GEORGIA REGISTERED PROFESSIONAL ENGINEERING CERTIFICATION

I certify that I am a qualified professional engineer who has received a baccalaureate or post-graduate degree in engineering and have sufficient training and experience in environmental engineering and related fields, as demonstrated by state registration and completion of accredited university courses, to enable me to make sound professional judgments regarding groundwater monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction.

## **1.0 INTRODUCTION**

Environmental Chemical Corporation (ECC) has been retained by the United States Army Environmental Command (USAEC) to perform investigation and remediation activities at Fort Stewart in accordance with the requirements of the Performance Based Contract Number: W9124J-18-D-0004, Delivery Order Number W9124J-20-F-0049.

Fort Stewart, originally known as Camp Stewart, was established in June 1940 as an anti-aircraft artillery training center. The current primary mission for Fort Stewart is a training and maneuver area, providing tank, field artillery, helicopter gunnery, and small arms training for regular Army and National Guard units. The 24<sup>th</sup> Infantry Division, which was reflagged as the 3<sup>rd</sup> Infantry Division in May 1996, was permanently stationed at Fort Stewart in 1975.

Fort Stewart is located in portions of Liberty, Bryan, Long, Tattnall, and Evans Counties, Georgia, approximately 40 miles west-southwest of Savannah, Georgia. The cantonment, or garrison area, is located within the Liberty County portion on the southern boundary of the reservation. Hinesville, Georgia, is the nearest city to the garrison area and is located immediately outside of the reservation boundary. **Figure 1-1** shows the location of Fort Stewart and the Former 724<sup>th</sup> Tanker Purging Station (TPS), Solid Waste Management Unit (SWMU) 26 (Site).

This Corrective Action Completion Report provides a summary of the final semi-annual monitoring and sampling events conducted in June/July and October 2021 in accordance with the current approved CAP Addendum for the Former 724<sup>th</sup> TPS, SWMU 26 (Arcadis U.S., Inc. [Arcadis], 2010) and approved modifications to the sampling plan. The 2021 sampling events completed three years of sampling results below regulatory goals. Corrective action activities at SWMU 26 were performed in accordance with Section III of the Hazardous Waste Facility Permit No. HW-045 (S), issued by the Georgia Environmental Protection Division (GAEPD) in August 2017.

### **1.1 Site Location and History**

The Former 724<sup>th</sup> TPS was used to clean tanker trailers that carried diesel fuel, jet propulsion fuel, and motor gasoline. The Former 724<sup>th</sup> TPS is located in the western cantonment area in the 1800 block of McFarland Avenue, at the western end of the fuel truck parking area. The Former 724<sup>th</sup> TPS occupied an area approximately 30 feet (ft) by 50 ft (Rust, 1996) located between the chain-link fence at the parking area (western end) and the wooded area approximately 25 ft to the west (**Figure 1-2**). The former Site facilities included an underground used oil tank and oil/water separator; an above ground storage tank (AST) that received water after oil/water phase separation; and an underground pump with surface access and pumping controls for pumping water into the AST.

The Former 724<sup>th</sup> TPS was constructed in 1982 and taken out of service in March 1996. During August 1996, the purging station was dismantled, a portion of the underground facilities were removed, and approximately 525 cubic yards of impacted soil were excavated and replaced with clean backfill. Soil was excavated to the water table at the former facility (approximate depth of three to 10 ft) and to a depth of six inches in the adjacent ditch. All associated equipment, above and below ground, was removed from the Site during removal activities.

### **1.2 Site Geology**

The Site geology at SWMU 26 is characterized by an interbedded series of sands and clay, with the sandy units ranging from clayey sand to sand with a low percentage (less than 10 percent [%]) of silt and clay. The clay units, in general, are comprised of medium to high plasticity clay with a low percentage of sand-

sized grains. The lithologies described at SWMU 26 are consistent with those anticipated for this region of the Coastal Plain. Three cross-sections have been prepared for the Site. The locations of the cross sections are shown on **Figure 1-3**. Cross-section A-A' originates at the edge of the biosparge system, at monitoring well MW-32, and trends to the east-northeast to soil boring SB-41 (**Figure 1-4**). Interbedded sands and clay extend to approximately 25 ft below ground surface (bgs) and clay and sandy clay units begin at approximately 25 ft bgs. In the western portion of the cross section, a calcareous marine shell-bearing unit of soft clay was identified between approximately 25 to 30 ft bgs. This unit was underlain by a firm, sandy clay unit. Cross-section B-B' originates northwest of the December 2010 excavation and MW-15R and extends southeast to approximately 30 ft north of MW-11 (**Figures 1-3 and 1-5**). Interbedded sand and clay units extend to a depth of approximately 28 ft bgs. Cross-section C-C' originates at monitoring well MW-55 and trends south to monitoring well MW-18 (**Figure 1-6**). Interbedded sand and clay units extend to a depth of approximately 24 ft bgs. In the southern portion of the cross section, a calcareous marine shell-bearing unit of soft clay was identified between approximately 25 to 30 ft bgs. This unit was underlain by a firm, sandy clay unit.

The cross sections were constructed using available boring logs presented in the historical CAP Progress Reports. Boring logs from monitoring wells, soil borings, temporary piezometers, and injection wells were used to create the cross sections.

### 1.3 Report Organization

This report contains six sections, including the introduction:

- **Section 1: Introduction** – summarizes the Site location and provides a brief history.
- **Section 2: Previous Investigations and Corrective Actions** – provides a summary of the previous investigations and corrective actions conducted at the Site.
- **Section 3: Post-Corrective Action- Final Confirmation Sampling Events (Period June 2021 through October 2021)** – summarizes the final confirmation sampling activities conducted during the final reporting period.
- **Section 4: Results and Analysis of Trends and Performance** – summarizes the June/July 2021 and October 2021 groundwater monitoring results.
- **Section 5: Conclusions and Recommendations.**
- **Section 6: References** – lists the references utilized to prepare this report.

## 2.0 PREVIOUS INVESTIGATIONS AND CORRECTIVE ACTIONS

A detailed summary of previous investigations and corrective actions (July 1997 through September 2008) is provided in the *Phase II Resource Conservation Recovery Act (RCRA) Facility Investigation (RFI)* (Science Application International Corporation [SAIC], 1998), the *CAP* (SAIC, 2000), the *Final Interim Removal Action Report* (Earth Tech, Inc. [Earth Tech], 2001), and the *Thirteenth CAP Progress Report* (SAIC, 2009). A summary is provided below.

### 2.1 RCRA Facility Assessment

A RCRA Facility Assessment (RFA), that listed 24 SWMUs as requiring further investigation including the then active 724<sup>th</sup> TPS, was submitted to the GAEPD in June 1990 (Geraghty and Miller, 1992).

### 2.2 Phase I RFI

A Phase I RFI was initiated in 1993 in response to the RFA submittal. The objective of the Phase I RFI was to determine if releases to the environment had occurred from any of the 24 identified SWMUs, including potential contamination due to fuel leakage at the Former 724<sup>th</sup> TPS Site. The Phase I RFI was completed in April 1996. Analytical results from soil sampling conducted during the Phase I RFI at the Former 724<sup>th</sup> TPS indicated fuel product and solvent impacts in the soil (SAIC, 1998). During August 1996, the TPS was dismantled, the underground facilities were removed, and approximately 525 cubic yards (cy) of impacted soil were excavated and replaced with clean backfill. The Site was then reseeded (SAIC, 1998).

### 2.3 Phase II RFI

Between 1997 and 1998, a Phase II RFI was conducted to delineate the horizontal and vertical extent of impacts and to determine if corrective action was necessary. During the investigation, free phase petroleum product was discovered at monitoring well MW-02 in the center of the former facility. Free product recovery was initiated to remove the product. Benzene, toluene, ethylbenzene, and xylene (BTEX) compounds were detected above the United States Environmental Protection Agency (USEPA) maximum contaminant levels (MCLs) in the shallow aquifer near the source.

Remedial levels (RLs) were established for BTEX in groundwater and soil during the Phase II RFI. The groundwater RL for benzene is 5 micrograms per liter ( $\mu\text{g}/\text{L}$ ), toluene is 1,000  $\mu\text{g}/\text{L}$ , ethylbenzene is 700  $\mu\text{g}/\text{L}$ , and xylenes are 10,000  $\mu\text{g}/\text{L}$ . The RLs for groundwater are based on MCLs. The soil RLs are based on leaching from soil to groundwater at levels exceeding MCLs. The soil RL for benzene is 20 micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ), toluene is 4,200  $\mu\text{g}/\text{kg}$ , ethylbenzene is 3,100  $\mu\text{g}/\text{kg}$ , and xylenes are 31,700  $\mu\text{g}/\text{kg}$  (SAIC, 1998).

