURs] and RfCs) are expressed as air concentrations. USEPA (1996a) recommends direct comparison of measured or modeled air concentrations to inhalation toxicity factors rather than using daily inhalation rates to convert to internal doses (i.e., mg/kg-day).

For aluminum, the oral RfD is 1.0E+00 mg/kg-day (value also used for the dermal exposure pathway), while the inhalation RfC is 5.0E-03 mg/m^3. These toxicity values are not published in the USEPA's IRIS (USEPA, 2012a), but are available as PPRTV (USEPA, 2006a).

6.2.4 Risk Characterization

The risk characterization step integrates the toxicity and exposure assessment outputs into quantitative estimates of risk. There are no carcinogens selected as COPCs, so this discussion focuses only on the calculation of non-carcinogenic hazard (as represented by the Hazard

Quotient [HQ]) posed by a chemical to a receptor. The non-cancer hazard quotient is calculated for aluminum, the only COPC, as follows:

$$HQ = CDI/RfD$$

Where:

- HQ is the non-cancer hazard quotient posed by the chemical through the pathway
- CDI is the intake of the chemical through the pathway
- RfD is the reference dose for the chemical by that pathway

The estimated total hazards were compared to established risk management criteria for non-carcinogens, using an HI of 1 to evaluate exceedance of acceptable total non-carcinogenic hazards for each receptor.

Tables F-13, F-14, and F-15 in Appendix F present the non-cancer hazard calculations for future construction workers, future adult residents, and future child residents for the COPC (aluminum) identified in soil at the Anti-Aircraft Range 90-mm – 2 MRS. Table F-16 of Appendix F presents a summary of the calculated RME HQs for this COPC. All HQs are less than 1, indicating that non-cancer hazards would not occur due to soil exposure under these theoretical future scenarios.

6.2.5 Uncertainty Assessment

This section includes a qualitative discussion of the uncertainties associated with the estimation of human health risks in this HHRA. All risk assessments involve the use of assumptions, judgments, and imperfect data to varying degrees, resulting in uncertainties in the final estimates of risk. These uncertainties are generally associated with each step of the process (data evaluation and identification of COPCs, exposure assessment, toxicity assessment, and risk characterization) (USEPA, 1989b). The parameters used are characteristically conservative and tend to over-estimate potential site-related risks.

Uncertainties associated with the HHRA include:

- Data Evaluation and Identification of COPCs: Representative soil sampling at a site is designed to ensure that a sufficient number of samples have been collected to adequately characterize the site. However, in designing site investigations, one can never be absolutely certain whether these samples truly represent the soil constituents at the site. Data validation conclusions, such as assigning a "J" (estimated) qualifier to a result, also add uncertainty to the data results. In addition, the reporting of detected concentrations below the reporting limit adds uncertainty to the risk assessments.
- Exposure Assessment: Generally, the selection of conservative exposure assumptions used in the HHRA, in particular, for the RME scenario, may result in over-estimates of risk.
- Toxicity Assessment: The use of toxicity values that have not been carried through EPA's IRIS evaluation adds uncertainty to the RA. For example, the toxicity value for aluminum, although provided by the USEPA's PPRTV program, has not been carried through the same peer-review process as values that are published in IRIS. Published toxicity values are based on all available data, however, there is uncertainty associated

with the selection of the toxic effect level and the application of uncertainty factors to that effect level.

- Risk Characterization: The potential for interactions between multiple chemicals has not been evaluated. The presentation of the RME scenario in this HHRA provides an upper-bound risk estimate; without the presentation of an average or central tendency scenario, average risks associated with site constituents cannot be evaluated.

6.3 Screening Level Ecological Risk Assessment

Although the Anti-Aircraft Range 90-mm – 2 MRS is not a maintained ecological habitat, a SLERA was conducted, in which constituents in surface soil, and sediment and surface water from a drainage ditch within the Anti-Aircraft Range – 90 mm MRS – 2, were screened against appropriate ecological benchmarks. The Hero Road Trench Area MRS consists of dense young forest and substantial undergrowth, but does not provide critical ecological habitat. Subsurface soil was not considered for ecological receptors. If constituents exceed ecological screening levels, a qualitative discussion of the potential ecological effects is presented, based on the relatively low ecological value of the MRSs.

In performing the SLERA, the GAEPD 1996 guidance was applied, following the five steps outlined in that guidance defined as a Preliminary Risk Evaluation (PRE):

1. Ecological screening value comparison
2. Preliminary problem formulation
3. Preliminary ecological effects evaluation
4. Preliminary exposure assessment
5. Preliminary risk characterization

These five steps are equivalent to a screening-level risk assessment, Steps 1 and 2 of the eight-step ecological risk assessment process outlined by U.S. EPA in the *Ecological Risk Assessment Guidance for Superfund (ERAGS): Process for Designing and Conducting Ecological Risk Assessments* (USEPA, 1997).

The GAEPD PRE is the initial ecological risk screening assessment at a RCRA facility. The primary purpose of the PRE is to compare concentrations of site-related constituents to ecological screening values and to conduct a preliminary risk characterization. Based on the extent of potential ecological harm, a more detailed ecological exposure assessment and risk characterization may be recommended as a possible next step for one or more ecological receptors.

6.3.1 Ecological Screening Value Comparison

For ecological receptors, surface soil results were evaluated in the SLERA, along with the sediment and surface water results of the samples collected from the drainage ditch within the Anti-Aircraft Range – 90 mm – 2 MRS. Subsurface soil was not evaluated.

Chemicals of potential ecological concern (COPECs) in soil were selected based on comparisons to the following:

1. USEPA Ecological Soil Criteria: the USEPA Region 4 Ecological Screening Values for Soil (USEPA, 2001b)

2. Background: for inorganic metals, the maximum detected concentrations were compared to background (see Section 6.2)

The USEPA Region 4 ecological soil screening levels are based on contaminant levels associated with a low probability of unacceptable risks to ecological receptors, and were developed for use at USEPA Region 4 hazardous waste sites. These numbers are based on conservative endpoints and sensitive ecological effects data. Thus, they represent a preliminary screening of site contaminant levels to determine if there is a need to conduct further investigations.

For sediment and surface water, although the drainage ditch is not an aquatic ecosystem, the analytical results were compared to the following:

1. Sediment: USEPA Region 4 ecological sediment screening values (USEPA, 2001b) and for inorganics, the maximum detected concentrations were compared to background.
2. Surface Water: Georgia In-Stream Water Quality Standards (GAEPD, 2012), if available, at both a water hardness of 50 mg/L $CaCO^3$ and a water hardness of 100 mg/L $CaCO^3$.[2] For one analyte in surface water, aluminum, a Georgia In-Stream Water Quality Standard value was not published. Thus, the EPA National Recommended Water Quality Criteria (NRWQC) aquatic life criterion for aluminum (USEPA, 1988) was used.

Tables F-2, F-4, F-6, and F-7 of Appendix F summarize the detected chemicals in surface soil, sediment, and surface water, and the ecological screening criteria and background comparisons used to select or eliminate a COPEC, along with the frequency of detection, the minimum, and the maximum detected concentrations. Ecological soil screening values are also presented on the subsurface soil summary tables (Tables F-3 and F-5, Appendix F) for reference. The results of the COPEC screening for each MRS are presented in the following subsections.

6.3.1.1 Anti-Aircraft Range 90-mm – 2 MRS

Surface Soil

Aluminum was detected in all surface soil samples collected from the Anti-Aircraft Range 90-mm – 2 MRS (11 samples, including 1 duplicate). One sample result, which is also the maximum detected concentration (10,900 mg/kg), is greater than, but of a similar order of magnitude to, background (10,273 mg/kg). All detected sample concentrations are greater than the USEPA ecological soil screening level (50 mg/kg) for aluminum.

Copper was detected in 10 of the 11 samples collected. The maximum detected concentration (4.6 mg/kg) is greater than background (3.1 mg/kg). All sample concentrations are less than the USEPA ecological soil screening level (40 mg/kg) for copper.

Lead was detected in all 11 samples collected. No detected concentrations are above background. All sample concentrations are less than the USEPA ecological soil screening level (50 mg/kg) for lead.

[2] Surface water hardness was not measured as part of the field program.

Zinc was detected in all 11 samples. No detected concentrations are above background. All sample concentrations are less than the USEPA ecological soil screening level (50 mg/kg) for zinc.

No explosives were detected in any of the 11 samples.

For surface soil, only aluminum was detected in concentrations greater than its USEPA ecological soil screening level, which is set at a very low level of 50 mg/kg. This value is apparently based on the publication of Efroymson et al. (1997)[3] and is likely derived from an assessment of aluminum toxicity to plants. Aluminum toxicity evaluations for fauna have shown much higher effect concentrations (e.g., for micro-organisms, effect level of 600 mg/kg, Efroymson, et al., 1997). In any case, the maximum detected aluminum concentration in soil is similar to the site-specific background soil concentration. Therefore, there are no COPECs selected in surface soil at the Anti-Aircraft Range 90-mm – 2 MRS for the SLERA.

Surface soil results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-2 of Appendix F.

Sediment

Aluminum was detected in both sediment samples collected from the Anti-Aircraft Range 90-mm – 2 MRS, but no sample results are greater than available soil background concentrations. There is no USEPA sediment ecological screening value; all sample results are greater than the ecological soil screening level (50 mg/kg) for aluminum.

Copper was detected in one of the 2 samples collected, but the sample result is not greater than background. The detected sample result is less than the ecological soil screening level (40 mg/kg) and the sediment screening value (18.7 mg/kg) for copper.

Lead was detected in both samples, but no sample results are greater than background soil concentrations. All detected concentrations are less than the ecological soil screening level (50 mg/kg) and the sediment screening value (30.2 mg/kg) for lead.

Zinc was detected in both samples, but no concentrations are greater than background soil concentrations. All detected concentrations are less than the ecological soil screening level (50 mg/kg) and the sediment screening value (124 mg/kg) for zinc.

No explosives were detected in either of the 2 samples.

In sediment samples collected from the drainage ditch within the Anti-Aircraft Range 90-mm – 2 MRS, only aluminum was detected in concentrations greater than its corresponding ecological soil screening level. While there is no published USEPA Region 4 sediment screening value, a sediment no effect concentration of 73,200 mg/kg and a sediment probable effect concentration

[3] Although this soil screening level (50 mg/kg) is published in the USEPA Region IV Ecological Screening Values for Soil table (USEPA, 2001b) and references Efroymson et al., 1997, the Efroymson document lists a soil screening level of 600 mg/kg for aluminum (Efroymson et al., 1997, page 4-2).

of 58,000 mg/kg were published by USEPA (1996c).[4] Moreover, USEPA (2000b) lists chemicals expected to be bioaccumulative when found in sediments, and chemicals that are known to be found in the sediment and in animal tissues at levels associated with toxic effects. Aluminum is not identified as a bioaccumulative chemical in the USEPA (2000b) document. Finally, the detected concentration of aluminum in sediment was not above the site-specific soil background concentration for aluminum; therefore, aluminum is not selected as a COPEC in sediment.

Sediment results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-6 of Appendix F.

Surface Water

For the single surface water sample taken from the drainage ditch within the Anti-Aircraft Range 90-mm – 2 MRS, results were compared to the Georgia In-Stream Water Quality Standards (GAEPD, 2012), which are expressed based on water hardness for copper, lead, and zinc. For aluminum, for which a Georgia In-Stream Water Quality Standard was not published, the EPA National Recommended Water Quality Criteria NRWQC freshwater aquatic life criterion (expressed in terms of total recoverable metal) was used for aluminum (USEPA, 1988). These freshwater aquatic life criteria are applied to the surface water results, although, as it has been noted, the surface water intermittently existing in this drainage ditch does not constitute a viable aquatic habitat.

Aluminum was detected in the surface water sample collected from the drainage ditch within the Anti-Aircraft Range 90-mm – 2 MRS at a concentration (2.3 mg/L), which is greater than the freshwater criterion value (0.087 mg/L total recoverable metal) for aluminum.

Copper, lead, and zinc exceeded the Georgia In-Stream Water Quality Standards at an assumed water hardness of 50 mg/l $CaCO^3$, but did not exceed the standards at an assumed water hardness of 100 mg/L $CaCO^3$. Since the water hardness of the ditch water was not measured, and since EPA water quality criteria are often listed at a water hardness of 100 mg/L $CaCO^3$, the comparisons to the standards are reported below for both levels of water hardness.

Copper was detected in the surface water sample at an estimated concentration (0.0054 mg/L) slightly greater than the copper freshwater benchmark value, when it is based on a water hardness of 50 mg/L $CaCO^3$ (0.005 mg/L), but not greater than the criterion when it is based on a hardness of 100 mg/L $CaCO^3$ (0.009 mg/L).

Lead was detected in the surface water sample at a concentration (0.0025 mg/L), which is greater than the freshwater benchmark value (0.0012 mg/L) for lead based on a water hardness of 50

[4] The no effect concentration is the representative effect concentration selected from among the high no-effect-concentrations for *Hyalella azteca* and *Chironomus riparius* are presented in USEPA (1996c). It is a concentration above which statistically significant adverse biological effects always occur. Effects may occur below these levels. The probable effect concentration (PEC) is the geometric mean of the 50th percentile in the effects data set and the 85th percentile in the no effects data set. It represents the lower limit of the range of concentrations usually associated with adverse effects. A concentration greater than the PEC is likely to result in adverse effects to these organisms.

mg/L $CaCO^3$, but the same as the criterion based on a water hardness of 100 mg/L $CaCO^3$ (mg/L).