### 2.4 PHOSter® II Enhanced Bioremediation and Source Area Excavation

Due to the presence of free product and BTEX detections in groundwater above MCLs, a CAP was developed for a PHOSter® II enhanced bioremediation system. The PHOSter® II enhanced bioremediation system began operation in February 2000 and was expanded in March 2000 (SAIC, 2009). Despite the PHOSter® injections, the lateral area of the groundwater plume continued to increase. Based on groundwater sample results, it was determined that a potential source area still existed inside the motor pool, where the CAP indicated the highest benzene concentration in soil was located.

A second soil excavation was conducted in January 2001 to remove 2,274 tons of impacted soil not addressed during the 1996 excavation. During the excavation, a pipe that contained product and product-saturated soil was discovered near MW-02. Closure records for the Former 724<sup>th</sup> facilities did not indicate

the presence of remaining underground piping. Post-excavation confirmatory sampling indicated contamination above RLs remained at the bottom of the excavation and along the northwest wall of the excavation (Earth Tech, 2001).

Additional PHOSter® II injection wells were installed in March 2001 to replace wells destroyed during excavation activities. A final system expansion was completed in April 2001. Injections continued until January 2002, when the PHOSter® II trailer was taken out of service after two years of operation (SAIC, 2009). Although the groundwater concentrations were decreasing, there was concern that the impacts remaining in the clay layer at the bottom of the 2001 excavation were potentially a continuing source of groundwater contamination. Between 2002 and 2007, additional soil investigations were conducted to evaluate the impacts remaining within the clay at the source area (the bottom of the excavation).

## 2.5 CAP Addendum

In May 2009, a CAP Addendum was submitted to address residual impacts in the soil and deep groundwater at SWMU 26. As part of the addendum, an excavation of soil impacts remaining in the clay layer in the source area was recommended. In groundwater, benzene was the only constituent above the RL. The highest detections were in deep groundwater downgradient of the source area. To expedite the attenuation of benzene in deep groundwater, a biosparging system was recommended in the Revised Final version of the CAP Addendum (Arcadis, 2010). The GAEPD approved the CAP Addendum in April 2010 (GAEPD, 2010).

## 2.6 DPT Investigation

In November 2009, six direct push technology (DPT) points were advanced in the vicinity of the source area (SB-58 through SB-63). The DPT investigation was conducted to confirm results from previous soil investigations, to characterize the soil prior to removal, and to better define the limits of a proposed excavation to remove the remaining impacted soil in the source area. During the investigation, two samples from each boring were collected at intervals determined with field screening equipment and a third sample was collected from the bottom of each boring. Samples were transported via courier to Shealy Laboratory and analyzed for volatile organic compounds (VOCs) by USEPA Method 8260B.

Soil borings SB-60 and SB-61 were collected within the proposed excavation area. Soil borings SB-58, SB-59, SB-62, and SB-63 were collected just outside the proposed excavation area to confirm the proposed excavation extent. The samples collected from the soil borings outside of the proposed excavation limits were all below the Site RLs for soil. The benzene and ethylbenzene concentrations in soil borings SB-60 and SB-61, which were collected within the proposed excavation limits, exceeded the Site RL of 20 µg/kg and 3,100 µg/kg, respectively. The sample from soil boring SB-60, taken at the depth interval 11 to 12 ft bgs, also exceeded the Site RL of 31,700 µg/kg for xylenes. The excavation area is shown on **Figure 1-2**.

## 2.7 Corrective Actions Conducted October 2010 through June 2011

The Sixteenth CAP Progress Report (Arcadis, 2012) summarized the corrective action activities proposed in the CAP Addendum (Arcadis, 2010) including excavation, a biosparging pilot test, and the installation of the biosparging system. Site-wide groundwater level measurements collected in June 2010 and April 2011, and data from samples collected in April 2011 were included in the report.

The excavation was conducted in December 2010 and January 2011. The top six feet of soil was visually inspected, segregated, and stockpiled to be reused as backfill. Groundwater was encountered at approximately 11.5 to 12 ft bgs. The soil was excavated to approximately 12 ft bgs. Several large concrete

structures (presumably related to the former tanker purging equipment) were unearthed at depths of six to 12 ft bgs. The concrete structures were removed and transported off-site for disposal. Soils surrounding these structures were impacted based on visual and olfactory observations. The visually impacted soils were removed. These soils are presumed to have been the continuing source area of the recalcitrant groundwater impacts. A total of 6,092 tons of impacted soil was taken off-site for disposal. Confirmation samples collected from the sidewalls of the excavation were below the remedial objectives identified in the CAP Addendum. Confirmation samples collected from the base of the excavation reported concentrations of BTEX above the remedial objectives toward the center and southwest corner of the excavation. Calcium peroxide granules were placed at the bottom of the excavation as an *in-situ* soil additive to promote oxidation in the subsurface and increase the natural bioremediation process for any residual impacts remaining in the soil. A total of 2,000 pounds of calcium peroxide was placed in the base of the excavation with a focus on the center and southwest corners. The calcium peroxide was mixed with the base soils using the track-hoe bucket. Prior to the excavation, monitoring wells MW-06, MW-08, MW-15, MW-24, MW-25, MW-27, MW-28, and MW-36, located within the excavation limits, were abandoned. Following the excavation, replacement monitoring wells MW-06R, MW-15R, MW-24R, MW-25R, MW-28R, and MW-36R were installed, as well as two new monitoring wells, MW-58 and MW-59 (**Figure 1-2**).

A biosparge pilot test was conducted on 26 and 27 October 2010 to evaluate the injection flow rates, pressures, and overall effectiveness of biosparging at SWMU 26. The test was conducted using one injection well and 12 surrounding monitoring wells. The 12 monitoring wells were installed in clusters of three wells per cluster, at distances of five to 20 ft from the injection well to monitor the radius of influence at various distances and depths. The pilot test confirmed that biosparge is a viable technology for SWMU 26. Based on the results of the pilot test, a full-scale design was developed including 17 injection wells which were screened within the known area of the benzene plume, in the deep portion of the upper aquifer.

Prior to installation of the full-scale system, baseline groundwater samples were collected in April 2011. No shallow wells exceeded the RL for benzene in April 2011. Deep monitoring wells MW-38, MW-50, MW-54, and MW-55 exceeded the RL for benzene during the monitoring event. The full scale biosparge system was installed in May and June 2011 and the system was started in June 2011.

## 2.8 Corrective Actions Conducted June 2011 through May 2016

The biosparge system operated continuously with a few exceptions due to mechanical or electrical problems that were subsequently repaired until it was turned off on 30 May 2016 with concurrence of GAEPD. During Operation and Maintenance (O&M) events, a YSI 556 multiparameter system was used to collect readings of temperature, specific conductance, dissolved oxygen content, pH, and oxidation reduction potential in monitoring wells. Operational parameters were recorded for the system and each biosparge well. In October 2011, flow meters were installed in-line at each injection well. Valves at each injection well were adjusted to control the flow going into each injection well as necessary to optimize influence throughout the plume for treatment. O&M site visits were stopped at the end of December 2014 pending contract award, and were restarted on 18 and 19 May 2015. Redevelopment of six shallow monitoring wells (MW-19, MW-31, MW-32, MW-41, MW-47, and MW-49) was completed during March 2016 due to observation of high turbidity during previous sampling events. Concentrations had decreased to near, or below, the RL for benzene, methyl tert-butyl ether (MTBE), and naphthalene. Therefore, the biosparge system was turned off the week of 30 May 2016 for post-remediation monitoring with the concurrence of GAEPD. Subsequent data did not indicate any significant increases in concentrations and the system remained off with GAEPD approval.

## **2.9      Corrective Actions Conducted October 2016 through October 2020**

Post-remediation monitoring of concentration trends in accordance with the CAP and GAEPD approved modifications continued during this period. All constituent concentrations were below the applicable USEPA MCL or Site-Specific Remedial Goals (SSRG) during 2019 and 2020.

## **3.0 POST-CORRECTIVE ACTION- FINAL CONFIRMATION SAMPLING EVENTS (PERIOD JUNE 2021 THROUGH OCTOBER 2021)**

### **3.1 Groundwater Sampling and Data Management**

During this reporting period, semiannual groundwater monitoring events were conducted in June/July and October 2021 in accordance with the CAP and GAEPD approved modifications. Prior to initiating the groundwater sampling event, site-wide groundwater level measurements were collected from existing monitoring wells on 29 June 2021, and 29-30 September 2021. The groundwater level measurements are summarized in **Table 3-1**. Potentiometric maps for both the shallow and deeper intervals of the surficial aquifer for June 2021 and September 2021 are included as **Figure 3-1** through **Figure 3-4**, respectively. Groundwater samples were collected from the select monitoring wells listed in the approved sampling program (**Table 3-2**). The June/July and October 2021 analytical data is included in **Table 3-3** and presented in **Figure 3-5** and **Figure 3-6**. Field data collected from the June/July and October groundwater sampling events are presented in **Table 3-4**. Sampling data sheets are included in **Appendix A**.

#### **3.1.1 Groundwater Sampling Events**

A total of 18 monitoring wells were included in the June/July 2021 groundwater monitoring and sampling events in accordance with the approved modified Sampling Plan for the sampling event. The modified Sampling Plan was approved by GAEPD in an email dated 6 June 2018 (GAEPD, 2018a) prior to the Spring 2018 Semiannual Sampling Event and in the subsequent approval letter for the 24<sup>th</sup> CAP Progress Report (GAEPD, 2018b). All samples were analyzed for BTEX, MTBE, and naphthalene by USEPA Method 8260B in accordance with the GAEPD approved sampling plan.

After the June/July 2021 sampling event, the ECC Team proposed that SWMU 26 be considered for site closure. GAEPD requires three consecutive years of results below the applicable USEPA MCL or SSRG for site closure. Therefore, an expanded sampling scope was proposed for the October 2021 sampling event to ensure SWMU 26 would meet the requirements for site closure. The scope for the October 2021 sampling event included the following monitoring wells: monitoring wells in the currently approved sampling plan (18 wells); monitoring wells that were removed from the sampling plan in 2006 with approval of GAEPD (seven wells); and monitoring wells not in the current sampling plan that have had an exceedance since 2010 (one well). This scope included a total of 26 monitoring wells to be sampled for BTEX, MTBE, and naphthalene. Concurrence by GAEPD was obtained prior to the October 2021 sampling event to confirm the specific closure requirements for SWMU 26 and ensure the proposed scope for the October 2021 sampling event would support site closure. One monitoring well (MW-08) included in the October 2021 sampling scope was determined to have been abandoned in October 2010 prior to source excavation. (Note: Well MW-08 was removed from the sampling plan in 2006 with approval of GAEPD.) Therefore, 25 monitoring wells were sampled during the October 2021 event.

Groundwater sampling was performed using low-flow, or micropurge, procedures in accordance with *Groundwater Sampling Operating Procedure, Number SESDPROC-301-R4* (USEPA, 2017). The sampling procedures utilized for the semiannual groundwater monitoring events were evaluated to optimize sample quality since some wells had exhibited high turbidity or unstable water quality parameters during previous sampling events.

All samples were transported, via field sampler to TestAmerica Laboratories, Inc. in Savannah, Georgia (National Environmental Laboratory Accreditation Conference No. E87052). Laboratory analytical data packages from this event are included in **Appendix B**.

### **3.1.2 Data QA/QC and Validation**

The field Quality Assurance/Quality Control (QA/QC) samples included trip blanks and field duplicates. One trip blank was collected for each sample cooler transporting samples for VOC analysis. A field duplicate sample is a second sample collected at the same location as the original sample. A field duplicate was collected at a rate of one per twenty samples. Laboratory quality assurance protocols included the performance of laboratory control samples and matrix spikes relating to method acceptance criteria.

Analytical data were evaluated in accordance with applicable USEPA SW-846 method requirements, “*USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*” (November 2020), analytical method control criteria, the analytical laboratory Quality Assurance Control Limits, the Hunter Army Airfield Quality Assurance Project Plan (Arcadis, 2014) and professional judgment. The purpose of the data quality evaluation was to determine the reliability of the chemical analyses and the accuracy and precision of information acquired from the laboratory. Data quality was assessed through the review and evaluation of field sampling activities, QC samples, and data associated with the chemical analytical results. The complete results of the data quality evaluation are provided in **Appendix B**.

The data verification was performed at a Level II and included review of data package completeness. QA/QC results and analytical data associated with analytes/compounds of interest were reviewed for this validation.

## 4.0 RESULTS AND ANALYSIS OF TRENDS AND PERFORMANCE

### 4.1 Groundwater Elevation Data

The hydrology at SWMU 26 has been characterized by groundwater monitoring wells installed across the Site at two different depth intervals. The total depth (bottom of the screened interval) of shallow monitoring wells ranges from 12.0 to 16.95 ft bgs, while the total depth (bottom of the screened interval) of deep monitoring wells ranges from 21.7 to 41.0 ft bgs. Potentiometric maps for the shallow and deeper intervals of the surficial aquifer for June 2021 are included as **Figures 3-1** and **3-2**, respectively. Potentiometric maps for the shallow and deeper intervals of the surficial aquifer for September 2021 are included as **Figures 3-3** and **3-4**, respectively.

Generally, the water table elevation increased between June 2021 and September 2021. This is typical of the seasonal water table variations at the site. The groundwater table elevation increased an average of 1.84 ft in the shallow portion of the surficial aquifer and 2.04 ft in the deeper portion of the surficial aquifer between June 2021 and September 2021.

Groundwater flow in the shallow portion of the surficial aquifer across the site was generally toward the southwest with an approximate gradient of 0.0043 feet per foot (ft/ft) in June 2021 and 0.0036 ft/ft in September 2021. The shallow potentiometric maps indicated potentiometric lows at the wells on the west side of the area (MW-40) and further west (MW-05) and a potentiometric high at MW-16 in June 2021. The potentiometric high during September 2021 was also at monitoring well MW-16.

The potentiometric map for the deeper wells in the surficial aquifer indicated groundwater lows at MW-58 and further west at MW-60 in both June 2021 and September 2021. Based on the heterogeneous nature of the sand and semi-confining units at the Site, the variability in elevations across the Site is likely related to the wells being screened in different stratigraphic units within the surficial aquifer. The characteristics noted on the potentiometric map for the deeper interval were generally consistent with previously reported groundwater elevations. Groundwater flow in this zone was variable with overall flow across the site generally to the south-southwest. The horizontal hydraulic gradient across the site for flow to the south-southwest for the deep zone was approximately 0.0025 ft/ft in June 2021 and 0.0013 ft/ft in September 2021.

### 4.2 Groundwater Analytical Results

During the June/July 2021 monitoring event and October 2021 monitoring event, benzene was not reported above detection limits in the sampled shallow or deep wells. The USEPA MCL for benzene is 5 µg/L.

MTBE was added to the monitoring program in October 2011. In a letter dated 5 February 2016, the GAEPD approved the SWMU 26 Nineteenth CAP Progress Report that recommended a SSRG for MTBE of 59 µg/L. MTBE was not detected above the SSRG in the sampled shallow or deep wells during the June/July 2021 monitoring event. The maximum concentrations of MTBE detected during the June/July 2021 sampling event in the shallow zone was at MW-51 (14 µg/L) and in the deep zone at MW-43 (49 µg/L). MTBE was not detected above the SSRG in the sampled shallow or deep wells during the October 2021 monitoring event. The maximum concentrations of MTBE detected in the shallow zone during the October 2021 sampling event was at MW-51 (16 µg/L) and in the deep zone at MW-43 (40 µg/L).

Naphthalene was added to the monitoring program in October 2013. In a letter dated 5 February 2016, the GAEPD approved a SSRG for naphthalene of 6.1 µg/L. During the June/July 2021 monitoring event, naphthalene was not detected above detection limits or SSRG in any of the sampled shallow or deep zone

wells. During the October 2021 monitoring event, naphthalene was detected above laboratory detection limits (0.76 J µg/L at MW-18) in the shallow zone but was not detected above the SSRG in any of the sampled shallow or deep zone wells.

The concentrations of toluene, ethylbenzene, and xylenes remained below the MCLs at the wells sampled during this reporting period; with no concentrations above detection limits. **Figure 3-5** and **Figure 3-6** depict the concentrations of BTEX, MTBE, and naphthalene detected in shallow and deep groundwater, respectively. **Appendix C** includes benzene and MTBE concentration graphs for select wells that are sampled semiannually. Field parameters from the June/July 2021 and October 2021 sampling event are shown in **Table 3-4**.