Zinc was detected at a concentration (0.075 mg/L), which is greater than the zinc freshwater benchmark value based on a water hardness of 50 mg/L $CaCO^3$ (0.065 mg/L), but not the freshwater benchmark value based on a water hardness of 100 mg/L $CaCO^3$ (0.116 mg/l).

Aluminum was detected at a concentration higher than the freshwater screening benchmark level. Aluminum is a naturally occurring inorganic element, and, in general, the freshwater aquatic criteria are based on potential exposures and toxicity for the most sensitive freshwater aquatic organisms. Since the drainage ditch is a limited aquatic habitat due to its intermittent nature, surface water in the drainage ditch at the Anti-Aircraft Range 90-mm – 2 MRS is not likely to be of ecological concern. In addition, it is noted that the detected aluminum concentration in surface water (2.3 mg/L) is also similar to the concentration reported for groundwater background (2.4 mg/L).

Surface water results for the Anti-Aircraft Range 90-mm – 2 MRS and comparison values are presented in Table F-7 of Appendix F. The available groundwater background data are also presented in Table F-7, for comparison purposes.

6.3.1.2 Hero Road Trench Area MRS

Surface Soil

Arsenic was detected in 17 of the 35 surface soil samples collected and the maximum concentration detected was 1.2 mg/kg. No sample results are greater than background (2.1 mg/kg). All sample concentrations are less than the ecological soil screening level (10 mg/kg) for arsenic.

There were no detected concentrations of 1,4-oxithiane, 1,4-dithiane, or thiodiglycol.

All soil arsenic results are less than the ecological soil screening level and are less than the site-specific arsenic background level. Therefore, there are no COPECs selected in surface soil at the Hero Road Trench Area MRS for the SLERA.

Surface soil results for the Hero Road Trench Area MRS and comparison values are presented in Table F-4 of Appendix F.

6.3.1.3 Summary of Ecological Screening Value Comparison

Based on the above assessments, there are no COPECs in surface soil, sediment, or surface water at either the Anti-Aircraft Range – 90 mm – 2 MRS or the Hero Road Trench Area MRS. Therefore, the discussions below present the problem formulation, to outline the factors related to this SLERA, but do not quantify ecological risks associated with these media at the two MRSs.

6.3.2 Preliminary Problem Formulation

The problem formulation step summarizes the ecological setting, discusses potential receptors and critical habitats, and discusses potential ecological exposure pathways.

Ecological Setting

Most of the Anti-Aircraft Range – 90 mm – 2 MRS is enclosed by a fence, relatively flat, and covered with maintained grass and buildings. It is an active ASP, with consistent daily human

activity. There are no surface water bodies on the MRS; however, sediment and surface water samples were taken from a drainage ditch that is located within the Anti-Aircraft Range 90-mm – 2 MRS. This is not an aquatic ecosystem, and fish or other aquatic organisms do not occur there. The surface water sample was taken at the north end because it contained standing water; the ditch was otherwise fairly dry at the time of sample collection.

The Hero Road Trench Area MRS lies within the cantonment area and is surrounded by a fence. The MRS consists of dense young forest and substantial undergrowth. This MRS is not currently in use. There are no surface water bodies within this MRS.

At other FTSW sites, numerous mammals and birds, or their signs, were noted by field personnel (SAIC, 1999). These species included: red-headed woodpecker, turkey vulture, deer, coyote, armadillo, and raccoon. Small mammals (e.g., shrews, voles, and mice), birds (e.g., robins, sparrows, and warblers), and mammals that are attracted to or tolerate humans (e.g., raccoons, opossums) are expected to occur in the forests adjacent to the two MRSs, and possibly within the Hero Road Trench Area MRS. Most wildlife species are unlikely to nest or forage at the Anti-Aircraft Range 90-mm – 2 MRS because of the consistent human activity that occurs at that location.

Potential Receptors and Critical Habitats

Potential ecological receptors for soil, and for sediment/surface water in the Anti-Aircraft Range 90-mm – 2 MRS drainage ditch, include terrestrial invertebrates, mammals, and birds. Surrogate species that may represent the generic small mammal and bird receptors are, respectively, the short-tailed shrew and the American robin,[5] consistent with past ecological risk assessments conducted at FTSW (e.g., SAIC, 1999).

There are no aquatic receptors, given the limited surface water habitat in the drainage ditch, and no critical habitats have been identified for either the Anti-Aircraft Range 90-mm – 2 MRS or the Hero Road Trench Area MRS.

Potential Ecological Exposure Pathways

The potential soil, sediment, and surface water exposure pathways for terrestrial organisms include direct contact, such as ingestion or dermal contact, or indirect contact, such as bioaccumulation of contaminants through the food chain.

Preliminary Assessment Endpoint

The preliminary assessment endpoint for surface soil, and sediment and surface water in the Anti-Aircraft Range 90-mm – 2 MRS drainage ditch, is protection of small mammals and birds from adverse effects.

6.3.3 Preliminary Ecological Effects Evaluation

In general, a preliminary ecological effects evaluation would include a discussion of the potential toxicity of the COPECs that are detected in concentrations greater than screening criteria for

[5] The home range of the shrew is small, and robins are territorial during the spring mating season. Earthworms and other soil-dwelling invertebrates can represent a large percentage of both species' diets (SAIC, 1999).

potential ecological receptors. However, since there were no COPECs identified in the screening step (Section 6.3.1), there are unlikely to be levels of contaminants in surface soil, sediment, or surface water that could cause adverse effects for the ecological receptors that may come in contact with these media at either the Anti-Aircraft Range 90-mm – 2 MRS or the Hero Road Trench Area MRS.

6.3.4 Preliminary Exposure Assessment

In general, a preliminary exposure assessment would estimate the nature, extent, and magnitude of potential exposure of receptors to COPECs that are present at or migrating from each MRS. Potential exposure pathways for terrestrial receptors include:

- Ingestion of soil
- Dermal contact with soil
- Uptake of contaminants through the food chain

However, since there were no COPECs identified in the screening step (Section 6.3.1), exposures of concern at either MRS for ecological receptors is unlikely.

6.3.5 Preliminary Risk Characterization

A preliminary risk characterization would be completed only if there were analytes detected at concentrations above screening levels, and thus were selected as COPECs. Since no COPECs were selected in surface soil, sediment, or surface water, a quantitative assessment of hazard is not necessary.

6.4 Risk Assessment Conclusions

6.4.1 Human Health Risk Assessment Conclusions

No COPCs are selected in surface soil or sediment for the Anti-Aircraft Range 90-mm – 2 MRS, and only aluminum is selected as a COPC in subsurface soil at that MRS. All HQs are less than 1 for aluminum (Table F-16, Appendix F), which indicates that non-cancer hazards would not occur due to soil exposure under the theoretical future construction workers, future adult residents, and future child residents scenarios.

At the Anti-Aircraft Range 90-mm – 2 MRS, only aluminum in subsurface soil, at a detected concentration of 30,200 mg/kg is greater than its corresponding generic USEPA SSL for the Protection of Groundwater (23,000 mg/kg) in one sample out of 11; however, this maximum detected value is within the same order of magnitude as the SSL, and due to the relatively large allowable concentration of aluminum in soil (USEPA, 2014b), aluminum is not generally considered a contaminant of great concern for leaching to groundwater.

No COPCs are selected in surface or subsurface soil at the Hero Road Trench Area MRS; therefore, evaluation of this MRS is not necessary in the HHRA. At the Hero Road Trench Area MRS, arsenic was detected at a concentration greater than its corresponding generic USEPA SSL for the Protection of Groundwater; however, all detects of arsenic at this MRS are below background levels.

6.4.2 Screening Level Ecological Risk Assessment Conclusions

No COPECs are identified in the screening step of the SLERA (Section 6.3.1) using comparisons to conservative ecological screening levels and background concentrations for surface soil, sediment, and surface water. Thus, there are unlikely to be levels of contaminants in surface soil, sediment, or surface water that could cause adverse effects for the ecological receptors that may come in contact with these media at either the Anti-Aircraft Range 90-mm – 2 MRS or the Hero Road Trench Area MRS. Further refinement of the SLERA in a more detailed ecological risk assessment (e.g., using receptor-specific exposure parameters) is therefore not necessary.

6.5 MEC Hazard Assessment

The MEC HA methodology was used to assess potential explosive hazards to human receptors at the Anti-Aircraft Range 90-mm – 2 MRS; per the Work Plan (ERT, 2012) a MEC HA was not completed for the Hero Road Trench Area MRS as no explosive hazard exists. MEC HA is the 'explosive hazard' component of a HHRA, intended to evaluate the potential explosive hazard associated with an MRS, given current conditions and under various potential cleanup scenarios, land use activities, and land use control alternatives. The *MEC Hazard Assessment Methodology, Interim* (DoD, 2008), provides the methodology for assessing explosive hazards to human receptors at MRSs.

The results of the MEC HA are used to evaluate potential munitions response alternatives. The risk characterization is used to communicate the magnitude of the risk at the location and the primary causes of that risk, and to aid in the development, evaluation, and selection of appropriate response alternatives. The MEC HA reflects the difference between chronic environmental contaminant exposure risk and acute MEC explosive hazards. If MEC is known or suspected to be present, a munitions response typically will be required. The munitions response may include further investigation, cleanup of MEC through a removal or remedial action, including land use controls (LUCs), or LUCs alone. LUCs may include educational programs and restrictions on land use activities. The MEC HA addresses human health and safety concerns associated with potential exposure to MEC at MRSs.

Appendix I presents the MEC HA scoring for the Anti-Aircraft Range 90-mm – 2 MRS where three MEC items were found in the subsurface during the RFI. The individual score sheets are summarized in Table 6-2 below.

Table 6-2. MEC HA Scores

Activity / Response Alternative	Anti-Aircraft Range 90-mm – 2 MRS	
	Hazard Level	Score
Current Use Activities	4	485
Response Alternative 1: LUCs	4	485
Response Alternative 2: Subsurface Clearance	4	405

The Anti-Aircraft Range 90-mm – 2 MRS score is in the hazard level 4 range for current use activities. The ranges and definitions are shown below.

- Hazard Level 1 represents sites with the highest hazard potential (840 - 1,000)
- Hazard Level 2 represents sites with a high hazard potential (725 - 835)
- Hazard Level 3 represents sites with a moderate hazard potential (530 - 720)
- Hazard Level 4 represents sites with low hazard potential (125 - 525)

In general, the inputs to the MEC HA are very conservative. There may be considerable uncertainty for some of the inputs that drive the hazard levels (e.g., identifying the number of people and contact time [hours per year] associated with an MRS is based on broad estimations). As a result, the MEC HA scoring differs from the "moderate to high" determination discussed in Section 5.2.2, which is based on UXO Estimator software outputs and Department of Defense Explosive Safety Manual (DoD, 20010) guidance; this determination is used by the Army to determine the severity of MEC hazard at an MRS.

All inputs to the MEC HA scoring are contained on the score sheets in Appendix I with explanations and input source.

Munitions Response Site Prioritization Protocol (MRSPP) scores were also prepared and are contained in Appendix H. The MRSPP is a tool used to rank sites for further action. At the RFI stage, the intent is to update the MRSPP ratings from the CS report (Malcolm Pirnie, 2007). Based on the findings of this RFI, the Anti-Aircraft Range 90-mm – 2 MRS was assigned an MRSPP rating of 4 and the Hero Road Trench Area MRS was given a rating of No Known or Suspected Hazard.

7.0 CONTAMINANT FATE AND TRANSPORT FOR MUNITIONS CONSTITUENTS

Based on conclusions from the HHRA and SLERA (Section 6.0), for both MRSs there are:

- No human health risks associated with potential human contact with surface or subsurface soil, surface water, sediments, or groundwater; and,
- No detailed ecological risk assessments were warranted.

Therefore, no contaminant fate and transport analysis for MCs at either MRS is warranted. The subsequent sections provide specific information to support this rationale.

7.1 Soil

Residential soil RSLs were used as screening levels for surface and subsurface soil at the MRSs. The use of these residential RSLs is conservative, particularly for the Anti-Aircraft Range 90-mm – 2 MRS as site use at this MRS is not expected to change to residential in the future. For subsurface soil, only aluminum is detected at levels greater than both the residential soil RSLs and the site-specific background, although it is not greater than the industrial soil RSLs, which are more appropriate for this MRS. Therefore, aluminum was selected as a COPC for the HHRA in subsurface soil for the Anti-Aircraft Range 90-mm – 2 MRS, and was evaluated for future construction workers and future residents (Section 6.2.1). The HHRA concluded that all HQs are less than 1 for this COPC, indicating that non-cancer hazards would not occur due to soil exposure under these theoretical future scenarios.

No COPCs were selected in surface or subsurface soil at the Hero Road Trench Area MRS; therefore, evaluation of this MRS was not necessary in the HHRA.

No explosives compounds were detected in the Anti-Aircraft Range 90-mm – 2 MRS. No degradation products associated with the dilute agent CAIS kits were detected in any of the soil samples collected at the Hero Road Trench Area MRS, except for arsenic, which was detected at levels below background.