#### 4.3 Groundwater Quality Trends and System Performance

In accordance with the approved CAP, the current remedy for SWMU 26 is biosparge and natural attenuation. The biosparge system was turned off the week of 30 May 2016 with the concurrence of GAEPD and has not been operated since with transition to natural attenuation. Natural attenuation is the reliance on natural physical, chemical, and/or biological processes to achieve site-specific remediation objectives (USEPA, 1999). Stable or decreasing trends in the concentrations of hydrocarbon constituents represent the primary line of evidence for natural attenuation of petroleum hydrocarbons in groundwater.

To verify that the dissolved-phase plume is stable or shrinking, groundwater constituents of concern (COC), specifically BTEX and MTBE concentrations, were evaluated through time at monitoring wells located throughout the plume. There have never been any exceedances of the naphthalene SSRG, so naphthalene trends were not evaluated.

Linear regression analyses using available historical groundwater monitoring data were conducted for monitoring wells where concentrations have exceeded the RL. RLs for benzene, toluene, ethylbenzene, total xylenes, and MTBE are 5 µg/L, 1,000 µg/L, 700 µg/L, 10,000 µg/L, and 59 µg/L, respectively. Trends were not evaluated at monitoring locations where:

- Concentrations have not exceeded the screening levels since May 2016, when the biosparge system was turned off;
- Insufficient data are available (less than eight data points); and/or
- Greater than 50% of the results are below detection limits.

Groundwater analytical data are available at the site as early as 2000 through October 2021. However, for the purposes of this evaluation; trend analyses were performed using post-operational data collected after May 2016, after the biosparge system was turned off. This data range was specifically selected to allow assessment of rebound after biosparge operation and of post-operational natural attenuation. Linear regression trend analyses were focused on MTBE concentrations. All other COC were screened out based on the criteria above. A total of 18 monitoring wells were sampled in the groundwater monitoring and sampling event in June/July 2021 and a total of 25 monitoring wells were sampled in October 2021 event (**Section 3.1**). Applying the criteria for trend analysis, six wells were appropriate for analysis, while other wells exhibited results below the SSRGs or below detection limits for greater than 50% of the results.

Linear regression analyses using natural log normalized concentration data were conducted to evaluate trend direction and to estimate attenuation rates for the locations with significant decreasing concentration trends (USEPA, 2002). The attenuation rates and the projected year to reach the RL are reflective of timeframes after the biosparge system was turned off. Please note that all COC concentrations were below RLs in May and October 2019, June and October 2020, as well as June/July and October 2021. Attenuation

rates were calculated using post-operational data only. The p-value of the correlation provides a measure of the significance of the slope, or the correlation between the x and y variables. Correlations were accepted as significant at the 90% confidence level, indicated by a p-value of 0.1 or less. The trend direction was defined as decreasing if the slope of the trend line was negative and increasing if the slope of the trend line was positive. The R<sup>2</sup> value is a measure of how well the linear regression fits the site data; R<sup>2</sup> values closer to zero indicate weak model fits, while R<sup>2</sup> values closer to one indicate stronger model fits. Results with R<sup>2</sup> values less than 0.1, indicating substantial variability in the data, and which did not show statistically significant trends, were defined as having no apparent trend. Where non-detect results were included in linear regression analyses, the reporting limit was substituted.

The linear regression analyses were conducted in Microsoft® Excel following USEPA guidance (USEPA, 2002 and 2009). The monitoring wells currently included in the trend analysis are those wells with results of MTBE that exceed the SSRG after the biosparge system was turned off, as approved by the GAEPD on 5 February 2016 (59 µg/L). Results of the analyses are summarized in **Appendix D**. Overall, the linear regression analysis showed decreasing trends in MTBE concentrations at four of the six monitoring wells analyzed, with two locations showing no significant trend. The data indicated that the previous biosparge system operation and ongoing natural attenuation have successfully reduced concentrations of MTBE at the Site below the SSRG (RL) for MTBE. The specific trends for each aquifer are discussed in more detail below.

#### **4.3.1 Shallow Aquifer**

In June/July and October 2021, no monitoring wells in the shallow aquifer met the criteria described above for statistical analysis of MTBE. MTBE concentrations were below the RL (59 µg/L in groundwater) at all monitoring wells during the most recent sampling event in October 2021 and the previous sampling event in June/July 2021.

None of the monitoring wells in the shallow aquifer met the criteria for statistical analysis of benzene or naphthalene. No detections of BTEX were reported above laboratory detection limits in the shallow zone during the June/July or October 2021 monitoring events. No detections of naphthalene were reported above laboratory detection limits in the shallow zone during the June/July monitoring event, but one detection (MW-18) did occur during the October 2021 monitoring event. The data show that enhanced attenuation at the Site has successfully reduced concentrations to below the RLs in the shallow zone.

#### **4.3.2 Deep Aquifer**

A total of six monitoring wells (MW-39, MW-42, MW-43, MW-44, MW-55, and MW-57) in the deep aquifer met the criteria for linear regression analysis outlined above for MTBE. None of the wells met the criteria for benzene or naphthalene. Benzene and naphthalene were not detected in deep zone monitoring wells above the detection limit during the October 2021 monitoring event.

Statistically significant decreasing trends in MTBE concentrations were observed at four of the six monitoring wells with two wells having no trend (MW-43 and MW-57). MTBE concentrations at all monitoring wells in the deep aquifer are currently below the SSRG (RL). The downgradient wells have continued to show non-detect or decreasing MTBE concentrations indicating the plume in these areas is stable.

Overall, the results of the linear regression trend analyses demonstrate that the combined effects of the previous biosparge system operation and ongoing natural attenuation are decreasing the size and magnitude of the dissolved plume at the Site to below the RLs.

## **5.0 CONCLUSIONS AND RECOMMENDATIONS**

### **5.1 Conclusions**

As recommended in the *CAP Addendum for the Former 724<sup>th</sup> TPS*, SWMU 26 (Arcadis, 2010) and reported in the *Sixteenth CAP Progress Report* (Arcadis, 2012), additional remedial actions were conducted to meet established RLs for soil and groundwater at SWMU 26. In order to meet established remedial criteria, source area soil was excavated and a biosparge system was installed to address COC impacts in deep groundwater (Arcadis, 2012). The effectiveness of the implemented remedial actions has been evaluated through semi-annual groundwater monitoring. Data indicate that the excavation was effective in removing the residual source mass in soil and that the biosparge system was effective in reducing COC concentrations in groundwater across the impacted area. The biosparge system was turned off at the end of May 2016 with GAEPD concurrence to evaluate COC rebound. Since May 2016, COC concentrations have not rebounded and have continued to decrease across the site.

The results from the June/July and October 2021 semi-annual groundwater monitoring events indicate that MTBE was not detected above the RL value of 59 µg/L, which was approved by the GAEPD in February 2016. MTBE has not been detected above the RL since 2018.

Additionally, benzene was not detected above the RL (MCL) of 5 µg/L in 2021. Benzene has not been detected above the applicable RL since 2014.

Naphthalene was only reported above the detection limit at one of the monitoring wells sampled during the October 2021 sampling event. When screened against the RL (GAEPD-approved SSRG) of 6.1 µg/L, all historical naphthalene concentrations detected at site monitoring wells do not exceed the RL.

SWMU 26 meets the GAEPD requirements to complete three years of sampling with COC results below the RL (USEPA MCLs or SSRGs) for site closure based on the results from the 2019 through 2021 sampling events presented in the *SWMU 26 Thirtieth Corrective Action Plan Progress Report* (ECC, 2022) which was approved by GAEPD in a letter dated May 16, 2022 (GAEPD, 2022). GAEPD approved No Further Action status for SWMU 26 in a letter dated February 2, 2023 (GAEPD, 2023). Upon approval of this Corrective Action Completion Report, a workplan for abandonment of monitoring wells on site and removal of the biosparge system and components will be developed and submitted for GAEPD approval.

### **5.2 Recommendations**

The data from the most recent sampling event indicate continued decreases in COC concentrations in Site groundwater resulting from successful biosparge system operations and ongoing natural attenuation processes. Concentrations in site monitoring wells are below the RL for all COCs (benzene, MTBE, and naphthalene) for the third consecutive year (from 2019 through 2021).

SWMU 26 has met the GAEPD requirement to complete three years of sampling with results below RLs and is therefore recommended for site closure.