No COPECs were identified in the screening step of the SLERA (Section 6.3.1) using comparisons to conservative ecological screening levels and background concentrations for surface soil. Thus, there are unlikely to be levels of contaminants in surface soil that could cause adverse effects for the ecological receptors that may come in contact with these media at either MRS.

7.2 Sediment

Residential soil RSLs for screening of sediment concentrations were used and are extremely conservative, since the likelihood of sediment contact in the Anti-Aircraft Range 90-mm – 2 MRS is low as site use at this MRS is not expected to change to residential in the future and very little sediment exists within the MRS.

Concentrations of select metals detected in sediment samples are below the residential RSLs as well as ecological screening criteria; the ecological screening criteria are detailed in Section 6.3.1.

7.3 Surface Water

Aluminum, copper, lead, and zinc were detected in the only surface water sample collected from the drainage ditch within the Anti-Aircraft Range 90-mm – 2 MRS; however, because water exists at this location only intermittently, potential exposures to contaminants in water at this location are expected to be low for human receptors. To evaluate potential ecological risks, surface water results were compared to the Georgia In-Stream Water Quality Standards (GAEPD, 2012) at two different hardness levels or the USEPA freshwater benchmark for aluminum (USEPA, 1988) , as discussed in Section 6.3.1.1, although, as it has been noted, the surface water intermittently existing in this drainage ditch does not constitute a viable aquatic habitat.

7.4 Groundwater

Groundwater samples were not collected at either MRS. At the Anti-Aircraft Range 90-mm – 2 MRS, only aluminum in subsurface soil, at a detected concentration of 30,200 mg/kg, is greater than its corresponding generic USEPA SSL for the Protection of Groundwater in one sample out of 11; however, this maximum detected value is within the same order of magnitude as the SSL, and due to the relatively large allowable concentration of aluminum in soil (USEPA, 2014b), aluminum is not generally considered a contaminant of great concern for leaching to groundwater.

At the Hero Road Trench Area MRS, arsenic was detected at a concentration greater than its corresponding generic USPEA SSL for the Protection of Groundwater; however, all detects of arsenic at this MRS were below background levels

Domestic use of shallow groundwater does not currently occur at FTSW. Based on the hydrogeological information detailed in SAIC, 1999 and discussed in Section 2.1.6, MC in shallow groundwater is not likely to migrate to the deeper aquifer that is used as a water supply for FTSW.

8.0 SUMMARY OF RESULTS

8.1 Summary

8.1.1 Nature and Extent of Contamination

8.1.1.1 MC

Environmental sampling of soil, surface water, and sediment, for MC, was completed for this RFI. A total of 101 surface and subsurface soil samples were collected and analyzed for select metals and explosives at the Anti-Aircraft Range 90-mm – 2 MRS and degradation products associated with the dilute agent CAIS kits, which include arsenic, 1,4-oxithiane, 1,4-dithiane, and thiodiglycol at the Hero Road Trench Area MRS. No explosives compounds were detected in any sample. Aluminum, copper, lead, and zinc were detected, but only aluminum is detected above residential RSLs and background levels in 8 and 5 samples, respectively, collected from the Anti-Aircraft Range 90-mm – 2 MRS. No metals were detected above ecological screening levels. Arsenic was detected at levels below background at the Hero Road Trench Area MRS and no degradation products associated with dilute agent CAIS kits were detected. Based on the DGM results and the trenching that was conducted at the areas that were most likely to be burial pits, there is no physical evidence that dilute agent CAIS kits were improperly buried at the Hero Road Trench Area MRS.

For the RFI, two sediment samples and one co-located surface water sample were collected from a drainage ditch within the Anti-Aircraft Range 90-mm – 2 MRS and analyzed for select metals and explosives at the request of GAEPD. Aluminum, copper, lead, and zinc were detected in these samples, but none were found in concentrations above residential RSLs or ecological screening levels. No explosives were detected in the sediment or surface water samples.

Section 8.1.2 below discusses the results with regard to whether these findings represent risks posed to human health or the environment.

8.1.1.2 MEC

A comprehensive, statistically based DGM and intrusive investigation of the Anti-Aircraft Range 90-mm – 2 MRS was conducted at FTSW, including approximately 13,630 feet of transects, 24 grids, and 1,199 anomalies intrusively investigated. Three MEC items (40-mm rounds) were found in the subsurface at the Anti-Aircraft Range 90-mm – 2 MRS.

The results of the DGM and intrusive investigations indicate that there is a “moderate to high” probability of encountering MEC within the subsurface of the Anti-Aircraft Range 90-mm – 2 MRS.

8.1.2 Risk Assessment

The HHRA evaluated potential current and future exposure of receptors to site media. This evaluation demonstrated that MC in the surface soil, subsurface soil, sediment, and surface water do not pose a threat to human health.

Aluminum was the only COPC identified for subsurface soil in the Anti-Aircraft Range 90-mm – 2 MRS (Section 6.2.1); however, all HQs for aluminum are less than 1, which indicates that non-cancer hazards would not occur. Arsenic in the Hero Road Trench Area MRS does not pose a threat to human health, as detected concentrations were below background.

At the Anti-Aircraft Range 90-mm – 2 MRS, only aluminum in subsurface soil, at a detected concentration of 30,200 mg/kg, was greater than its corresponding generic USEPA SSL (23,000 mg/kg) for the Protection of Groundwater in one sample out of 11; however, this maximum detected value is within the same order of magnitude as the SSL, and aluminum is not generally considered a contaminant of great concern for leaching to groundwater.

No COPECs were identified in the screening step of the SLERA (Section 6.3.1) using comparisons to conservative ecological screening levels and background concentrations for surface soil, sediment, and surface water. Further refinement of the SLERA in a more detailed ecological risk assessment (e.g., using receptor-specific exposure parameters) was therefore not necessary.

8.1.3 MEC Hazard Assessment

The MEC HA methodology was used to assess potential explosive hazards to human receptors at the Anti-Aircraft Range 90-mm – 2 MRS. The MEC HA scored in the hazard level 4 range. The MRS-4 score is a function of the size and location of the three MEC items that were found during the RFI (40-mm rounds, found in the subsurface). These items were properly disposed of by FTSW EOD (Appendix C-5). Based on the findings of this RFI, the Anti-Aircraft Range 90-mm – 2 MRS was given a MRSPP rating of 4 and the Hero Road Trench Area MRS was given a rating of No Known or Suspected Hazard.

8.2 Conclusions and Recommendations

The nature and extent of MC contamination and MEC hazards have been characterized, as described above. Based on the results of this RFI and the associated human health and ecological risk assessments, there is no release of MC at either the Anti-Aircraft Range 90-mm - 2 MRS or the Hero Road Trench Area MRS. A release of MEC has been found at the Anti-Aircraft Range 90-mm – MRS; this release is associated with a possible subsurface soil explosive hazard risk to humans. Based on the results of this investigation, a Corrective Measures Study is recommended for potential MEC hazards at the Anti-Aircraft Range 90-mm - 2 MRS; no further action is recommended for the Hero Road Trench Area MRS.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

One hour rain delay today for both brush cutter and Surveyor. Brush cutter did transects 62,61,60,59,and 58. Brush is very dense and transects are still not completely clear due to larger trees and over hanging bushs/trees in the transect path. The inner fence boundary was 3/4 completed/brush cut as was requested for safety purposes for quicker access route to egress to gate locations. The complete inner fence boundary could not be completed due to large trees and fenced off area. The lower South area of the Hero Road Trench Area is completely fenced in below the Parking area, there is a single gate access to the area on the west or school side of the area. Brush cutter requested transects be marked better for his cutting and departed the area at 11:47 am. Five more transect lines were marked with tape orange and pink alternating to help identify the individual transect lines. The transect lines are increasing in length as we go east and the brush is getting thicker. An alternate cutting pattern will be discussed in the morning with the brush cutter. The Survey crew has completed putting in transect points today.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Brush cutting commenced this morning; and after 3 hours, ended as the hydraulic pump was malfunctioning on the cutting machine. Charlie left to get the machine repaired, returned five hours later, and continued to cut transects. After two hours of operation a vine caught the hose of the hydraulic line and snapped the line at the joint coupling. Charlie left to get the machine fixed. He will return Tuesday to continue. Transects have been taped/marked for cutting to transect 39 from transect 62. 15 transects are available for EM31 processing. The conex was placed yesterday next to the bike/walking path across from the Balfur Beaty Housing offices by the parking area in the MMRP Hero Road site.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceded to the Hero site. GEO downloaded the van and checked out the EM31. GEO put in flags for marking fiducials and noted transect 57 and 59 need be re-cut. Tyler and I flagged transects 39 to 30. Transects 34 to 30 flagging is partially complete as the terrain and brush limited access. Flagging of transects will continue from 29 tomorrow. Charlie is scheduled for two machines on site tomorrow. Chris Larson of the USACE GEO Baltimore was on site today at about 1550 hrs. A thunderstorm began at 1555 and we had lightning at 1558. A 30 minute wait was established and we called it a day. Ticks are abundant on site and the humidity was very high.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceded to the Hero site. Chris Larson of the USACE GEO Baltimore was on site today for most of the day. Lynelle and Alex assited in flagging today and put in some fiducials as well. Ticks are abundanton site and the humidity was very high. Flagging is down to transect 17 however; heavy brush has kept us from completing transects 34 to 29 as heavy brush needs to be cleared prior to marking some sections of these transects. The fenced in south portion below the parking area has been cut(looks good). Both machines had some mechanical problems, but each machine cut brush for about 7 hours. Notified by the PM that the surveyed transects were installed at 20 foot spacing intervals rather than 15 feet; PM will provide update on revised approach once approved by the Corps.

*significant portions of over half of the transects have been cut but not finished due to heavy brush areas that are left to cut

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceeded to the Hero site. Chris Larson of the USACE GEO Baltimore was on site today for most of the day. Lynelle and Alex ran transects with the EM31. Ticks are abundant on site and the humidity was very high. Flagging for brush cutting of original transects is mostly completed; however, heavy brush has kept us from completing all of the transect marking. No brush cutting occurred on the site today. Transects cleared has been updated from yesterday's reported number (which was the number of transects that were marked with flagging tape rather than cleared transects).

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceeded to the Hero site . Ticks are abundant on site and the humidity was very high. Brush cutting is on hold until Wednesday due to death in the family of the brush cutting contractor. Noted which original transects still need to be complete. EM31 data was collected today. In addition, the Anti-Aircraft Range MRS boundary and expected IVS location was marked out with white flags for the Georgia811 utilities mapping.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area. A second briefing was held in the ASP parking lot for the survey crew. Lynelle, Shawn, and Alex proceded to the Hero RD site. Tyler and I went to the ASP where we met Craig Brewer. Hero Rd: Lynelle, Shawn, and Alex put in fiducals at the Hero Rd site. Brush cutting occurred today. *Additional portions of transects were cut, but no full transects were completed due to heavy brush areas. Anti-Aircraft Range: Survey put in 60 points, and 15 grids today at the ASP. Survey will complete grid corner and transect spacing and install seed items on Friday.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceeded to the Hero Rd site. Lynelle and Shawn worked the EM31. They collected data from the transects in the fenced area and transects 2 thru 8. Alex and Tyler put in fiducals in transects 2 thru 7 and 9 and 10. Charlie arrived a litttle before noon and cut until 16:30; all brush clearing of the original transects is complete. Dig folks from electric company marked off areas in the ASP today.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceeded to the 90mm site. Geo assembled the GPS and EM61. UXO swept the IVS and flagged the anomalies (82). The Geo party departed the area and the UXO located and dug the anomalies. Geo returned and ran the EM61 and found 7 additional anomalies that were not detected with the schonstadts. Using the EM61 to pinpoint the anomaly, it was determined that the 7 anomalies were brass and aluminum items. The IVS was then totally clear and ISO items were placed, surveyed in and covered. Received verbal approval from David King for IVS.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

Pounds of Non-MEC Scrap Today:		Pounds of Non-MEC Scrap To Date:	5

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0630 in the hotel breakfast area and we proceeded to the 90mm site. Geo assembled the GPS and EM61. Static test conducted and 5 grids collected: 10, 11,12,13, and15. At Hero Road site, Lynelle and shawn completed fiducials for the originial transects. All brush cutting for the additional transects was completed today. Heat was a factor in the work day. Teams had to be monitored closely and multiple breaks used to keep them cool.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Safety Brief was held at 0700 in the hotel breakfast area and we proceded to the 90mm Site/ASP. EM61 GPS unit used to reacquire and flag anomaly positions. Flags installed in Grids 10 -23; reacquisition occurred in Grids 18, 20, 21, and 23.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Began site training for the project at 0615. All personnel received training on the Work Plan, ESS, Health and Safety Plan. Collected all Certs from the intrusive team for the UXOSO. The team truck was picked up from Enterprise. We arrived at the ASP and issued equipment to the team and the gear for the work truck. The team tested instruments in the IVS. We began intrusive operations at 0930.

Stopped intrusive operations at 1540. Lynelle took the EM61 through the IVS at the end of the day. Grids completed for the day G12, G15 and G16. The team worked 7 grids but have a few no contacts that need to be checked with the EM61 before the grids are considered complete. Total targets investigated: 109 for the day.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0700. Went to the ASP and conducted instrument checks. We began intrusive operations in G18. 0830 team found 40mm Bofors in G18. All Installation personnel where contacted by the Safety Officer and EOD came out to pickup the round at 0920 to take it for disposal. Jimmy McGowen came by from DPW to speak with the Safety Officer and the USACE Rep. USACE Rep left the site at 1115. We started work in G24 next to the receiving building for the ASP at 1200. USACE Rep came back to the site so that we could go to the EOD shop and discuss what needs to be done with the MEC items found on the ASP. We spoke with them and following the previously set-up protocol, ERT will notify DPW and the ASP Manager; EOD will be called and due to the safety zone associated with the ASP, they will treat all of our calls as emergency responses. EOD will forward all response logs to USACE. The second 40mm Bofors was found in G19 and EOD came to pickup at 1530. Stopped intrusive operations at 1545. Ended the day at 1600.

Grids completed today: G17,G18, G19, G20, G24. Total targets dug: 166
Grids QC checked with the EM61: G17,G18,G24

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. Went to the ASP and conducted instrument checks. We began intrusive operations in G21. 0745 team found 40mm Bofors in G21. All Installation personnel were contacted by the Safety Officer. The intrusive team also found a 37mm AP projectile in G22 that was deemed MDAS. USACE Rep left the site 1030. We broke for lunch and Wes Rogers asked if I could go purchase a canopy for the team to get out of the sun on the ASP. I went to Walmart to purchase. USACE Rep returned to the site around 1230. EOD arrived on site to remove the 40mm Bofors at 1515. Geophysics recollected 16 short transects as the data quality was deemed poor when processing the data to select targets. Ended the day at 1530.

Grids completed today G21,G23, G22, G03, G07, G06. Total targets dug 150.
Grids QC checked with the EM61:G11,G13,G14,G15

The following grids have been accepted by the Gov per 948 #	
The following grids are ready for Government QA:	
The following grids were accepted today by UXOQCS:	4

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. Went to the ASP and conducted instrument checks. We began intrusive operations in G09. There was a 90mm AP projectile found in grid G09 at 1015; it is deemed MDAS. SUXOS, Safety Officer and USACE Rep went to Hero Road site at lunch in preparation for next week's activities. Had to modify work rest due to the heat. Geo completed reaquistion of targets on the short transects today. Environmental completed 8 random sampling locations at the AAR. Ended the day at 1545.

Grids completed today: G09,G01. Total targets dug 127.

The following grids have been accepted by the Gov per 948 #

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. Went to the ASP and conducted instrument checks. We began intrusive operations in G02. Completed all grids inside the ASP and started digging the long transects. The targets directly behind the bunkers are very hard digging and the only thing being found is rebar. I am having Lynelle pickup a tanker bar at Home Depot and they will dig those targets next week. Geo completed QC checks of 11 grids today. Environmental finished all sampling within the AAR MRS and completed 5 of the background samples. We completed operations at 1545.

Grids completed today G02.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0700. We began operationsat the Hero Road site at 0745. The team began removing all of the flags and the survey tape from the site while we were waiting for the mini-ex to arrive. We got the mini-ex in and checked it out and took pictures for damage purposes. The team began digging the trenches at 0945. All 5 trenches were dug to native soil today. No evidence of dilute agent CAIS kits was found. The trenches in the Landfill are complete. T1 & T2 were dug to 4 feet; T3 & T5 were dug to 5 feet; T6 was dug to 6 feet.

Environmental completed 2 background samples, 5 of the random sampling locations in Hero Road and oversaw trenching activities to determine native soil and when digging of the trenches was complete.

Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. Rebekah and Lynelle went to the Hero Road site to continue with soil sampling and documenting trench soils/anomalies. The UXO team continued to work in the ASP. We are working on completing the transects inside the ASP. We are having the mini-ex moved over to the ASP on Wed morning to dig out the deep targets that are in the hard soil between the bunkers.

Environmental completed the remaining random samples at Hero Road, collected all samples from the trenches, and documented in writing and with photographs trench conditions, soil types, and anomalies causing responses in geophysics work.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. Rebekah and Lynelle went to the Hero Road site to continue with soil sampling. The team continued to work in the ASP. We have completed all of the initial digs in the ASP. We have 19 digs left in the ASP that need to be dug with the mini-ex. We completed digging G04 outside the ASP. We were visited today by a Federal Law Enforcement Officer with the Forestry Service (Thompson) to question what we were doing as the area outside of the ASP fence is overseen by his department. We needed passes for our vehicles. Jimmy McGowan brought me the documents and they will be in the trucks tomorrow.

Environmental collected all 16 of the biased surface soil samples at Hero Road and 3 of the subsurface samples. The subsurface is difficult to auger through and groundwater is below 10 feet bgs.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0645. SUXOS, Geophysisict and 2 UXO personnel went over to the ASP to complete the QC checks of the remaining flags at the ASP. All QC checks were completed. We then removed all remaining flags and stakes from the ASP & removed the IVS. We then went over to the Hero Road Landfill to continue with the sampling. The team completed all removal of the debris from the first few feet from each sample site to make it easier to conduct the hand augering to take the subsamples. Lynelle completed subsurface samples Bias #3, #5, #6 and #8. A portion of the team will be demobbing on Saturday.

The following grids have been accepted by the Gov per 948 #	
The following grids are ready for Government QA:	
The following grids were accepted today by UXOQCS:	0

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0615. Went to the Hero Road Landfill site to continue with the remaining subsurface soil samples to be collected. We had to go on a weather hold this morning for about 45 minutes. We completed 7 of the remaining 9 subsurface samples to be collected.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

GENERAL COMMENTS

(Include any delays in work progress, any possible modifications and/or claims, evaluation of work progress to include progress on critical path, work sequence, work behind schedule, proper staffing of trades and conflicts between trades.) Narrative of what was accomplished this date to include subcontractor activities.

Conducted morning safety brief and operations brief at 0615. Went to the Hero Road Landfill site to continue with the remaining soil samples to be collected. We collected the last 2 subsurface biased soil samples. The IDW (10 gallon drum of decontamination water from soil auger) was left on site at the North end of the site. I notified the container company to pickup the container (confirmation #211000359). The mini-ex will be picked up this afternoon. Lynelle Brode is shipping the last of the samples today. The two rental trucks have been returned to Enterprise. The site has been closed down and all equipment and supplies demobilized from the Installation.

CERTIFICATION

On behalf of ERT, I certify that this report is complete and correct and to the best of my knowledge, all equipment and material used and work performed during this reporting period are in compliance with the contract plans and specifications excepted as noted above.

N/C = no contact
"no find" is a location where the mV value does not change within 2 feet of the flag, meaning there is no detectable metal in the ground.
LIP = Left in place

N/C = no contact
"no find" is a location where the mV value does not change within 2 feet of the flag, meaning there is no detectable metal in the ground.
LIP = Left in place

Subject: Letter about using EOD at ASP
Attachments: message_walker_to_Horton_pg_1_001.jpg; walker_to_horton_pg_2_001.jpg; walker_to_horton_pg_3_001.jpg

Attached is an email message from Laryy Walker at the ASP to higher Belinda Horton about 731st EOD being available to handle UXO/MEC items. Commander Ashley Philben (CPT) has said they would be available for response as needed. I gave a copy to Jimmie Mcgowan at DPW/environmental. Larry Walker is rather serious about not doing demo in the ASP proper if at all possible.

Mrs. Horton,

We will be able to support you. We will not be able to have someone sit out there while they dig just due to manning, but if anything comes up, we would be able to respond immediately. Any questions, please let me know. Thanks!

v/r,

Ashley Philbin

Classification: UNCLASSIFIED
Caveats: FOUO

Good Afternoon-
Please see message below (and attachment) regarding an inspection scheduled for the Fort Stewart Ammunition Supply Point.

There is a possibility that during this inspection the team may locate and/or
recover some discarded military munitions that would require detonation.

Mr. Walker, Chief of Ammunition Supply Point, was told that the contractor is
not supposed to transport the munitions;-- according to their contract, they

are required to detonate on site.

If munitions are discovered, we would like to request that EOD analyze situation and provide additional guidance for disposal/detonation. Our concern
is that the munitions may need to be taken to another site (away from ASP) to
detonate.

Please advise if this support will be available (if needed) and provide a point of contact. Our POC is Mr. Larry Walker, phone 435-8119/435-8112.

v/r-

18. INCIDENT NARRATIVE (INCLUDE ALL SIGNIFICANT DETAILS AND PROBLEMS)

On 241500LJUL2012 Fort Stewart Range Control reported a UXO dug up during construction at the ASP at grid 17R MR 34711 32737. EOD arrived on scene at 241514LJUL2012 and met with Steven Burhans, who was the UXO representative on ground and assumed control of the scene. EOD Team Leader performed a recon of the UXO and, utilizing AEODPS, positively identified the UXO as a MK1 BL&P (40mm) projectile. Due to the proximity of the UXO to infrastructure (BLD 17001 explosives receiving ramp), and inside the ASP, the UXO was remotely moved and placed in a CMC with sand then removed from the scene for Emergency Disposal. EOD Team Leader relinquished the sight back to Mr. Burhans. EOD Team received a follow on call and moved the UXO to a safe disposal area on OP4 at grid 17R MR 4503736944. No further explosive hazards were found. EOD team moved to follow on mission at 251540LJUL2012.

Sample Management

This report contains the results of the analysis of twenty-two (22) solid samples collected on July 31, 2012. Analytical results and quality control information are summarized in this data package.

Qualifier Symbol Definitions:

U = Qualifier indicates that the analyte was not detected above the LOD.
J = Qualifier indicates that the analyte value is between the DL and the LOQ.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds the calibration range.
P = Qualifier indicates that the RPD between the two analytical columns is greater than 40%.
NSC = Qualifier indicates that spike recoveries were not calculated based on the spiking concentration.

Result Symbol Definitions:

DL = The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration at the 99% level of confidence.
LOD = The smallest analyte concentration that must be present in a sample in order to be detected at a high level of confidence.
LOQ = The lowest concentration that produces a quantitative result within specified limits of precision or bias.

Sample Receipt

Samples arrived at ALS via courier on August 1, 2012. Upon receipt, the samples were inspected and compared to the Chain of Custody. Sample temperature was documented on the enclosed Chain of Custody. Samples were received intact and properly preserved, unless noted on the enclosed Certificate of Analysis and/or Chain of Custody.

Subcontracting

Twenty-two (22) samples were subcontracted for Method 8270/8321 analysis. Results are provided at the end of this report.

Totals Metals by SW-846 Method 6020A

Sample handling. Twenty-two (22) solid samples were digested and analyzed for total metals on the Agilent 7700x using SW-846 Method 6020A. The samples were analyzed within the six-month holding time established for this method.

Calibration. All criteria associated with the calibration were within method control limits.

Blanks. Metals were not detected in the blanks.