Notes:

ft amsl - feet above mean sea level

NA - Not applicable

ft bgs - feet below ground surface

NM - Not measured

ft btoc - feet below top of casing

\* - Replacement well

a - Well was dry at the time of gauging

MW-44	Deep	16.7 - 21.7	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-45	Deep	18.0 - 23.0	--	--
MW-46	Deep	19.9 - 24.5	--	--
MW-47	Shallow	3.9 - 13.5	--	--
MW-48	Deep	23.4 - 27.9	--	--
MW-49	Shallow	3.9 - 13.5	--	--
MW-50	Deep	29.6 - 31.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-51	Shallow	3.9 - 13.5	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-52	Deep	25.9 - 30.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-53	Deep	26.7 - 31.1	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-54	Deep	26.9 - 31.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-55	Deep	26.9 - 31.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-56	Deep	26.9 - 31.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-57	Deep	26.9 - 31.4	BTEX, MTBE, and NP	BTEX, MTBE, and NP
MW-58	Deep	26.0 - 31.0	--	--
MW-59	Shallow	3.0 - 13.0	--	--
MW-60	Deep	15.0 - 25.0	--	--

Notes:

Note 1            Well determined to have been abandoned.

--                Not Sampled; Water Level Only

BTEX              Benzene, toluene, ethylbenzene, and xylene compounds

MTBE             Methyl tert-butyl ether

NP                Naphthalene

**Table 3-3**  
**Groundwater Analytical Data - April 2011 through October 2021**  
**SWMU 26, Former 724th Tanker Purgung Area**  
**Fort Stewart, Georgia**

	VOCs - USEPA Method SW8260 ( $\mu\text{g}/\text{L}$ )						
	Chemical Name	Benzene	Toluene	Ethylbenzene	Xylenes (total)	MTBE*	Naphthalene**
	MCL/SSRG	5	1000	700	10000	59**	6.1**
Location ID	Sample Date						

Notes:

- Indicates the sample result exceeds the MCL or Site Specific Remediation Goal

\* - All data highlights updated to reflect screening criteria change from data exceeding the Tap Water RSL (MTBE - 14  $\mu\text{g}/\text{L}$ , Naphthalene - 0.17  $\mu\text{g}/\text{L}$ ) to data exceeding Site-Specific Remediation Goals for MTBE and Naphthalene.

\*\* - Site-Specific Remediation Goal (GAEPD, February 5, 2016)

$\mu\text{g}/\text{L}$  - micrograms per liter

**BOLD** - indicate the analyte was detected

D - Sample diluted for analysis.

DUP - Duplicate sample

J - The sample result is estimated

J+ - Detected and greater than the upper control limit

MCL - USEPA Maximum Contaminant Level - National Primary Drinking Water Regulations

MTBE - Methyl tert-butyl ether

NA - Not Analyzed

SSRG - Site-Specific Remediation Goal

U - The analyte was not detected above the level of detection

UB - Compound/analyte detected in blank or associated blank, qualified as a non-detect at listed value