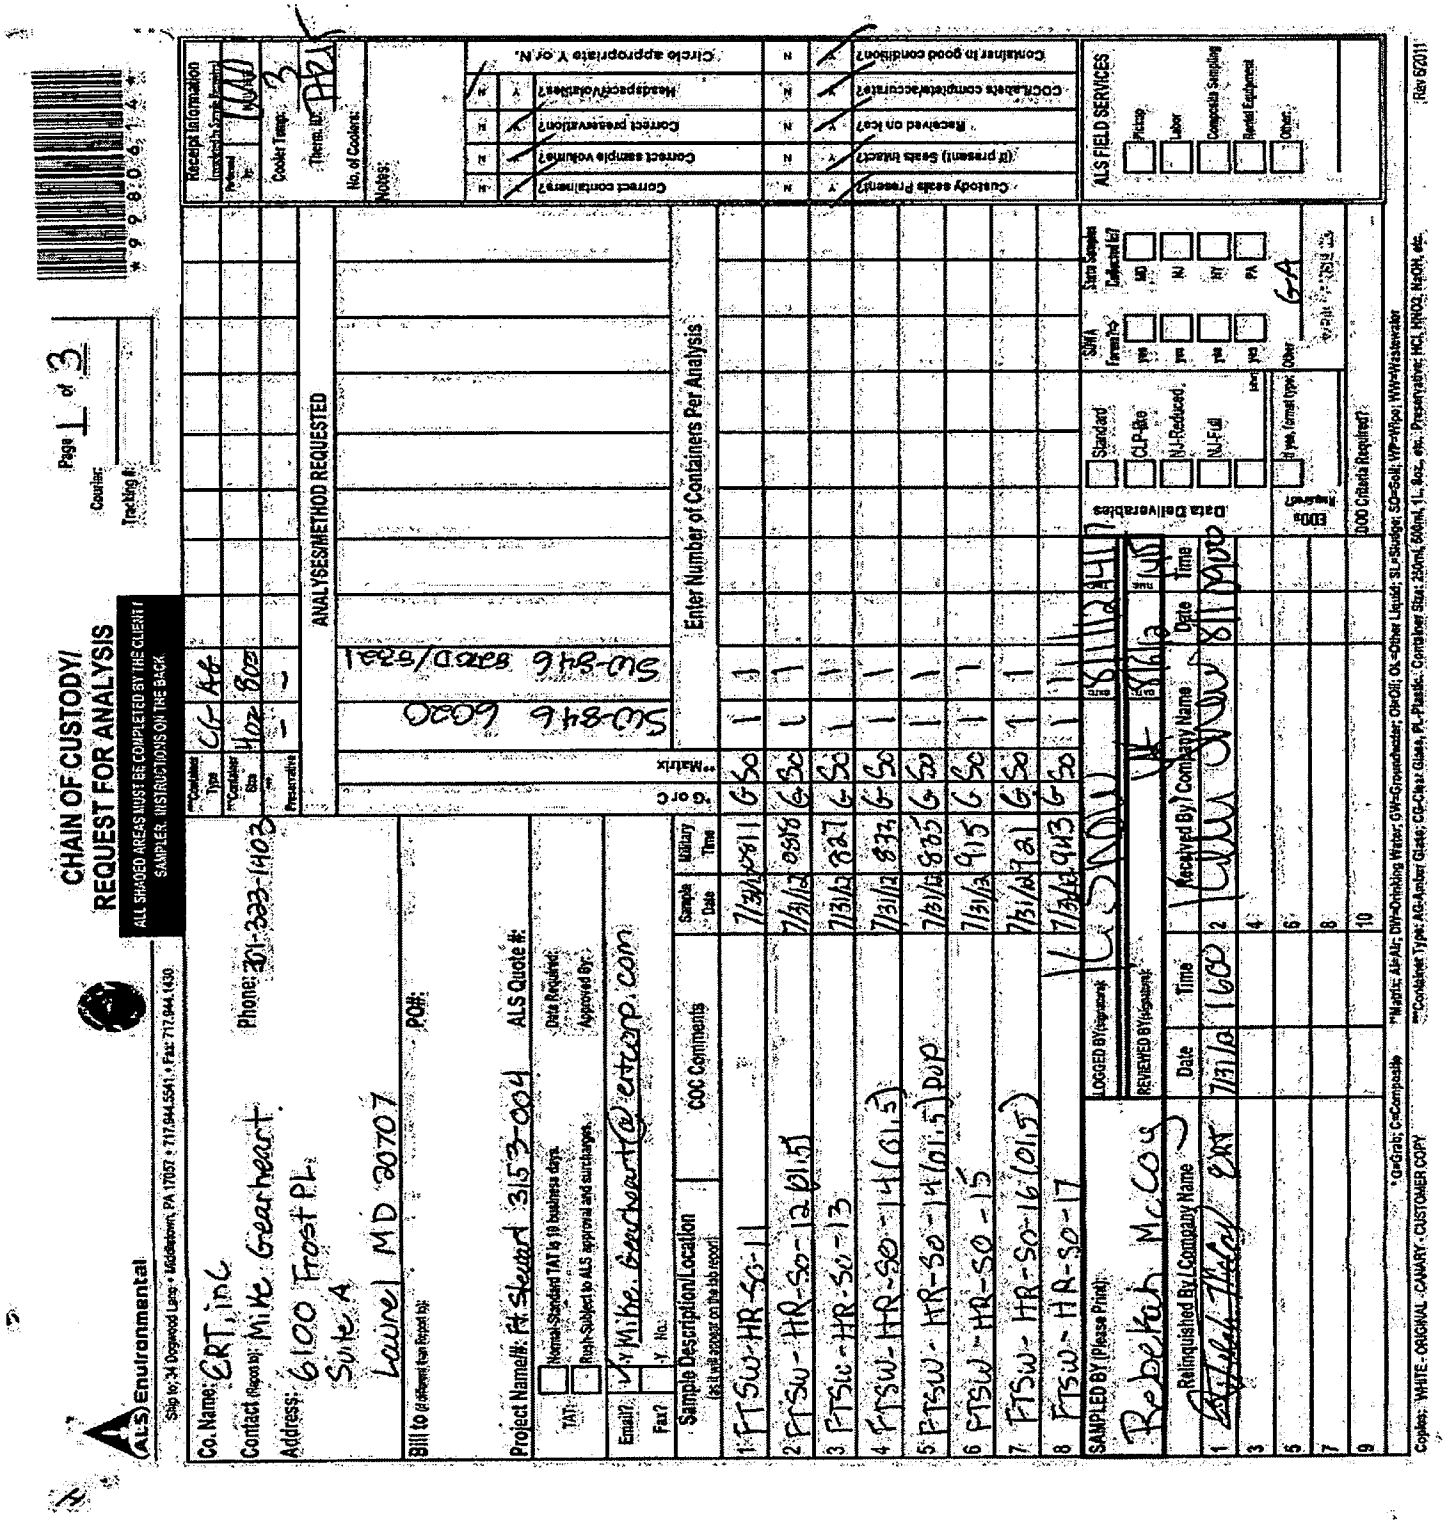
Laboratory Control Samples. Recoveries were within method control limits.

Matrix Spike/Matrix Spike Duplicate. A matrix spike and matrix spike duplicate were performed on sample FTSW-HR-SO-22 (04) (9980614013) in this data deliverable. The MS and MSD recoveries and their RPDs were within method control limits.

Total Solids by SM 2540G

Sample handling. Twenty-two (22) solid samples were analyzed for total solids by Standard Method 2540G for dry weight reporting purposes. The samples were analyzed within the 14-day method recommended hold time for dry weight reporting.

Duplicate. A duplicate analysis, identified as 1018169, was performed on sample 9980614003 (FTSW-HR-SO-13). The relative percent difference between the results was within the QC limit of 5%.



A duplicate analysis, identified as 1018170, was performed on sample 9980614013 (FTSW-HR-SO-22(04)). The relative percent difference between the results was within the QC limit of 5%.

Certificate of Analysis

Project Name:	**Ft. Stewart GA project**	Workorder:	**9980614**
Purchase Order:		Workorder ID:	**ERT004|Ft. Stewart 3153-004**

Dear Mr. Gearhart,

Enclosed are the analytical results for samples received by the laboratory on Wednesday, August 01, 2012.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Vicki Forney (Project Coordinator) or Anna G Milliken (Technical Manager) at (717) 944-5541.

Please visit us at www.analyticallab.com for a listing of ALS' NELAP accreditations and Scope of Work, as well as other links to Water Quality documentation on the internet.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

This page is included as part of the Analytical Report and must be retained as a permanent record thereof.

Anna G Milliken
Technical Manager

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are performed in the laboratory and are therefore analyzed out of hold time.

Standard Acronyms/Flags

J, B	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference

Total Solids Summary Forms

Sample Description
FTSW-HR-SO-13

Form 7
Duplicate Summary

Analysis Method: 2540G
SDG No.: ERT-004

Matrix (soil/water): soil
Units: %
Instrument ID: N/A
GC Column: N/A
Sample % Moisture: N/A

Lab Sample ID: 9980614003
Lab File ID: N/A
Lab Sample Dup. ID: 1018169
Dup. Lab File ID: N/A
Dup. % Moisture: N/A

Analyte	Sample Concentration	Duplicate Concentration	Relative Percent Difference (RPD)	(1)	Acceptable Limit
Total Solids	91.2	91.0	0.3		5%

(1) The following qualifiers are used:
* : Values outside of acceptable limits

Comments:

Comments

Quality Control: SW 8270 - (HBN: 91657)

Outliers in the MS/MSD are attributed to matrix effect. Since recoveries are within limits in the LCS, the method is deemed to be in control for this batch.

Recovery of surrogate 2,4,6-tribromophenol was below QC limits in Sample 1221564011. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit.
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Case Narrative

Method: ALS-LC/MS
Analysis: Agent Breakdown Products
ALS WO ID(s): 1221555

Client: ALS Laboratory Group
Account: 08001
Matrix: Soil
HBN #: 91624

General Set Information: There were 11 field samples in this workorder. The samples were analyzed for thiodiglycol (TDG).

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1200 LC/MSD system in select ion monitoring (SIM) mode at m/z 97, 125, 139, 146, 181, 105 and 113. ChemStation software was used for instrument control and data analysis.

Sample Preparation: Approximately 1.00g of each sample was weighed into a 15-mL centrifuge tube, and 9.9mL of ASTM Type II water was added to each tube. 100µL of internal standard solution was then added to each sample, bringing the total extract volume to 10mL. The samples were capped, vortexed, rotated for at least 30 minutes, and filtered with Phenomenex Phenex 0.45µm PES syringe filters.

Holding Times: Holding times were met for all samples.

Dilutions: No dilutions were necessary.

Method QC data: The method blank criteria were met. The method blank (LMB 289795) was less than 1/2 the RL of 0.5ug/g for all analytes. The recoveries for LCS 289796 were within acceptable parameters.

MS/MSD Analysis: The matrix spike and matrix spike duplicate were performed on parent sample 1221555001. Recoveries and RPDs were within acceptable limits for all analytes.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with established procedures.

NC/CAR(s): None.

Sample Calculation: Samples were reported in µg/g. Results were calculated in µg/g by the equation (A)x(B)x(C)/(D).

where: A = Analyte concentration from the standard curve (µg/mL)
B = Dilution performed at time of analysis
C = Volume of extract (10mL)
D = Actual weight of sample aliquot (g)

Miscellaneous Comments: None.

Thomas T. McKay — August 14, 2012
Date

Case Narrative

Method: ALS-LC/MS
Analysis: Agent Breakdown Products
ALS WO ID(s): 1221555

Client: ALS Laboratory Group
Account: 08001
Matrix: Water
HBN #: 91545

General Set Information: There was one field sample in this workorder. The sample was analyzed for thiodiglycol (TDG).

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1200 LC/MSD system in select ion monitoring (SIM) mode at m/z 97, 125, 139, 146, 181, 105 and 113. ChemStation software was used for instrument control and data analysis.

Sample Preparation: 9.9mL of each sample was transferred into a 15-mL centrifuge tube. 100µL of an internal standard solution was then added to each sample. The samples were capped, vortexed, and filtered with Phenomenex Phenex 0.45µm PES syringe filters.

Holding Times: All samples were analyzed within holding times.

Dilutions: No dilutions were necessary.

Method QC data: The method blank criteria were met. The method blank (LMB 289537) was less than 1/2 the RL of 50ug/L for all analytes. The recovery for LCS 289538 was within acceptable limits.

MS/MSD Analysis: A matrix spike and matrix spike duplicate were performed on parent sample 1221555006. The recovery and RPD were within acceptable parameters.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with established procedures.

NC/CAR(s): None were required for this set.

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B)x(C),

where: A = Analyte concentration from the standard curve (µg/mL)
B = Dilution performed at time of analysis
C = Conversion factor from µg/mL to µg/L (1000)

Miscellaneous Comments: None.

Thomas T. McKay — August 15, 2012
Date

Case Narrative

Method: 8270D
Analysis: Semivolatiles by GC/MS
SOP ref: OE-SW-3550, OE-SW-3510, OS-SW-8270D

Set ID: 1221555
Client: ALS Laboratory Group
Matrix: Soil and Water

General Set Information: There are twelve field samples plus MS/MSD in this reporting group.

Method Summary: This is a GC/MS method for determination of semivolatile organic compounds in soil according to the SW-846 Guidelines. Thirty grams of soil were extracted by sonication and then concentrated to final volume of 1.0 mL. One liter of water is extracted by separatory funnel and then concentrated to a final volume of 1.0 mL. The resulting extract is analyzed using an Agilent model 5975 GC/MS system with an electron impact ionization source and a quadrapole mass-filter detector.

Sample Preparation: All samples were prepared in accordance with method 3550 or 3510.

Holding Times: All preparation and analysis holding times were met for most samples; however, the water sample was extracted two days past the Method-prescribed holding time. The reason for the out-of-hold extraction is that an incorrect spiking solution was used in the original extraction (which was within holding time). A re-extraction was performed as soon as the error was discovered, but it was not possible to initiate this second extraction within the 7-day holding time.

Dilutions: None were needed.

Method and Sample QC data: All target compounds were within recovery limits for the laboratory control sample. The method blank met the acceptance criteria with no target compounds detected above the reporting limit. All sample met pertinent internal standard area criteria. In some instances the latter-eluting internal standard areas were low due to a likely matrix effect, but the requested target analytes do not reference those internal standards. Most surrogate recoveries were within QC limits. In the soil analysis, surrogate terphenyl-d14 was above the QC limits and 2,4,6-tribromophenol below the limit in Sample 1221555010. In the water extraction batch, surrogate terphenyl-d14 had high recovery in three of the samples. This surrogate has a tendency to precipitate out of solution when stored under refrigeration, and it is prone to becoming concentrated in the solution. The old solution has since been discarded and replaced with a fresh one. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits. Of the six surrogates used in Method 8270, the two eluting closest to oxathiane and dithiane are 2-fluorophenol and phenol-d6, both of which were within limits in all samples.

MS/MSD Analysis: Matrix spiking was performed on soil Sample 1221555001 (FTSW-HR-SO-01). There was not enough sample to perform matrix spiking on the water samples. All recoveries were within expected ranges.

Instrument QC: The instrument was tuned with 50 ng DFTPP. A six-point initial calibration curve was analyzed prior to sample analysis. The concentrations of the standards were: 5, 20, 35, 50, 65 and 80 µg/mL. A calibration verification standard at a concentration of 50 ug/mL was analyzed to verify instrument response against the initial calibration. The initial calibration and continuing calibration verification passed all method criteria.

Miscellaneous Comments: None.

Comments

Quality Control: SW 8270 - (HBN: 91368)

Surrogate terphenyl-d14 was above the QC limits and 2,4,6-tribromophenol below the limit in Sample 1221555010. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

Quality Control: SW 8270 - (HBN: 91473)

Surrogate terphenyl-d14 was above the QC limits in some samples. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

Client: ALS Laboratory Group
Project Manager: Kevin W. Griffiths

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier Indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Basis: ALS Laboratory Group	**Batch:** ENVX/15748 (HBN: 91114)	**Batch:** ESVO/3809 (HBN: 91368)
	Prepared By: Dustin Calder	**Analyzed By:** Reed A. Hendricks

Comments

Surrogate terphenyl-d14 was above the QC limits and 2,4,6-tribromophenol below the limit in Sample 1221555010. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

After printing this label:

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com.FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery,misdelivery,or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim.Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental,consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss.Maximum for items of extraordinary value is $500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our ServiceGuide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Analytical Documentation

ALS WO ID #(S):1221555

ALS Sample #(S):1221555001-014

ALS Account #(s). 8001 Method: ALS LC/MS Matrix: Soil

Sequence: \\CHEM:2\1\SEQUENCE\13AUG12-ABB-S.S

Prep Date: 08/06/2012 Analysis Date: 08/13/12 - 08/14/12

Prep/Analysis HBN #s: 91618/91624 Instrument LOD: 0.050µg/mL

Analyte: Thiodiglycol (TDG)

Reported MDL: See Report Reported LOD: See Report

SAMPLE PREPARATION: All ALS sample #'s agreed with field ID #'s. Samples were prepared by TTM. Approximately 1.00g of each sample was weighed into a 15-mL centrifuge tube, and 9.9mL of ASTM Type II water was added to each tube. 100µL of internal standard solution was then added to each sample, bringing the total extraction volume to 10.0mL. The samples were capped, vortexed, rotated for at least 30 minutes, and filtered with Pall 0.45µm Ion Chromatography Acrodiscs prior to analysis.

REAGENTS: Eluent A: 100% ASTM Type II water/0.1% glacial acetic acid.
Eluent B: 95% ACN/ 5% ASTM Type II water/0.1% glacial acetic acid.

HORIZON STANDARD(S): TDG (14169); MPA (14170); IMPA (14172); EMPA (14174); DIMP (14179)
All standards are at 1000µg/mL. Standards used to create calibration standards and those used for CCVs (target = 5.00µg/mL) and RLVS (target = 0.050µg/mL).
Internal Standard Solution: TDG-D8 (14177) at 100ug/mL.

CALIBRATION CURVE: Run 05/01/2012.
Raw data can be found in \\Alsltws013\DataReview\85766.

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1200 LC/MSD system, in positive SIM mode, monitoring m/z 97, 125, 139, 146, 181, 105 and 113.
Instrument ID: LCMS03 Run Time: 35.00 min. Flow Rate: 0.8mL/min Temp: 30°C
Output Gain: 3 Injection Volume: 10µL Fragmentor Voltage: 75 & 125
Column: Phenomenex Synergi Hydro-RP 4 micron (4.6 x 250mm) s/n: 245485-24

GRADIENT:

Time(min)	%Eluent A	%Eluent B
0.00	100.0	0.0
15.00	100.0	0.0
17.00	50.0	50.0
25.00	50.0	50.0
25.01	100.0	0.0

QC DATA: LMB/LCS **289795/96** were run with the batch. 1.00g of washed sand (EMD Lot# 36211706) was prepared in the same manner as the samples. 20µl of Horizon QC standard 13383 was added to 10.0mL of sample preparation for the LCS. Target = 20.0ug/g. ASTM Type II water was used for LMB extraction.

MS/MSD: MS/MSD was performed on sample 1221555001. 50µl of Horizon standard 14169 was added to 10.0mL of sample preparation. Spike target = 50.0µg/g.

COMMENTS: 1) Quantitation was done using m/z 105 for TDG. No confirmation ions were available for TDG. Results are reported in ug/g.
2) All CCV, LMB, LCS and MS/MSD results were within acceptable limits.

SIGMA-ALDRICH

Product Name	2,2'-Thiodiethanol, ≥99%
Product Number	166782
Product Brand	Aldrich
CAS Number	111-48-8
Molecular Formula	$S(CH_2CH_2OH)_2$
Molecular Weight	122.19

TEST	SPECIFICATION	LOT 11613AR RESULTS
APPEARANCE	COLORLESS LIQUID	COLORLESS LIQUID
INFRARED SPECTRUM	CONFORMS TO STRUCTURE.	CONFORMS TO STRUCTURE AND STANDARD AS ILLUSTRATED ON PAGE 276B OF EDITION I, VOLUME 1 OF "THE ALDRICH LIBRARY OF FT-IR SPECTRA".
GAS LIQUID CHROMATOGRAPHY	99.0% (MINIMUM)	99.6 %
QUALITY CONTROL ACCEPTANCE DATE		JANUARY 1997

Calibration Table

Agent Breakdown Products

Calib. Data Modified : 7/9/2012 11:13:05 AM

Calculate : Internal Standard
Based on : Peak Area

Rel. Reference Window : 10.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 10.000 %
Abs. Non-ref. Window : 0.000 min
Use Multiplier & Dilution Factor with ISTDs
Uncalibrated Peaks : not reported
Partial Calibration : No recalibration if peaks missing

Curve Type : Quadratic (some peaks differ, see below)
Origin : Ignored (some peaks differ, see below)
Weight : Linear (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Default Sample ISTD Information (if not set in sample table):

Analytical Documentation

ALS WO ID #(S):1221555; 1221656; 1222142
ALS Sample #(S):1221555006; 1221656017; 1222142012
ALS Account #(s): 8001 Method: ALS LC/MS Matrix: Water
Sequence: \\CHEM32\1\SEQUENCE\13AUG12-ABP.S
Prep Date: 08/13/2012 Analysis Date: 08/13/2012
HBN #: 91545 Instrument LOD: 0.050µg/mL
Analyte: **Thiodiglycol (TDG)**
Reported MDL: See Report Reported LOD: 50µg/L

SAMPLE PREPARATION: All ALS sample #'s agreed with field ID #'s. Samples were prepared by TTM. 9.9mL of each sample was transferred into a 15-mL centrifuge tube. 100µL of an internal standard solution was then added to each sample. The samples were capped, vortexed, and filtered with Phenex 0.45µm PES filters prior to analysis.

REAGENTS: Eluent A: 100% ASTM Type II water/0.1% glacial acetic acid.
Eluent B: 95% ACN/ 5% ASTM Type II water/0.1% glacial acetic acid.

HORIZON STANDARD(S): TDG (14169); MPA (14170); IMPA (14172); EMPA (14174); DIMP (14179)
All standards are at 1000µg/mL. Standards used to create calibration standards and those used for CCVs (target = 5.00µg/mL) and RLVS (target = 0.050µg/mL).
Internal Standard Solution: TDG-D8 (14177) at 100ug/mL.

CALIBRATION CURVE: Run 03/05/2012.
Raw data can be found in \\Alsltws013\DataReview\82050

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1200 LC/MSD system, in positive SIM mode, monitoring m/z 97, 125, 139, 146, 181, 105 and 113.
Instrument ID: LCMS03 Run Time: 35.00 min. Flow Rate: 0.8mL/min Temp: 30°C
Output Gain: 3 Injection Volume: 10µL Fragmentor Voltage: 75 & 125
Column: Phenomenex Synergi Hydro-RP 4 micron (4.6 x 250mm) s/n: 245485-24

GRADIENT:

Time(min)	%Eluent A	%Eluent B
0.00	100.0	0.0
15.00	100.0	0.0
17.00	50.0	50.0
25.00	50.0	50.0
25.01	100.0	0.0

QC DATA: 20µl of Horizon QC standard 13383 were used to spike LCS 289538; target = 2000µg/L. ASTM type II water was used for LMB 289537.

MS/MSD: MS/MSD was performed on sample 1221555006. 50µl of Horizon standard 14169 was added to 10.0mL of sample preparation. Spike target = 5000µg/L.

COMMENTS: 1) Quantitation was done using m/z 105 for TDG. No confirmation ions were available for TDG. Results are reported in ug/L.
2) All CCV, Blank, LCS and MS/MSD results were within acceptable limits.

Stock Standard - TDG QC STK

TDG QC STK					Description - Thiodiglycol QC Stock
Standard:	5844	Expires:	1/1/2025	Usable:	Yes
Lab Lot:	TDG QC STK	Created By:	T. McKay	Amount:	50 grams
Part ID:	88559	Create Date:	10/7/2009	Validated By:	T. Bosch
MFG:	Fluka	MFG Lot:	1410377	Validated Date:	10/7/2009

Pos.	Analyte	Name	Concentration
1	111-48-8	Thiodiglycol	1000 mg/g

5844

Certificate of Analysis

Product Brand	Fluka
PRODUCT-NO	88559
PRODUCT	2,2'-THIODIETHANOL *BioChemika*
FORMULA	$C_4H_{10}O_2S$
MOLECULAR MASS	122.19
CAS NUMBER	111-48-8
LOT	1410377

Test	Specification	Result
APPEARANCE (COLOR)	COLORLESS	COLORLESS
APPEARANCE (FORM)	CLEAR TO CLEAR VISCOUS LIQUID	CLEAR VISCOUS LIQUID
PURITY (GC AREA %)	≥ 99.0 % REL	99.9 % REL
GC (METHOD)	--	100% POLYETHYLENEGLYCOL (30 M X 0.32 MM X 0.25 UM), IN DICHLORMETHANE
REFRACTIVE INDEX N20/D	1.520 - 1.522	1.522
RESIDUE ON IGNITION	≤ 0.1 %	< 0.05 %
CARBON CONTENT	39.32 % (THEORY)	38.90 %
HYDROGEN CONTENT	8.25 % (THEORY)	8.49 %
INFRARED SPECTRUM	CONFORMS TO STRUCTURE	CONFORMS
QC RELEASE DATE	28/OCT/08

Quality Control
Buchs, Switzerland

Sigma-Aldrich guarantees the 'Sales-Specification' values only, additional lot specific tests may be included for further information. The current 'Sales-Specifications' sheet is available on request. For further inquiries, please contact our Technical Service.Sigma-Aldrich warrants, that its products conform to the information contained in this and other Sigma-Aldrich publications. Purchaser must determine the suitability of the product for its particular use. See reverse side of invoice for additional terms and conditions of sale. The values given on the 'Certificate of Analysis' are the results determined at the time of analysis.

Sample Management

This report contains the results of the analysis of one (1) water sample and thirteen (13) solid samples collected on July 30, 2012. Analytical results and quality control information are summarized in this data package.

Qualifier Symbol Definitions:

U = Qualifier indicates that the analyte was not detected above the LOD.
J = Qualifier indicates that the analyte value is between the DL and the LOQ.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds the calibration range.
P = Qualifier indicates that the RPD between the two analytical columns is greater than 40%.
NSC = Qualifier indicates that spike recoveries were not calculated based on the spiking concentration.

Result Symbol Definitions:

DL = The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration at the 99% level of confidence.
LOD = The smallest analyte concentration that must be present in a sample in order to be detected at a high level of confidence.
LOQ = The lowest concentration that produces a quantitative result within specified limits of precision or bias.

Sample Receipt

Samples arrived at ALS via courier on July 31, 2012. Upon receipt, the samples were inspected and compared to the Chain of Custody. Sample temperature was documented on the enclosed Chain of Custody. Samples were received intact and properly preserved, unless noted on the enclosed Certificate of Analysis and/or Chain of Custody.

Subcontracting

Twelve (12) samples were subcontracted for Method 8270 analysis. Results are provided at the end of this report.

Totals Metals by SW-846 Method 6020A

Sample handling. One (1) water samples was analyzed for total metals on the Agilent 7700x using SW-846 Method 6020A. The sample was analyzed within the six-month holding time established for this method.

Calibration. All criteria associated with the calibration were within method control limits.

Blanks. Metals were not detected in the blanks, except as follows:

- In 1017577 arsenic was detected at 0.00108Jmg/L.

Laboratory Control Samples. Recoveries were within method control limits.

Matrix Spike/Matrix Spike Duplicate. A matrix spike and matrix spike were performed on sample FTSW-HR-SO-02 (01.5) ER (9980395006) in this data deliverable. The MS and MSD recoveries and their RPDs were within method control limits.

Totals Metals by SW-846 Method 6020A

Sample handling. Thirteen (13) solid samples were digested and analyzed for total metals on the Agilent 7700x using SW-846 Method 6020A. The samples were analyzed within the six-month holding time established for this method.

Calibration. All criteria associated with the calibration were within method control limits.