UJ - Result is considered not detected but estimated due to QC deficiencies

VOCs - Volatile Organic Compounds

**MTBE Concentrations along Geologic Cross-Section B-B'**

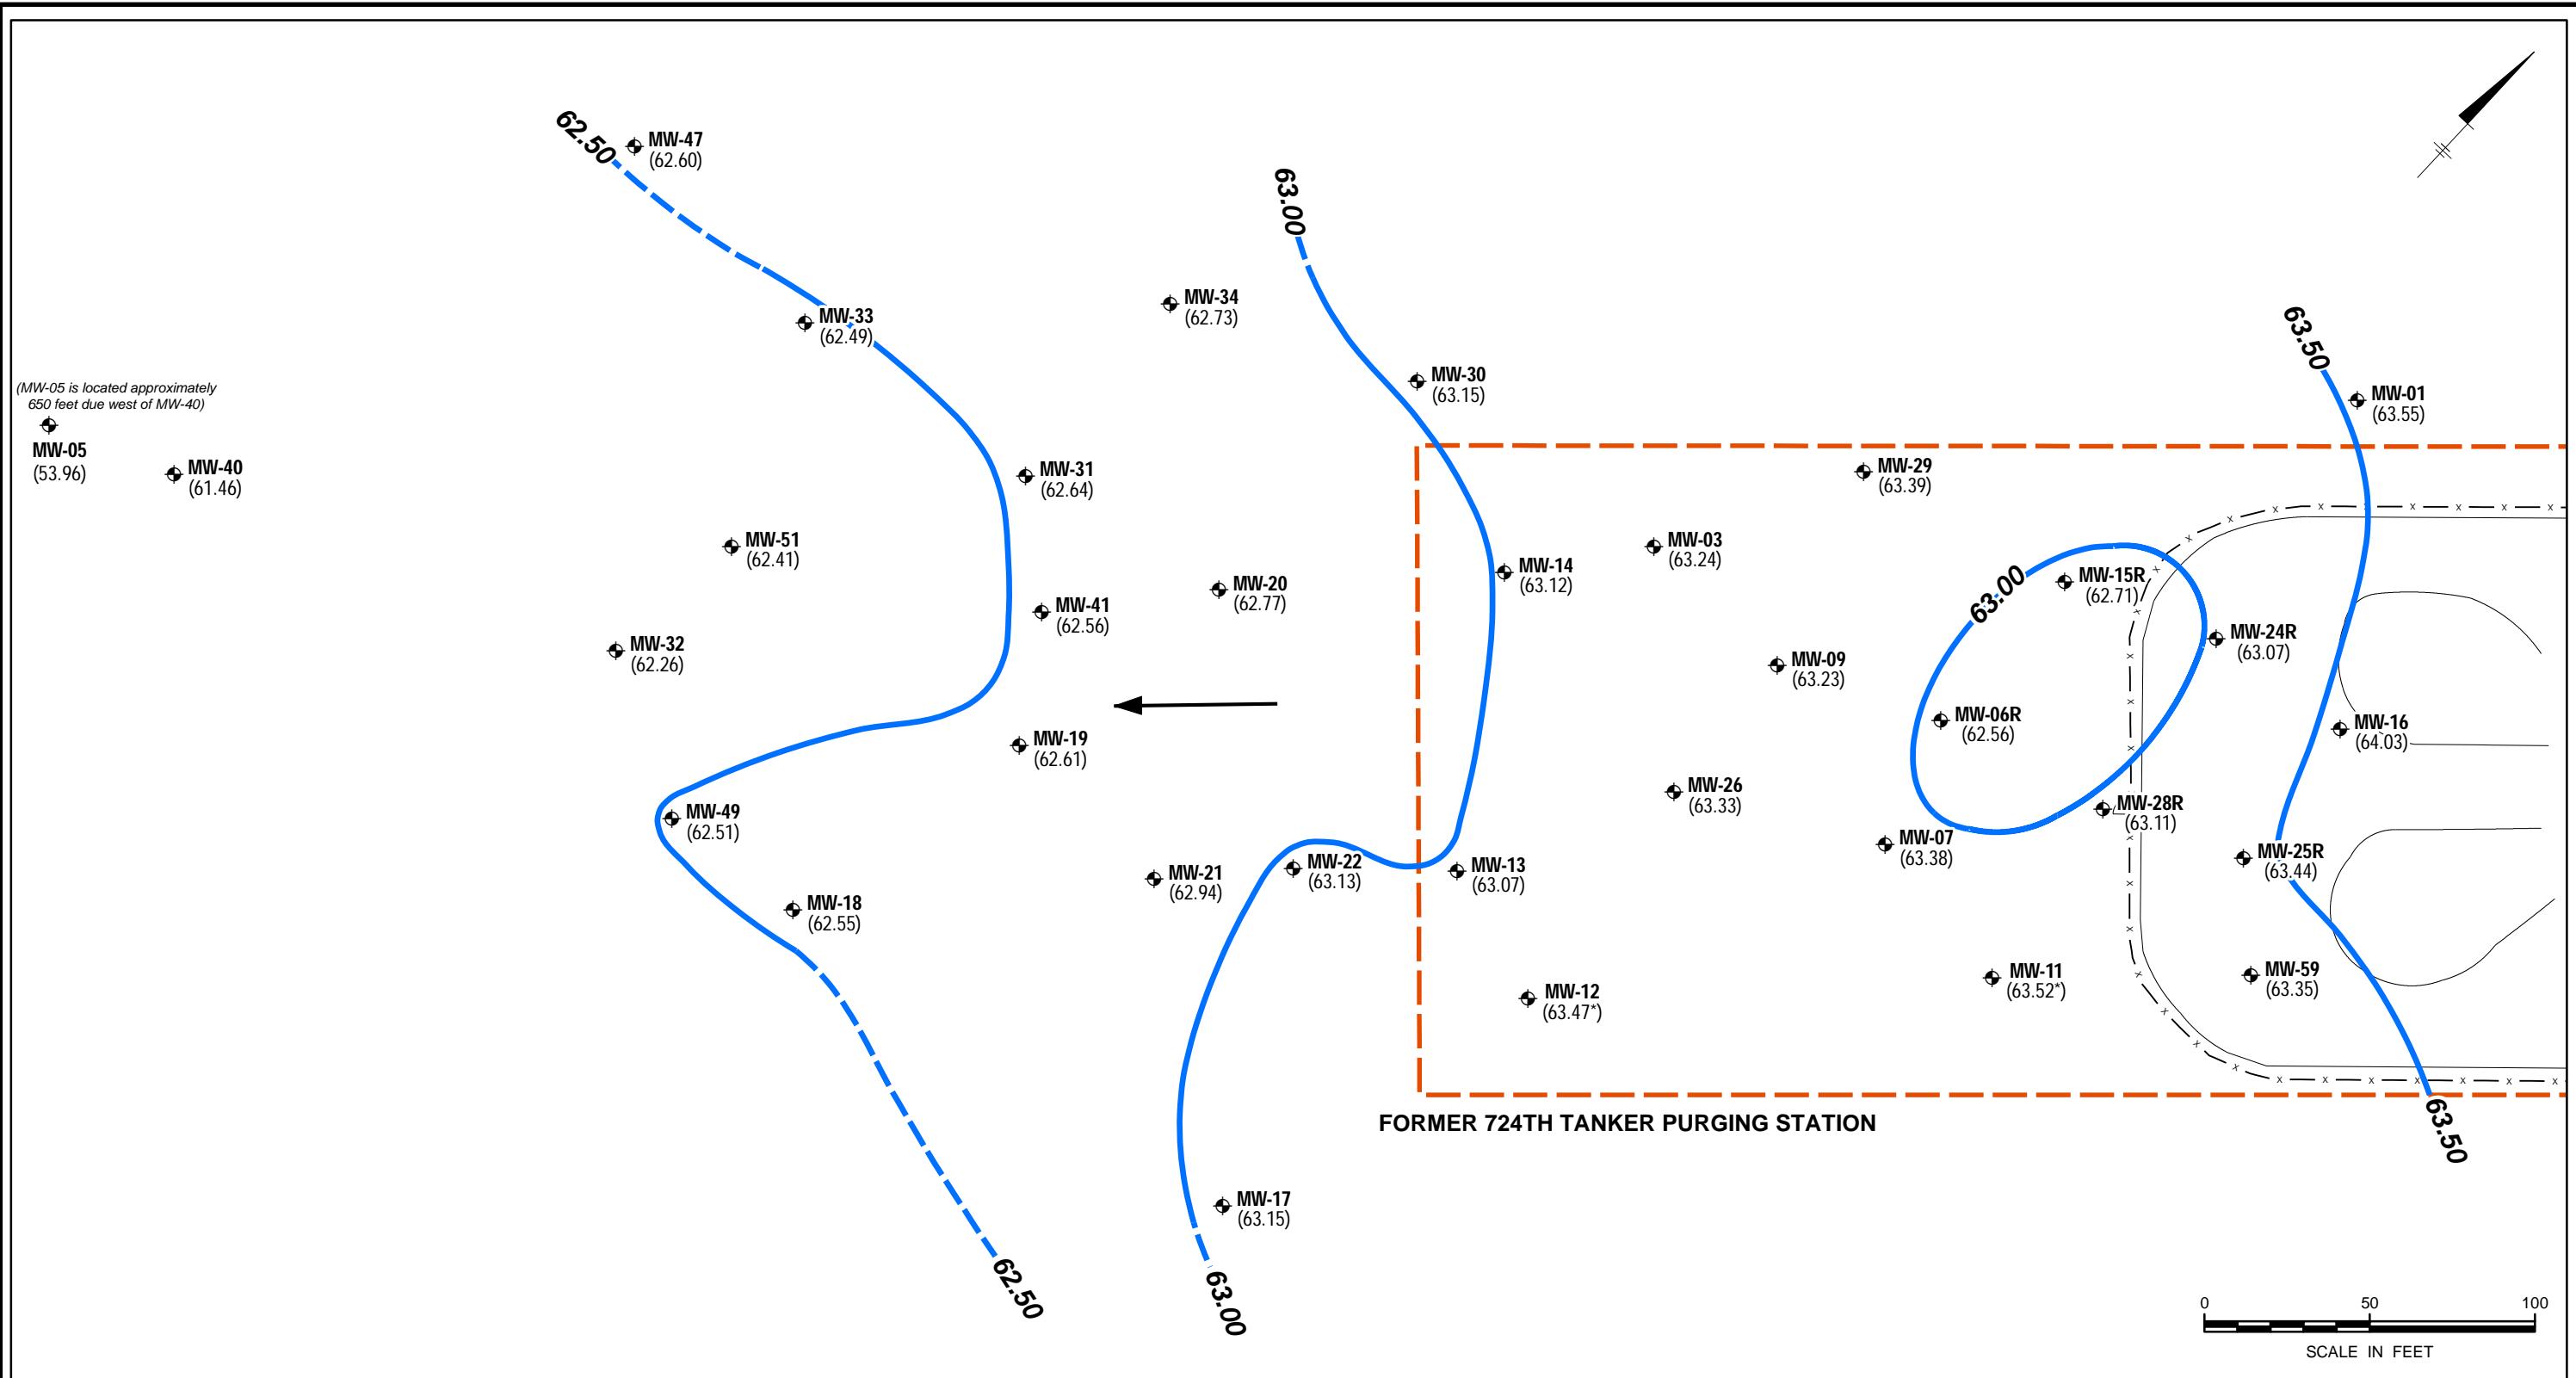

**NOTES:**

1. Lithologic contacts were inferred.
2. Water table estimated based on groundwater elevations measured in shallow monitoring wells.
3. All Concentrations are reported in micrograms per liter ( $\mu\text{g}/\text{L}$ ).
4. GAEPD approved the Site-Specific Remediation Goal of 59  $\mu\text{g}/\text{L}$  for Methyl tert-butyl ether (MTBE) in February 2016.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

## CASE NARRATIVE

**Client: ARCADIS U.S., Inc.**

**Project: Ft. Sewart/ FTG-26**

**Report Number: 680-200935-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In the event of interference or analytes present at high concentrations, samples may be diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

### **RECEIPT**

The samples were received on 07/02/2021; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 3.3 C.

### **Receipt Exceptions**

The method requirement for no headspace was not met. The following volatile sample#20 were received in TA-Sac with significant headspace in the sample container. Significant headspace is defined as a bubble greater than 6 mm in diameter. TRIP BLANK (680-200935-20)

### **VOLATILE ORGANIC COMPOUNDS (GC/MS)**

Samples FST26-MW-38(062921) (680-200935-1), FST26-MW-54(062921) (680-200935-2), FST26-MW-19(062921) (680-200935-3), FST26-MW-25R(062921) (680-200935-4), FST26-MW-28R(062921) (680-200935-5), FST26-MW-36R(062921) (680-200935-6), FST26-MW-23(063021) (680-200935-7), FST26-MW-56(063021) (680-200935-8), FST26-MW-50(063021) (680-200935-9), FST26-MW-42(063021) (680-200935-10), FST26-MW-52(063021) (680-200935-11), FST26-MW-51(063021) (680-200935-12), FST26-MW-39(070121) (680-200935-13), FST26-MW-53(070121) (680-200935-14), FST26-MW-43(070121) (680-200935-15), FST26-MW-57(070121) (680-200935-16), FST26-MW-55(070221) (680-200935-17), FST26-MW-44(070221) (680-200935-18), FST26-DUP-01(070221) (680-200935-19) and TRIP BLANK (680-200935-20) were analyzed for Volatile Organic Compounds (GC/MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 07/12/2021 and 07/13/2021.

Toluene-d8 (Surrogate) recovery for the following samples were outside the upper control limit: FST26-MW-28R(062921) (680-200935-5) and FST26-MW-23(063021) (680-200935-7). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Toluene-d8 (Surrogate) recovery for the laboratory control sample associated with analytical batch 320-505737 was outside the upper control limit: (LCSD 320-505737/10). As the target analytes were within control limits for this LCS, and the associated samples surrogate were in control, a re- analysis was not performed.

4-Bromofluorobenzene (Surrogate) recovery for the following sample was outside the upper control limit: FST26-MW-36R(062921) (680-200935-6). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Internal standard (ISTD) response for Dioxane-d8 and TBA-d9 for the following samples were outside acceptance criteria: FST26-MW-54(062921) (680-200935-2), FST26-MW-19(062921) (680-200935-3), FST26-MW-28R(062921) (680-200935-5[MSD]), FST26-MW-36R(062921) (680-200935-6), (CCV 320-505737/4) and (CCVC 320-505737/33). This ISTD does not correspond to any of the requested target compounds; therefore, the data have been reported.