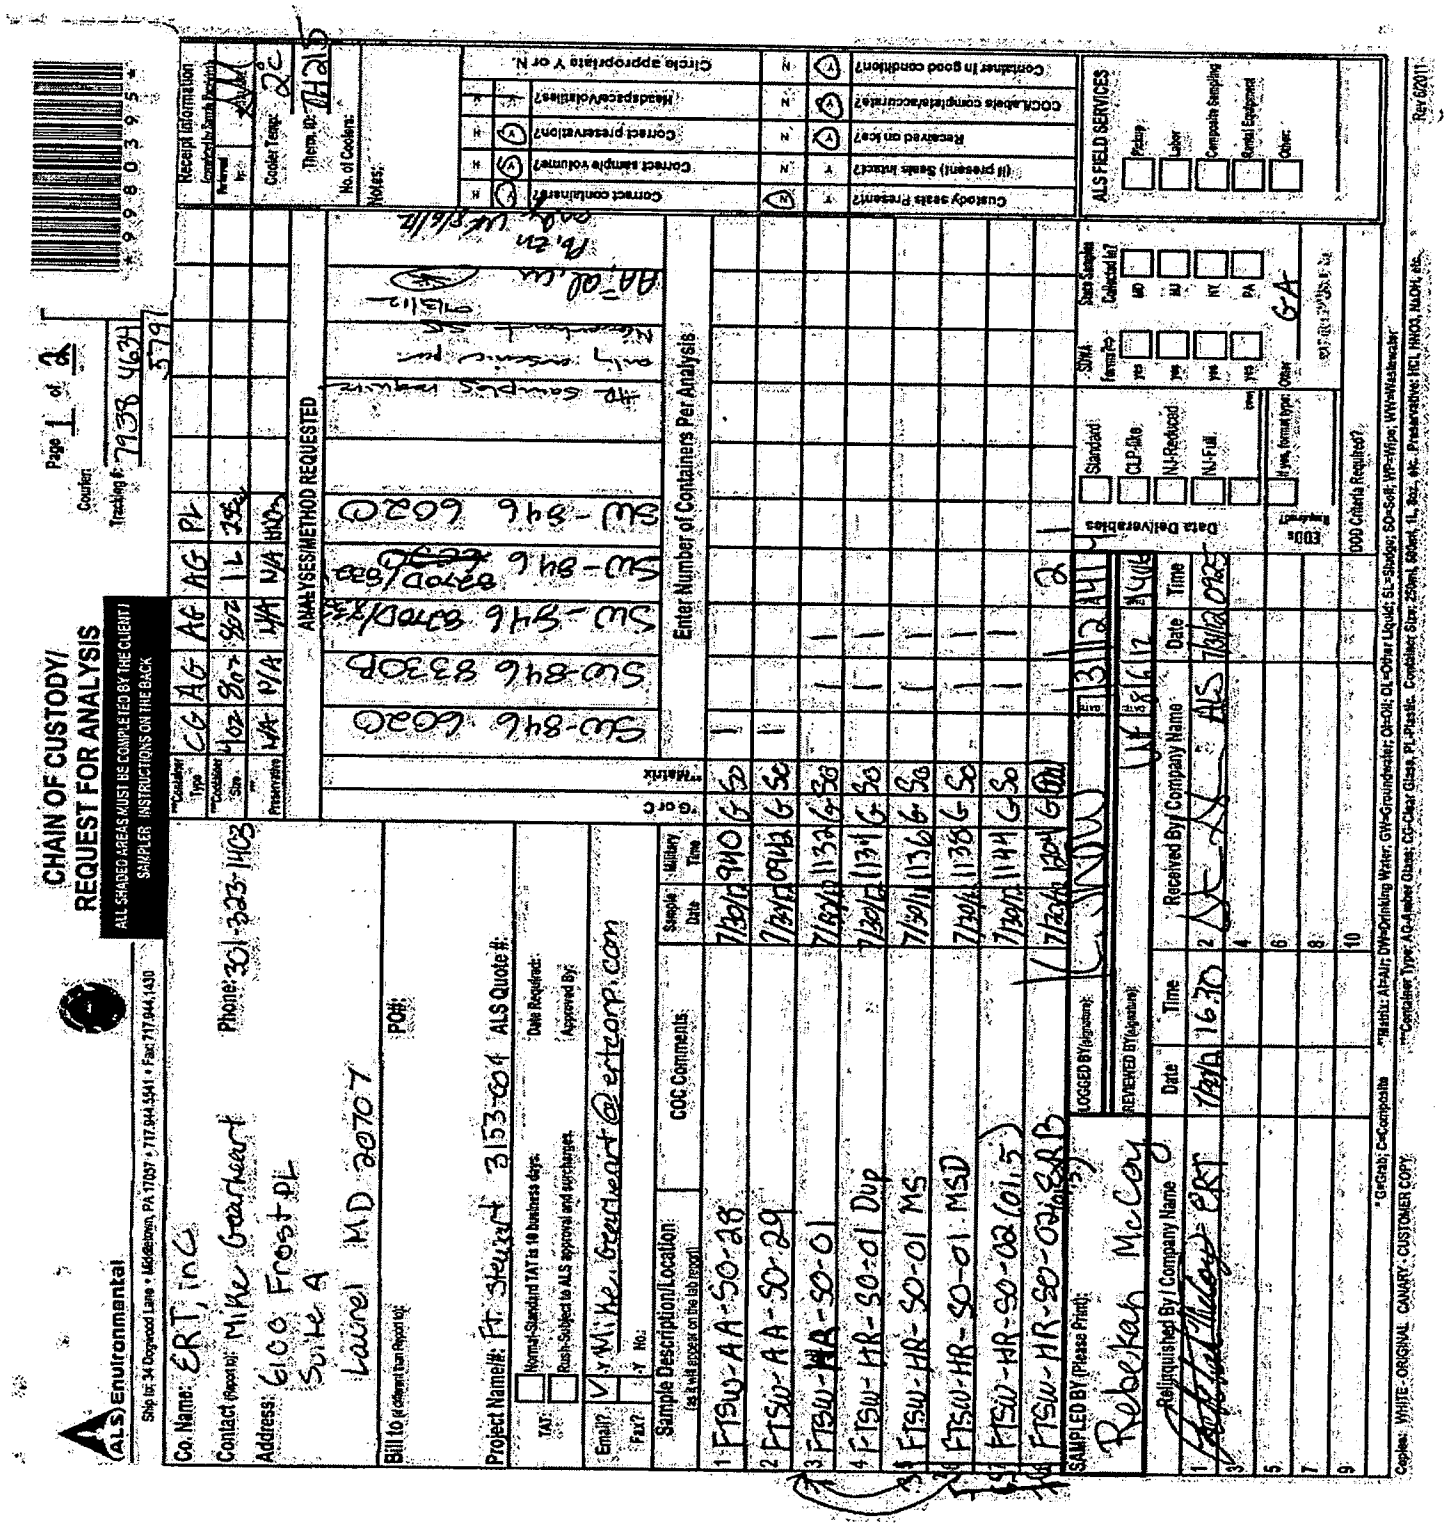
Blanks. Metals were not detected in the blanks.

Laboratory Control Samples. Recoveries were within method control limits.

Matrix Spike/Matrix Spike Duplicate. A matrix spike and matrix spike duplicate were performed on sample FTSW-HR-SO-01 (9980395003) in this data deliverable. The MS and MSD recoveries and their RPDs were within method control limits for all target analytes. The Aluminum concentration in the sample was greater than four times the spiking concentration; therefore, the spike recoveries were not evaluated for aluminum.

Total Solids by SM 2540G

Sample handling. Fourteen (14) solid samples were analyzed for total solids by Standard Method 2540G for dry weight reporting purposes. The samples were analyzed within the 14-day method recommended hold time for dry weight reporting.



Duplicate. A duplicate analysis, identified as 1017717, was performed on sample 9980395009 (FTSW-HR-SO-05). The relative percent difference between the results was within the QC limit of 5%.

Certificate of Analysis

Project Name:	**Ft. Stewart GA project**	Workorder:	**9980395**
Purchase Order:		Workorder ID:	**ERT003|Ft. Stewart 3153-004**

Dear Mr. Gearhart,

Enclosed are the analytical results for samples received by the laboratory on Tuesday, July 31, 2012.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Vicki Forney (Project Coordinator) or Anna G Milliken (Technical Manager) at (717) 944-5541.

Please visit us at www.analyticallab.com for a listing of ALS' NELAP accreditations and Scope of Work, as well as other links to Water Quality documentation on the internet.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

This page is included as part of the Analytical Report and must be retained as a permanent record thereof.

Anna G Milliken
Technical Manager

Notes

- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
- The Chain of Custody document is included as part of this report.
- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are performed in the laboratory and are therefore analyzed out of hold time.

Standard Acronyms/Flags

J, B	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference

Total Solids Summary Forms

Sample Description
FTSW-HR-SO-05

Form 7
Duplicate Summary

Analysis Method: 2540G
SDG No.: ERT-003

Matrix (soil/water): soil
Units: %
Instrument ID: N/A
GC Column: N/A
Sample % Moisture: N/A

Lab Sample ID: 9980395009
Lab File ID: N/A
Lab Sample Dup. ID: 1017717
Dup. Lab File ID: N/A
Dup. % Moisture: N/A

Analyte	Sample Concentration	Duplicate Concentration	Relative Percent Difference (RPD)	(1)	Acceptable Limit
Total Solids	90.6	91.1	0.6		5%

(1) The following qualifiers are used:
* : Values outside of acceptable limits

Comments

Quality Control: SW 8270 - (HBN: 91368)

Surrogate terphenyl-d14 was above the QC limits and 2,4,6-tribromophenol below the limit in Sample 1221555010. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

Quality Control: SW 8270 - (HBN: 91473)

Surrogate terphenyl-d14 was above the QC limits in some samples. With the large number of analytes reported by Method 8270, it is to be expected that occasional outliers will occur. Based on the rule of marginal exceedences, the ALS SOP makes allowances for the data to be considered acceptable with one base/neutral surrogate and one acid surrogate outside control limits.

General Lab Comments

The results provided in this report relate only to the items tested.
Samples were received in acceptable condition unless otherwise noted.
Samples have not been blank corrected unless otherwise noted.
This test report shall not be reproduced, except in full, without written approval of ALS.

ALS provides professional analytical services for all samples submitted. ALS is not in a position to interpret the data and assumes no responsibility for the quality of the samples submitted.

All quality control samples processed with the samples in this report yielded acceptable results unless otherwise noted.

ALS is accredited for specific fields of testing (scopes) in the following testing sectors. The quality system implemented at ALS conforms to accreditation requirements and is applied to all analytical testing performed by ALS. The following table lists testing sector, accreditation body, accreditation number and website. Please contact these accrediting bodies or your ALS project manager for the current scope of accreditation that applies to your analytical testing.

Result Symbol Definitions

MDL = Method Detection Limit, a statistical estimate of method/media/instrument sensitivity.
RL = Reporting Limit, a verified value of method/media/instrument sensitivity.
CRDL = Contract Required Detection Limit
Reg. Limit = Regulatory Limit.
ND = Not Detected, testing result not detected above the MDL or RL.
< This testing result is less than the numerical value.
** No result could be reported, see sample comments for details.

Qualifier Symbol Definitions

U = Qualifier indicates that the analyte was not detected above the MDL.
J = Qualifier indicates that the analyte value is between the MDL and the RL. It is also used to indicate an estimated value for tentatively identified compounds in mass spectrometry where a 1:1 response is assumed.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds calibration range.
P = Qualifier indicates that the RPD between the two columns is greater than 40%.

Sample Management

This report contains the results of the analysis of two (2) water samples and twelve (12) solid samples collected on July 27, 2012. Analytical results and quality control information are summarized in this data package.

Qualifier Symbol Definitions:

U = Qualifier indicates that the analyte was not detected above the LOD.
J = Qualifier indicates that the analyte value is between the DL and the LOQ.
B = Qualifier indicates that the analyte was detected in the blank.
E = Qualifier indicates that the analyte result exceeds the calibration range.
P = Qualifier indicates that the RPD between the two analytical columns is greater than 40%.
NSC = Qualifier indicates that spike recoveries were not calculated based on the spiking concentration.

Result Symbol Definitions:

DL = The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration at the 99% level of confidence.
LOD = The smallest analyte concentration that must be present in a sample in order to be detected at a high level of confidence.
LOQ = The lowest concentration that produces a quantitative result within specified limits of precision or bias.

Sample Receipt

Samples arrived at ALS via courier on July 31, 2012. Upon receipt, the samples were inspected and compared to the Chain of Custody. Sample temperature was documented on the enclosed Chain of Custody. Samples were received intact and properly preserved, unless noted on the enclosed Certificate of Analysis and/or Chain of Custody.

Explosives in Water by Method 8330B

Sample Handling. Two (2) water samples were extracted and analyzed by SW-846 Method 8330B for explosives. All sample extractions and analyses were performed within the holding times associated with the method.

Reporting. In Method 8330B, each sample extract may be analyzed on two dissimilar columns, an "Acclaim Explosives E1" column and an "Acclaim Explosives E2-Proprietary" column. In general, the final result reported on the Certificate of Analysis is the result from the primary column (E1), provided the target analyte is detected on both columns. For the samples in this deliverable group, no target analytes detected on Column E1. were confirmed by analysis on Column E2.

Initial Calibrations. The initial calibrations for all target analytes were in control.

Calibration Verification. Results for the second source and calibration verification standards were within control limits.

Surrogates. All surrogate recoveries were in within control limits, except as follows:

- In sample FTSW-AA-SW-21 (9980394006), surrogate recoveries were below control limits. The sample was beyond the holding time for re-extraction. Client was notified via email and instructed the laboratory to report the results for this sample with qualification.

Blanks. Target analytes were not detected in the method blank.

Laboratory Control Sample. Spike recoveries for all target analytes were within control limits.

Explosives in Soil by Method 8330B

Sample Handling. Six (6) solid samples were air dried upon receipt. Once received, each sample was completely emptied and broken up onto a large tray lined with aluminum foil. The trays were then placed in a controlled environment to eliminate outside contamination. Samples were allowed to air dry to a constant weight at constant room temperature unexposed to light until all moisture was removed. Once dry, each sample was passed through a clean, dry 10-mesh (2 mm) sieve to remove any oversized fractions or debris.

Once the samples were dried, an aliquot for extraction was removed. The aliquot was laid out on the original tray it was dried on so that it was 1-2 cm thick. 10 grams of each sample, using 30 different increments (portions ~0.3grams) from randomly chosen locations were collected.

The dried samples were then extracted and analyzed by SW-846 Method 8330B for explosives. All sample extractions and analyses were performed within the holding times associated with the method.

Reporting. In Method 8330B, each sample extract may be analyzed on two dissimilar columns, an "Acclaim Explosives E1" column and an "Acclaim Explosives E2-Proprietary" column. In general, the final result reported on the Certificate of Analysis is the result from the primary column (E1), provided the target analyte is detected on both columns. For the samples in this deliverable group, there were no target analytes detected so confirmation on E2 was not warranted.

Initial Calibrations. The initial calibrations for all target analytes were in control.

Calibration Verification. Results for the second source and calibration verification standards were within control limits.

Surrogates. Surrogate recoveries were in within control limits, except as follows:

- Surrogate recoveries were below QC limits in sample FTSW-AA-SW-21 (9980394006). This sample was not re-extracted since the sample was past the holding time once review of the data was completed. The client was contacted and the data qualified.

Blanks. Target analytes were not detected in the method blank.

Laboratory Control Sample. Spike recoveries for all target analytes were within control limits.

Totals Metals by SW-846 Method 6020A

Sample handling. Two (2) water samples were analyzed for total metals on the Agilent 7700x using SW-846 Method 6020A. The samples were analyzed within the six-month holding time established for this method.

Calibration. All criteria associated with the calibration were within method control limits with the exception of the mid-level CCV analyzed at 14:21 on 8/7/12 for copper which was recovered above the method control limits. The associated LLCCV was within method control limits of 90-110%, and the sample did not contain copper. Data were reported.

Blanks. Metals were not detected in the reagent blanks. In the method blank, identified as 1017577, zinc was detected at 0.00222J mg/L.

Laboratory Control Samples. The LCS's, identified as 1017578, spike recoveries were within method control limits.

Matrix Spike/Matrix Spike Duplicate. A matrix spike and matrix spike were performed on a sample not in this data deliverable. The MS and MSD recoveries and their RPDs were within method control limits.

Totals Metals by SW-846 Method 6020A

Sample handling. Twelve (12) solid samples were digested and analyzed for total metals on the Agilent 7700x using SW-846 Method 6020A. The samples were analyzed within the six-month holding time established for this method.

Calibration. All criteria associated with the calibration were within method control limits.

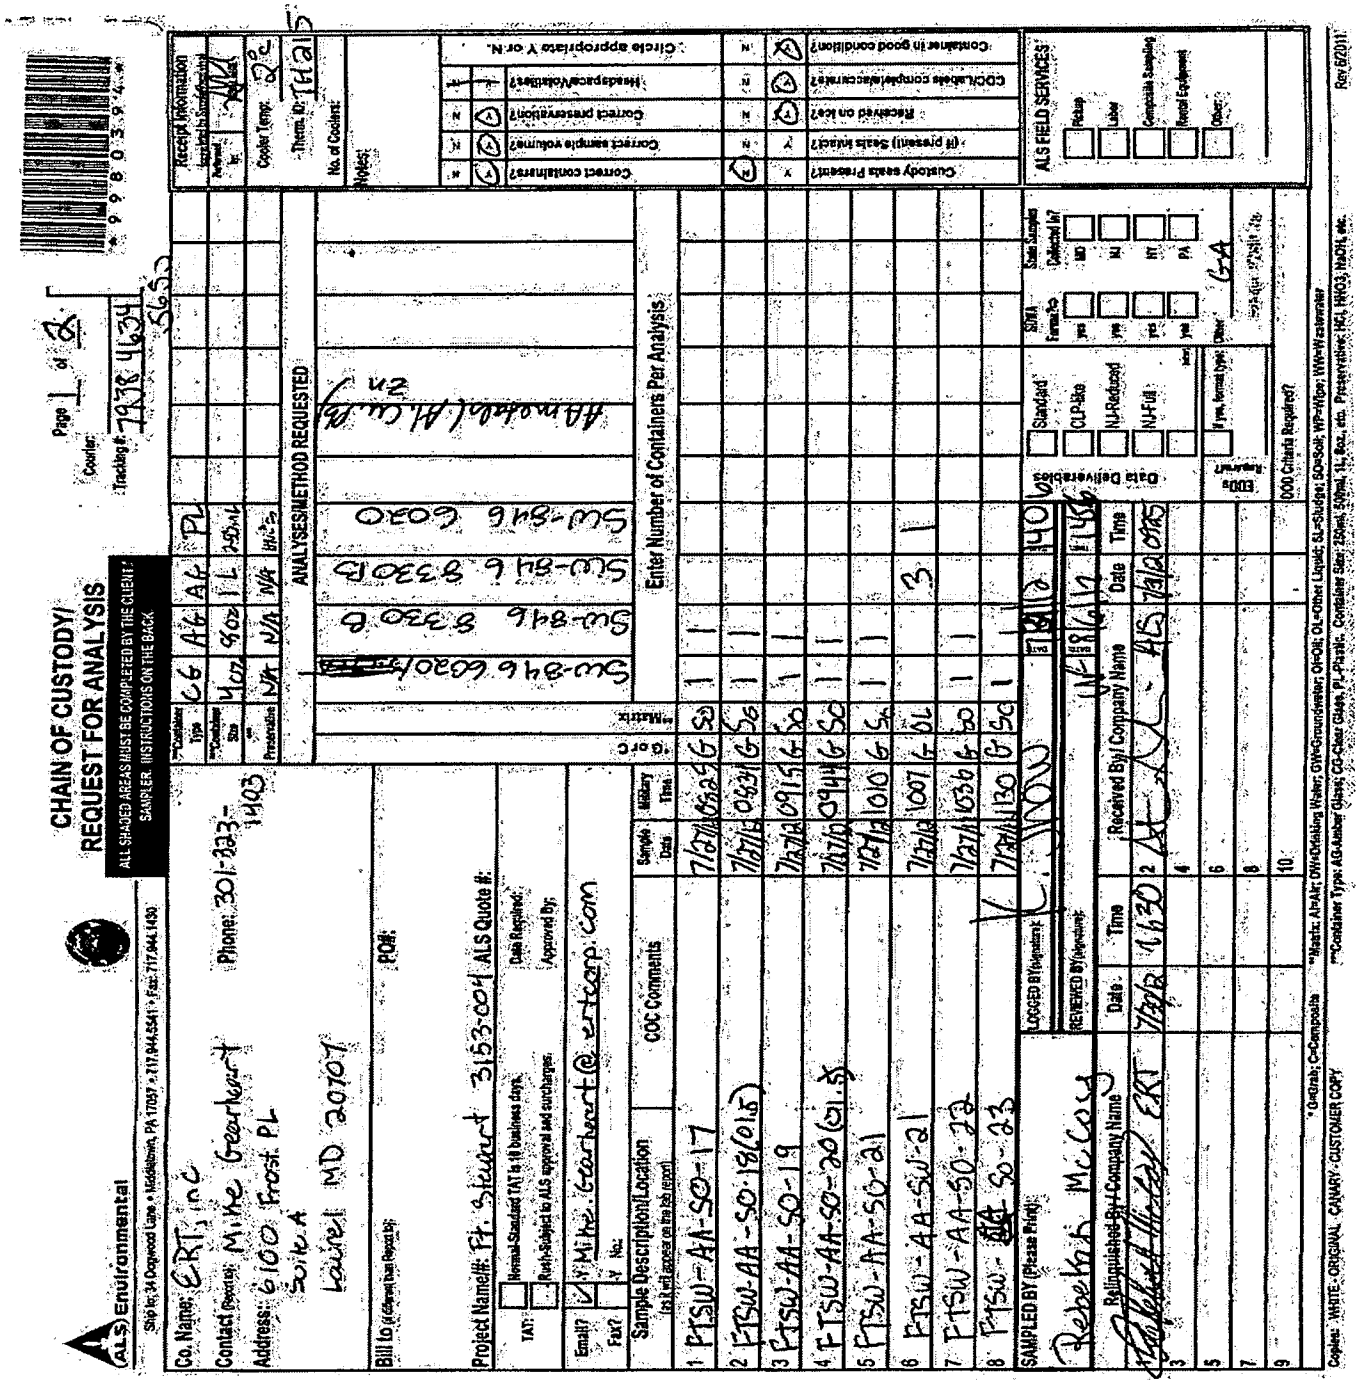
Blanks. Metals were not detected in the reagent blanks or the method blank, identified as 1020183.

Laboratory Control Samples. Recoveries were within method control limits.

Matrix Spike/Matrix Spike Duplicate. A matrix spike and matrix spike duplicate were performed on a non-project sample. The MS and MSD recoveries and their RPDs were within method control limits for the target analytes, with the exception of aluminum and lead which were recovered above method control limits. A post-digestion spike was performed for lead. Recovery was within control limits.

Total Solids by SM 2540G

Sample handling. Thirteen (13) solid samples were analyzed for total solids by Standard Method 2540G for dry weight reporting purposes. The samples were analyzed within the 14-day method recommended hold time for dry weight reporting.



Duplicate. A duplicate analysis, identified as 1017716, was performed on sample 9980394011 (FTSW-AA-SO-25 DUP). The relative percent difference between the results was within the QC limit of 5%.

ALSI Corrective Action Report (CAR)

To be Completed by Laboratory and Submitted to Customer Service:

Date: 7/31/12 CAR Submitted By: SHSS
Dept: SR Supervisor:

Chain of Custody No.(s): 9980394014-A

Problem/Reason for Corrective Action:

- ___ Login Error (2nd reviewed by: _____)
- X Incorrect Preservative
- ___ Missed Holding Time
- ___ Calibration failure
- ___ QC failure due to sample matrix
- ___ QC failure NOT due to sample matrix
- ___ Sample Lost in process
- ___ Reporting Error
- ___ Other _____

Method:

Explanation of Problem: Sample was unpreserved when it should have been preserved w/ nitric acid

Signature(s) where Applicable:
Analyst: Ann Salisbury
1st Review: _____
2nd Review: _____
Result Entered By: _____
Result Approved By: _____
Supervisor: _____

Immediate Corrective Action Taken: By SHSS Date: 7/31/12
Added 2 ml of nitric acid

138606

Are there policies/procedures in place to prevent this from occurring? Yes ___ No ___ Not Applicable ✓
If Yes, What is the procedure, and why didn't it work?

If No, What procedure is needed to prevent this from occurring?
Target Date for Implementation: _____ Person Responsible for Implementation: _____

Customer Service Rep. Notified: _____ Date: _____

To be Completed by Customer Service and submitted to QA:

Date: _____ Customer Service Rep.: _____ Client Contacted? Yes ___ No ___
Project(s) / Client(s) involved: Date: _____ Person: _____

Action Taken (if no action taken, explain why):

Laboratory Notified of Client Response? Yes ___ No ___ Not Applicable ___

To be Completed by QA and filed:

Was action taken appropriate? Yes ___ No ___ Date: _____
Is further action necessary? Yes ___ No ___ QA Initials: _____
If Yes, What action is needed?

Modification of SOP needed? Yes ___ No ___
If Yes, What is the procedure? Has it been instituted? Yes ___ No ___

Rev. 3/00

Certificate of Analysis

Project Name:	**Ft. Stewart GA project**	Workorder:	**9980394**
Purchase Order:		Workorder ID:	**ERT002|Ft. Stewart 3153-004**

Dear Mr. Gearhart,

Enclosed are the analytical results for samples received by the laboratory on Tuesday, July 31, 2012.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Vicki Forney (Project Coordinator) or Anna G Milliken (Technical Manager) at (717) 944-5541.

Please visit us at www.analyticallab.com for a listing of ALS' NELAP accreditations and Scope of Work, as well as other links to Water Quality documentation on the internet.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

This page is included as part of the Analytical Report and must be retained as a permanent record thereof.

Anna G Milliken
Technical Manager

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are performed in the laboratory and are therefore analyzed out of hold time.

Standard Acronyms/Flags

J, B	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference

Sample Comments:

The pH of the total metals bottle was adjusted to pH < 2 by the addition of nitric acid upon receipt at the laboratory.

PARAMETER QUALIFIERS\FLAGS

[1] The surrogate 1,4-Dinitrobenzene for method SW846 8330B was outside of control limits. The % Recovery was reported as 10 and the control limits were 50 to 150. This result was reported at a dilution of 1.

[2] The surrogate 1,4-Dinitrobenzene for method SW846 8330B was outside of control limits. The % Recovery was reported as 11.8 and the control limits were 50 to 150. This result was reported at a dilution of 1.