Internal standard (ISTD) response for Dioxane-d8 and TBA-d9 for the following samples were outside acceptance criteria: FST26-MW-52(063021) (680-200935-11), FST26-MW-44(070221) (680-200935-18), FST26-DUP-01(070221) (680-200935-19), (CCV 320-506142/4), (CCVC 320-506142/50), (LCS 320-506142/5), (LCSD 320-506142/6) and (MB 320-506142/9). This ISTD does not

## Case Narrative

Client: ARCADIS U.S., Inc.  
Project/Site: Ft. Stewart/ FTG-26

Job ID: 680-200935-1

### Job ID: 680-200935-1 (Continued)

#### Laboratory: Eurofins TestAmerica, Savannah (Continued)

correspond to any of the requested target compounds; therefore, the data have been reported.

Internal standard (ISTD) response for Dioxane-d8 for the following samples were outside acceptance criteria: FST26-MW-42(063021) (680-200935-10), FST26-MW-53(070121) (680-200935-14), FST26-MW-57(070121) (680-200935-16) and FST26-MW-55(070221) (680-200935-17). This ISTD does not correspond to any of the requested target compounds; therefore, the data have been reported.

The laboratory control sample (LCS) for analytical batch 320-505737 recovered outside control limits for the following analytes: Naphthalene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 320-506142.

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 320-506091.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Definitions/Glossary

Client: ARCADIS U.S., Inc.  
Project/Site: Ft. Stewart/ FTG-26

Job ID: 680-200935-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Detection Summary

Client: ARCADIS U.S., Inc.  
Project/Site: Ft. Stewart/ FTG-26

Job ID: 680-200935-1

### **Client Sample ID: FST26-MW-38(062921)**

**Lab Sample ID: 680-200935-1**

Analyte	Result	Qualifier	LOQ	LOD	DL	Unit	Dil Fac	D	Method	Prep Type

Job Number: 680-200935-1

**Login Number: 200935**

**List Source: Eurofins TestAmerica, Savannah**

**List Number: 1**

**Creator: Mooken, Darmal**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## DATA REVIEW

Savannah, Georgia

Volatile Organic Compounds

SDG # 680-200935-1

Analyses Performed by:

Eurofins TestAmerica

Savannah, GA

Report # 42232R

Review Level: Stage 2

Project: 30047054. FST-26

## DATA REVIEW REPORT

# SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # 680-200935-1 for samples collected in association with the Fort Stewart Site, Georgia. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis
					VOC
FST26-MW-38(062921)	680-200935-1	Water	06/29/21		X
FST26-MW-54(062921)	680-200935-2	Water	06/29/21		X
FST26-MW-19(062921)	680-200935-3	Water	06/29/21		X
FST26-MW-25R(062921)	680-200935-4	Water	06/29/21		X
FST26-MW-28R(062921)	680-200935-5	Water	06/29/21		X
FST26-MW-36R(062921)	680-200935-6	Water	06/29/21		X
FST26-MW-23(063021)	680-200935-7	Water	06/30/21		X
FST26-MW-56(063021)	680-200935-8	Water	06/30/21		X
FST26-MW-50(063021)	680-200935-9	Water	06/30/21		X
FST26-MW-42(063021)	680-200935-10	Water	06/30/21		X
FST26-MW-52(063021)	680-200935-11	Water	06/30/21		X

## DATA REVIEW REPORT

### ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

**Note:**

QA - Quality Assurance

## DATA REVIEW REPORT

### ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW 846 method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The reported result was an estimated value with an unknown bias.
  - UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

## DATA REVIEW REPORT

### VOLATILE ORGANIC COMPOUNDS ANALYSES

#### 1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

All samples were analyzed within the specified holding time criteria.

#### 2. Sample Receipt Condition

The laboratory used VOC vials with headspace greater than 6mm in size for sample TRIP BLANK, due to the need for dilution. The container used for the following sample was previously opened and contained headspace. In case of any deviation, the sample results were qualified as documented in the table below.

Control Limit	Sample Result	Qualification
Bubbles in VOC vials < 6 mm	Non-detect	No Action
	Detect	No Action
Bubbles in VOC vials > 6 mm	Non-detect	UJ
	Detect	J

#### 3. Blank Contamination

Quality assurance (QA) blanks (i.e., method, instrument, and equipment rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination. Equipment rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the Limit of detection (LOD). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the LOD in the associated blanks; therefore, detected sample results were not associated with blank contamination.

#### 4. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

## DATA REVIEW REPORT

Samples associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample ID	Surrogate	Recovery
FST26-MW-28R (062921)	Toluene-d8	>UL
FST26-MW-23(063021)		
FST26-MW-36R (062921)		

**Notes:**

UL - upper control limit

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compounds	Non-detect	UJ <sup>1</sup>
	Detect	J <sup>1</sup>

**Note:**

- <sup>1</sup> A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

### 5. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD was performed on the sample FST26-MW-28R (062921). MS/MSD analysis exhibited acceptable recoveries and RPD.

### 6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

## DATA REVIEW REPORT

Sample ID	Compound	LCS Recovery	LCSD Recovery
FST26-MW-38(062921)	Naphthalene	>UL	Acceptable
FST26-MW-54(062921)			
FST26-MW-19(062921)			
FST26-MW-25R (062921)			
FST26-MW-28R (062921)			
FST26-MW-36R (062921)			
FST26-MW-23(062921)			

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

### 7. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soils is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the LOQ, a control limit of two times the LOQ is applied for water matrices and three time the LOQ for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Compound	Sample Result ( $\mu\text{g}/\text{L}$ )	Duplicate Result ( $\mu\text{g}/\text{L}$ )	RPD
FST26-MW-55(070221) / FST26-DUP-01(070221)	Methyl tert-butyl ether	0.71 J	0.70 J	AC

**Notes:**

AC - acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable

### 8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

## DATA REVIEW REPORT

### DATA VALIDATION CHECKLIST FOR VOCs

VOCs: SW-846 8260B	Reported		Performance Acceptable		Not Required	
	No	Yes	No	Yes		
<b>GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)</b>						
<b>Tier II Validation</b>						
Holding times		X	X			
Reporting limits (units)		X		X

Job ID: 680-200935-1

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

## Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

### Narrative

#### Job Narrative 680-206713-1

### Comments

No additional comments.

### Receipt

The samples were received on 10/29/2021 4:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.1° C.

### GC/MS VOA

Method 8260B: Internal standard (ISTD) response for Dioxane-d8 and TBA-d9 for the following samples in analytical batch 320-540893 was outside acceptance criteria: FST26 - MW38 (102821) (680-206713-4), FST26 - MW19 (102821) (680-206713-8), FST26 - MW14 (102721) (680-206713-15), DUP-02 (102821) (680-206713-23), (CCV 320-540893/4) and (LCSD 320-540893/6). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Method 8260B: Internal standard (ISTD) response for Dioxane-d8 for the following samples in analytical batch 320-540893 was outside acceptance criteria: FST26 - MW56 (102821) (680-206713-9), FST26 - MW25R (102921) (680-206713-20), (CCVC 320-540893/31) and (LCS 320-540893/5). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Method 8260B: Internal standard (ISTD) response for TBA-d9 for the following samples in analytical batch 320-540897 was outside acceptance criteria: DUP-01 (102721) (680-206713-22). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

Method 8260B: The continuing calibration verification (CCV) associated with analytical batch 320-540893 recovered outside the control limit of +/-20% for Naphthalene. Naphthalene has been classified as a poor performing analyte. The acceptance limits of +/-30% are applied to this analyte per client's approval.

(CCV 320-540893/4)

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 320-540893 recovered outside control limits for the following analytes: Naphthalene.

Method 8260B: The following volatiles samples were diluted due to color and foaming at the time of purging during the original sample analysis: FST26 - MW13 (102821) (680-206713-11), FST26 - MW03 (102721) (680-206713-13), FST26 - MW12 (102721) (680-206713-14), FST26 - MW14 (102721) (680-206713-15) and FST26 - MW22 (102921) (680-206713-21). Elevated reporting limits (RLs) are provided.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batches 320-540893, and 320-540897.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Method Summary

Client: ARCADIS U.S., Inc.

Job ID: 680-206713-1

Project/Site: Ft. Stewart Environmental Remediation (FST-26)

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL SAC
5030B	Purge and Trap	SW846	TAL SAC

**Protocol References:**

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

**Laboratory References:**

TAL SAC = Eurofins TestAmerica, Sacramento, 880 Riverside Parkway, West Sacramento, CA 95605, TEL (916)373-5600

## Definitions/Glossary

Client: ARCADIS U.S., Inc.

Job ID: 680-206713-1

Project/Site: Ft. Stewart Environmental Remediation (FST-26)

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

### Glossary

**Abbreviation** These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

## Detection Summary

Client: ARCADIS U.S., Inc.

Job ID: 680-206713-1

Project/Site: Ft. Stewart Environmental Remediation (FST-26)

### **Client Sample ID: FST26 - MW36R (102721)**

**Lab Sample ID: 680-206713-1**

Analyte	Result	Qualifier	LOQ	LOD	DL	Unit	Dil Fac	D	Method	Prep Type
Methyl tert-butyl ether	0.53	J M	2.0	0.40	0.19	ug/L	1		8260B	Total/NA

### **Client Sample ID: FST26 - MW28R (102721)**

**Lab Sample ID: 680-206713-2**

No Detections.

## Chain of Custody Record

Savannah, GA 31404  
Phone: 912-354-7858 Fax: 912-352-0165

Note Since laboratories are subject to change Eurofins TestAmerica places the ownership of method, analytic & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently have manufacutrial accreditation in the State of Origin listed above for analysis/test/analysis matrix being analyzed the samples must be shipped back to the Eurofins TestAmerica laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins TestAmerica attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins TestAmerica

## Login Sample Receipt Checklist

Client: ARCADIS U.S., Inc.

Job Number: 680-206713-1

**Login Number:** 206713

**List Source:** Eurofins TestAmerica, Savannah

**List Number:** 1

**Creator:** Sims, Robert D

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

## Job ID: 680-206802-1

Laboratory: Eurofins TestAmerica, Savannah

### Narrative

Job Narrative  
680-206802-1

### Comments

No additional comments.

### Receipt

The samples were received on 11/2/2021 10:35 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.1° C.

### GC/MS VOA

Method 8260B: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for analytical batch 320-541259 recovered outside control limits for the following analytes: Naphthalene.

Method 8260B: Internal standard (ISTD) response for TBA-d9 for the following samples in analytical batch 320-541259 was outside acceptance criteria: FST26-MW43 (102821) (680-206802-3), Trip Blank (680-206802-5) and (LCS 320-541259/6). This ISTD does not correspond to any of the requested target compounds reported from this analytical batch; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Definitions/Glossary

Client: ARCADIS U.S., Inc.  
Project/Site: Ft. Stewart (FST-26)

Job ID: 680-206802-1

### Qualifiers

#### GC/MS VOA

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
Q	One or more quality control criteria failed.
U	Undetected at the Limit of Detection.

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment	
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A		1
The cooler's custody seal, if present, is intact.	True		2
Sample custody seals, if present, are intact.	True		3
The cooler or samples do not appear to have been compromised or tampered with.	True		4
Samples were received on ice.	True		5
Cooler Temperature is acceptable.	True		6
Cooler Temperature is recorded.	True		7
COC is present.	True		8
COC is filled out in ink and legible.	True		9
COC is filled out with all pertinent information.	True		10
Is the Field Sampler's name present on COC?	N/A		11
There are no discrepancies between the containers received and the COC.	True		12
Samples are received within Holding Time (excluding tests with immediate HTs)	True		13
Sample containers have legible labels.	True		14
Containers are not broken or leaking.	True		15
Sample collection date/times are provided.	True		
Appropriate sample containers are used.	True		
Sample bottles are completely filled.	True		
Sample Preservation Verified.	True		
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True		
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True		
Multiphasic samples are not present.	True		
Samples do not require splitting or compositing.	True		
Residual Chlorine Checked.	N/A

## DATA REVIEW

Savannah, Georgia

Volatile Organic Compounds

SDG # 680-206713-1

Analyses Performed by:

Eurofins TestAmerica

Savannah, GA

Report # 43546R

Review Level: Stage 2

Project: 30047054.03-FST-26

## DATA REVIEW REPORT

# SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # 680-206713-1 for samples collected in association with the Fort Stewart Site, Georgia. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis
					VOC
FST26 - MW36R (102721)	680-206713-1	Water	10/27/21		X

## DATA REVIEW REPORT

### ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA = Quality Assurance

## DATA REVIEW REPORT

### ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

- U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
- B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

- E The compound was quantitated above the calibration range.
- D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

- J The reported result was an estimated value with an unknown bias.
- UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
- UB Compound considered non-detect at the listed value due to associated blank contamination.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

## DATA REVIEW REPORT

### VOLATILE ORGANIC COMPOUNDS ANALYSES

#### 1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis (preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

All samples were analyzed within the specified holding time.

#### 2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, and Trip blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the limit of detection (LOD). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the LOD in the associated blanks; therefore, detected sample results were not associated with blank contamination.

#### 3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

#### 4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

MS/MSD analysis was performed on the sample ID FST26 - MW28R (102721), exhibited acceptable recoveries and RPD.

## DATA REVIEW REPORT

### 5. Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
FST26 - MW55 (102721)	
FST26 - MW38 (102821)	
FST26 - MW54 (102821)	
FST26 - MW44 (102821)	
FST26 - MW57 (102821)	
FST26 - MW19 (102821)	
FST26 - MW56 (102821)	
FST26 - MW05 (102821)	
FST26 - MW13 (102821)	
FST26 - MW23 (102821)	Naphthalene
FST26 - MW03 (102721)	
FST26 - MW12 (102721)	
FST26 - MW14 (102721)	
FST26 - MW39 (102821)	
FST26 - MW50 (102821)	
FST26 - MW51 (102821)	
FST26 - MW52 (102821)	
FST26 - MW25R (102921)	
FST26 - MW22 (102921)	
DUP-02 (102821)	

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

### 6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations

## DATA REVIEW REPORT

are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
FST26 - MW55 (102721) / DUP-01 (102721)	Methyl tert-butyl ether	0.40 U	0.85	AC
FST26 - MW38 (102821) / DUP-02 (102821)	Methyl tert-butyl ether	2.9	2.6	AC

Notes:

AC              Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

### 7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

## DATA REVIEW REPORT

## DATA REVIEW

Savannah, Georgia

Volatile Organic Compounds

SDG # 680-206802-1

Analyses Performed by:

Eurofins TestAmerica

Savannah, GA

Report # 43547R

Review Level: Stage 2

Project: 30047054.03-FST-26

## DATA REVIEW REPORT

# SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # 680-206802-1 for samples collected in association with the Fort Stewart Site, Georgia. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis
					VOC
FST26-MW18 (102821)	680-206802-1	Water	10/28/21		X
FST26-MW42 (102821)	680-206802-2	Water	10/28/21		X
FST26-MW43 (102821)	680-206802-3	Water	10/28/21		X
FST26-MW53 (102821)	680-206802-4	Water	10/28/21		X
Trip Blank	680-206802-5	Water	10/28/21		X

Note:

VOC = volatile organic compounds

## DATA REVIEW REPORT

### ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:

QA = Quality Assurance

## DATA REVIEW REPORT

### ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified, and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes:

- Concentration (C) Qualifiers

- U The analyte was not detected and was reported as less than the LOD. The LOD has been adjusted for any dilution or concentration of the sample.
- B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

- E The compound was quantitated above the calibration range.
- D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

- J The reported result was an estimated value with an unknown bias.
- UJ The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
- UB Compound considered non-detect at the listed value due to associated blank contamination.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

## DATA REVIEW REPORT

### VOLATILE ORGANIC COMPOUNDS ANALYSES

#### 1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis (preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

All samples were analyzed within the specified holding time.

#### 2. Blank Contamination

Quality assurance (QA) blanks (i.e., method, and Trip blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Instrument blanks measure carryover in the instrument from one sample to another. Method blanks measure laboratory contamination.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the limit of detection (LOD). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the LOD in the associated blanks; therefore, detected sample results were not associated with blank contamination.

#### 3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

#### 4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

MS/MSD analysis was not performed on any of the samples from this SDG.

## DATA REVIEW REPORT

### 5. Laboratory Control Sample/ Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
FST26-MW18 (102821)	
FST26-MW42 (102821)	
FST26-MW43 (102821)	Naphthalene
FST26-MW53 (102821)	
Trip Blank	

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

### 6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate sample was not collected from this SDG.

### 7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

## DATA REVIEW REPORT
